Morning Session - 1994 Meeting

1. Bigger meeting venue needed next year

WARREN BUFFETT: Put this over here.

CHARLIE MUNGER:

WARREN BUFFETT: Am I live yet? Yeah.

Morning.

AUDIENCE: Morning.

WARREN BUFFETT: We were a little worried today because we weren't sure from the reservations whether we can handle everybody, but it looks to me like there may be a couple seats left up there.

But I think next year, we're going to have to find a different spot because it looks to me like we're up about 600 this year from last year, and to be on the safe side we will seek out a larger spot.

Now, there are certain implications to that because, as some of the more experienced of you know, a few years ago we were holding this meeting at the Joslyn Museum, which is a temple of culture. (Laughter)

And we've now, of course, moved to an old vaudeville theater. And the only place in town that can hold us next year, I think, is the Ak-Sar-Ben Coliseum where they have keno and racetracks. (Laughter)

We are sliding down the cultural chain — (laughter) — just as Charlie predicted years ago. He saw all this coming. (Laughter)

2. Buffett loses "Miss Congeniality" title to Munger

WARREN BUFFETT: Charlie — I have some rather distressing news to report. There are always a few people that vote against everyone on the slate for directors and there's maybe a dozen or so people do that. And then there are others that single shot it, and they pick out people to vote against.

And, this will come as news to Charlie, I haven't told him yet. But he is the only one among our candidates for directors that received no negative votes this year. (Applause).

Hold it — hold it. No need to applaud.

I tell you, when you lose out the title of Miss Congeniality to Charlie, you know you're in trouble. (Laughter)

3. Meeting timetable

WARREN BUFFETT: Now, I'd like to tell you a little bit how we'll run this. We will have the business meeting in a hurry with the cooperation of all of you, and then we will introduce our managers who are here, and then we will have a Q&A period.

We will run that until 12 o'clock, at which point we'll break, and then at 12:15, if the hardcore want to stick around, we will have another hour or so until about 1:15 of questions.

So, you're free to leave, of course, any time and I've pointed out in the past that it's much better form if you leave while Charlie is talking rather than when I'm talking, but — (Laughter)

Feel free anytime, but you can — if you're panicked and you're worried about being conspicuous by leaving, you will be able to leave at noon.

We will have buses out front that will take you to the hotels or the airport or to any place in town in which we have a commercial interest. (Laughter)

We encourage you staying around on that basis.

4. Berkshire directors introduced

WARREN BUFFETT: Let's have the — let's get the business of the meeting out of the way. Then we can get on to more interesting things.

I will first introduce the Berkshire Hathaway directors that are present in addition to myself and —

First of all, there's Charlie, who is the vice chairman of Berkshire, and if the rest of you will stand.

We have Susan T. Buffett, Howard Buffett, Malcolm Chase III, and Walter Scott Jr. And that's it. (Applause)

5. Meeting quorum

WARREN BUFFETT: Also with us today are partners in the firm of Deloitte and Touche, our auditors, Mr. Ron Burgess and Mr. Craig Christiansen (PH).

They are available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter, secretary of Berkshire. He will make a written record of the proceedings.

Mr. Robert M. Fitzsimmons has been appointed inspector of election at this meeting. He will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg.

Proxy cards have been returned through last Friday representing 1,035,680 Berkshire shares to be voted by the proxy holders as indicated on the cards. That number of shares represents a quorum and we will therefore directly proceed with the meeting.

We will conduct the business of the meeting and then adjourn to the formal meeting — and then adjourn the formal meeting. After that, we will entertain questions that you might have.

First order of business will be a reading of the minutes of the last meeting of shareholders.

I recognize Mr. Walter Scott Jr. who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICES: Seconded.

Motion has been moved and seconded. Are there any comments or questions? Hearing none, we will vote on the motion by voice vote. (Laughter)

All those in favor say aye.

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion is carried and it's a vote.

Does the secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first class mail to all shareholders of record on March 8, 1994, being the record date for this meeting, there were 1,177,750 shares of Berkshire common stock outstanding, with each share entitled to one vote on motions considered at the meeting. Of that number, 1,035,680 shares are represented at this meeting by proxies returned through last Friday.

6. Directors elected

WARREN BUFFETT: Thank you. We will proceed to elect directors.

If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person, he or she may do so.

Also, if any shareholder that's present has not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you.

Would those persons desiring ballots please identify themselves so that we may distribute them? Just raise your hand.

I now recognize Mr. Walter Scott Jr. to place a motion before the meeting with respect to election of directors.

WALTER SCOTT: I move that Warren Buffett, Susan Buffett, Howard Buffett, Malcolm Chase, Charles Munger, and Walter Scott be elected as directors.

WARREN BUFFETT: Is there a second?

VOICE: Seconded.

WARREN BUFFETT: It's been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase III, Charles T. Munger, and Walter Scott Jr. be elected as directors.

Are there any other nominations? Is there any discussion? Motions and nominations are ready to be acted upon.

If there are any shareholders voting in person, they should now mark their ballots and allow the ballots to be delivered to the inspector of elections.

Seeing none, will the proxy holders please also submit to the inspector of elections the ballot voting the proxies in accordance with the instructions they have received.

Mr. Fitzsimmons, when you're ready you may give your report.

ROBERT FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast not less than a 1,035,407 votes for each nominee.

That number far exceeds a majority of the number of all shares outstanding and a more precise count cannot change the results of the election.

However, the certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase III, Charles T. Munger, and Walter Scott Jr. have been elected as directors. (Applause)

7. Formal meeting adjourns

WARREN BUFFETT: Does anyone have any further business to come before this meeting before we adjourn?

If not, I recognize Mr. Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT: I move the meeting be adjourned.

WARREN BUFFETT: Second?

VOICES: Seconded.

The motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say aye?

VOICES: Aye

WARREN BUFFETT: Opposed say no, the meeting is adjourned. (Laughter)

It's democracy in Middle America. (Laughter)

8. Berkshire managers introduced

WARREN BUFFETT: Now, I'd like to introduce some of the people that make this place work to you. And if you would hold your applause until the end because there are quite a number of our managers here.

I'm not sure which ones for sure are here, some of them may be out tending the store as well.

But, first of all, from Nebraska Furniture Mart, Louie, Ron, and Irv Blumkin. I'm not sure who's here, but would you stand please, any of the Blumkins that are present?

OK, we've — looks like Irv. I can't quite see it.

From Borsheims, is Susan Jacques here? Susan? There she is. Susan had a record day yesterday. She just — (applause) — Susan became CEO just a few months ago and she's turning in records already. Keep it up. (Laughter)

And from Central States Indemnity, we have the Kizers. I'm not sure which ones are here, but there's Bill Sr., Bill Jr., John, and Dick.

Kizers, stand up. I think I can see him — John.

Don Wurster from National Indemnity.

Rod Eldred from the Homestate Companies.

Brad Kinstler from Cypress, our worker's comp company.

Ajit Jain, the big ticket writer in the East.

And Mike Goldberg, who runs our real estate finance group and also generally oversees the insurance group. Mike.

Gary Heldman from Fechheimers.

Chuck Huggins from See's, the candy man.

Stan Lipsey from the Buffalo News.

Chuck's been with us, incidentally, twenty-odd years. Stan's been working with me for well over 25 years.

Frank Rooney and Jim Issler from H.H. Brown.

Dave Hillstrom from Precision Steel.

Ralph Schey from Scott Fetzer.

Peter Lunder, who is with our newest acquisition, Dexter Shoe. And Harold Alfond, his partner, couldn't be with us because his wife is ill.

And finally, the manager that's been with Charlie and me the longest, Harry Bottle from K&W. Harry, you here? There's Harry.

Harry saved our bacon back in 19 — what? — 62 or so, when in some mad moment I went into the windmill business. And Harry got me out of it. (Laughter)

That's our group of managers and I appreciate it if you give them a hand. (Applause)

9. Midwest Express adding flights to Omaha

WARREN BUFFETT: I have one piece of good news about next year for you.

In addition to moving to larger quarters, they're going to add nonstop air service from New York, Washington, and Los Angeles here in the next few months, Midwest Express.

So, I hope they do very well with it and I hope that makes it easier for you to get into town.

10. Q&A logistics

WARREN BUFFETT: Now, in this — for the next two hours and 15 minutes or so, we'll have a session where we will take questions.

We have seven zones, three on the main floor. We'll go start over there with zone one and work across.

On the main floor, if you'll raise your hand, the person who is handling the mic will pass it to you and we'll try to not repeat any individual in any one zone till everyone in that zone has had a chance to ask one question. So, after you've been on once, let other people get a shot.

When we move up to the loge, we have one person there and in the case — and then we have three in the balcony, which is essentially full now.

And we would, up there, we would appreciate it if you would you leave your seat and go to the person with the mic. It'll be a little easier in both the loge and the balcony to handle it that way.

And if you'll go a little ahead of time, that way if there's a line of two or three you can you can line up for questions in both the loge and balcony.

So, whatever you'd care to ask. If you want an optimistic answer you'll, of course, direct your question to Charlie. If you'd like a little more realism you'll come to me and — (laughter).

11. Derivatives: dangerous combination of "ignorance and borrowed money"

WARREN BUFFETT: Let's start over in zone 1.

Sometimes we can't see too well from up here, but —

In fact, I can't even see the monitor right now, but do we have one over there?

And if you'll identify yourself by name and your hometown, we'd appreciate it.

AUDIENCE MEMBER: My name is Michael Mullen (PH) from Omaha.

Would you comment on the use of derivatives? I noticed that Dell computer stock was off 2 1/2 points Friday with the loss of derivatives.

WARREN BUFFETT: Question is about derivatives. We have in this room the author of the best thing you can read on that. There was an article in Fortune about a month ago or so by Carol Loomis on derivatives, and far and away it's the best article that has been written.

We also have some people in the room that do business in derivatives from Salomon.

And it's a very broad subject. It — as we said last year, I think someone asked what might be the big financial story of the '90s and we said we obviously don't know, but that if we had to pick a topic that it could well be derivatives because they lend themselves to the use of unusual amounts of leverage and they're sometimes not completely understood by the people involved.

And any time you combine ignorance and borrowed money — (laughter) — you can get some pretty interesting consequences. (Laughter)

Particularly when the numbers get vague. And you've seen that, of course, recently with the recent Procter and Gamble announcement.

Now, I don't know the details of the P&G derivatives, but I understand, at least from press reports, that what started out as interest rate swaps ended up with P&G writing puts on large quantities of U.S. and, I think, one other country's bonds. And any time you go from selling soap to writing puts on bonds, you've made a big jump. (Laughter)

And it — the ability to borrow enormous amounts of money combined with a chance to get either very rich or very poor very quickly, has historically been a recipe for trouble at some point.

Derivatives are not going to go away. They serve useful purposes and all that, but I'm just saying that it has that potential. We've seen a little bit of that.

I can't think of anything that we've done that would — can you think of anything we do that approaches derivatives, Charlie? Directly?

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: I may have to cut him off if he talks too long. (Laughter)

Is there anything you would like to add to your already extensive remarks? (Laughter)

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: OK.

12. Berkshire participated in Cap Cities stock buyback

WARREN BUFFETT: In that case we'll go to zone 2. (Laughter)

AUDIENCE MEMBER: My name is Hugh Stevenson (PH). I'm a shareholder from Atlanta.

My question involves the company's investment in the stock of Cap Cities. It's been my understanding in the past that that was regarded as one of the four, quote unquote, "permanent" holdings of the company.

So I was a little bit confused by the disposition of one million shares. Could you clarify that? Was my previous misunderstanding — was my previous understanding incorrect? Or has there been some change or is there a third possibility?

WARREN BUFFETT: Well, we have classified the Washington Post Company and Cap Cities and GEICO and Coke in the category of permanent holdings. And —

But in the case of three of those four, The Washington Post Company, I don't know, maybe seven or eight years ago, GEICO some years back, and now Cap Cities, we have participated in tenders where the company has repurchased shares.

Now the first two, the Post and GEICO, we participated proportionally. That was not feasible, and incidentally, not as attractive taxwise anymore.

The 1968 Tax Act changed the desirability of proportional redemptions of shares, from our standpoint. That point has been missed by a lot of journalists in commenting on it, but it just so happens that the commentary that has been written has been obsolete, in some cases, by six or seven years.

But, we did participate in the Cap Cities tender offer, just as we did in the Post and GEICO.

We still are, by far, the largest shareholder of Cap Cities. We think it's a superbly run operation in a business that looks a little tougher than it did 15 years ago, but looks a little bit better than it did 15 months ago.

Charlie, you have anything?

CHARLIE MUNGER: Uh, no. (Laughter)

WARREN BUFFETT: He’s thinking it over now though before — (Laughter)

13. Unlikely we’d buy company with no current cash flow

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Good morning. My name is Howard Bask (PH) and I’m from Kansas City. And I’ve got a theoretical value question for you.

If you were to buy a business and you bought it at its intrinsic value, what’s the minimum after-tax free cash flow yield you’d need to get?

WARREN BUFFETT: Well, your question is if we were buying all of a business and we’re buying at what we thought was intrinsic value, what was the minimum —

AUDIENCE MEMBER: Correct.

WARREN BUFFETT: — present earning power or what the present — the minimum discount rate of future streams?

AUDIENCE MEMBER: No, what’s the minimum current after-tax free cash flow yield you’d…

WARREN BUFFETT: We could conceivably buy a business — I don’t think we would be likely to — but we could we could conceivably buy a business that had no current after-tax cash flow. But, we would have to think it had a tremendous future.

But we would not find — obviously the current figures, particularly in the kind of businesses we buy, tend to be representative, we think, of what’s going to happen in the future.

But that would not necessarily have to be the case. You can argue, for example, in buying stocks, we bought GEICO at a time when it was losing significant money. We didn’t expect it to continue to lose significant money.

But if we think the present value of the future earning power is attractive enough compared to the purchase price, we would not be overwhelmed by what the first year’s figure would be.

Charlie, you want to add to that?

CHARLIE MUNGER: Yeah. We don’t care what we report in the first year or two of — after buying anything.

AUDIENCE MEMBER OFF MIC: (INAUDIBLE) on average over the years (INAUDIBLE).

WARREN BUFFETT: Well, I would say that in a world of 7 percent long-term bond rates that we would certainly want to think we were discounting future after-tax streams of cash at at least a 10 percent rate.

But that will depend on the certainty we feel about the business. The more certain we feel about a business, the closer we are willing to play it.

We have to feel pretty certain about any business before we're even interested at all. But there are still degrees of certainty, and —

If we thought we were getting a stream of cash over the next 30 years that we felt extremely certain about, we would use a discount rate that would be somewhat less than if it was one where we thought we might get some surprises in five or 10 years — possibility existed. Charlie?

CHARLIE MUNGER: Nothing to add.

14. Insurance business intrinsic value is well above book value

WARREN BUFFETT: OK. Zone 4.

AUDIENCE MEMBER: Morris Spence (PH) from Omaha, Nebraska.

You've made comments on several occasions about the intrinsic business value of the insurance operations. And in this year's report you state that the insurance business possesses an intrinsic value that exceeds book value by a large amount, larger, in fact, than is the case at any Berkshire — other Berkshire business.

I was wondering if you would explain in greater detail why you believe that to be true.

WARREN BUFFETT: Well, I — it's very hard to quantify, as we've said many times in the report. But, I think that it's clear that even taking fairly pessimistic assumptions, that the excess of intrinsic value over carrying value is higher, by some margin, for the insurance business.

And I think that the table in the report that shows you what our cost to float has been over the years, and also what the trend of float has been over the years, would, unless you thought that table had no validity for the future, I think that that table would tend to the point you in the direction of saying the insurance business does have a very significant excess of intrinsic value over carrying value.

Very hard number to put something on. But — and you don't want to extrapolate that table out. But I think that table shows that we started with maybe 20 million of float and that we're up to something close to three billion of float. And that that float has come to us at a cost that's extremely attractive, on average, over the years.

And just to pick an example, last year, when we actually had an underwriting profit, the value of that float was something over $200 million. And that figure was a lot bigger than it was 10 years ago or 20 years ago.

So that's — that is a stream — last year was unusually favorable, but that is a — that's a very significant stream of earnings, and it's one we feel we have reasonably good prospects in. So we feel very good about the insurance business.

15. Why Berkshire doesn't split its stock

WARREN BUFFETT: OK. Zone 5?

AUDIENCE MEMBER: My name is Cy Rademacher (PH) from Omaha.

Is there any point at which your stock would rise to the point where you might split the stock?

WARREN BUFFETT: Surprise, surprise. (Laughter)

I think I'll let Charlie answer that this year. (Laughs)

He's so popular with the shareholders that I can afford to let him take the tough questions. (Laughter)

CHARLIE MUNGER: I think the answer is no. (Laughter and applause)

I think the idea of carving ownerships in an enterprise into little, tiny $20 pieces is almost insane. And it's quite inefficient to service a $20 account and I don't see why there shouldn't be a minimum as a condition of joining some enterprise. Certainly we'd all feel that way if we were organizing a private enterprise.

WARREN BUFFETT: Yeah, we would not carve it up in $20 units.

We find it very — it's interesting because every company finds a way to fill up its common shareholder list. And you can start with the As and work through to the Zs and you'll — every company in the New York Stock Exchange, one way or another, has attracted some constituency of shareholders.

And frankly, we can't imagine a better constituency than is in this room. I mean, we have — we don't think we can improve on this group, and we followed certain policies that we think attracted certain types of shareholders and actually pushed away others.

And that is part of our eugenics program here at Berkshire. (Laughter)

CHARLIE MUNGER: Yeah, just look around this room and as you mingle with one another. This is a very outstanding group of people. And why would anybody want a different kind of a group?

WARREN BUFFETT: Yeah, if we cause — if we follow some policies that cause a whole bunch of people to buy Berkshire for the wrong reason, the only way they can buy it is to replace somebody in this room, or in this larger metaphorical room, of shareholders that we have.

So someone in one of these seats gets up and somebody else walks in. The question is do we have a better audience?

I don't think so. So I think that — I think Charlie said it very well.

16. Buffett is keeping his private jet

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Mr. Buffett, my name is Rob Na (PH) and I'm from Omaha, Nebraska.

My question is, given the recent announcement of Midwest Express and their nonstop jet service between East and West Coasts, will this cut down on your use of "The Indefensible?" (Laughter)

And will you use more commercial air travel?

WARREN BUFFETT: This is a question planted by Charlie. (Laughter)

I think you should know, I take it to the drugstore at the moment, and I — (Laughter)

No, it's just a question when I start sleeping in it at the hangar.

Nothing will cut back on "The Indefensible." It's being painted right now, but I told them to make it last a long time.

Charlie, though, was pointing out the merits of other kinds of transportation last night at the meeting of our managers. He might want to repeat those here.

CHARLIE MUNGER: Well, I just pointed out that the back of the plane arrived at the same time as the front of the plane, invariably. (Laughter)

WARREN BUFFETT: He's even more of an authority on buses, incidentally, if anybody has his — (Laughter)

17. Buffett's next goal in life

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Mr. Buffett, my name's Allan Maxwell from Omaha. I've got two questions.

What is your next goal in life now that you're the richest man in the country?

WARREN BUFFETT: That's easy. It's to be the oldest man in the country. (Laughter and applause)

18. "Two yardsticks" for judging management

AUDIENCE MEMBER: Secondly, you talk about good management with corporations and that you try and buy companies with good management.

I feel that I have about as much chance of meeting good managers, other than yourself, as I do bringing Richard Nixon back to life.

How do I, as an average investor, find out what good management is?

WARREN BUFFETT: Well, I think you judge management by two yardsticks.

One is how well they run the business and I think you can learn a lot about that by reading about both what they've accomplished and what their competitors have accomplished, and seeing how they have allocated capital over time.

You have to have some understanding of the hand they were dealt when they themselves got a chance to play the hand.

But, if you understand something about the business they're in — and you can't understand it in every business, but you can find industries or companies where you can understand it — then you simply want to look at how well they have been doing in playing the hand, essentially, that's been dealt with them.

And then the second thing you want to figure out is how well that they treat their owners. And I think you can get a handle on that, oftentimes. A lot of times you can't. I mean it — they're many companies that obviously fall in — somewhere — in that 20th to 80th percentile and it's a little hard to pick out where they do fall.

But, I think you can usually figure out — I mean, it's not hard to figure out that, say, Bill Gates, or Tom Murphy, or Don Keough, or people like that, are really outstanding managers. And it's not hard to figure out who they're working for.

And I can give you some cases on the other end of the spectrum, too.

It's interesting how often the ones that, in my view, are the poor managers also turn out to be the ones that really don't think that much about the shareholders, too. The two often go hand in hand.

But, I think reading of reports — reading of competitors' reports — I think you'll get a fix on that in some cases. You don't have to — you know, you don't have to make a hundred correct judgments in this business or 50 correct judgments. You only have to make a few. And that's all we try to do.

And, generally speaking, the conclusions I've come to about managers have really come about the same way you can make yours. I mean they come about by reading reports rather than any intimate personal knowledge or — and knowing them personally at all.

So it — you know, read the proxy statements, see what they think of — see how they treat themselves versus how they treat the shareholders, look at what they have accomplished, considering what the hand was that they were dealt when they took over compared to what is going on in the industry.

And I think you can figure it out sometimes. You don't have to figure out very often.

Charlie?

CHARLIE MUNGER: Nothing to add.

19. How Berkshire keeps great managers

WARREN BUFFETT: Ok, we're back to zone 1.

AUDIENCE MEMBER: Hi there. My name is Lee. I'm from Palo Alto, California.

In meeting Ajit Jain, I've been very impressed over the years. And I think I even met his parents once they came from India.

Please comment on your deepest impressions of his personality and managerial skills, and also how you go about exactly keeping somebody who has such fine skills within the fold. He might go to Walt Disney someday and, you know, pull down 200 million.

WARREN BUFFETT: Well, if he gets offered 200 million — (laughs) — we may not compete too vigorously at that level. (Laughter)

We basically try to run a business so that — Charlie and I have two jobs. We have to identify and keep good managers interested after we've figured out who they are.

And that often is a little different here, because I would say a majority of our managers are financially independent, so that they don't go to work because they are worried about putting kids through school or putting food on the table. So they have to have some reason to go to work aside from that.

They have to be treated fairly in terms of compensation, but they also have to figure it is better than playing golf every day or whatever it may be.

And, so that's one of the jobs we have and we basically attack that the same way — we look at what they do the same way we look at what we do.

We've got a wonderful group of shareholders. Before I ran this, I had a partnership. I had a great group of partners. And essentially, I like to be left alone to do what I did. I like to be judged on the scorecard at the end of the year rather than on every stroke, and not second guessed in a way that was inappropriate.

I like to have people who understood the environment in which I was operating.

And so the important thing we do with managers, generally, is to find the .400 hitters and then not tell them how to swing, as I put in the report.

The second thing we do is allocate capital. And aside from that, we play bridge. (Laughter)

Pretty much what happens at Berkshire.

So, with any of the managers you might name here, we try to make it interesting and fun for them to run their business. We try to have a compensation arrangement that's appropriate for the kind of business they're in.

We have no company-wide compensation plan. We wouldn't dream of having some compensation expert or consultant come in and screw it up. (Laughter)

We try to — some businesses require a lot of capital that we're in, some require no capital. Some are easy businesses where good profit margins are a cinch to come by, but we're really paying for the extra beyond that. Some are very tough businesses to make money in.

And it would be crazy to have some huge framework that we try to place everybody in that — where one size would fit all.

People, generally, are compensated relating in some manner that relates to how their business does as opposed to — there's no reason to pay anybody based on how Berkshire does, because no one has responsibility for Berkshire except for Charlie and me.

And we try to make them responsible for their own units, compensated based on how those units do.

We try to understand the businesses they're in, so we know what the difference between a good performance and a bad performance —

And that's about — that's how we work with people.

We've had terrific luck over the years in retaining the managers that we wanted to retain. I think, largely, it's because — particularly if they sell us a business — to a great extent, the next day they're running it just as they were the day before. And they're having as much fun running their business as I am running Berkshire.

Charlie?

CHARLIE MUNGER: Well, I've got nothing to add, but I think that concept of treating the other fellow the way you'd like to be treated if the roles were reversed — it's so simple, when you stop to think about it, but —

It's a rare evening when Ajit and Warren aren't talking once on the phone. It's more than a business relationship, at least it seems that way to me.

WARREN BUFFETT: Yeah, well, it is. It will stay that way, too.

CHARLIE MUNGER: And by the way, we like our businesses — our relationships — to be more than a business relationship

WARREN BUFFETT: Charlie and I are very — we basically — it's a luxury but it's a luxury that we should try to nurture — we get to work with people we like. And it makes life a lot simpler.

It probably helps in that goal of being the oldest living American, too. (Laughter)

CHARLIE MUNGER: Yeah, and we tend to like people we admire. (Laughter)

WARREN BUFFETT: Yeah, who do we like that we don't admire, Charlie? (Laughter)

Start naming names. These people have names. (Laughter)

20. Guinness hurt by weak demand for scotch

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: My name is Peter Bevelin from Sweden.

How do you perceive Guinness long-term, economics growth-wise?

WARREN BUFFETT: Fitz — would you repeat that please, Fitz. What was it? What firm growth-wise?

VOICE: Guinness.

AUDIENCE MEMBER: Guinness.

WARREN BUFFETT: Oh, Guinness.

I'm not as much of an expert on Guinness' products as Charlie is.

CHARLIE MUNGER: We approved that. (Laughter)

WARREN BUFFETT: You didn't hear him. He said, "I approved that."

I made the decision to buy Guinness and Guinness has — it's down somewhat from — actually, the price in pounds is about the same but the pound is at about $1.46 or -7 against an average of $1.80-something, so we've had a significant exchange loss on that.

The — Guinness' — despite the name — you know, the main product, of course, is scotch. And that's where most of the money is made, although they make good money in brewing.

But, distilling is the main business. And, you know, the usage of scotch, particularly in this country, the trends have not been strong at all, but that was true when we bought it, too.

There are some countries around the world where it's grown and there are certain countries where it's a huge prestige item.

I mean, in certain parts of the Far East, the more you pay for scotch, the better you think people think of you. Which I don't understand completely, but I hope it continues. (Laughter)

But — the scotch — worldwide scotch consumption has not been anything to write home about.

Guinness makes a lot of money in the business. But, I would not — I don't see anything in the — in published history that would lead you to believe that the growth prospects, in terms of physical volume, are high for scotch.

The — Guinness itself, the beer, actually has shown pretty good growth rates in some countries. Actually, from a very tiny base in the U.S. as well.

But, they will have to do well in distilling or — I mean that will govern the outcome of Guinness.

I think Guinness is well run and it's a very important company in that business. But, I wouldn't count on a lot of physical growth.

Charlie, what — any consumer insights?

CHARLIE MUNGER: No. (Laughter)

21. Why Berkshire will be OK if Buffett dies suddenly

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Mr. Buffett, my name is Arthur Coleus (PH) from Canton, Massachusetts.

And I'd like to know how you'd respond to the question that my associates ask me when they say that Berkshire Hathaway has been a good investment up to now, but what happens to your investment if, God forbid, something happens to Mr. Warren Buffett?

WARREN BUFFETT: Well, I'm glad you didn't say Charlie Munger. (Laughter)

No, there — Berkshire will do just fine. We've got a wonderful group of businesses.

I've told you the two things I do in life. And, in terms of the managers we have, you have to come in and really want to mess it up, I would think. And we don't have anybody like that, in terms of succession plans at Berkshire.

And then there's the question of allocation of capital. And, you could do worse than just adding it to some of the positions that we already had.

The ownership is — if I die tonight, the ownership structure does not change. So, you've the same large block of stock that has every interest in having good successor management as I would.

I mean, there's no — there would be no greater interest. And it is not a complicated business. I mean, you ought to worry more about, if you own Microsoft, about Bill Gates, I think, or something of the sort.

But, this place is, you know, we've got a group down here that are running these. You didn't see me out at Borsheims selling any jewelry the other day. I mean, that's somebody else's job. So, I — it is not — it's not very complicated.

Incidentally, I think I'm in pretty good health. I mean this stuff (Coca-Cola) will do wonders for you if you'll just try it. (Laughter)

Charlie, do you want to add anything as the —?

CHARLIE MUNGER: Yeah. I think the prospects of Berkshire would be diminished — obviously diminished — if Warren were to drop off tomorrow morning. But it would still be one hell of a company and I think it would still do quite well.

I used to do legal work, when I was young, for Charlie Skouras. I heard him once say, my business, which was movie theaters like this one, was off 25 percent last year, and last year was off 25 percent from the year before, and that was off 25 percent from the year before, and then he pounded the table and he'd say, "But it's still one hell of a business."

WARREN BUFFETT: It's not a formula we want to test, incidentally.

CHARLIE MUNGER: No, no. (Laughter)

WARREN BUFFETT: It is one hell of a business that we've got here. I mean — and if you saw what happened at Berkshire headquarters, you would not worry as much. There's very little going on there that contributes to things. (Laughter)

We're, right now, at our peak of activity. This is it.

22. Easy answer: no reverse split, either

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: First of all, my name is Al Martin (PH) and my wife Terry (PH) is here with me. And I appreciate the invitation to attend this meeting.

I was a little bit dubious and quite excited at that game Saturday night. I didn't know which side was going to throw the game to the other one. But I did find out at the end.

The first question, actually, was somewhat answered, but not fully. Has the board considered a reverse split? My experience has been that —

WARREN BUFFETT: Would you like to make that a motion? There was a motion for a reserve — reverse split. (Laughter)

AUDIENCE MEMBER: I would say a two-for-one because if it were three or four-for-one I might end up with no shares. Or fractional shares.

But, anyway, my experience has been that all of the stocks that have split have gone down in the next two or three months or the next two or three years, including one which you are drinking, which is a flat Coke.

Also, I have observed Merck over the last several years to be hitting a low, which split three-for-one.

So, I think that, you know, the reasons for splitting stocks are to make it affordable. I found that every stock I ever bought was never affordable. I found the reason I bought it was because I couldn't afford not to buy it.

So that's a different philosophy, I guess, as somewhat shared indirectly with the boards running the stock.

The second question, which is — has to do with —

WARREN BUFFETT: Hope it's as easy as the first question. (Laughter)

AUDIENCE MEMBER: Well, I didn't want to wait for an answer of the first question for that reason, because it could be complicated and confusing and so forth.

23. Hillary Clinton's success as commodities trader

AUDIENCE MEMBER: The second question has to do with, could the board consider looking into a commodity broker, or a lawyer, or both, that could take action similar to Hillary Clinton's?

I think, you know, making your net worth go up by a factor of five overnight is more than enticing. Some of us might even want to wait for ten months to get a 100-to-1 return on the money.

WARREN BUFFETT: Well, I want to say — I want to say to you, when I saw that 530 percent in one day, it — Charlie has never done that for us.

I mean — (laughter) — it really caused me to reassess succession plans at Berkshire. (Laughter)

And Hillary may be free in a few years. (Laughter and applause)

I hope you're applauding over her coming to Berkshire, not — but I'll leave that up — (Laughter)

OK, that was their second question. (Laughs)

AUDIENCE MEMBER: That was my second question.

Of course, in my experience, it's been that most of us have thought through this situation and I guess it's pretty speculative, but I found out that the rules and laws that are made for trading are interpreted rather than enforced. And I think that applied to this particular case, so let's go on to the third question. (Laughter)

WARREN BUFFETT: Alright. They're getting easier. (Laughter)

24. Blue Chip Stamps is a disaster under Buffett and Munger

AUDIENCE MEMBER: This one is real easy. My wife was a collector of Blue Chip stamps for many, many years. And she brought some stamps with her. What should she do with them?

WARREN BUFFETT: Well, that — we can give you a definitive answer to that. Charlie and I entered the trading stamp business to apply our wizardry to it in what, 1969 or so, Charlie?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: We were doing what then, about 110 million?

CHARLIE MUNGER: No, it went up to 120.

WARREN BUFFETT: OK. And then we arrived on the scene and we're going to do what, about 400,000 this year?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: Yeah. (Laughter)

That shows you what can be done when your management gets active. (Laughter)

CHARLIE MUNGER: We have presided over a decline of 99 1/2 percent. (Laughter)

WARREN BUFFETT: Yeah. Yeah. But, we're waiting for a bounce — (Laughter)

I would say this. The trading stamp business, as those of you who have followed all know, it only works because of the float.

I mean, there — a very, very high percentage of the stamps in the '60s were cashed in. We have some years that we've gone up to 99 percent, I believe — we sampled the returns — because they were given out in such quantity.

But, our advice to anyone who has stamps is to save them because they're going to be collector's items, and besides if you bring them to us we have to give you merchandise for them.

Tell her to keep them. They'll do nothing but gain in value over years. (Laughter)

25. Stock split wouldn't raise long-term average price

WARREN BUFFETT: Going back, incidentally, to your point on the split.

I think most people think that the stock would sell for more money split.

A, we wouldn't necessarily think that was advisable in the first place.

But we — in the second place, we don't think it would necessarily be true over a period of time.

We think our stock is more likely to be rationally priced over time following the present policies than if we were to split it in some major way.

And we don't think the average price would necessarily be higher. We think that the volatility would probably be somewhat greater, and we see no way that volatility helps our shareholders as a group.

26. Fed Chairman Greenspan's actions are "quite sound"

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: I am Peg Gallagher from Omaha.

Mr. Buffett, are you interested in influencing Mr. Greenspan at the Fed to stop raising interest rates?

WARREN BUFFETT: Well, I wouldn't have any influence with him. He was on the board of Cap Cities some years ago and I know him a bit. But I don't think anyone would have any influence with Mr. Greenspan on that point.

But, I generally think that his actions have been quite sound during his period as Fed chief.

I mean, it's part of the job of the Fed, as Mr. Martin said many years ago, was to take away the punchbowl at the party, occasionally. And that's a very difficult, difficult policy to quantify working with markets day-by-day.

And, of course, it's always been the job of the Fed, basically, to lean against the wind. Which, of course, means if the wind changes, you fall flat on your face. But that's another question.

But the — I don't — I think what he has done is probably been somewhat appropriate. I think he's probably been surprised, a little bit, as to what has happened with long-term rates as he's nudged up short-term rates.

I think he was hoping that — this is just a guess on my part — that action, sort of early in the cycle on the short-term rate front, would — might make people feel more confident about the longer-term rates and therefore that the yield curve would flatten some. I don't know that. And, he may have been a little surprised on that.

But it's not an easy job he has. So, I would not second guess him myself.

Charlie, how do you feel about him?

CHARLIE MUNGER: Fine. (Laughter)

WARREN BUFFETT: Greenspan is safe. (Laughter)

27. Don't pay attention to what people say about stocks

WARREN BUFFETT: Zone 6.

MILLER: Mr. Buffett, I'm Lee Miller (PH) from St Louis.

There was an article in the April 18th Barron's that attempted to calculate the value behind each Berkshire Hathaway share.

I'm sure you have some views on that and I'd be very interested in your perspective on that issue.

WARREN BUFFETT: Yeah, there was an article about a week or so ago in Barron's. The same fellow wrote an article about four years ago reaching pretty much the same conclusion, and I hope he hasn't been short in between, but the — (Laughter)

I would say this. It is not the way I would calculate the intrinsic value of Berkshire.

But everyone in securities markets make choices on that. Every day somebody sells a few shares of Berkshire and someone sell — buys — and, you know, they are probably coming to differing opinions about valuation.

I would say that I found it strange that apparently he forgot we were in the insurance business, but that — that's not — (Applause).

It really doesn't make any difference. I mean, what — we don't pay any attention to what people say about Coca-Cola stock or Gillette stock or any of those things.

I mean, on any given day, two million shares of Coca-Cola may trade. That's a lot of people selling, a lot of people buying. If you talk to one person, you'd hear one thing, and you'd talk to another — you really should not make decisions in securities based on what other people think.

If you're doing that, you should think about doing something else, because it's —

A public opinion poll will just — it will not get you rich on Wall Street. So you really want to stick with businesses that you feel you can somehow evaluate yourself.

And, I don't think — I mean Charlie and I, we don't read anything about what business is going to be — the economy is going to do, or the market's going to do, or what anybody —

Anytime I see some article that says, you know, these analysts say this or that about some business, it just — it doesn't mean anything to us.

You cannot get rich with a weather vane.

28. Judge bank stock buybacks on case-by-case basis

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: I'm Edward Barr from Lexington, Kentucky, and I'd like to ask, given the amount of capital in the banking industry, do you think that more banks should be buying back significant amounts of their stock, like SunTrust, versus just the token amounts that they're buying back or just the authorized amounts?

And then also, related question in banking. Are they — are banks too focused on goodwill amortization when declining to buy other banks for cash, thereby using purchase accounting versus the normal practice in the industry of pooling accounting even when the stock they issue may be depressed or undervalued?

WARREN BUFFETT: Well, the first question about the capital in the industry — that — you really have to look at that on a bank-by-bank basis and there is a lot more repurchasing of shares by banks taking place.

You mentioned SunTrust, but National City is — they bought it back, I think, 5 percent of their — National City of Cleveland — bought back 5 percent of their stock in the first quarter.

There's much more repurchasing going on, and that's simply a judgment call by management that — as to the level of capital they need going forward, and what level of capital enables them to earn the return on equity that they think appropriate and whether they — what they feel like paying for their own shares.

So, I think you have to look at that on case-by-case.

We certainly like it, if we were to own a bank, we would — or own shares in a bank — we would like the idea of the bank repurchasing its stock at a price that we thought was attractive. We would think that they probably knew more about their own bank than some other bank they were going to buy and that if the numbers are right, it's an attractive way to use capital.

29. We don't pay attention to accounting of a transaction

WARREN BUFFETT: Your second question about goodwill amortization and purchase accounting versus pooling: we care not — at Berkshire, it absolutely makes no difference to us what accounting treatment we get on something. We are interested in the economics of a transaction.

Some banks — some businesses generally, most businesses perhaps — prefer pooling because they don't like to take a goodwill amortization charge.

We think our shareholders are smart enough, particularly if we make it clear to them — the accounting consequences — we think they're smart enough to look through to the economic reality of what Berkshire's businesses are all about.

And I think that some managements sell short their own ownership group by doing various kinds of financial acrobatics in order to have the charges come in a certain way rather than, as you point out, often they might be better off buying for cash rather than using their own stock as currency, but they may prefer to use their own stock because they avoid goodwill charges.

We've written a few things on goodwill in the past and past annual reports that might get to that subject.

We don't care what accounting — we sort of rewrite the accounting for any business that we're looking at, because in our heads we want to have, in effect, a standardized way of looking at businesses.

And if one company goes through pooling transactions and another goes through purchase transactions, we're going to recast them in our own minds so that there is comparability.

Charlie?

CHARLIE MUNGER: Yeah, the published accounting results are in accordance with standard convention and they're a place to start economic analysis. The figures are frequently quite silly on a functional basis. I'm not criticizing accounting conventions except for some. (Laughter)

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: But, I think it's just a place to start thinking about economic reality.

By their nature, they can't tie perfectly — they can't even tie very well — to economic reality.

WARREN BUFFETT: We regard it is a negative when we find a management that's preoccupied with accounting considerations. But, we find it so frequent that we can't afford to use it as a total exclusionary factor.

It really surprises me how many managements focus on accounting, and the time they spend on it, the — it's really unproductive.

If you find a management that doesn't care about the accounting but does explain to you in clear terms what's going on, I think you should regard that as a plus in owning a security.

30. Buffett praises new Salomon Brothers management

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Mr. Buffett, my name is Bill Ackman. I'm from New York City. And my question relates to the appeal of Salomon Brothers as an investment.

You talked earlier about leverage and the dangers of leverage. Salomon is a business which is levered 30-to-1, which has very narrow margins, and earns a relatively modest return on equity, in light of the amount of leverage that they use. What is the appeal of the business to you?

WARREN BUFFETT: We have here today the chief executive of Salomon, Inc., the parent company, and also the chief executive of Salomon Brothers, the investment banking arm.

And, I would say one of the things we — Charlie and I — feel extraordinarily good about are the two fellows that are running that operation. They did an exceptional job under extraordinarily difficult circumstances, as did John Macfarlane, who's also here today.

The three of them — I mentioned four people in the annual report — and Salomon wouldn't be here today without those three. And it wouldn't be the company in the future that it's going to be without them. They did an absolutely fabulous job.

It's the sort of business that, as you point out, uses a lot of leverage. It doesn't — in one way it doesn't use as much as it looks like and in another way it uses even more than it looks like.

But — it — the test will be: A, whether they control that business in a way that that leverage does not prove dangerous, and secondly, what kind of returns on equity they earn while using it.

You certainly should expect to earn somewhat higher returns on equity when you are necessarily exposed to a small amount of systemic risk and significant amounts of borrowed money, than you would in a business that's an extremely plain vanilla business.

But, I don't know whether you've met Bob and Deryck, but, I think you'd feel better about having a leverage in their hands than about any other hand you can imagine.

Charlie?

CHARLIE MUNGER: Why don't we have those three gentlemen stand up?

WARREN BUFFETT: Yeah, you ought to give them a hand.

CHARLIE MUNGER: They really have done a job for Berkshire in this last year.

WARREN BUFFETT: Yeah, I'll lead the applause for them. Where are they? There they are. (Applause).

I mentioned this before, but it's worth mentioning again. Deryck took on the job of being the operating head of Salomon Brothers on what, August 18th, 1991.

He didn't know what — he couldn't know what he was getting into, exactly. He — two months later or three months later, we'd never had a conversation about compensation. He did not ask me for Berkshire, or my, guarantee for indemnification because he was walking in not knowing legal problems. We didn't know what we would finally uncover.

And he worked incredible hours to keep that place together, which was not easy.

Bob Denham, I called — I guess on the 23rd or so, 20th. I called him on a Friday. I got home on a Saturday, the 24th of August.

He was living a nice pleasant peaceful life in California. And had a first class law firm, a good group of clients, wife had a good job there.

And I told him I was in a mess and there wasn't any second choice and three days later he was back in New York and living in a small apartment in Battery City and handling the general counsel's job at Salomon.

They found John Macfarlane on that Sunday, on the 18th. I think he was running a triathlon or something.

Not a practice that Charlie and I follow, but, ah — (Laughter)

And he was yanked from that and came down, and I think John was over in New Jersey, but he holed up in the Downtown Athletic Club. And it was his job to keep funding what was then $150 billion balance sheet during a period when people right and left were canceling.

It's not because we weren't a good credit, but because they just didn't want to have anything to do with us for a while.

And the World Bank and the State of Texas pension fund and CalPERS, all these people were shutting off funding at a time — and funding in a business is — gentleman just indicated — is the lifeblood of an enterprise like Salomon.

And so those three deserve an enormous hand by — really by the Salomon shareholders — but by this group in turn because we have an important investment. So I thank them publicly. (Applause)

31. Wesco sold small savings and loan as regulations tightened after crisis

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: I'm Kelly Ranson from San Antonio, Texas.

And I wondered if you could comment on the Mutual Savings and Loan. There was just a footnote that the deposits have been assumed by a federal savings bank.

And also, what about the annual report for Wesco Financial that I know it used to be in the annual report for Berkshire. Just wondered if you could comment on that, please.

WARREN BUFFETT: The question is about — we — our 80 percent-owned subsidiary Wesco Financial sold its ownership in Mutual Savings and Loan of Pasadena last year. I'll let Charlie comment on that.

And then the second question is about the Wesco report, which is available to any Berkshire shareholder simply by writing Wesco. But, we found that the stapling problems and other things made it a little difficult to keep adding that every year to the report. So, now we just — we make it available to anyone who would, at Berkshire, who would like to have it.

But Charlie, want to comment on the sale of Mutual?

CHARLIE MUNGER: Yes. The savings and loan business became very much more heavily regulated after the huge nationwide collection of scandal and insolvency and so on.

And meanwhile, we had a very small savings and loan association. And the combination of the new regulation, and the fact that it was a very small part of our operation, made us decide that we were better off without it.

That does happen from time to time in Berkshire. We do exit once in a while.

And, by the way, we would reserve the right to change our mind. I always liked Lord Keynes when he said that he got new facts or new insights, why he changed his mind and then he'd say, what do you do? So we changed our mind.

WARREN BUFFETT: They start — they asked our directors at Mutual to start going to school on Saturday, didn't they, Charlie? Or something? I think that helped change our mind about Mutual.

CHARLIE MUNGER: There's a time to vote with your feet. (Laughter)

WARREN BUFFETT: And even your wallet.

32. Shoe industry is tough, but Dexter has great managers

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: (Inaudible) Chicago. Can you speak to some of the economic characteristics of the shoe industry that allow the business to be profitable and, in your view, attractive?

WARREN BUFFETT: I didn't hear that. Did you hear that, Charlie?

CHARLIE MUNGER: He wanted you to comment on the merits of the shoe industry.

WARREN BUFFETT: Well, I think our feelings for the shoe industry are very clear from what's been happening the last few years.

We think it's a great business to be in as long as you're in with Frank Rooney and Jim Issler and Peter Lunder and Harold Alfond. Otherwise, it hasn't been too good.

The — we have a couple of extraordinary shoe operations, but they're not extraordinary because we get our leather from different steers or anything of the sort.

It's — we have two companies, really three now that Lowell's been brought in, too, but that have truly extraordinary records. I think those same managements would have been enormous successes in any business they'd gone into.

But, they have gone into the — they are in the shoe business and the companies earn unusual returns on equity. They earn unusual returns on sale. They've got terrific trade reputations.

And I think that to the extent we can find ways to expand in the shoe business while employing those managements, we'll be very excited about doing so.

It isn't because we think that the shoe industry is any cinch, you know, per se, or anything of the sort. But we've got a lot of talent employed in the shoe business and whenever we've got talent we like to try and figure out a way to give them as big a domain as we can.

And it's not inconceivable that we would expand the shoe business, perhaps even significantly over time.

33. Buffett on investing in tobacco companies

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Yeah, thanks Mr. Buffett. My name is Stewart Hartman from Sioux City. After the brevity of the last question from section 4, I'll try to be extremely brief.

The — given the scrutiny that the tobacco business is going under right now, number one, what do you see as the business prospects for those huge cash cows? And, at any point, would that be attractive to you given their liability?

WARREN BUFFETT: The question is about the future of the tobacco business?

I don't — I probably know no more about that then you do because it's fraught with questions that relate to societal attitudes and you can form an opinion on that just as well as I could.

But, I would not like to have a significant percentage of my net worth in the tobacco business myself, but —

They may have better futures than I envision. I don't really think that I have special insights on that.

Charlie, you —?

CHARLIE MUNGER: No.

WARREN BUFFETT: You have to come to a conclusion as to how society is going to want to treat — and the present administration for that matter. And the economics of the business may be fine, but that doesn't mean it has a great future.

34. "Hard to argue with the market"

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: I'm Harriet Morton from Seattle, Washington.

I'm wondering, when you are considering an acquisition, how you look at the usefulness of the product?

WARREN BUFFETT: In looking at any business?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah. Well, obviously we look at what the market says is the utility. And the market has voted very heavily for Dexter Shoe, just to be an example.

I don't know many how many pairs of shoes they were turning out back in 1958 or thereabouts, but year after year, people have essentially voted for the utility of that product.

There are 750 million or so 8-ounce servings of one product or another from the Coca-Cola Company consumed every day around the world. And there are those of us who think the utility is very high. I can't make it through the day without a few. But there are other people that might rate it differently.

But essentially, people are going to get thirsty and if this is the way they take care of their thirst better than — and they prefer that to other forms — then I would rate the utility high of the product. But, I think it's hard to argue with the market on that.

I mean, people — some people may think that, you know, listening to a rock concert is not something of high utility. Other people might think it's terrific.

And so, we would judge that — I don't think we would come to an independent decision that there was some great utility residing in some product that had been available to the public for a long time, but that the public and not endorsed in any way.

Charlie?

CHARLIE MUNGER: Well, I think that's right. But, that's averaged out.

We're in a bunch of high-utility products. I mean, nurses' shoes, work shoes, casual shoes. We don't have a lot of, what, Italian pumps? (Laughter)

WARREN BUFFETT: Don't rule it out, Charlie. We may be here next year defending it. (Laughter)

CHARLIE MUNGER: Yeah, right, well.

No, I'm just saying, if you judge the existing portfolio as indicating what the future's likely to be like, why —

WARREN BUFFETT: Well, certainly a lot of essentials were sold out of Borsheims yesterday.

CHARLIE MUNGER: Yes. (Laughter and applause)

WARREN BUFFETT: I hear my family clapping.

35. No question from zone 6

WARREN BUFFETT: Zone 6.

VOICE: We have no question up here.

36. Insurers have "head in the sand" on catastrophes

WARREN BUFFETT: OK, zone 7.

AUDIENCE MEMBER: Good morning, Mr. Berkshire, uh, Buffett. (Laughter)

WARREN BUFFETT: I have a niece here who has a son named Berkshire so it —

AUDIENCE MEMBER: I'm Chris Blunt (PH) from Omaha.

My first question is, in years past, we've had samples of various products. When are we going to have some Guinness?

WARREN BUFFETT: Some what now?

AUDIENCE MEMBER: Guinness samples?

WARREN BUFFETT: (Laughs)

AUDIENCE MEMBER: And my second question is, in light of the multiple disasters that have taken place in LA, has that had any impact on the cats for Berkshire?

WARREN BUFFETT: On our super-cat business?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: The LA earthquake, which is originally — I believe the first estimate of insured damage was a billion-five, which struck us as kind of ludicrous, but has now escalated.

The last official estimate, the one we use that's a trigger in our policies, I think is either 4.5 billion or 4.8 billion. But it's going to be higher than that.

Our losses are fairly minor. If it gets to eight billion of insured damage, that would trigger another policy or two. But, I would say that the LA quake — which did considerably more damage, I think, than people would have anticipated from a 6.7 for various reasons having to do with how quakes operate — that quake is not going to turn out to be of any real — it's not the kind of super-cat that a 15 or $20 billion hurricane which hit Florida or Long Island or New England would be.

That's the kind of — we could lose — or we could pay out — 6 or $700 million in sort of a worst case super-cat. Now our total premiums this year might be, say, 250 million or something in that area.

So one super-cat in the wrong place would produce — and there could be more than one — could produce, we'll say, a $400 million or thereabouts underwriting loss from that business.

The LA quake is peanuts on that scale, but it wouldn't have taken a whole lot more in terms of numbers on the Richter scale, if it happened to have an epicenter where it did, and be of the type that it was, relatively shallow, that we could have had that sort of thing happen.

I think that the insurance industry has vastly underestimated — maybe not now, but up till a few years ago — the full potential of what a super-cat could do. But Hurricane Andrew and the LA quake may have been something of a wake-up call.

They were far from a worst-case situation. A really big Type Five hurricane on Long Island would end up leaving a lot of very major insurance companies in significant trouble.

We define our losses — essentially, 700 million sounds like a lot of money. It is a lot of money. But, there are limits on our policies. That is not true of people that are just writing the basic homeowners or business. Those losses could go off the chart.

There were certain companies in the LA quake that thought they had a — what they call a "probable maximum loss" for California quakes. And the LA quake, which was far from the worst case you can imagine, turned out to far exceed those probable maximum losses.

So, I think the industry has had, and may still have, its head in the sand a little bit, in terms of what can happen, either in terms of a quake in California or, more probably, in terms of a hurricane along the East Coast.

So far this year we're in reasonable shape, but that doesn't mean much because, by far, the larger exposure is in hurricanes and essentially 50 percent of the hurricanes hit in September. And about — I think it's about 15 percent would be in August. Close to 15 percent in October. So you have 80 percent, roughly, in those three months and there's a little tail on both sides.

But that's when you find out whether you've had a good or bad year in the super-cat business, basically.

It's a business we like at the right rates because there are very few people who can afford to write it at the level that the underlying company, the reinsured companies, need it. And we're in a position, if the rates are right, to do significant business.

Charlie?

CHARLIE MUNGER: Nothing to add.

37. Book recommendations

WARREN BUFFETT: Zone 1,

AUDIENCE MEMBER: Clayton Riley (PH) from Jacksonville, Florida.

This is a little different than all the other questions, but what were the three best books you read last year outside of the investment field? Why don't — even one will do.

WARREN BUFFETT: I'll give you — I'll tout a book first that I've read but that isn't available yet. But it will be in September.

The woman who wrote it, I believe, is in the audience and it's Ben Graham's biography, which will be available in September, by Janet Lowe. And I've read it and I think those of you who are interested in investments, for sure, will enjoy it. She's done a good job of capturing Ben.

One of the books I enjoyed a lot was written also by a shareholder who is not here because he's being sworn in, I believe today or tomorrow, maybe tomorrow, as head of the Voice of America.

And that's Geoff Cowan's book, which is on "The People v. Clarence Darrow." It's the story of the Clarence Darrow trial for, essentially, jury bribery in Los Angeles back around 1912, when the McNamara brothers had bombed the LA Times.

It's a fascinating book. Geoff uncovered a lot of information that the previous biographies of Darrow didn't have. I think you'd enjoy that.

Charlie?

CHARLIE MUNGER: Well, I very much enjoyed Connie Bruck's biography Master of the Game, which was a biography of Steve Ross, who headed Warner and later was, what, co-chairman of Time Warner.

WARREN BUFFETT: Yeah, he's a little more than co-chairman. (Laughs)

CHARLIE MUNGER: Yeah, and — she's a very insightful writer and it's a very interesting story.

I am rereading a book I really like, which is Van Doren's biography of Benjamin Franklin, which came out in 1952, and I'd almost forgotten how good a book it was. And that's available in paperback everywhere. We've never had anybody quite like Franklin in this country. Never again.

WARREN BUFFETT: He believed in compound interest, too, incidentally, as you may remember. (Laughter)

What did he — he set up those two little funds, one in Philadelphia, one in Boston?

CHARLIE MUNGER: Right.

WARREN BUFFETT: Yeah, to demonstrate the advantages of compound interest. I think that's the part Charlie's rereading. (Laughter)

38. Nike and Reebok

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Thank you for teaching me — teaching so much to all of us about business. My name is Mike Assail (PH) from New York City.

You mentioned earlier that Berkshire's shoe business was great, but that other shoe businesses were not so good.

What are the uncertainties of the global brand leaders that Berkshire seems to like? They like Coke and Gillette. The global brand leaders in the shoe business being Nike and Reebok.

What are their uncertainties, in terms of long-term competitive advantage, business economics, consumer behavior, and the other risk factors that you mentioned in the annual report this year? Thank you.

WARREN BUFFETT: So, you're really asking about the future prospects of Nike and Reebok?

Yeah. I don't know that much about those businesses. We do have one person in this audience, at least, who owns a lot of Reebok.

But I am not expressing a negative view in any way on that. I just — I don't understand that — I don't understand their competitive position and the likelihood of permanence of their competitive position over a 10 or 20 year period as well as I think I understand the position of Brown and Dexter.

That doesn't mean I think that it's inferior. Doesn't mean I think that we've got better businesses or anything.

I think we've got very good businesses. But I — I'm not — I haven't done the work and I'm not sure if I did the work I would understand them.

I think they are harder to understand, frankly, and to develop a fix on, than our kinds. But, they may be easier for other people who just have a better insight into that kind of business.

39. "You don't have to do exceptional things to get exceptional results"

WARREN BUFFETT: Some businesses are a lot easier to understand than others. And Charlie and I don't like difficult problems. I mean, we — if something is hard to figure, you know, we'd rather multiply by three than by pi. I mean it's just easier for us. (Laughter)

Charlie, you have any —?

CHARLIE MUNGER: Well, that is such an obvious point. And yet so many people think if they just hire somebody with the appropriate labels they can do something very difficult. That is one of the most dangerous ideas a human being can have.

All kinds of things just intrinsically create problems. The other day I was dealing with a problem and I said, this thing — it's a new building — and I said this thing has three things I've learned to fear: an architect, a contractor, and a hill. (Laughter)

And — if you go at life like that, I think you, at least, make fewer mistakes than people who think they can do anything by just hiring somebody with a label.

WARREN BUFFETT: We don't comment — excuse me, go ahead.

CHARLIE MUNGER: You don't have to hire out your thinking if you keep it simple.

WARREN BUFFETT: You don't have to do — we've said this before — but you don't have to do exceptional things to get exceptional results.

And some people think that if you jump over a seven-foot bar that the ribbon they pin on you is going to be worth more money than if you step over a one-foot bar. And it just isn't true in the investment world, at all.

So, you can do very ordinary things. I mean, what is complicated about this? But, you know, we're $3 billion pretax better off than we were a few years ago because of it.

There's nothing that I know about that product, or its distribution system, its finances, or anything, that, really, hundreds of thousands — or millions — of people aren't capable of, that they don't already know. They just don't do anything about it.

And similarly, if you get into some complicated business, you can get a report that's a thousand pages thick and you got Ph.D.s working on it, but it doesn't mean anything.

You know, what you've got is a report but you don't — it — you won't understand that business, what it's going to look like in 10 or 15 years.

The big thing to do is avoid being wrong. (Laughter)

CHARLIE MUNGER: There are some things that are so intrinsically dangerous. Another of my heroes is Mark Twain, who looked at the promoters of his day and he said, “A mine is a hole in the ground owned by a liar.” (Laughter)

And that’s the way I’ve come to look at projections. I mean, basically, I can remember, Warren and I were offered $2 million worth of projections once in the course of buying a business and the book was this thick.

WARREN BUFFETT: For nothing.

CHARLIE MUNGER: And, if we were given it for nothing, and we wouldn’t open it.

WARREN BUFFETT: We almost paid 2 million not to look at it. (Laughter)

It’s ridiculous. I do not understand why any buyer of a business looks at a bunch of projections put together by a seller or —

CHARLIE MUNGER: Or his agent.

WARREN BUFFETT: — or his agent.

I mean, it — you can almost say that it’s naive to think that that has any utility whatsoever. We just are not interested.

If we don’t have some idea ourselves of what we think the future is, to sit there and listen to some other guy who’s trying to sell us the business or get a commission on it tell us what the future’s going to be — it — like I say, it’s very naïve.

CHARLIE MUNGER: Yeah, and five years out.

WARREN BUFFETT: Yeah. We had a line in the report one time, “Don’t ask the barber whether you need a haircut.” And — (laughter) — it’s quite applicable to projections of — by sellers — of businesses.

40. Cutting USAir’s costs will be “enormously tough”

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Mr. Buffett, Greg Elright (PH) from Washington, DC.

In the last year, United Airlines and Northwest have resolved some of their financial problems by moving ownership over to the employees.

With USAir's current positions — uh, problems — what do you see as occurring with USAir and do you see any movement toward employee ownership? And how will that affect Berkshire's interest in the company?

WARREN BUFFETT: USAir has a cost structure which is non-viable in today's airline business. Now that, in an important way, involves its labor cost, but it involves other things, too. But it certainly involves its labor costs.

And they've stated this publicly. And I think — and they have — they are talking with their unions about it and they're talking with other people about other parts of their cost structure.

And I think you'll just see what unfolds in the next relatively few months, because there isn't any question that the cost structure is out of line. I think the cost structure could be brought into line. But whether it will be brought into line or not is another is another question.

And, looking backwards, the answer is not to get into businesses that need to solve problems like that. It's to — but — that was a mistake I made.

And I think in Seth Schofield you've got a manager who understands that business extremely well, who probably is as — in my view, anyway — is as well regarded and trusted by people who are going to have to make changes as anyone could be in that position. But that may not be enough. I mean that — there's enormous tensions when you need to take hundreds and hundreds of millions of dollars out of the cost structure of any business.

And when you need cooperative action, all by various groups, each one of which feels that maybe they're having to give a little more than some other group, and understandably feels that way, you know that is an enormously tough negotiating job.

I think Seth is as well-equipped for that as anyone. But I would not want to — you know, I cannot predict the outcome.

WARREN BUFFETT: Charlie, do you —?

CHARLIE MUNGER: Well, if I were a union leader, I would give Seth whatever he wants because he's not the kind of a fellow who would ask for more than he needs. And, it's perfectly obvious that's the correct decision on the labor side. But whether the obvious will be done or not is in the lap of the gods.

WARREN BUFFETT: It's a lot of people with a lot of different motivations and, I mean, those are really tough questions. I mean, we — Charlie and I've been involved in that sort of thing a few times and frequently it works out, but it's not preordained.

41. We're "not in any hurry" to retire

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: My name is Sheldon Scizick (PH) from Chicago, Illinois. I have two questions.

The first one is concerning Mr. Munger. We know what Mr. Buffett's retirement plans are. I was wondering what yours — your plans for the future concerning Berkshire are?

CHARLIE MUNGER: I have always preferred the system of retirement where you can't quite tell from observing from the outside whether the man is working or retired. (Laughter)

WARREN BUFFETT: He does it well, too. (Laughter)

CHARLIE MUNGER: You know, a problem in many businesses, particularly the more bureaucratic ones, is that your employees retire, but they don't tell you. (Laughter)

WARREN BUFFETT: I think I can speak for Charlie on this one.

Charlie and I are not in any hurry to retire. He's trying to outlast me, actually. (Laughter)

AUDIENCE MEMBER: Thank you.

42. Berkshire sold some Cap Cities shares in tender offer

AUDIENCE MEMBER: My second question is, I was just curious why you sold a portion of Cap Cities?

WARREN BUFFETT: We thought that — we thought it was a good idea for Cap Cities to have a tender offer. They had cash that we thought that they could not use in any — they were not likely to be able to use — in a better way than repurchasing their own shares because they do have some very good businesses.

They, and we, felt that a tender offer would not be successful, in terms of attracting a number of shares unless Berkshire were tendering. We felt the price was reasonable to tender at.

It turned out that the business was getting stronger during that period and various things were happening in media, so there were only 100,000 shares or so tendered outside of our million. That isn't necessarily what we thought was going to happen going in, but that is what happened.

It's acceptable to us, but that doesn't mean that it was the desired outcome. We would not have tendered all of our shares or anything of the sort.

We want to remain a substantial shareholder of Cap Cities. We've always — most of the time we favored Cap Cities buying in its stock and it's bought in a fair amount of stock since the ABC merger took place in 19 — started in 1986.

43. Structured settlements business isn't big, but is "perfectly satisfactory"

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Good morning. My name is Matt Voke (PH). I'm from Omaha.

In last year's meeting you made reference to structured settlements. I was wondering, how is that business progressing for you?

WARREN BUFFETT: Question's about the structured settlement business, which is a business in which Berkshire guarantees, in effect, an annuity to some claimant of another — usually — of another insurance company, who suffered an injury and instead of getting a lump sum now wants to get a stream of payments over many years in the future, sometimes going out 75 years.

We have set up a life company to do that business. We formerly did it all through our property-casualty companies. And, we have done some business, but it's not been a big business yet, and it may never be a big business.

It's a perfectly satisfactory business, but it's not an important item at present in the analysis of Berkshire's value.

Are you getting — having a problem with sound out there on this or no? Just — no?

44. No comment on Wrigley

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: My name is David Samra. I'm from San Francisco, California.

In your annual report, I noticed you mention Wrigley as being a company that has worldwide dominance, somewhat like Coca-Cola and Gillette. And, was curious to know if you had looked at the company in any detail. And, if so, whether or not — if you decided not to invest, what were the reasons why?

WARREN BUFFETT: Well, we wouldn't want to comment on a company like that because we might or might not be buying it. We might or might not be selling it. We might or might not buy or sell it in the future. (Laughter)

And, since it falls under that narrow definition of things that we don't talk about —

It’s a good illustration of a company that has a high market share worldwide, but you can understand the Wrigley Company just as well as I can. I have no insights in the — into the Wrigley Company that you wouldn’t have and I don’t — I wouldn’t want to go beyond that in giving you our evaluation of the company.

I hate to disappoint you on those, but on specific securities, we are not too forthcoming sometimes.

Charlie?

CHARLIE MUNGER: I’m good at not being forthcoming. (Laughter)

45. “No specific desire” to buy companies in certain parts of the world

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Mr. Buffett, Kathleen Ambrose (PH) from Omaha.

I have a question regarding global diversification. Just in general, what do you look for in a company and, if so, as far as Europe or Latin America, if you’d like to be specific?

WARREN BUFFETT: The question is about global diversification.

All we want to be in is businesses that we understand, run by people that we like, and priced attractively compared to the future prospects.

So, there is no specific desire to either be in the rest of Europe, or the rest of the world, or Far East, or to avoid it.

It’s simply a factor that — it’s not a big factor. There may be more chances for growth in some countries.

We — 80 percent of Coca-Cola’s earnings, roughly, will come from outside the United States. Eighty percent of Guinness’s earnings will come from outside the United States, but they’re domiciled outside the United States, whereas Coca-Cola is domiciled here.

Certainly, in many cases, there are markets outside the United States that have way better prospects for growth than the U.S. market would have, but they probably have some other risks to them that this market may not have.

But, we, you know, we like the international prospects, obviously, of a company like Coke. We like the international prospects of a company like Gillette. Gillette earned 70 percent of its money outside this country.

So, if you look — on a look-through basis — Coke — we might this year get something like $150 million of earnings, indirectly, for Berkshire's interest from the rest of the world just through Coca-Cola alone.

But, we don't make any specific — we don't think in terms of, I like this region so I want to be there or something of a sort.

It's something that's specific to the companies we're looking at, then we'll try to evaluate that.

Coke is expanding in China. Well, it — you know — I think that — I forget what they showed last year, maybe 38 percent growth, or something like that, in cases. Maybe —

It's nice to have markets like that that are relatively untapped.

Actually, Gillette is expanding in China in a big way and the Chinese don't shave as often. And more of them are what they call "dry shavers" than "wet shavers" there, which is electric shavers.

But you know, maybe we could stick something in the Coke that would — (laughter)

Maybe a little synergy at Berkshire, finally. Who knows?

46. Hurricanes are bigger insurance risk than riots

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Good morning. I'm Marshall Patton (PH) from Bandera, Texas.

And back to the insurance losses. What is the comparison between natural disasters, such as the earthquake, and so on, and the LA riots?

WARREN BUFFETT: Well, I'm not sure what the connection —

They, you know, they obviously can both lead to super-cats that we insure against, because if there is enough insured damage, it's likely to trigger a payment under some of our policies.

It would take some really big riot damage to get to our levels, because normally we don't kick in now until an event gets up to at least, you know, $5 billion or so of insured damage under a very large majority of our policies.

Something like a quake causes a fair amount of damage that is not insured, because of the extent that it's highways and things of that sort, public buildings. A lot of that is not insured.

But you get interesting questions on this. Usually we insure an event, but what's an event? If you go back to the riots that occurred after Martin Luther King was shot, you had riots in dozens of cities.

Is that one event or is that a multiple number of events? I mean, it was started by different people, but maybe arising from a common cause. Some of those things aren't actually very well-defined, even after hundreds of years of insurance law and custom, the experience of that. But I would say that rioting is very unlikely to get to a level that triggers our policy.

The big risks we face are quake and hurricanes, and hurricanes are a more significant risk than quake. They call them typhoons in the Pacific Ocean.

But floods, tremendous damage from floods last year. But basically there's not a lot of private flood insurance bought, so the insured losses do not get large.

Just watch the Weather Channel. (Laughter)

47. Why we have no short-term opinion on stocks

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Diane West (PH) from Corona Del Mar, California.

I know, Mr. Buffett, that you said that you don't read what other people say about the market or the economy, but do either you or Charlie have an opinion about how you think things are going to go? Are you bullish or bearish?

WARREN BUFFETT: You may have trouble believing this, but Charlie and I never have an opinion about the market because it wouldn't be any good and it might interfere with the opinions we have that are good. (Laughter)

If we're right about a business, if we think a business is attractive, it would be very foolish for us to not take action on that because we thought something about what the market was going to do, or anything of that sort.

Because we just don't know. And to give up something that you do know and that is profitable for something that you don't know and won't know because of that, it just doesn't make any sense to us, and it doesn't really make any difference to us.

I mean, I bought my first stock in, probably, April of 1942 when I was 11. And since then, I mean, actually World War II didn't look so good at that time. I mean, the prospects, they really didn't. I mean, you know, we were not doing well in the Pacific. I'm not sure I calculated that into my purchase of my three shares. (Laughter)

But I mean, just think of all the things that have happened since then, you know? Atomic weapons and major wars, presidents resigning, and all kinds of things, massive inflation at certain times.

To give up what you're doing well because of guesses about what's going to happen in some macro way just doesn't make any sense to us. The best thing that can happen from Berkshire's standpoint — we don't wish this on anybody — but is that over time is to have markets that go down a tremendous amount.

I mean, we are going to be buyers of things over time. And if you're going to be buyers of groceries over time, you like grocery prices to go down. If you're going to be buying cars over time, you like car prices to go down.

We buy businesses. We buy pieces of businesses: stocks. And we're going to be much better off if we can buy those things at an attractive price than if we can't.

So we don't have any fear at all. I mean, what we fear is an irrational bull market that's sustained for some long period of time.

You, as shareholders of Berkshire, unless you own your shares on borrowed money or are going to sell them in a very short period of time, are better off if stocks get cheaper, because it means that we can be doing more intelligent things on your behalf than would be the case otherwise.

But we have no idea what — and we wouldn't care what anybody thought about it. I mean, most of all ourselves. (Laughter)

Charlie, do you have anything?

CHARLIE MUNGER: No. I think the — if you're agnostic about those macro factors and therefore devote all your time to thinking about the individual businesses and the individual opportunities, it's just, it's a way more efficient way to behave, at least with our particular talents and lacks thereof.

WARREN BUFFETT: If you're right about the businesses, you'll end up doing fine.

We don't know, and we don't think about when something will happen. We think about what will happen. It's fairly, it's not so difficult to figure out what will happen. It's impossible, in our view, to figure out when it will happen. So we focus on what will happen.

This company in 1890 or thereabouts, the whole company sold for $2,000. It's got a market value now of about 50-odd-billion, you know?

Somebody could've said to the fellow who was buying this in 1890, you know, "You're going to have a couple of great World Wars, and you know, you'll have the panic of 1907, all these things will happen. And wouldn't it be a better idea to wait?" (Laughter)

We can't afford that mistake, basically. Yeah.

48. We'd rather buy an entire company, but stocks offer more bargains

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, last year — I'm Tim Medley from Jackson, Mississippi — last year the question was asked about your preference for purchasing entire businesses versus parts of public companies.

You mentioned you prefer to buy private businesses because of the tax advantages and your attraction to the people in those businesses.

Are you finding today that there are better purchases within the private market versus in the public securities market?

WARREN BUFFETT: Well, I would answer that no.

We do not — we very seldom find something to buy on a negotiated basis for an entire business. We have certain size requirements. A big limiting factor is it has to be something we can understand. I mean, that eliminates 95 percent of the businesses.

And we don't pay any attention to them, but we get lots of proposals for things that just are totally outside the boundaries of what we've already said we're interested in.

We prefer to buy entire businesses, or 80 percent or greater interest in businesses, partly for the tax reasons you mentioned, and frankly, we like it better. We just, it's the kind of business we would like to build if we had our absolute druthers on it.

Counter to that is we can usually get more for our money in wonderful businesses, in terms of buying little pieces of them in the market, because the market is far more inefficient in pricing businesses than is the negotiated market.

You're not going to buy any bargains, and I mean, you shouldn't even approach the idea of buying a bargain in a negotiated purchase.

You want to buy it from people who are going to run it for you. You want to buy it from people who are intelligent enough to price their business properly, and they are. I mean, that's the way things are.

The market does not do that. The market — in the stock market, you get a chance to buy businesses at foolish prices, and that is why we end up with a lot of money in marketable securities.

If we absolutely had our choice, we would own a group of — we would own three times the number of businesses we own outright.

We're unlikely to get that opportunity over time, but periodically we'll get the chance to find something that fits our test.

And in between we will, when the market offers us the right prices, we will buy more, either businesses we already own pieces of, or we'll buy one or two new ones. Something's usually going on.

There are tax advantages to owning all of them, but that's more than offset by the fact that you'll never get a chance to buy the whole Coca-Cola Company or the whole Gillette company.

I mean, businesses like that, sensational businesses, are just not available. Sometimes you get a chance to make a sensible purchase in the market of such businesses.

Charlie?

CHARLIE MUNGER: Well, I think that's exactly right. And if you stop to think about it, if a hundred percent of a business is for sale, you've got — the average corporate buyer is being run by people who have the mindset of people buying with somebody else's money. And we have the mindset of people buying with our own money.

And there's also a class of buyers for a hundred percent of businesses who are basically able and assured financial promoters. I'm talking about the leveraged buyout funds and so on.

And those people tend to have the upside, but not the downside, in the private arrangements they've made with their investors. And naturally, they tend to be somewhat optimistic.

And so we have formidable competition when we try and buy a hundred percent of businesses.

WARREN BUFFETT: Most managers are better off, in terms of their personal equation, if they're running something larger. And they're also better off if they're running something larger and more profitable.

But the first condition alone will usually leave them better off. We're only better off if we're running something that's more profitable. We also like it if it's larger, too.

But our equation, actually, our personal equation is actually different than a great many managers in that respect. Even if that didn't operate, I think most managers psychically would enjoy running something larger. And if you can pay for it with other people's money, I mean, that gets pretty attractive.

You know, how much would — and let's just say you're a baseball fan — well, how much would you pay to own whatever your hometown, the Yankees?

You might pay more if you were writing a check on someone else's bank account than if you were writing it on your own. It's been known to happen. (Laughter)

And in corporate America, animal spirits are there. And those are our competitors on buying entire businesses. In terms of buying securities, most managers don't even think about it.

It's very interesting to me, because they'll say that — they'll have somebody else manage their money in terms of portfolio securities. Well, all that is is a portfolio of businesses.

And I'll say, "Well, why don't you pick out your own portfolio?" And they'll say, "That's much too difficult."

And then some guy will come along with some business that they never heard of a week before and give them some figures and a few projections, and the guy thinks he knows enough to buy that business. It's very puzzling to me sometimes.

49. Revealing Wesco's estimated intrinsic value was a "quirk"

WARREN BUFFETT: Zone 4.

Could you hold it a little closer to you? I can't hear too well.

It's hard to hear. Is the mic on there?

AUDIENCE MEMBER: It's on.

WARREN BUFFETT: OK, I can hear that fine.

AUDIENCE MEMBER: Let's try it one more time. Dan Raider (PH) —

WARREN BUFFETT: Got it.

AUDIENCE MEMBER: — San Mateo, California. This is a question for Mr. Munger.

In your most recent letter to shareholders in Wesco's annual report, you calculated the intrinsic value of Wesco at about $100 per share, and compared that to the then-current market price of Wesco of about $130 per share.

In the same letter, you stated that it was unclear whether at then-current market prices Berkshire or Wesco presented a better value to prospective purchasers.

In light of that, would you compare the intrinsic value of Berkshire to its current market price?

CHARLIE MUNGER: Well, the answer to that is no. (Laughter)

Berkshire has never calculated intrinsic value per share and reported it to the shareholders, and Wesco never did before this year.

We changed our mind at Wesco because we really thought some of the buyers had gone a little crazy, and a lot of things were being said to prospective shareholders that, in our opinion, were unwise.

And we don’t really like attracting — even though we’ve had nothing to do with it — we don’t like attracting people in at high prices that may not be wise.

So we departed from our long precedent, and we did in the Wesco report make an estimate of intrinsic value per share.

But we’re not changing the general policy. That was just a one-time quirk.

WARREN BUFFETT: Well, and also I think it’s true that the Wesco intrinsic value per share can be estimated by anyone within fairly close limits.

It just isn’t that complicated because there aren’t a number of businesses there that have values different than carrying values, or where they are, they’re all footnoted, in terms of numbers.

So it would be almost impossible to come up with numbers that are significantly different than the number Charlie put in there.

Berkshire has assets that, number one of which would be the insurance business, that it’s clear have very significant excess values, but one person might estimate those at maybe three times what somebody else would estimate them at. That’s less true of our other businesses, but it’s still true in a way, so that Berkshire’s range would be somewhat greater.

And as Charlie — we basically — we don’t want to disappoint people, but we also don’t want to disappoint ourselves. But we have our own yardsticks for what we think is doable.

We try to convey that as well as we can to the people who are partners in the business, and I think that we saw some things being published about Wesco that simply might have led to, and probably did lead to, some expectations that simply weren’t consonant with our own personal expectations. And that leaves us uncomfortable.

50. Risk is "inextricably wound up" in how long an asset is held

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Hello, my name is Charles Pyle (PH) from Ann Arbor, Michigan.

I'd like to ask you to expound on your view of risk in the financial world, and I ask that against the background of what appear to be a number of inconsistencies between your view of risk and the conventional view of risk.

I mention that in a recent article you pointed out inconsistency in the use of beta as a measure of risk, which is a common standard.

And I mention that derivatives are dangerous, and yet you feel comfortable playing at derivatives through Salomon Brothers. And betting on hurricanes is dangerous, and yet you feel comfortable playing with hurricanes through insurance companies.

So it appears that you have some view of risk that's inconsistent with what would appear on the face of it to be the conventional view of risk.

WARREN BUFFETT: Well, we do define risk as the possibility of harm or injury. And in that respect we think it's inextricably wound up in your time horizon for holding an asset.

I mean, if your risk is that you're going — if you intend to buy XYZ Corporation at 11:30 this morning and sell it out before the close today, I mean, that is, in our view, that is a very risky transaction. Because we think 50 percent of the time you're going to suffer some harm or injury.

If you have a time horizon on a business, we think the risk of buying something like Coca-Cola at the price we bought it at a few years ago is essentially, is so close to nil, in terms of our perspective holding period. But if you asked me the risk of buying Coca-Cola this morning and you're going to sell it tomorrow morning, I say that is a very risky transaction.

Now, as I pointed out in the annual report, it became very fashionable in the academic world, and then that spilled over into the financial markets, to define risk in terms of volatility, of which beta became a measure.

But that is no measure of risk to us. The risk, in terms of our super-cat business, is not that we lose money in any given year. We know we're going to lose money in some given day, that is for certain. And we're extremely likely to lose money in a given year.

Our time horizon of writing that business, you know, would be at least a decade. And we think the probability of losing money over a decade is low. So we feel that, in terms of our horizon of investment, that that is not a risky business. And it's a whole lot less risky than writing something that's much more predictable.

Interesting thing is that using conventional measures of risk, something whose return varies from year to year between plus-20 percent and plus-80 percent is riskier, as defined, than something whose return is 5 percent a year every year.

We just think the financial world has gone haywire in terms of measures of risk.

We look at what we do — we are perfectly willing to lose money on a given transaction, arbitrage being an example, any given insurance policy being another example. We are perfectly willing to lose money on any given transaction.

We are not willing to enter into transactions in which we think the probability of doing a number of mutually independent events, but of a similar type, has an expectancy of loss. And we hope that we are entering into our transactions where our calculations of those probabilities have validity.

And to do so, we try to narrow it down. There are a whole bunch of things we just won't do because we don't think we can write the equation on them.

But we, basically, Charlie and I by nature are pretty risk-averse. But we are very willing to enter into transactions —

We, if we knew it was an honest coin, and someone wanted to give us seven-to-five or something of the sort on one flip, how much of Berkshire's net worth would we put on that flip?

Well we would — it would sound like a big number to you. It would not be a huge percentage of the net worth, but it would be a significant number. We will do things when probabilities favor us.

Charlie?

CHARLIE MUNGER: Yeah, we, I would say we try and think like Fermat and Pascal as if they'd never heard of modern finance theory.

I really think that a lot of modern finance theory can only be described as disgusting. (Laughter)

51. Buffett favors a "steeply progressive" consumption tax

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Good morning, I'm Paul Miller (PH) from Kansas City, Missouri. I've got two questions.

First, not too long ago, I believe it was Fortune Magazine that ran an article regarding personal tax rates.

And at the risk of misquoting you, my recollection is that you favored higher personal rates, rates even higher than those proposed by those in Washington.

The second question is, I've heard Berkshire Hathaway referred to as nothing more than a high-priced rich man's mutual fund. Would you care to comment on that also?

WARREN BUFFETT: Well, on tax rates, if you ask me what I personally favor, I personally favor a steeply progressive consumption tax.

That has a little more attention being paid to it now, although the "steeply progressive" might be modified by most of the advocates of the consumption tax, maybe to "mildly progressive" or something of the sort.

There's a Nunn-Domenici proposal along that line, and there are other people that are talking about it more. It may be examined by the new Kerrey-Danforth Commission, of which we've got a member in the audience.

But I believe, in one way or another, I believe in progressive taxes. So I am not shocked in terms of my own situation, and I don't think Charlie is particularly, about having a progressive income tax.

Although, like I say, I think society would run better over time if it were a progressive consumption tax instead.

Do you want the comment on the tax situation, Charlie?

CHARLIE MUNGER: Well, I think there is a point at which income taxes become quite counterproductive if their progression is too high. But I don't think we're there yet.

WARREN BUFFETT: We think — at least I think — I'm extraordinarily well treated by this society, and I think most people with high incomes are. I think if you transported most of them to Bangladesh or Peru or something, they would find out how much of it is them and how much is the society.

And I think there's nothing better than a market system, in terms of motivating people and in terms of producing the goods and services that the society wants.

But I do think it gets a little out of whack, in terms of what the productivity may be of an outstanding teacher compared to somebody who is good at figuring out the intrinsic value of businesses.

I don't have a better system on the income side, but I think society should figure out some way to make those who are particularly blessed, in a sense, that have talents that get paid off enormously in a market system, to give back a fair amount of that to the society that produces that.

52. Berkshire isn't a "rich man's mutual fund"

WARREN BUFFETT: The question about Berkshire being I think it was, was it rich man's mutual fund or something like that?

We don't look at it that way at all. We look at it as a collection of businesses, and ideally we would own all of those businesses.

So it's, to the extent that a mutual fund owns stock in a lot of companies and diversifies among businesses and we try to own a lot of businesses ourselves, I guess that's true. But I guess you could say the same thing of General Electric, or an operation like that.

We are more prone to buy pieces of businesses than the typical manager, but we are trying to do, in a sense, the same thing Jack Welch is trying to do at General Electric, which is try to own a number of first-class businesses.

He gets to put the imprint of his own management, which I think is very good, on those businesses, and we are more hands-off, both in the businesses we own outright and in the ones that we own pieces of.

But we're going at it the same way. And General Electric has been very successful under Jack's leadership, and doing it his way.

We think, in terms of what we bring to the game, and the problems of putting money to work all the time, that our own system will work best for us.

Charlie?

CHARLIE MUNGER: Yeah, I've got nothing to add to that.

53. Don't need interest rate outlook to value companies

WARREN BUFFETT: Zone 1.

CHRISTOPHER DAVIS: Hello, I'm Christopher Davis from New York City.

I'm interested in that many of the holdings of Berkshire are in industries that are perceived as interest rate-sensitive industries, including Wells Fargo, Salomon, Freddie Mac, even GEICO. And yet you have an admitted sort of ambivalence towards interest rates or changes in interest rates.

And it therefore seems that you don't feel that those changes affect the fundamental attractiveness of those businesses.

I thought maybe you could share your thoughts on what you see in these businesses that the investment community as a whole is ignoring.

WARREN BUFFETT: Well, the value of every business, the value of a farm, the value of an apartment house, the value of any economic asset, is 100 percent sensitive to interest rates, because all you are doing in investing is transferring some money to somebody now in exchange for what you expect the stream of money to be, to come in, over a period of time. And the higher interest rates are, the less that present value is going to be.

So every business, by its nature, whether it's Coca-Cola or Gillette or Wells Fargo, is in its intrinsic valuation, is a hundred percent sensitive to interest rates.

Now, the question as to whether a Wells Fargo or a Freddie Mac or whatever it may be, whether their business gets better or worse internally, as opposed to the valuation process, because of higher interest rates, that is not easy to figure.

I mean, GEICO, if they write their insurance business at the same underwriting ratio — in other words they have the same loss and expense experience relative to premiums — they benefit by higher interest rates, obviously, over time, because they're a float business, and the float is worth more to them.

Now, externally, getting back to the valuation part, the present value of those earnings also becomes less then.

But the present value of Coke's earnings becomes less in a higher interest rate environment.

Wells Fargo, it's — whether they earn more or less money under any given interest rate scenario is hard to figure. There may be one short-term effect and there may be another long-term effect.

So I do not have to have a view on interest rates — and I don't have a view on interest rates — to make a decision as to an insurance business, or a mortgage guarantor business, or a banking business, or something of the sort, relative to making a judgment about Coke or Gillette.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

54. "Retroactive" insurance is small part of our business

WARREN BUFFETT: Zone two?

AUDIENCE MEMBER: Hello, I'm Benjamin Baron (PH) from New York.

Could you speak about your insurance business a little bit? And especially the retroactive policies you've been writing.

WARREN BUFFETT: Can we speak about the — you say the reinsurance business?

CHARLIE MUNGER: Retroactive —

WARREN BUFFETT: I heard the retroactive part, but the first part.

BENJAMIN BARON: The reinsurance and the retroactive, and also the market in Bermuda and how you see it as one of your potential markets.

WARREN BUFFETT: I think the retroactive market is, what's called "retroactive insurance," has been pretty well eliminated by developments in accounting.

So I would not expect us to really have any volume in retroactive-type policies.

Now, when we write workers' comp with a policy holder dividend, in effect that's a retroactive policy. But that's a relative — that's small part of Berkshire's business.

Did I answer what you were driving at there?

AUDIENCE MEMBER: (Inaudible)

WARREN BUFFETT: Pardon me?

AUDIENCE MEMBER: (Inaudible)

WARREN BUFFETT: Did you get that, Charlie?

55. "You don't find out who's been swimming naked until the tide goes out"

CHARLIE MUNGER: Just comment on the development of the insurance business in Bermuda.

WARREN BUFFETT: Oh, Bermuda is simply a, you know, a new competitor. They're not so new, I mean, there've been companies in Bermuda before.

But in the last 15 months, 18 months, maybe there's been 4 billion-plus raised. And because, for tax reasons — maybe other reasons as well, but certainly for tax reasons — that capacity has been concentrated in Bermuda-based, Bermuda-domiciled reinsurers.

But essentially there's no great difference between that type of competition and other reinsurers competition, except for the fact that that capacity is new and the money's just been raised, and so there may be some greater pressure on the managers of those businesses to go out and write business promptly than on somebody that's been around for 50 years.

But it's no plus for us any time new capacity enters any business that we're in, and that certainly goes for the reinsurance business.

Reinsurance business, by its nature, will be a business in which some very stupid things are done en masse periodically. I mean, you can be doing dumb things and not know it in reinsurance, and then all of a sudden wake up and find out, you know, the money is gone.

And it's what people have found out — and I used that line in the report a year ago — it's what people have found out that were speculating on bonds with (inaudible) margins recently, that, you know, you don't find out who's been swimming naked until the tide goes out. And — (laughter) — essentially that's what happens in reinsurance. You don't, you really don't find out who's been swimming naked until the wind blows at them.

56. When cash "piles up," it's not through choice

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: I'm Whitney Anderson (PH) from Miami, Florida. And my question is, right now, we are reading about various analysts and how you should, in their individual opinion, adjust your more cash, more stocks, more bonds because of …

How does Berkshire Hathaway feel about times of relative financial insecurity? Do you arrange for more cash reserves looking forward to a time when you might be able to buy? Or do you go along your path?

WARREN BUFFETT: I think the question is do we sort of get into asset allocation by maintaining given levels of cash, depending on some kind of outlook or something of the sort?

We don't really think that way at all. If we have cash, it's because we haven't found anything intelligent to do with it that day, in the way of buying into the kind of businesses we like.

And when we can't find anything for a while, the cash piles up. But that's not through choice, that's because we're failing at what we essentially are trying to do, which is to find things to buy, and —

We make no attempt to guess whether cash is going to be worth more three months from now or six months from now or a year from now.

So it is — you will never see — we don't have any meetings of any kind anyway at Berkshire, but we would never have an asset allocation meeting. We would — (laughter) — keep looking. I mean, Charlie's looking, I'm looking. Some of our managers are looking.

We're looking for things to buy that meet our tests, and if we showed no cash or short-term securities at year-end, we would love it, because it would mean that we'd found ways to employ the money in ways that we like.

I think I would have to admit that if we have a lot of money around, we are a little dumber than usual. I mean, it tends to make you careless.

And I would say that the best purchases are usually made when you have to sell something to raise the money to get them, because it just raises the bar a little bit that you jump over in the mental decisions.

But we have, I don't know what we'll show, but certainly well over a billion dollars of cash around, and that's not through choice. That is a — you can look at that as an index of failure on the part of your management.

And we will be happy when we can buy businesses, or small pieces of businesses, that use up that money.

57. Fannie Mae and Freddie Mac as investments

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Gentlemen, my name is Richard Sercer from Tucson, Arizona.

I understand that 40 percent of all home mortgages have been securitized by Fannie Mae and Freddie Mac, the duopoly.

I would, at the risk of asking you for a projection, since you've talked about projections before, I'd be interested in understanding what you think will happen to that market share over time for this duopoly. Thank you.

WARREN BUFFETT: Well, the answer to that doesn't involve much of a prediction. That market share is essentially certain to go up.

That doesn't mean that those are wonderful businesses to buy, but the market share is essentially certain to go up because the economics that those two entities possess, compared to other ways of intermediating money between investors and people who want to borrow, no one else has those economics.

So what holds the share of Freddie Mac and Fannie Mae down is the fact that they are only allowed to loan roughly $200,000 on any mortgage. That's a limiting factor. It's probably been a good thing for them that it has been a limiting factor, but they are shut out of part of the market.

But the market that they are in, they essentially have economics that other people can't touch for intermediating money, including the savings and loan business that we were in.

We had a business that intermediated money, went out and got it from depositors and lent it to people who wanted to borrow on a home.

Freddie Mac and Fannie Mae do it the same way. They don't do it exactly the same way, but they perform the same function. And they could do it so much more cheaply than we could do it by having branches or anything of the sort and paying the insurance fee we paid.

They're going to get the business. They should get the business. And so their market share will grow.

Charlie?

CHARLIE MUNGER: Well, I think that's right. (Laughter)

WARREN BUFFETT: You're doing great. (Laughter)

58. Increased information speed doesn't affect our decisions

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Good morning, I'm Sarah Pruitt (PH) from Milwaukee, Wisconsin.

And I wondered if you feel that the speed with which information is available and disseminated today has affected your business-buying decision process. And do you believe that speed has caused you to miss opportunities?

WARREN BUFFETT: Question about seas expanding?

CHARLIE MUNGER: No. Does the speed of information today affect our decision-making process?

WARREN BUFFETT: No, we — I would say that we perform about like we were doing 30 or 40 years ago.

I mean — (laughter) — we read annual reports.

It isn't the — the speed of information really doesn't make any difference to us. It's the processing and finally coming to some judgment that actually has some utility, that is, that it's a judgment about the price of a business or a part of a business, a security, versus what it's essentially worth.

And none of that involves anything to do, really, with quick information. It involves getting good information.

But usually that — it's not — we're not looking for needles in haystacks or anything of the sort. You know, we like haystacks, not needles, basically. And we want it to shout at us.

And I would say that, well, virtually everything we've done has been reading public reports, and then maybe asking questions around to ascertain trade positions or product strengths or something of that sort.

But we never have to — we can make decisions very fast. I mean, we get called on a business — or we can make up our mind whether we're interested in two or three minutes. That takes no time. We may have to do a little checking on a few things subsequently.

But we don't need to get — I can't think of anything where we really need lots of price data or things like that extremely fast to make any decisions.

We've got good management information systems in our operating businesses, but that's just another — that's a question of keeping inventories where they should be and all of that sort of thing.

I don't think the invest — I think you could be in someplace where the mails were delayed three weeks, and the quotations were delayed three weeks, and I think you could do just fine in investing.

59. Why a stock buyback is unlikely

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: James Pan (PH), New York City. I have a two-parter question.

One, do you think the stock price of Berkshire Hathaway is trading within 15 percent of its intrinsic value currently?

And two, if you think Berkshire Hathaway is undervalued with the amount of cash you have on your balance sheet, would you consider a buyback?

WARREN BUFFETT: The answer about a buyback is that we generally have felt that market conditions that would make Berkshire attractively priced is probably going to make other things even more attractively priced, because we think our shareholders are more rational than the shareholders of many companies.

It's more likely that we will find some wonderful business at a silly price than we will find Berkshire at a silly price as we go along. So — (applause) that tends to eliminate repurchases.

But it doesn't rule them out, but it explains why the circumstances will not arise very often where repurchases would make good sense.

60. Why we don't estimate our intrinsic value

WARREN BUFFETT: In terms of giving you a number on intrinsic value, I don't want to spoil your fun. I mean, you really should work that one out for yourself. (Laughter)

Charlie is the expert on intrinsic —

Do you have any comment for him, Charlie?

CHARLIE MUNGER: Well, your attitude on that subject reminds me of a famous headmaster who used to address the graduating class every year. And he'd say, "You know," he says, "Five percent of you people are going to end up criminals." And he says, "I know exactly who you are." (Laughter)

And he said, "But I'm not going to tell you, because it would deprive your lives of a sense of excitement." (Laughter)

If you stop to think about it, the companies that constantly told their shareholders what the intrinsic value was were the real estate holding companies in corporate form.

And I must say, that the amount of folly and misbehavior that crept into that process was disgusting. We would be just associating with a bad group if we were to change our ways.

WARREN BUFFETT: Bill Zeckendorf Sr. I think was probably the first one to do that, with Webb and Knapp back in the late '50s. I still have those annual reports. And he would announce, you know, like, to eight decimal places what the intrinsic value of Webb and Knapp was. And he did it right till the day they filed for Chapter 11. (Laughter)

CHARLIE MUNGER: I remember that well, because somebody said that he fell into bankruptcy. And somebody else said, "How can you fall off a pancake?" (Laughter)

WARREN BUFFETT: Beware of people that give you a lot of numbers about their businesses. I mean, in terms of projections or valuations or that sort of thing.

We try to give you all of the numbers that we would use ourselves in making our own calculations of value.

We really — if you read the Berkshire reports, you essentially — you have all the information that Charlie and I would use in making a decision about the security.

And if there's anything really lacking in that respect, you know, we would actually — we would truly appreciate hearing from you, because we want to have that kind of information in the report. But then we want you to make the calculation.

But we've stuck, I mean, that material, for example, on the float in the insurance business, we consider that quite relevant, obviously, because we use up almost a page printing it. It's pretty serious stuff at Berkshire. (Laughter)

But that is relevant. I mean, your interpretation may be different than mine or Charlie's, but those are important numbers.

And we could give you a lot of baloney about satisfied policyholders, you know, in Lincoln, Nebraska. It wouldn't tell you a thing about what the company's worth — and have pictures of them, and happy, you know, receiving the check from the agent and all of that. (Laughter)

We're not going to do that.

61. Buffett on Peter Lynch

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Mike Macy (PH) from Indianapolis.

I have really enjoyed reading your annual letters and your annual report, and I've gone back and read all of the older ones, too. They're terrific.

I have also enjoyed reading the two books by Peter Lynch, and I see a lot of commonalities between the two of you, the way you think, your philosophy, et cetera.

I'd certainly appreciate it if you'd make a few comments on what you think of Peter Lynch, the things he says in his two books, and the advice that he gives to investors. Thank you.

WARREN BUFFETT: Well, I know Peter. I don't know him well, but we've played bridge together in Omaha as a matter of fact.

I like him personally, and obviously he has an outstanding record. And he has written those two books, which have been bestsellers, about his investment philosophy. I don't really have anything — you know, I'm not going to embroider on his.

There's certainly a fair amount of overlap. There's some difference.

Peter, obviously, likes to diversify a lot more than I do. He owns more stocks than the names of companies I can remember. I mean, but that's Peter. (Laughter)

And, you know, I've said in investing, in the past, that there's more than one way to get to heaven. And there isn't a true religion in this, but there's some very useful religions.

And Peter's got one, and I think we've got one that's useful, too. And there is a lot of overlap.

But I would not do as well if I tried to do it the way Peter does it, and he probably wouldn't do as well if he tried to do it exactly the way I'd do it.

I like him personally very much. He's a high-grade guy.

62. We'll only write insurance when prices make sense

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, my name is Dave Lankes (PH). I'm a senior editor at Business Insurance Magazine.

A two-part question for you. Can you explain a little bit regarding your primary insurance operations? What drove up written premiums by more than 50 percent last year, and if you expect that to continue this year?

And then regarding your earlier comments on the stupid things reinsurers can do en masse, can you explain what potential pitfalls that the new cat facilities in Bermuda will have to avoid that you feel Berkshire Hathaway won't fall into?

WARREN BUFFETT: Well, the first question about our primary insurance figures, you'll find it way in the back someplace. But they're a little distorted because we bought Central States Indemnity, what would it be, late in the year '92. So there's a lot more premium volume in there for Central States in '93 than there was in '92.

Our basic — National Indemnity's basic insurance, which is commercial, auto, and general liability, premium volume was fairly flat, the Homestate operation fairly flat, Cypress up somewhat. But those numbers were not anything like the changes —

So our business last year, pro forma for including Central States Indemnity for all of '92, would not have shown a dramatic change. There really hasn't been much happening in our primary business, except that it's been run, it's done very well, but it is not growing or exploding. And that's true this year as well as last year.

It's a good business. And it could grow in certain kinds of markets very substantially, but it is not growing in this market, and it did not grow last year, although its underwriting was very good.

In the reinsurance business, I think, essentially, the difference in our reinsurance business from many others, you know — it doesn't include them all in a place like Bermuda — is essentially the difference that may exist in our operations and securities versus other people.

We will offer reinsurance at any time in very large quantities at prices we think make sense. But we won't do business if we don't think it makes sense, just like we will buy securities, to the extent of the cash we have available, if they make sense. But we have no interest in being in the stock market per say just to be in it. We want to own securities that make sense to us.

I think for most managements, if the only thing they're in is the reinsurance business, they may like it better when prices make sense, but they will, I think they will be prone to do quite a bit of business when prices don't make sense as well, because there's no alternative, except to give the money back to the owners. And that is not something that most managements, you know, do somersaults over. (Laughter)

So, I think we are in a favored position, essentially being — having the flexibility of capital allocation that lets us take the lack of business with a certain equanimity that most managements probably can't, because of their sole focus on the business.

Rates will get silly, in all likelihood, after a period when nothing much happens, when you've had a couple of years of good experience.

We price to what we think is exposure. We don't price to experience. I mean, the fact that there was no big hurricane last year — I forget the name of the one that was coming in at North Carolina and then veered out essentially — but to us, it has nothing to do with the rates next year whether that hurricane actually came in in a big way or veered out into the Atlantic again. I mean, we are pricing to exposure.

And everyone says that, but the market tends to price and respond to experience, and generally to recent experience. That's why all the retrocessional operations in London, you know, in the spiral, went busted, because they priced, in our view, they priced to experience rather than to exposure.

It's very hard not to do that, to be there year after year with business coming by and investors expecting this of you and not do that.

But we will never knowingly do that. We may get influenced subconsciously in some way to do that, but we will not do that any more than we will accept stock market norms as being the proper way for us to invest money and equities.

Basically, when you lay out money or accept insurance risks, you really have to think for yourself. You cannot let the market think for you.

Charlie?

CHARLIE MUNGER: Yeah, I think Berkshire is basically a very old-fashioned kind of a place. And it tries to exert discipline to stay old-fashioned.

And I don't mean old-fashioned stupid, I mean, you know, the eternal verity, so to speak, basic mathematics, you know, basic horse sense, basic fear, basic discriminations regarding human nature, all very old-fashioned. And if you just do that with a certain amount of discipline, I think it's likely to work out quite well.

63. Praise from Sandy Gottesman

WARREN BUFFETT: Zone 3.

DAVID GOTTESMAN: David Gottesman from New York.

It's no wonder that this meeting draws stockholders from all over the country. And despite the talk about age today, I'm happy to say this meeting gets better every year.

Berkshire stands unique in American business as a company whose name has become synonymous with management excellence.

Unlike many American corporations, we, as stockholders, don't have to worry about reorganizations, large write-offs, massive restructurings, overstated earnings, and overpaid executives with strategic visions.

Instead, year in and year out, we enjoy the benefits of the common sense and brilliance of Charlie and Warren. (APPLAUSE)

WARREN BUFFETT: What did you say your name was? (Laughter)

DAVID GOTTESMAN: I want to add to that, to say nothing of your good humor.

It's easy to take such consistently outstanding results for granted, but we in this room are the direct beneficiaries of their efforts.

By our presence here today, we show our appreciation to them for their exceptional performance. But we can also demonstrate in another way. I would like to suggest we give them a rousing hand of applause for a job well done. Thank you. (APPLAUSE)

WARREN BUFFETT: Thank you. That was Sandy Gottesman. We've worked together for 30-odd years, and he's finally got that down. I appreciate that, Sandy. (Laughter)

64. Brief adjournment

WARREN BUFFETT: With that, we will adjourn. And anyone who wants to stay around, we'll reconvene in 15 minutes, and then we'll be here till about 1:15.

Afternoon Session - 1994 Meeting

1. No comment on Guinness investment

WARREN BUFFETT: Zone 2 now. Well, I don't know where zone 2 is, but we'll — (laughs)

AUDIENCE MEMBER: Do you feel basically the same about your investment in Guinness now as when you made the investment, in terms of the company?

WARREN BUFFETT: Well, I wouldn't like to comment on anything that we own, in terms of how we rate them as desirability or anything. I mean, whether it's Coke or Gillette or anything that — we made decisions at a given time, at a given price, which you can figure out by looking at our purchases.

But we may be buying or selling any of those securities right as we talk. And we simply don't think it's in the interest of Berkshire shareholders as a group to be talking about things that we could be buying or selling.

2. World Book's sales slide: "I wish I knew the answer"

WARREN BUFFETT: OK?

AUDIENCE MEMBER: Hi, David Winters, from Mountain Lakes, New Jersey.

Just wondering, World Book's had a tough time lately, and I'm wondering if there's things you're doing to try to improve that.

And also, The Buffalo News has been fabulous. And I'm kind of wondering what's driving The Buffalo News?

WARREN BUFFETT: Buffalo News is doing what?

AUDIENCE MEMBER: Fabulously.

WARREN BUFFETT: Yeah, it's doing well, right. Well, I would say you got to give credit Stan Lipsey — I'm not sure whether Stan's here right now, but — who's been running the News.

World Book, in terms of unit sales — as we put in the report — have fallen off significantly the last few years. It's actually surprising, in a sense, how well the profits have held up because they've done a good job, a very good job, in that respect.

And as we put in the report, we don't know the answer, precisely. We are, Ralph Schey is — has taken some actions — is taking some actions — that he thinks will improve the operations. Ralph's record as a manager is absolutely at the top of the list. I mean, it — I wrote about it in the 1992 report.

In 1993, Ralph did even better. I mean, it was a — fabulous. I think, probably, may have been 110 or so million pre-tax on 90-some million of average equity capital, or something of the sort. So it's a fabulous record.

But Encyclopedia Britannica, as you probably know, ran at a loss last year. The encyclopedia business has been very — has been poor. Could be due to electronic competition, could be due to recruiting problems for salespeople. Obviously, it can be a combination of many factors.

If we knew the answer, we'd have — you wouldn't be seeing those figures right now. But it is a top item of attention for Ralph. He takes anything that's not performing as well as before very seriously. And we will see what happens.

But I don't have a prediction on it. I wish I knew the answer. I don't see any variables to, in any intelligent way, tell you or — we put in the report the best we could do on that.

The profitability has, like I say, has been pretty good. But obviously, current trends of new sales will catch up with us at some point, unless we boost unit sales.

I don't think our market share, if you look at print encyclopedias, has fallen. But I can't be sure of that, but I think that's probably true. But there are an awful lot of encyclopedias going out there as part of a bundled product with computer sales.

3. Breaking up Berkshire wouldn't help

WARREN BUFFETT: How are we going to do this, is there?

VOICE: We got three now.

WARREN BUFFETT: OK, I'll let you hand the mic to whomever, you —

VOICE: (Inaudible) three.

AUDIENCE MEMBER: Lee again, from Palo Alto. By Omaha standards you are a relatively young man.

And every year, you point out that Berkshire's size now precludes you from making the great, relatively small trades which made your reputation.

How much thought have you given to breaking up Berkshire into smaller entities?

WARREN BUFFETT: How much what?

AUDIENCE MEMBER: How much thought have you given into breaking up Berkshire into smaller entities, which would allow you to make those nice, small, wonderful trades that you made from the beginning?

WARREN BUFFETT: It wouldn't do any good to break into smaller entities, because I'd still own, you know, we'd still have 10 billion-plus of capital to be responsible for, wherever it would be.

So, the — we could distribute it out to the shareholders, and let them make their own decisions, obviously. And any time we thought that we weren't going to get more than a dollar of value per dollar retained, that, obviously, would be the course to follow.

But there's no magic to creating multiple little — I mean, we could call Berkshire Two, Berkshire Three, Berkshire Four, but you still got the problem. There's $10 billion to invest, and it doesn't really solve anything.

Charlie, do you have any thoughts on that?

CHARLIE MUNGER: No, the — Berkshire is incredibly decentralized, in the — in terms of power and decisions resting in the operating divisions. In terms of the marketable securities, it's incredibly centralized.

And so far, we have not had any big penalty from not being able to do the things that we did when we were young. Eventually we will reach the penalty.

WARREN BUFFETT: Yeah, I think we're — there's no question we could earn higher percentage returns working with $100,000, though, than $10 billion. But, yeah — but it hasn't hurt us as much as we thought it would, as size has increased.

But your universe of opportunity shrinks. But it shrinks no matter — I mean, you can set it up in 20 bank accounts or one bank account, but you still — the universe still has to fit the 10 billion, in aggregate.

4. "Absolutely sensational job" by General Dynamics management

WARREN BUFFETT: Now, how are we doing this? Do we have another zone over there? Yeah.

AUDIENCE MEMBER: Michael Bunyaner (PH), New York City.

Two questions. One, last year you discussed in your annual report your investment in General Dynamics. And you also gave your proxy to the company and its management. This year, it appears you have sold the stock.

WARREN BUFFETT: This year, what?

AUDIENCE MEMBER: This year, it appears that you have sold the stock in General Dynamics.

What has changed that you sold 20 percent of your stake? This is question number one, and I have number two.

WARREN BUFFETT: Probably inappropriate to be talking about what we're buying or selling, except to the extent that we make a public — have to make a public announcement, which, on something like General Dynamics, we've got 13G requirements if we change by more than 5 percent.

And we also have — as long as we own more than 10 percent — we have monthly reporting requirements under Form 4.

We think the management of General Dynamics has done an absolutely sensational job.

Obviously, also it isn't the kind of business, basically, that we have a 20-year view on, or something of the sort. So, it's — the shareholders of General Dynamics have been extraordinarily well-served by the management of that company. And we've — we're thankful, because we prospered accordingly.

AUDIENCE MEMBER: But should I take from this comment that you have changed your view about the business itself?

WARREN BUFFETT: Pardon me?

AUDIENCE MEMBER: Should I take from your comment that you have changed your view about the business itself?

WARREN BUFFETT: No, no. I think you take my comments as saying just what I've said. (Laughs)

AUDIENCE MEMBER: OK. (Laughter)

Question number two, could you tell me —

WARREN BUFFETT: I think we want to give people a chance around the room, and then when, in the zone you're in, when a second question comes along, it will be fine. But we want to get as many people in this hour as we can, because this is the hard core here.

5. No encouragement for short-term stockholders

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: It appeared to me that in 1993 the variation between the stock price for the high and the low was much greater than years in the past. Would you mind commenting on that?

WARREN BUFFETT: Well, there was more volatility in the price of Berkshire last year. And as I put in the annual report, the stock overperformed the business last year.

Now, over any 10 or 20 or 30-year history, every year the stock is going to perform a little differently, at least, from the business. I mean, it may slightly underperform, or slightly overperform.

We would prefer that those variations be as small as possible. But there was more variability last year than historically's been the case. Although we've had one or two other — we had a few years like that. We —

Our best way to handle that is to give all the information we can to shareholders and prospective shareholders, and follow policies that we think will induce the investment-oriented with long time horizons to join us, and not to encourage other people. But, occasionally — you know, we can't guarantee that result.

One of the things that was interesting to me, I don't know whether it was three months ago or when, but I happened to be talking to the [NYSE] specialist, terrific specialist, Jimmy Maguire. He had to leave, but he was here earlier in the session.

And I think, at the time, the stock was around 16,000 or something like that. And he had some rather significant stop-loss orders on the books at 15-5, or thereabouts, involving some hundreds of shares.

And that to me is a signal that, you know, we have some people that are — in my view — are not really the kind of owners that we would like to attract. Because why somebody wants to put in an order to sell something for 15,500 that they don't want to sell at 16,000 is beyond me, but — (Laughter)

The idea of people using stop-loss orders with Berkshire, obviously — it tells me that we've got some people in that are using it as trading vehicle of some sort, or have some totally non-investment-type calculations in their mind.

I don't think we have very many of them. But obviously, if we have enough people like that, you will have a more volatile stock than if you have a whole bunch of people who look at it as something that they're going to hold for the rest of their life.

And the stock did go down at that time and hit 15,500. And there were — that — I think it was close to 300 shares, which is 4 1/2 million dollars' worth of stock.

And somebody made a decision, apparently, that they — or some small number of people — made a decision that they wanted to sell something at 15,500 that they could have sold for 16,000. The lower it went, the better they liked it, apparently. I mean, the better they liked the sale. (Laughter)

Which, you know, has always struck me as like having a house that you like, and you're living in, and, you know, it's worth $100,000 and you tell your broker, you know, if anybody ever comes along and offers 90, you want to sell it. I mean, it doesn't — (laughter) — make any sense to me.

But it has — I would say that there's been some small — I think, relatively small — tendency for people to get — relatively few people — but to get more interested in the price of the stock in terms of — and thinking of it in terms of whether it's going to go up or down in the next six months, than might formerly have been the case.

I think we're unusually well-blessed in that respect, in that we've got people who basically want to own it for a very long time.

But to the extent that you get people who were owning it because they think the stock market's going to go up, or something of that sort's going to happen, that is not good news from our standpoint, and it will increase the volatility in it.

We will do nothing to encourage that.

6. Berkshire benefits when the stock market falls

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Yes, Mr. Buffett, Steve Lang (PH) from Toronto.

I was just curious about when you were saying that one of the best things that could happen to shareholders is the — the market goes down and you're able to buy good businesses at foolish prices.

And then a little on, you were saying that we could judge your ability to do what it is that you feel you should be doing by how much cash you have in the account at any given point in time, and —

WARREN BUFFETT: By what?

AUDIENCE MEMBER: By the amount of cash that you have in the account. In other words, I guess, what you feel you're supposed to be doing is investing the cash in good businesses.

So I'm just wondering about that kind of dichotomy. Where does the cash come from if the market does go down, if you've been successful in your first ability? Would that be from the cash flow on the operations of the business from the float?

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: Is that —?

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: So really, the success of the company then is, to some degree, the fact that you're able to dollar-cost average into the market on an ongoing basis? Is that right?

WARREN BUFFETT: Well, it isn't that precise. But A, we do generate cash in considerable amounts, so that we will not husband cash, simply because we think the market's going to go down, in order to buy something.

But obviously, as cash comes in, we're always looking for things to do. And the cheaper that the market is generally, the more likely it is that we will find something that we understand and that we like, and that the price will be attractive, and that we will do it.

But it isn't like we can change around the whole portfolio then, because that doesn't gain us anything. I mean, we'd be selling things at lower prices to buy things at lower prices.

But to the extent that we have net cash coming in — which we do, and which we will have — on balance, we're, you know, we're adding to our businesses at more attractive prices than would be the other case.

And it's no prediction on any given company. I mean, whether it's Gillette or Coke, or anything. It might be something we already own, it might be something we don't own. But we welcome the chance to buy more shares.

We're not wishing it on anybody. But if you asked us next month whether Berkshire would be better off if the whole stock market were down 50 percent or where it is now, we would be better off if it was down 50 percent, whether we had any cash on hand now or not, because we would be generating cash to buy things.

7. Salomon's compensation: "Far from ideal"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Byron Ransdell (PH) from Raleigh, North Carolina. Thanks for your hospitality to this weekend.

WARREN BUFFETT: Well, we thank you for coming, too.

AUDIENCE MEMBER: My question concerns Salomon, Inc., and more specifically, Salomon Brothers. I know that you were on the board of directors, I think, from '87 to the current time. Very much interested in compensation there, and maybe on the compensation committee.

Between 1987 and 1992, Salomon's financial results were quite dismal in a very lumpy way, but overall, quite dismal.

In your opinion, if the compensation had been rational during this time, would Salomon have shown results that would make it a quite decent business?

WARREN BUFFETT: Would Salomon — if the compensation —

CHARLIE MUNGER: If the past compensation —

WARREN BUFFETT: — had been more rational —

CHARLIE MUNGER: — decisions had been more rational, '87 to the current time, would Salomon have done better? Yeah, was that it?

AUDIENCE MEMBER: Yes, sir.

WARREN BUFFETT: Well, I would — yeah, I would say that, if the present people and the present compensation philosophy — which allows for very large payments for very large results — I think the company would have done better, yeah.

It — you're going to see very big numbers paid in Wall Street. That's the nature of it. The trick is to pay them only when you're getting very big results for the owners. I mean, it — there's no way you're going to pay numbers that look like numbers in other industries, and get great results for owners.

But if you pay these big numbers, I think you should be getting very good results for owners.

And there — the old system was not — I mean, it wasn't totally off the mark on that. But it was far from an ideal system, in my view.

8. Unlikely to write put options on Coca-Cola again

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Warren, I have one question.

Last year you were using Coca-Cola puts as a way to increase income, and conversely, if they were exercised, as a way of increasing your position. Do you still use puts in this type on investments you wish to add to?

(BREAK IN RECORDING)

WARREN BUFFETT: — five million shares, as I remember, of Coke sometime in the early fall or thereby — I don't remember exactly — last year. And the puts, I think the premium was around 7 1/2 million dollars, and they were priced around 35.

We have not done that very often, and we're unlikely to do very much of it. For one thing, there are position limits on puts, which don't apply to us, but they apply to the brokers for which we do them. And those position limits were not clear before that. But we could probably write puts on that same amount by doing it through a bunch of different brokers.

It's not something we're really very likely to do. I was happy to do it, and in that particular case, we made 7 1/2 million dollars.

But we're better off, probably — if we like something well enough to write a put on it, we're probably better off buying the security itself, and particularly since we can't do it in the kind of quantities that really would make it meaningful to Berkshire.

There are securities I would not mind writing puts for 10 million shares or something, but I — that probably — it's probably allowable for us to do it. It's not allowed — we'd probably have to do it through multiple brokers to get the job done.

And on balance, I don't think it's as useful a way to spend my time as just looking for securities to buy outright.

Charlie, you have anything?

CHARLIE MUNGER: No.

9. Don't believe reports on what we're buying or selling

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Mr. Buffett, I'm from West Point. And my name is Rogers.

A couple of months ago, there were stories in The World-Herald that Berkshire Hathaway had taken a large position in Philip Morris, and UST. But in your annual report, I don't see anything about that. Can you comment?

WARREN BUFFETT: Yeah, I would say, in the last two years maybe — I'm just approximating — I've probably seen reports in either The Wall Street Journal, or USA Today — maybe picked up by The Associated Press, or in The Herald, but in papers of some significance — I've probably seen stories that we were buying maybe any one of 10 companies in aggregate over that period of time. I would say a significant majority were erroneous.

We don't correct the erroneous ones, because if we don't correct the erroneous ones — if we correct the erroneous ones, and don't say anything about the correct ones, in effect we're identifying the correct ones, too.

So we will never comment on those stories, no matter how ridiculous they are.

And it's interesting because, you know, they keep getting printed. And frankly, from our standpoint, the fact that most of them are inaccurate is probably useful to us. We don't do anything to encourage it, but it — the fact that people are reading that we are buying A, B, C, or X, Y, Z when we aren't — you know, that's — I don't think people should be buying stocks because they're reading in the paper that we're buying something. But if they do, they may get cured of it at some point.

Maybe the newspapers will even get cured of writing the stories when they don't know, you know, what the facts are.

But it's something we live with, and we'll probably continue to live with.

And I would say that based on history, if you read something about us buying or selling something, other than through reports we've filed with the SEC or regulatory bodies, the chances are well over 50 percent — that I can tell you, based on history, is correct — well over 50 percent that it's wrong.

10. Unlikely Berkshire will be a Dow or S&P 500 stock

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Do you expect that Berkshire will become one of the Standard & Poor 500 stocks, or a Dow Jones stock?

WARREN BUFFETT: Well, I think it's unlikely it ever becomes a Dow Jones stock.

I don't know what the criteria are for the S&P 500. But I imagine there's some reason why we don't fit. I don't know whether they have questions about number of shares outstanding or — I've never checked with S&P.

I wouldn't be surprised if we have the largest market capitalization of any company that isn't in the S&P, although I don't know that. But they may have some criteria that preclude Berkshire being part of it.

I've always thought it would be very interesting, for those of you who like to think about such things, that if we were part of the S&P 500, and enough people became indexed so that 60 percent of the market was indexed, and if Charlie and I wouldn't sell, which we wouldn't, it'd be an interesting proposition as to how the index funds would ever get their 60 percent if they tried to replicate the S&P.

It'd be — I don't know whether they have rules even about concentration of ownership. That same line of thinking might have applied to Walmart, or some company.

Because just take the extreme example of a company that had 90 percent of its stock owned by one individual, and 12 percent of the money in the market were indexed, and the 90 percent wouldn't sell, it would bring back the Northern Pacific Corner or something of the sort.

In any event, I don't think that's going to be a problem. And I don't think we are going to end up being in either index, so —

11. Diversify if you don't understand businesses

WARREN BUFFETT: Yeah, zone 1?

AUDIENCE MEMBER: Mr. Buffett, my name is Aaron Morris (PH). I'm from California.

What I wanted to know was how you think about how large a position you're willing to take in a given security, both in your case, where you have new cash coming in that you can invest, and in the case of an investor, where they have a fixed amount of capital, and they're trying to decide what's the most (inaudible) security that they really love?

WARREN BUFFETT: Well, Charlie and I have — probably at our present size, we will never find anything that we get as much money into as we want. Don't you think that's probably true, Charlie? If we really like it?

CHARLIE MUNGER: Yeah, I think that's quite likely.

WARREN BUFFETT: Yeah, so we will probably never hit the limit. We would love to. We'd love to find something we felt that strongly about, and occasionally we do.

But we won't get as much money into it as we would wish, or as if we were running a million dollars of our own money or some number like that, so —

We are willing to put a lot of money into a single security. When I ran the partnership, the limit I got to was about 40 percent in a single stock. I think Charlie, when you ran your partnership, you had more than 40 percent in —

CHARLIE MUNGER: Sure. (Laughter)

WARREN BUFFETT: And we would do the same thing if we were running smaller partnerships, or our own capital were smaller and we were running that ourselves.

Because, no, we're not going to do that unless we think we understand the business very well, and we think the nature of the business, what we're paying for it, the people running it, and all of that lead up to virtually no risk, and —

But you find those things, occasionally. And we would put — assuming it were that much more attractive than the second, and third, and fourth choices — we would put a big percentage of our net worth in it.

We only advise you to do that — well, we probably don't advise you to do it all, maybe — but we would only advise you to do it, if you're doing it based on your conclusions about — your own ideas of value, and something that you really feel you know enough to buy the whole business, if your funds were sufficient, and it was being offered to you. You ought to really understand the business.

But people do that all the time, incidentally, in private businesses, which have got terrible prospects. I mean, they buy dry cleaning establishments, or filling stations, or whatever, and they put very high —franchises of some kind — they put a very high percentage of their net worth into something — a business that's very risky, basically. I mean, it —

People put all their money in a farm, you know. It's a business. It's subject to all kinds of business risk.

So it's not crazy, if you understand the business well, and if the price is sufficiently attractive, to put a very significant percentage of your net worth in. If you don't understand businesses, then you're better off diversifying and fairly widely diversifying.

Zone — go ahead. Sorry

CHARLIE: Berkshire has a substantial shareholder whose father accumulated the original position, and when he died he left a very large estate, practically all of which was in two securities, Berkshire and one other outstanding company.

A bank was co-trustee. And the bank trust officer said you've got to diversify this. And, you know, it was a very large estate.

And the young man who was co-trustee with the bank said, “Well,” he says, “you know, if my father believed the way you do, he might have been a trust officer in a bank instead of — (laughter) — leaving this large estate.” (Applause)

And that young man holds the Berkshire to this day. And I suppose the bank is still giving the same advice. (Laughter)

12. We don’t like to “give you our answers” on Coca-Cola

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Mr. Buffett, this is Chuck Peterson (PH) from Omaha.

And I was just wondering if you could comment on the Coca-Cola Company — you haven’t really talked about it too much today — in regards to what you foresee over the next five years, the earnings per share growth, and where this growth is, perhaps, going to come from.

WARREN BUFFETT: Was that the question, about the growth of Coke?

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: You really have to come to your own conclusion.

Coca-Cola Company writes — their annual reports are extremely good. I mean, they’re very informative. You know, you —

My guess is that, at least, if you read a few of the reports, you’d absolutely know as much about the Coca-Cola Company as I would.

But in the end, you have to make your own decisions about growth potential, profitability potential, and all that.

But the one thing I can assure you is that, probably, if you spend a relatively small amount of time on it, the facts that you will have available to you for making a decision on that question will be just as good, essentially, as the facts you’d get if you’d worked at the Coca-Cola Company for 20 years, or if you were a food and beverage analyst in Wall Street or anything of the sort.

That’s the kind of businesses we like to look at, are things that we think we can understand that way. And they’re also businesses that, usually, I think you could understand that way.

But we don’t like you to give you our answers. I mean, that would not be a good idea.

13. Allianz deal was “close to a wash”

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: David — I'm sorry — David Swab (PH) from Austin, Texas.

I have a question pertaining to the convertible bonds that were outstanding for about four years.

Any thoughts on, if you're a teacher, to grade if that was a good deal, bad deal, how the money was employed compared to the cost of getting out of the bonds? Any thoughts?

WARREN BUFFETT: Charlie what? Did you get that?

CHARLIE MUNGER: He wants to know if you think, in retrospect, your deal with Allianz was a good deal for Berkshire.

WARREN BUFFETT: No, I would say that if I knew everything at the time that we did the Allianz deal — which was a convertible shareholder coupon debenture — if I knew everything now — then — that I know now, would we have done it? Probably pretty close. We had relatively few bonds converted when we called — when he called them. And so — that — it really wasn't a negative in that sense.

But if we'd had more — we could have easily had a lot more converted. And that would not have been so good, obviously, if we'd ended up selling a lot of stock at 11,800 or whatever it was.

It's very hard to measure exactly what we did with the 400 million or so that we took in at the time. So, money being fungible, separating that 400 million from other resources to measure the — what happened on the plus side from having the money — is hard to do.

But my guess is, if you could play the whole hand over again, it probably was maybe a tiny minus to have issued them. What do you think, Charlie?

CHARLIE MUNGER: It's certainly close to a wash.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Now, you could ask about USAir, and that is one we would have been well to duck. (Laughter)

WARREN BUFFETT: And I might say Charlie had nothing to do with that decision. (Laughter) He didn't even know about it till I did it. And when he knew about it, hmmm. (Laughter)

14. "Size is a disadvantage" in buying and selling

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Mr. Buffett, I'm Joe Sirdevan from Toronto.

With respect to Berkshire's non-permanent, but large — and therefore, illiquid — holdings, what is your strategy for managing market impact on sales, given the intense scrutiny that Berkshire's under by the market?

WARREN BUFFETT: I didn't get that either. You get that?

CHARLIE MUNGER: I'm not hearing that very well.

WARREN BUFFETT: Yeah, I don't know whether you're too close to the mic — we're having a little trouble on that.

CHARLIE MUNGER: Speak a little more slowly.

WARREN BUFFETT: Or maybe the monitor can repeat that and — would you repeat the question?

AUDIENCE MEMBER: Sorry. Just with respect to Berkshire's large non-permanent holdings that are, therefore, illiquid, I'm just wondering what your strategy is for managing market impact when you do decide to sell portions of those holdings, given the intense scrutiny you're under?

WARREN BUFFETT: Yeah, question about the things we might sell, and what's going to happen to the market when we sell them.

That depends. I mean, it can be a very significant impact. It can be a negligible impact.

And it depends on market conditions, it depends on whether we might sell in a couple of large blocks to some institutions, it depends on — it could be, you know, there could be a tender off or something of the sort we would sell through. So, it's hard to measure.

But it is a disadvantage. Size is a disadvantage, you're absolutely correct in the basic point, both in buying and in selling. And we don't know any way around that.

We allow for it, in terms of what we expect, you know, the kind of possibilities we need to see. And we do — we sell so infrequently, that it's not a crusher of a negative point, but it's a negative we have that you do not.

15. No key man insurance for Buffett and Munger

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name is Anna (inaudible). I'm from Roanoke, Virginia.

Does Berkshire Hathaway or any of its subsidiaries have key man insurance on you and Mr. Munger?

CHARLIE MUNGER: Does Berkshire have key man insurance on —

WARREN BUFFETT: Oh, no. No. We have no life insurance, to my knowledge, on anyone except the maybe standard — the group life contracts people have. We have no key man insurance.

It really doesn't — it wouldn't be material.

I mean, that if we have a market value of 18 billion or something like that, if it really didn't — if it — a one — if it made a 1 percent difference, it'd be $180 million.

And basically, the math of intelligently selling insurance is better than the math of intelligently buying insurance. (Laughter and applause)

16. Guinness-VNMH restructuring was "logical"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Mr. Buffett, I'm Barry Siskind (PH) from Mesa, Arizona. Long-time admirer of yours. Question pertains to Guinness.

I remember reading in a publication I greatly respect, Outstanding Investor Digest by [editor] Henry Emerson in New York, that back in — I think it was '58 or '59, you made an investment in Cuba, decided to never to make an investment outside the United States again at that time.

Have subsequently invested in Guinness. I'm a fellow investor in Guinness. I've invested in Guinness for — and its sister company, Louis Vuitton Moët Hennessy — for over five years. And I'm very happy with those investments, by the way.

There's been a restructuring, as you know, of the Guinness-LVMH relationship, where Guinness no longer owns 24 percent of LVMH. Rather, it owns only its distilling, or I should say, alcoholic beverage-related businesses —

WARREN BUFFETT: The Moët Hennessy part.

AUDIENCE MEMBER: Right, the Moët Hennessy part.

The other parts of LVMH are showing better results these days, namely the Louis Vuitton luggage, as well as the Christian Dior perfume. They've also expanded into the newspaper business this past year, a business that you understand.

Do you intend to look at the possibility, first of all, of participating in those businesses that you no longer own now — with the restructured Guinness-LVMH deal — through some other form?

And the second question relates to the currency risk inherent in the Guinness investment, having bought it at about $1.80, as you mentioned, pound sterling now down to about $1.48.

The cost of hedging foreign currency through the FX has diminished through the combination of lower interest rates in the U.K., and higher interest rates, most recently in the U.S., to just about zero.

I take it we're all investors in companies, not speculators in currencies. So, the second part of the question is, do you intend to do anything about the currency risk portion of that investment?

WARREN BUFFETT: Well LVMH, which as you mentioned was 24 percent owned by Guinness — you know, that's one of thousands of securities that we could be a buyer or a seller of. So, I really don't want to comment on LVMH's specific attractiveness, or lack thereof.

And Guinness, I think what Guinness did was quite logical. I mean, their interest in that operation was basically through the distribution advantages that it gave to Guinness's own brands around the world, to be hooked up with Moët Hennessy, and vice versa. So, I think what they did was logical.

You can — the question of the exchange rate and all of that — the exchange rate, in terms of what they got in the spirits business, versus what they gave up in the luggage business, as in Christian Dior and a few things. You can form your own opinion on that.

But I think the logic was sound. But in terms of whether we want to be in LVMH by itself, that's like any other security, which we really can't answer.

17. Berkshire doesn't hedge currencies

WARREN BUFFETT: Second question related to —

CHARLIE MUNGER: Hedging.

WARREN BUFFETT: Hedge. Yeah, the hedging of currency —

CHARLIE MUNGER: Do we hedge?

WARREN BUFFETT: The answer to that is we don't. And Coca-Cola, as I mentioned, gets 80 percent of their earnings from a variety of currencies, the yen and the mark being two very important ones. They're going to be getting a very high percentage five years from now, 10 years from now.

They do certain currency transactions, but it's a practical matter. If you own Coca-Cola, you own a bunch of foreign bonds with coupons on them, denominated in local currencies, that go on forever.

Now, should you try and engage in currency swaps on all those coupons — you don't know what those coupons are yet, because you don't know how much they're going to earn in Japan or Germany, but you do know it's going to go on for decades, and it's — they're going to be very significant sums.

Should you try and engage in a whole bunch of currency swaps to go on out and convert all that stream into dollars or anything?

We basically don't think it's worth it. We don't think our opinion on currencies is any good. We don't think — we think the market probably know — well, we know it knows as much about it — it probably knows more about currencies, but it — we don't know — we do not know more than the market does about currencies.

So there are costs to hedging. And even though interest rate structures may cause the curve to look flat going out forward, so that, in effect, there's no contango on it, there's still the cost — there are costs in it. Now, it's a relatively efficient market, so that they're not huge.

But we see no reason to incur those costs with what we regard as a — totally, a 50-50 proposition. And it really doesn't go out that far anyway. I mean, we could do it for a couple of years.

But if you take that — the way we look at businesses, being the discounted flow of future cash out between now and Judgment Day, we can't really hedge that kind of a risk anyway. We could keep rolling hedges, but there's a cost to it that we don't want to incur.

We don't — we wouldn't worry a whole lot about whether some portion of our earnings, whether it's from Guinness, whether it's from Coke, whether it's from Gillette, are denominated at some mixture of marks, and pounds, and yen, and dollars, or whether they're all in dollars.

We'd slightly prefer if it were all in dollars, but we don't lose sleep over the fact that it may be coming from a mix of currencies like that. We wouldn't like it, in terms of, obviously, some very weak currencies.

18. Insurance intrinsic value far exceeds book value

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Lawrence Grawning (PH), Mill Valley, California.

On page 13 of the annual report, in — talking about the insurance operation, you say that it possesses an intrinsic value that exceeds its book value by a "large amount — larger, in fact, than is the case at any other Berkshire business."

To refine an earlier question that was asked, could you tell me whether you mean that it is larger in — by a percentage or in absolute dollars, that is —

WARREN BUFFETT: By absolute dollars. And —

AUDIENCE MEMBER: That's what you're referring to?

WARREN BUFFETT: Yeah, by absolute — it's very hard to stick a percentage figure on the insurance business, because we have so much capital in there that —

And then — and we have other businesses. I think that the — we've got businesses with a book value of in the tens of millions that are worth in the many hundreds of millions. So, you couldn't apply that to the insurance company (Inaudible). So, it's absolute dollars.

But in terms of absolute dollars, we think the excess of intrinsic value over carrying value — at least I do — is substantially greater for the insurance business than any other business we own.

Charlie, do you have any —

CHARLIE MUNGER: No —

WARREN BUFFETT: — thoughts on that?

CHARLIE MUNGER: — that's exactly right.

19. No concerns on Coca-Cola succession

AUDIENCE MEMBER: Joe Little (PH), Vancouver, Canada.

Does the management succession issue for the top job at Coca-Cola concern you?

WARREN BUFFETT: Management picture, you'd do what with the —?

AUDIENCE MEMBER: The management succession issue over the next several years.

WARREN BUFFETT: Oh, yeah.

AUDIENCE MEMBER: The top job. Does that concern you?

WARREN BUFFETT: At Coca-Cola —

AUDIENCE MEMBER: Yeah.

WARREN BUFFETT: I think any announcement that — from that would come with — from Coca-Cola.

CHARLIE MUNGER: He said do you like it?

AUDIENCE MEMBER: Does it concern you?

CHARLIE MUNGER: Does it concern you?

WARREN BUFFETT: Oh, I'm not concerned at all, no. No, Coca-Cola is very well managed. (Laughs)

20. Salomon CEO's $24M bonus target "hellishly hard to hit"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Chris Stavrou (PH) from New York.

According to the latest Salomon Brothers proxy, if [Chairman and CEO] Deryck [Maughan] earns 30 percent on allocated equity of Salomon Brothers, provided that that's at least 10 percent above the return for competitors, he could earn a bonus of $24 million.

My question is whether that return number is reduced by a charge for preferred dividends?

WARREN BUFFETT: I, Charlie, do you remember on the comp committee —?

CHARLIE MUNGER: I can't remember the detail on that.

WARREN BUFFETT: I think the equity — I — my — I'm fairly sure, but I'm not positive, that the equity figure would include our preferred, but not non-convertible preferreds.

And it would apply to the earnings applicable to the — to our preferred plus common, but not — but it would be after dividends on non-convertible preferred.

But I, you know, I'm not on the comp committee, and I have not read the description that carefully.

CHARLIE MUNGER: Well, I am, and I can't remember. (Laughter)

But I will tell you, one thing I do remember about that, and that is a target which would be one — would be hellishly hard to hit.

WARREN BUFFETT: It'd be unbelievable. I mean —

CHARLIE MUNGER: That's is, you're talking about Babe Ruth —

WARREN BUFFETT: Squared.

CHARLIE MUNGER: Yeah, doing 150 home runs in a season instead of a — if that happens, you'll be very glad to pay the money. (Laughter)

WARREN BUFFETT: Very. Under either calculation, yeah. It really — but it, you know, I'm glad it's there. (Laughs)

I hope Deryck's paying attention to it.

21. Salomon is a "better company than it was some years back"

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Hi, I'm Chris Davis again, from New York.

I wanted to ask if you — I feel there's such a huge discrepancy between the valuation of some of your holdings versus others, in terms of the market valuation, in terms of price-to-earnings, price-to-book.

In your opinion, do the growth prospects of Salomon Brothers, or the quality — or your anticipation of your ability to clip the coupons at Salomon Brothers — justify such a dramatic discount to the growth prospects of Coca-Cola or Gillette, in terms of our ability as Berkshire shareholders to clip those coupons?

And if you could explain, or perhaps share your thoughts on why the market perception, if it is — justifies that distinction?

WARREN BUFFETT: Yeah, I'm not sure I can answer that question without getting into a discussion of the relative merits of the two companies — or the three companies — you mentioned, at these prices, but —

Salomon and Coca-Cola are obviously very different kinds of businesses, or Salomon and Gillette. And Charlie and I do our best to try to understand the businesses.

Obviously, it's easier to understand the future of a Coca-Cola than it is a Salomon. But that doesn't mean it's a better buy.

And what you see at any given time in our holdings is partly the historical accident, even, of when we bought, and when we had money available, and all that. But it reflected an affirmative decision at that point, obviously.

Our guess would be that the — you know, we would feel reasonably good about anything that we owned, in terms of the price at which we bought it, and the facts at the time we bought it. And the facts change over time.

Salomon, I think, is a better company now than it was some years back. But it's still in a business that's — can be very volatile, and it has a small amount — as does any investment banking firm and as any commercial banking firm — of systemic risk. I mean, you can't get rid of that.

Charlie, you want to?

CHARLIE MUNGER: No, I've got nothing to add.

22. Calculating intrinsic value

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Thank you. Sean Barry, Regina, Canada.

Mr. Buffett, you've indicated that most of us in this room could acquire a lot of the information that you and Charlie acquire through the annual reports. Yet you both also indicated that the GAAP rules, a lot of times, leave a little to be desired.

Could you perhaps give an indication as to how you and Charlie come up with the economic value, or the intrinsic value, of the businesses that you finally decide to invest in? And a little bit about the process that you go through with that? Thank you.

WARREN BUFFETT: Well, the — in the 1992 annual report, we discuss that a fair amount.

But the economic value of any asset, essentially, is the present value, the appropriate interest rate, of all the future streams of cash going in or out of the business.

And there are all kinds of businesses that Charlie and I don't think we have the faintest idea what that future stream will look like. And if we don't have the faintest idea what the future stream is going to look like, we don't have the faintest idea what it's worth, now. Now that —

So, if you think you know what the price of a stock should be today, but you don't think you have any idea what the stream of cash will be over the next 20 years, you've got cognitive dissonance, I guess, is what they call it. (Laughter) The —

So we are looking for things where we feel — fairly high degree of probability — that we can come within a range of looking at those numbers out over a period of time, and then we discount them back.

And we are more concerned with the certainty of those numbers than we are with getting the one that looks absolutely the cheapest, but based upon numbers that we don't have any — we don't have great confidence in.

And that's basically what economic value is all about.

The numbers in any accounting report mean nothing, per se, as to economic value. They are guidelines to tell you something about how to get at economic value.

But they don't tell you anything. It — there are no answers in the financial statements. There are guidelines to enable you to figure out the answer. And to figure out that answer, you have to understand something about business.

You don't have to understand a lot about mathematics. I mean, the math is not complicated. But you do have to understand something about the business.

But that's the same thing you would do if you were going to buy an apartment house, or a farm, or any other small business you might be interested in.

You would try to figure out what you are laying out currently, and what you are likely to get back over time, and how certain you felt about getting it, and how it compared to other alternatives. That's all we do, we just do it with large businesses, basically.

The accounting figures are very helpful to us, in the sense that they generally guide us to what we should be thinking about.

And of course, if we find numbers where it looks like people are taking the most optimistic interpretation of things that they can under GAAP and all of that, we get very worried about people who look like they massage the numbers in any way. And there are plenty of people that do.

23. Growth alone doesn't make a company a good investment

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: I'm Howard Bask (PH). I'm from Kansas City.

When you are estimating a growth rate on a company (inaudible), a very predictable company, I imagine you apply a big margin of safety to it. What kind of rate do you generally apply? I mean, high single digits?

WARREN BUFFETT: In the margin of safety, or —

AUDIENCE MEMBER: What kind of growth rate would you, on a predictable company, might you —

WARREN BUFFETT: We are willing to —

AUDIENCE MEMBER: — stab at?

WARREN BUFFETT: — buy companies that aren't going to grow at all.

AUDIENCE MEMBER: OK.

WARREN BUFFETT: It — assuming we get enough for our money when we do it. So, it — we are not looking — we are looking at projecting numbers out, as to what kind of cash we think we'll get back over time.

But you know, would you rather have a savings — if you're going to put a million dollars in a savings account, would you rather have something that paid you 10 percent a year and never changed, or would you rather have something that paid you 2 percent a year and increased at 10 percent a year? Well, you can work out the math to answer those questions.

But you can certainly have a situation where there's absolutely no growth in the business, and it's a much better investment than some company that's going to grow at very substantial rates, particularly if they're going to need capital in order to grow.

There's a huge difference in the business that grows and requires a lot of capital to do so, and the business that grows, and doesn't require capital.

And I would say that, generally, financial analysts do not give adequate weight to the difference in those. In fact, it's amazing how little attention is paid to that. Believe me, if you're investing, you should pay a lot of attention to it.

Charlie?

CHARLIE MUNGER: I agree with that. But it's fairly simple, but it's not so simple it can all be explained in one sentence. (Laughter)

WARREN BUFFETT: Our — some of our best businesses that we own outright don't grow. But they throw off lots of money, which we can use to buy something else. And therefore, our capital is growing, without physical growth being in the business.

And we are much better off being in that kind of situation [than] being in some business that, itself, is growing, but that takes up all the money in order to grow, and doesn't produce at high returns as we go along. A lot of managements don't understand that very well, actually.

24. Capital allocation shouldn't be delegated

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Byron Wien from New York.

You said that you decentralized the operating decisions, but centralized the capital allocation decisions.

What kind of staff do you have in Omaha to help you with the capital allocation decisions and the stock selection decisions you make? Or do you and Charlie do that, pretty much, by yourselves?

WARREN BUFFETT: Yeah, we don't have any staff to help us on it. I mean, basically we tell them to mail all the money to Omaha — (laughter) — and then when we get there, we put our arms around it. (Laughs)

And we allocate all the capital ourselves. I mean, that is our job.

And we don't feel we should delegate, I mean, we wouldn't do it anyway. Our personalities aren't such that we would delegate our — allocating our own money to someone — letting somebody else allocate our own money.

But we feel that's our job. And it's interesting, and we've — I've written about this in the past — that that's an important job for most managements. There's some companies where it's not, but it's a — it usually is a very important job for most managements.

And if you take a CEO that's in a job for 10 years, and he has a business that earns, say, 12 percent on equity, and he's — and he pays out a third, that means he's got 8 percent per year of equity. I mean, when you think of his tenure in office, how much capital he's allocated, it's an enormous factor over time.

And yet, probably relatively few chief executives are either trained for, or are selected on, the basis of their ability to allocate capital. I mean, they get there through other routes.

So, I've said it's like somebody playing the piano all their life, and then getting to Carnegie Hall and they hand him a violin. I mean, it is a different function than most — than the route — than the functions that exist along the routes to the CEO's job at most companies.

And so many CEOs, when they get there, think they can solve it by either having a staff that does it, or by hiring consultants, or whatever it may be.

And in our view, that is — and that's a terrible mistake, because it's — it is, if not the key function of the CEO, it's one of two or three key functions at say 80 or 90 percent of all companies.

And if you can't do it yourself, you're going to make a lot of mistakes. You may make a lot of mistakes even if you do it yourself. But if you —

You know, you wouldn't want anybody in any other position of that importance in the company essentially saying, "I don't know how to do this, so I'm going to have somebody else do it," when it's their key responsibility. But that's the way it works in business.

And Charlie and I take responsibility for all capital allocation decisions, other than just, sort of, routine expenditures at the operating businesses. And we don't get into those at all.

I mean, if our managers are spending three or four million dollars a year on machinery — or if one of them is, I mean — on machinery, equipment, plants, new leases — we have no review process on that. We don't have a staff at headquarters. We don't waste the time to do that.

We think those people know how to allocate the money that relates to the actual operations of their business. We think, in terms of the capital that is generated above that, that that's our job.

Charlie, anything —?

CHARLIE MUNGER: I would say we have practically nobody at headquarters in Omaha. One of the reasons Warren shines up so well is, you know, he's being compared to practically nobody. (Laughter)

WARREN BUFFETT: I might say if — one interesting — when we're having this meeting, for example, I think there's one person there in the office. I mean, the rest of them are down here helping on the meeting. I mean, it —

CHARLIE MUNGER: Here we are, Warren and I are selling candy and encyclopedias, and so forth. The chief financial officer of Berkshire Hathaway is handling the microphones. I mean, this makes Southwest Airlines look like they don't understand —

WARREN BUFFETT: Cost control. (Laughter)

CHARLIE MUNGER: — cost accounting, yeah. It's a very old-fashioned place.

And by the way, speaking of hawking our merchandise, if any of you have safety deposit boxes full of Berkshire Hathaway certificates, and have children or grandchildren who don't have World Book in print in the house, you are making a very serious error.

That is a marvelous thing for — to have in the house with —

WARREN BUFFETT: And the discount only applies —

CHARLIE MUNGER: — full of young people.

WAWRREN BUFFETT: The discount only applies today — (laughs) — incidentally. I think that's right.

CHARLIE MUNGER: It is. That is, it may not be selling too well because of the current vogue for encyclopedias on computers. And by the way, those encyclopedias that are available are inferior compared to World Book, which is very user-friendly for children, and I like it that way myself. And —

WARREN BUFFETT: We —

CHARLIE MUNGER: That is one product you really ought to buy.

WARREN BUFFETT: We both use it, personally. I mean, I keep a set at the office, and a set at home. And I —

CHARLIE MUNGER: I give away more of that product —

WARREN BUFFETT: — I use it a lot.

CHARLIE MUNGER: — than other product that Berkshire Hathaway makes in any subsidiary. It's a perfectly fabulous human achievement. To edit a thing, to — that user friendly, with that much wisdom encapsulated. It is a — it's a fabulous thing.

25. Keynes: Great "wisdom" about investing

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: (Inaudible) from Houston, Texas. From time to time, you have quoted John Maynard Keynes, the British economist.

So, I would assume that you have read the investment writings very extensively. What are two or three investment lessons, in your opinion, one can learn from that economist?

WARREN BUFFETT: Well, I forget which, I think it's chapter eight of "The General Theory," do you remember Charlie? Or is it chapter —

CHARLIE MUNGER: No.

WARREN BUFFETT: There's one chapter in "The General Theory" that relates to markets, and the psychology of markets, and the behavior of market participants and so on, that probably is, aside from Ben Graham's two chapters, eight and 20, in "The Intelligent Investor" — I think you'll find you'll get as much wisdom from reading that as anything written in investments. And you'll know it when you see it in "The General Theory."

It's a chapter that jumps out to you about securities and so on. And I — could be chapter eight, but I may be wrong on that. But I would recommend reading that.

Keynes and Graham, from vastly different starting points, came to the same conclusion at about the same time in the '30s, as to the soundest way to invest over time. They differed some on their ideas on diversification. Keynes believed in diversifying far less than did Graham.

But Keynes started off with the wrong theory, I would say, in the '20s and essentially tried to predict business cycles in markets, and then shifted to fundamental analysis of businesses in the '30s, and did extremely well.

And about the same time, Graham was writing his first material. I think Janet Lowe, in her book on Ben Graham, actually has a little correspondence that took place between Keynes and Ben. So I would advise you to read that.

And there's some letters of his that he — of Keynes' — that he wrote to co-trustees of life insurance societies, and colleges, and so on, that I think you'd find interesting, too.

SYNC TRANSCRIPT TO VIDEO

Morning Session - 1995 Meeting

1. Welcome

WARREN BUFFETT: Morning. I'm Warren Buffett, the chairman of Berkshire Hathaway. And on my left is Charlie Munger, the vice chairman and my partner. And we'll try to get him to say a few words at some point in the proceedings. (Laughter)

The format today is going to be just slightly different.

We have one item to — normally, we breeze through the meeting pretty fast, and we'll do that, but we have one item of business on the preferred stock that I could tell caused some confusion with people. So, I'll discuss that a little bit.

And if, before the vote on that, anybody would like to talk about the preferred issue, we'll have any comments or questions at that time. And then we'll breeze through the rest of the meeting, and then we'll open it up. And I'll have one announcement to make then, too.

And then after that, we'll go for, maybe, close to noon. And feel free, earlier, anybody that would like to leave, you're free to, obviously, at any time. Better form to do it while Charlie's talking, as I've mentioned. (Laughter) And you'll have to be quick. (Laughter)

But then we'll have a break a little before noon for a few minutes, while a more orderly retreat can be conducted. And we'll have buses outside to take you back to the hotels or to any of the commercial establishments that Berkshire's involved in.

And then because so many of the — we have people here, at least based on the tickets reserved, from 49 of the 50 states. Only Vermont is absent. We have — but we have Alaska, we have a delegation from every place.

We have people from Australia, Israel, Sweden, France, the U.K., 40-some from Canada. So, a lot of people have come a long way. So, Charlie and I will stick around.

In fact, we'll eat our lunch right up here. And we will — you don't want to watch what we eat. The — but the — well, we'll stick around until perhaps as late as even 3 o'clock, but if the crowd gets below a couple of hundred, then we'll feel we can cut it off.

But we do want to answer everyone's questions. You people are part owners of the company. And any question that relates to your ownership of Berkshire, we want to be able to give you a chance to ask.

And it's tough because of the numbers of people here. I don't know how many are in the other room. But there're about 3,300, I believe, in this room. And we want to get to you — to all of you. So, that will come after the meeting.

Now, we've got a little business to take care of.

2. Election of directors

WARREN BUFFETT: The meeting will come to order. And I'll first introduce the directors of Berkshire, in addition to myself. They're right down here. And if you'll stand up when I give your name.

Susan T. Buffett (Applause).

Howard Buffett (Applause)

These are names we found in the phone book, you can understand — (Laughter)

Malcolm Chace, III (Applause)

And Walter Scott Jr. (Applause)

Also with us today are partners in the firm of Deloitte and Touche, our auditors, Mr. Ron Burgess and Mr. Craig Christiansen (PH). They're available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings.

Mr. Robert M. Fitzsimmons has been appointed inspector of elections at this meeting. He will certify to the account of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc Hamburg. Proxy cards have been returned through last Friday representing 998,258 Berkshire shares to be voted by the proxy holders as indicated on the cards.

That number of shares represents a quorum, and we will therefore directly proceed with the meeting. We will conduct the business of the meeting and then adjourn the formal meeting. After that we'll entertain questions you might have.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott Jr. who will place a motion before the meeting.

WALTER SCOTT JR.: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICE: I second the motion.

WARREN BUFFETT: Do I hear a second? (Laughter)

VOICE: I second the motion.

WARREN BUFFETT: The motion has been moved and seconded. Are there any comments or questions? We'll vote on the motion by voice vote. All of those in favor say, "Aye."

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion is carried. (Laughter)

Does the secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first-class mail to all shareholders of record on March 7, 1995, being the record date for this meeting, there were 1,177,750 shares of Berkshire common stock outstanding, with each share entitled to one vote on motions considered at the meeting.

Of that number, 998,258 shares are represented at this meeting by proxies returned through last Friday.

WARREN BUFFETT: Thank you. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the two items of business provided for in the proxy statement, he or she may do so.

Also, if any shareholder that's present has not turned in a proxy and desires a ballot in order to vote in person on these two items, you may do so. If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish two ballots to you, one for each item.

Would those persons desiring ballots please identify themselves so we may distribute them? Just raise your hand and you'll get one.

The first item of business of this meeting is to elect directors. I now recognize Mr. Walter Scott Jr. to place a motion before the meeting with respect to election of directors.

WALTER SCOTT JR.: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase, III, Charles T. Munger and Walter Scott Jr. be elected as directors.

VOICE: I second the motion.

WARREN BUFFETT: It has been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase, III, Charles T. Munger and Walter Scott Jr. be elected as directors. Are there any other nominations? There any discussion? You're doing fine. (Laughter)

The nominations are ready to be acted upon. If there are shareholders voting in person, they should now mark their ballots on the election for directors and allow the ballots to be delivered to the inspector of election. Collect those, please.

Would the proxy holders please also submit to the inspector of elections, a ballot on the election of directors, voting the proxies in accordance with the instructions they've received?

Mr. Fitzsimmons, when you're ready, you may give your report.

ROBERT FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast not less than 996,892 votes for each nominee. That number far exceeds a majority of the number of shares outstanding.

The certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons. Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase, III, Charles T. Munger and Walter Scott Jr. Have been elected as directors.

3. Motion authorizing preferred stock

WARREN BUFFETT: The second item of business at this meeting is to consider the recommendation of the board of directors to amend the company's certificate of incorporation.

The proposed amendment would add a provision to the certificate of incorporation authorizing the board of directors to issue up to one million shares of preferred stock in one or more series, with such preferences, limitations, and relative rights as the board of directors may determine.

Now, we discussed this some in the annual report. But I would say — and we'll find out the exact number — but I think we probably had 11 or 12 — maybe 12,000 or so shares voted against the proposal. And I think we had a couple thousand shares that abstained.

And since there really is no downside to the proposal, that indicated to me that I'd not done a very adequate job of explaining the logic of authorizing the preferred. So, I'd like to discuss that for a minute now.

And I'd also like anybody that would like to ask questions about it, they can do so now. We can talk about it later, too. But if you'd like to do it before the vote, that'd be fine.

The authorization is just that. It's an authorization. It's not a command to issue shares. It's not a directive. It simply gives the directors of the company the ability, in a situation where it makes sense for the company to issue preferred shares, to do so.

Now, when we acquire businesses — and I'll tell you about one when we're through with this in a few minutes — when we acquire businesses, sometimes the seller of the business wants cash. Sometimes they would like common stock.

And it's certainly possible, as one potential seller did last year, that they wanted, in that case, a convertible preferred stock.

Now, from our standpoint, as long as the value of the consideration that we give equates, we really don't care, aside from a question of tax basis we might obtain, but we —

In other economic respects, we don't care what form of consideration we use, because we will equate the value of cash, versus a straight preferred, versus a convertible preferred, versus common stock, whatever it may be.

So, if the worry is that we will do something dumb in issuing the preferred stock, you should — that's a perfectly valid worry. But you should worry just as much we'll do something dumb in terms of using cash or common stock.

I mean, if we're going to do something unintelligent, we can do it with a variety of instruments. (Laughter)

And we will not get more licentious in our behavior or anything simply because we have the preferred stock.

And the preferred stock may offer sellers of a business the chance to do a tax-free exchange with us. And they may not want common stock, because they may have an ownership situation where they don't want to run the risk of common stock ownership. And that's why our preferred is flexible as to terms.

Because we could give those people a straight preferred with a coupon that made it worth par at the time we issued it. And then they would know what their income would be for the next umpteen years. And that may be of paramount interest to them.

We could issue them an adjustable-rate preferred, which as money market conditions change, would also change its coupon. And then they would be sure of a constant principal value for the rest of their lifetimes. And one or both of those factors could be more important to one seller or another.

So that we simply have more forms of currency available to make acquisitions if we have the ability to issue various forms of preferred. Because a preferred stock, if it's properly structured, allows for the possibility of a tax-free transaction with a seller. And that's important to many sellers.

Now, in the end, many sellers will prefer cash, just as in the past. And probably most of the sellers that don't want cash will want common stock. But we will have a preferred stock available.

We're only authorizing a million shares because under Delaware law, there's an annual — I think there's an annual fee. I know there's an initial fee. And I think there's an annual fee that relates to the amount of shares authorized.

So, if we authorized a hundred million shares, we would be paying a larger annual fee, which is something Mr. Munger wouldn't let me do. (Laughter)

So what we will do, if we issue this, we will issue — undoubtedly, we will issue some sub-shares so that the numbers of shares, for taxation purposes, is relatively limited.

But that we will issue sub-shares to make it easier to make change, essentially, in the market.

We may issue — if the occasion demands — we may issue a convertible preferred. But that convertible preferred would not be worth any more, at the time we issue it, than a straight preferred. We would adjust, in terms of the coupon, and the conversion price, and so on.

So we can equate various forms of currency to fit the desires of the seller of the business. And this is simply one more tool to do it. There's no downside, like I say, unless we do something stupid.

And if we do something stupid with this, we would do something stupid with cash or whatever. So it —we probably should've done this some time ago, but we never had a case of a seller wanting that form of currency before.

And so it just — and we always felt we could get it authorized promptly. But there's no reason to lose a couple of months, if a transaction is pending, to call a meeting to get this on the books. So, it's simply one more tool.

And if there are — anybody that has any questions or comments on the preferred, like I say, you can hold them until later, but I'd be glad to have them before we have the vote. Do we have any?

Yeah, there's a question over there. If you'll wait just a second, we'll get a microphone to you.

When you ask questions, now or later, if you'll give your name and where you live, I'd appreciate it.

AUDIENCE MEMBER: Hi, my name is Dr. Lawrence Wasser. I'm from New York.

My question is this. If you want to buy a business and the people in the business want cash, you have to have cash, cash that — you know, this kind of cash.

WARREN BUFFETT: We're familiar with it.

AUDIENCE MEMBER: Yeah. (Laughter and applause)

But it strikes me that the preferred isn't really cash, it's fiat currency. That is, it's currency that we can create.

WARREN BUFFETT: That's true. It's like common stock in that respect. It is the — it is a form — it is an alternate form of currency, and — but it is —

Just in terms of common stock, for example, assuming we had enough authorized, we have an unlimited ability to create currency. Now, if we created the wrong price, it dilutes the value of the old currency. But go ahead on.

AUDIENCE MEMBER: Until we vote in the affirmative, which I'm sure that this group will probably do because of their confidence in you, but until we vote in the affirmative, it doesn't exist.

WARREN BUFFETT: That is correct. That would be true, incidentally, with common stock. If we had no more authorized common stock out than we had issued, we have, I think, a million and a half authorized.

But let's assume that we'd issued all that we had authorized. Until more was authorized by the shareholders, there would — it would not be available to be issued.

AUDIENCE MEMBER: But if more were authorized by the shareholders then isn't it true that the value of the shareholders' holding would be diluted?

WARREN BUFFETT: Only if we receive less in value than we give. That's the key to it.

I mean, if we issue $200 million worth of preferred and we receive a business that's only worth 150 million, there's no question you're worse off than before. So are we, incidentally. But we're all worse off.

The — and that's true if we give cash that's worth more for a business than the business is worth. If we give 200 million of cash for a business that's worth a 150 million, we are worse off. We may not have issued a share of stock. But we have diluted the value of your stock if we do that.

As long as we get value received, in terms of whether — of cash, common stock, or preferred stock — then you are not diluted in terms of value. It's an important point.

And obviously, a number of companies, as you may have — Charlie and I have commented about in reports and elsewhere — a number of companies, in our opinion, have issued common stock, particularly, which has a value greater than what they receive.

And — when they do that, they are running what I — what John Medlin of the Wachovia called a "chain letter in reverse." (Laughter)

And that's cost American shareholders a lot of money. I don't think it'll cost them any money at Berkshire. But it's a perfectly valid worry for shareholders to have.

Because a management can build an empire just by issuing these little pieces of paper, which they feel don't cost them anything.

I think Charlie had one story about that in the past. You want to comment on that, Charlie? No-names basis, of course. (Laughs)

CHARLIE MUNGER: There was a particular bank where one of the officers wanted stock options, pointed out to the management that they could issue all these shares and it didn't cost anything.

Now, imagine hiring a manager who thinks that way and paying them money — (laughter) — to behave like Judas in your very midst.

WARREN BUFFETT: We have had conversations with managers — (laughter) — where they tell us how fortunate they feel because the stock is down and they can issue options cheaper.

Now, if they were issuing those to the third parties, you know, I'm not sure whether they'd have exactly the same attitude.

But we have no feeling that we're getting richer when we issue shares. We have a feeling we're getting richer when we get at least as much value in a business as the shares are worth that we issue. And we don't intend to issue them under any other circumstances. But it's a perfectly valid worry.

AUDIENCE MEMBER: The second part of the question is that, obviously, with preferred issue, you have a situation where the common shareholder is — moves to the back of the line, as it were.

Why should the common shareholder in this room want to step to the back of the line if he's at the front of the line now?

WARREN BUFFETT: Well, it — but it's also true if we buy a business for cash, and we — let's say we borrow the money, the bank that we borrow the money from will come ahead of the common shareholder.

There's no question. Any time you move — you engage in transactions that involve the capital structure, you are changing the potential for each part of the capital structure.

If you issue a lot of common and you've got some debt outstanding, you've generally improved the position of the debt.

And the question really becomes whether you think that the position of the common shareholder is improved by issuing either preferred stock, or perhaps borrowing a lot of money, to make an acquisition.

I mean, a couple of times in the history of Berkshire, we've borrowed money to buy something, to buy a business. And when we do that, we are placing a bank, or an insurance company, or whomever, ahead of the position of the common shareholder. We did that when we issued some debt a few years back.

And there's a question of weighing whether the common shareholders are going to be better off by borrowing money. But borrowing money is not necessarily at all harmful to shareholders — although certainly, if it's carried to excess, it is.

And the preferred is a form of quasi-borrowed money that does rank ahead of the common shareholder. But then, at the same time, we're adding a business which we think is going to benefit the shareholder, if we issue that. So that's the tradeoff.

Yeah.

AUDIENCE MEMBER: My name is Matt Zuckerman (PH). I'm from Miami, Florida.

My question is, it seems to me that there's some requirement for shareholder votes if convertible stock — preferred stock — is issued beyond a certain limit. What are those limits?

WARREN BUFFETT: There are no limits on the conversion term that we might do. But for example, if we were going to issue a convertible preferred — now we have no plans to do it, but it could happen. In fact, it might well happen this year.

The — we would — and the alternative, we'll say, was giving somebody a hundred million dollars in cash for a business. If we were to issue a straight preferred, we would figure out what a hundred million dollars' worth of a straight preferred would sell for, what coupon would be necessary.

And that would depend on call provisions and a few things. But for a triple-A credit like Berkshire, you know, it would be somewhere in the area of 7 percent or thereabouts. And then they would have no participation in the upside of the common.

If they wanted something that was sure to maintain its principal value, then you have to issue an adjustable-rate preferred that will keep its value around par.

That preferred might have an initial coupon of, say, 5 percent or something of the sort, because it has the ability to go up or down based on interest rates. But it would always be worth about par.

If we were to issue a convertible preferred, it might have a conversion price of, just to pick a figure, 28,000 or something of the sort, and a coupon well below the coupon on a straight preferred.

And so, whatever we did, they would equate out in our mind as to the value we were giving.

We're not going to give 120 percent of X if we're only willing to pay a hundred percent of X, just because the form of a deal changes.

But you may well see us issue, at some point — you may see us issue a convertible preferred. You may see us issue a straight preferred. You may see us issue an adjustable-rate preferred. I hope we do something because I'd like, you know —

AUDIENCE MEMBER: Yeah. Based on —

WARREN BUFFETT: If we do it, we'll think we're better off.

AUDIENCE MEMBER: Well, based on your past performance, I'm sure you'll get more value than you give.

WARREN BUFFETT: Well.

AUDIENCE MEMBER: But in any case, it was my understanding that if the amount of shares issued for a conversion of a convertible issue were greater than 20 percent of the total amount of shares outstanding, then it would require a vote of the stockholders, under Delaware law. I may be wrong.

WARREN BUFFETT: I think it's a stock exchange rule, isn't it, Charlie?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: You're right about the rule, but —

CHARLIE MUNGER: It's a New York Stock Exchange rule.

WARREN BUFFETT: It's a New York Stock Exchange rule. That would be $5 billion-plus of deal. And, you know, we would love to make a $5 billion deal, but I don't think we're going to do it.

So I would say that the chances of any acquisition being large enough so that it requires a shareholder vote is probably slim.

But it isn't because we wouldn't be interested. (Laughter)

And you know, if we have one, we'll be coming back to you — (laughter) — with the votes already in hand. (Laughter and applause)

Are there any other questions on the preferred? We can talk more about it later, too. I just want to — oh, here we are. Sure.

AUDIENCE MEMBER: Good morning, Mr. Buffett.

WARREN BUFFETT: Morning.

AUDIENCE MEMBER: I'm Raina Di Costiloy (PH) from Chicago. I'm very proud to be here. And I've seen you grow so, that pretty soon we're going to be out in a football field. (Laughter)

I think your explanation was very helpful. Because as I read this, and I'm sure many of the other lay folk, I didn't understand what you —

WARREN BUFFETT: (Inaudible)

RAYNA DI COSTILOY: — what you were doing. And you mentioned the preferred stock. But in the prospectus, it's not clear whether it would be the convertible preferred, the straight preferred. And you cleared that, answering a few other questions, but some of the people felt it would dilute their stock.

WARREN BUFFETT: Yeah. Well, I should've made that clear in the annual report. And I'm glad I've had this chance to do it today.

Anything else on the preferred? OK.

AUDIENCE MEMBER: You don't have to come back to the shareholders for a vote, after these shares are authorized, for the terms of it. And you've discussed this in terms of buying companies.

My question is, you yourself, through Berkshire Hathaway, own the preferred shares of several companies: Salomon, USAir, American Express.

Do those shareholders have to vote on the terms of the preferred shares that you bought for those companies? Or is that left at the board of directors' decision level.

WARREN BUFFETT: Those —

AUDIENCE MEMBER: Could you clarify that point?

WARREN BUFFETT: Go — excuse me, go ahead.

AUDIENCE MEMBER: Could you clarify that point, please?

WARREN BUFFETT: Yeah. We bought a — I think we've probably bought six issues of preferred directly from companies.

And since none of those triggered that New York Stock Exchange rule that we discussed earlier — and they could've if they'd been somewhat larger, but they didn't — none of those deals had to be approved by the shareholders.

I think the only deal we've had with a company that had to be approved by the shareholders was when we bought the Cap Cities/ABC stock. Well, we bought early in 1986. I think it was approved by their shareholders in 1985.

But the only situations where it would've had to have been approved is if it triggered the New York Stock Exchange rule. And our purchases were not that large that they did that.

Any other questions? Yeah, there's one more.

AUDIENCE MEMBER: My name is Dale Vocawitz (PH). I'm from Champagne, Illinois.

A recent issue of Barron's indicated that it may be possible to issue a best of all possible worlds preferred, that being one where the dividend looks like interest to the issuer and is tax-deductible.

And to the purchaser, it would qualify for the dividends received deduction. Do you think that structure might be possible with these shares?

WARREN BUFFETT: Well, we haven't thought about that. I know what you're talking about on that, but I don't think it would be possible.

For one thing, I don't think you probably have a tax-free deal that way. Charlie, do you?

CHARLIE MUNGER: We probably wouldn't try and be that cute. (Laughter)

WARREN BUFFETT: I've got several quips in mind, but I think I'll keep them to myself. (Laughter)

My guess is that that form does not work for a long time. I know what you're talking about on it, but my guess is it doesn't.

Some companies — then we'll get on with this — but some companies care about the consideration they give in a deal, whether it's cash, or preferred, or so on, because they care about the accounting treatment that they get.

They want — they usually want pooling treatment rather than purchase accounting treatment. I won't get into that here. I know it's going to disappoint you, but I won't get into that here. Although I may in the next annual report.

And that is of absolutely no consequence to us. We care not a wit about the accounting treatment that we receive. We feel that we have a shareholder body that's intelligent enough to understand the economic reality of a transaction.

And that by playing various games, in terms of how we try to structure it, and maybe flow part of the purchase price back through the income statement or anything of the sort, which is done — that's not something that we care about at all.

We would rather do whatever makes the most sense for us and for the seller, and then explain to you whatever accounting peculiarities may arise out of the transaction. And that probably differentiates us from most companies. And it probably helps us make a deal, occasionally.

Anything else?

AUDIENCE MEMBER: — really

WARREN BUFFETT: OK, now I can hear you fine.

DALE VOCAWITZ: OK. And I was wondering, will there be any opportunity for shareholders who may find the preferred issue preferable, for any number of reasons, to participate in that?

WARREN BUFFETT: Well, if we issued a preferred and it became actively traded — let's say it was a company with many shareholders instead of a few. Obviously, that would be something that any new or present shareholder could make a decision on whether they preferred that issue than others.

We could, but have no plans of doing it and I don't see it happening, we could offer to exchange preferred for present common.

And it's conceivable a few people would have an interest, but the — most people have self-selected in terms of the kind of security they want to own in terms of owning Berkshire common.

So it's unlikely they would want to switch into a preferred, because they would — we wouldn't have a premium of value, it would just be an alternative security.

We could do that, though. I mean, and it would probably be a tax-free deal.

We have no plans of doing that, but it's something that if we ever thought that enough people might want, we could offer it. But no one would be obliged to take it. It's a good question.

OK? We'll move on.

Is there a motion to adopt the board of directors' recommendation?

WALTER SCOTT JR.: I move the adoption of the amendment to the fourth article of the certificate of corporation as set forth in exhibit A of the company's proxy statement for this meeting.

WARREN BUFFETT: Is there a second?

VOICE: I second the motion.

WARREN BUFFETT: Motion's been made and seconded to adopt the proposed amendment to certificate of incorporation. Any further discussion?

We are ready to act upon the motion. If there are any shareholders voting in person, they should now mark their ballot on the proposed amendment to the certificate of incorporation and allow the ballots to be delivered to the inspector of election.

Collecting a few there. Would the proxy holders please also submit to the inspector of elections a ballot on the proposed amendment voting the proxies in accordance with the instructions they have received?

We'll wait just a second here.

Mr. Fitzsimmons, when you're ready you may give your report.

ROBERT FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast lot — not less than 928,889 in favor of the proposed amendment to the certificate of incorporation.

That number far exceeds the majority of the number of all shares outstanding. The certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons. The amendment to the certificate of incorporation as set forth in exhibit A to the proxy statement for this meeting is approved.

After adjournment of the business meeting, I will respond to questions that you may have that relate to the businesses of Berkshire, but do not call for any action at this meeting.

Does anyone have any further business to come before this meeting before we adjourn? If not, I recognize Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT JR.: I move this meeting be adjourned.

VOICE: I second the motion.

WARREN BUFFETT: Motion to adjourn has been made and seconded. We will vote by voice. Any discussion? If not, all in favor say, "Aye."

AUDIENCE: Aye.

WARREN BUFFETT: All opposed say, "No." The meeting is adjourned. (Laughter)

4. Helzberg's Diamonds acquisition

WARREN BUFFETT: Now, I'd like to tell you about one thing that — since the annual report — that some of you probably read about in the papers, but maybe not all of you have heard about.

Just shortly after the annual report was issued, we completed a transaction with Helzberg's Diamonds, with Barnett Helzberg, who's here today. Barnett, would you stand up, please? All right. There he is. Give him a hand. (Applause)

You may be interested in how it came about, because Barnett attended two of the last three meetings of Berkshire. He had a few shares in an IRA account, and he was here last year.

And shortly after this meeting, I was back in New York City. And I was crossing the street at 58th Street, right near the Plaza Hotel on 5th Avenue. And a woman said, "Mr. Buffett," and I turned around.

And she came up, and she said she'd attended the annual meeting last year — or a few days ago — and said that she enjoyed it. And I said, "That's terrific," and I started to cross again.

And Barnett had been about 30 or 40 feet away. I didn't know him, and he had heard this woman. So, he said the same thing. And I turned around. And we shook hands. First time I'd met him, and he said, "You know," he said, "I might have a business you'd be interested in."

And I get that all the time, so — (Laughter)

So I said, "Well, why don't you write me?" And a time went by, and I got a letter from Barnett. And he'd been thinking about doing something with the business his father had started in 1950, and based in Kansas City that whole time. And he'd been exploring various avenues.

But probably, in some part because of his background as Berkshire shareholder, he had some specific interest in the company becoming associated with Berkshire. He cared very much about the company having a permanent home.

He cared very much about it having an environment in which it could grow and be run autonomously and be based in Kansas City. And he wanted to receive something in exchange — that he was happy to own for the rest of his life.

And so, we worked out a transaction shortly — just very shortly after the annual report went to press.

And so now Berkshire, as of 12:01, I guess, yesterday morning, the deal closed. There's this waiting period because of the Hart-Scott-Rodino Act and a few other things.

The transaction closed. And now Berkshire is the owner of Helzberg's Diamonds, which has roughly 150 stores around, perhaps, 26 or 27 states. I'm not sure the exact number. And mostly in malls, although some others. It's been enormously successful.

Barnett brought in Jeff Comment, who formerly ran Wanamaker's about eight years ago, I guess it is.

And the company has both expanded in its traditional format — it's gone with a new format recently, which has been very successful.

It is — in its position in the jewelry industry, it tends to compete with a Zales or Gordon's, but it does a far, far better job.

Their sales, per store, on roughly equivalent square footage, will be very close to double what competitors achieve.

It's got a magnificent morale, and organizational structure. And the people — Barnett was very generous with people in making the sale. He took it out of his own pocket to treat people right because they'd done such a terrific job over the years.

And I think you'll see Helzberg's become a very big factor in Berkshire over time. And it just shows you what can come out of these annual meetings. So, the rest of you, you know, do your stuff. (Laughter)

So anyway, that is an acquisition that was made for — largely for common stock. It did not involve preferred, and — because Barnett preferred common.

And — but different people have different needs. And sometimes there's a group of shareholders that can have different priorities. And that's the reason we want to have various currencies.

If we had not been able to use common stock, we would not have made this transaction, because Barnett has been in no hurry to write a large check to the government. And we can help him in that respect with a common stock deal.

So anyway, we're glad to have Helzberg's become part of Berkshire. I wouldn't be surprised if we have another announcement or two in the next year before we have the next meeting. I hope so. But there's no guarantees.

5. Buffetts on the board adds stability

WARREN BUFFETT: Now we're going to turn the meeting open for questions. We'll do it as we've done before. We've got this room divided into six zones. And if you will raise your hand, the monitor in that — in your zone will recognize you. And we'll keep going around.

We will not go to a second person in any zone until we've exhausted all those who have yet to ask their first question. We have — we also have a zone in the overflow room. So, there'll be a total of seven.

And we'll just keep going around, if you'll identify yourself, please. And we'll be delighted to answer your questions. And the more, the better. So, we'll start with zone 1.

AUDIENCE MEMBER: My name is Fred Elfell Jr. (PH) from Sacramento, California.

And I wanted to ask if you could elaborate upon the logic of adding two family members to the board of trustees?

WARREN BUFFETT: Well, it's terrific for family harmony, just to start with. (Laughter)

The — as I've talked about in the annual report, the — if I die tonight, you know, my stock goes to my wife, who is a member of the board of directors.

And she will own that stock until her death, when it will go to a foundation. So, there is a desire to have as long a term and permanent ownership structure as can really be done, in terms of planning, and the tax laws, and so on.

I mean, I — we have invited people like Helzberg's to join in with Berkshire into what we think is a particularly advantageous way for them to conduct a business and to know the future that they're joining.

And part of knowing the future that they're joining involves knowing that the ownership is stable. And it will be stable for a very long period of time in Berkshire, probably about as long as you can — anybody can plan for in this world.

After my death, the family would not be involved in the management of the business, but they'd be involved in the ownership of the business.

And you would have a very large concentrated ownership position, going well on into the foundation, that would care very much about having the best management structure in place.

And to, in effect, prepare for that over time, I think it's very advisable that family members who will not be involved in management, but who will have a key ownership role to play, become more and more familiar with the business and the philosophy behind it.

I discussed that some in the — I guess, it was the 1993 annual report, because I think it's important that you understand.

And anybody that wants to sell us a business — if you've built a business since 1915, and you care enormously about it, and you care about the people that you've developed, but you've got something else you want to do in life, it's more than, you know, advertising your car in the paper to sell it.

I mean, it is an important — a very important transaction to you. Not just in terms of how much money you receive, but in terms of who you deliver thousands of people that have joined you — who you deliver them to.

And I think we have a structure that is about as good as you can do. Nothing is forever.

But we have a structure that's about as good as you can do, in terms of people knowing what they're getting into when they make a deal with us and being able to count on the conditions that prevail at the time of the deal, continuing for a long period in the future.

Many people — I had a fellow tell me the other day about a business where he'd been wooed by the acquirer. And, you know, the day after the deal, they came in and fired the top half-dozen people. They had a secret plan all along. Well, I don't think you run into much of that.

But what you do run into is the company that's the acquiring company, itself, either being acquired or some new management coming along, or some new management consultant coming along, and saying, "Well, this doesn't fit our strategic plan anymore, so let's dump this division."

And people that join in with Berkshire can be relatively, I think, comfortable about nothing like that happening.

Charlie, you want to elaborate on —

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: I was hoping Charlie would have a near-life experience this morning. (Laughter)

Keep encouraging him.

6. No comment on Kerkorian’s Chrysler bid

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Hello. My name is Jim Lichty (PH) from Des Moines. I’m interested in, like, Chrysler. Can you make a comment on the Chrysler Corporation? (Laughter)

WARREN BUFFETT: No, I don’t think I can make a comment on Chrysler. (Laughter)

I think Salomon Brothers, incidentally, has been retained by them. We have nothing to do with it. Charlie and I — I read that in the paper.

And Charlie and I are not familiar with — normally — with investment banking arrangements at Salomon.

But it has been in the paper that Salomon’s involved with that. We have no involvement.

Charlie, you’re not interested in commenting on the question? No? (Laughter)

Try him on something else.

7. Managers need to know “money costs money”

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: I’m Jim Vardaman (PH) from Jackson, Mississippi.

In describing the — your allocation of capital to your wholly-owned subsidiaries, you wrote in the annual report that, quote, you “charge managers a high rate for incremental capital they employ and credit them at an equally high rate for capital they release,” end quote.

How do you determine this high rate, and how do they determine how much capital they can release?

WARREN BUFFETT: Well, what we try to do with those — the question's about incentive arrangements we have with managers or other situations, where we either advance capital to a wholly-owned subsidiary or withdraw it — usually, that ties in with the compensation plan.

And we want our managers to understand just how highly we do value capital. And we feel there's nothing that creates a better understanding than to charge them for it.

So, we have different arrangements. Sometimes it's based a little on the history of the company. It may be based a little bit on the industry. It may be based on interest rates at the time that we first draw it up.

We have arrangements depending on the — on those variables and perhaps some others and perhaps just, you know, how we felt the day we drew it up, that range between 14 percent and 20 percent, in terms of capital advanced.

And sometimes we have an arrangement where, if it's a seasonal business where, for a few months of the year, when they have a seasonal requirement, we give it to them very cheap at LIBOR.

But, if they use more capital over — beyond that, we start saying, "Well, that's permanent capital," so we charge them considerably more.

Now, if we buy a business that's using a couple hundred million of capital, and we work out a bonus arrangement, and the manager figures out a way to do the business with less capital, we may credit him at a very high rate — same rate we would use in charging him — in terms of his bonus arrangement.

So, we believe in managers knowing that money costs money. And I would say that, just generally, my experience in business is that most managers, when using their own money, understand that money costs money.

But sometimes managers, when using other people's money, start thinking of it a little bit like free money. And that's a habit we don't want to encourage around Berkshire.

We — by sticking these rates on capital, we are telling the people who run our business how much capital is worth to us.

And I think that's a useful guideline, in terms of the decisions they're making, because we don't make very many decisions about our operating business. We make very, very few. I don't see capital budgets, in most cases, from our hundred percent-owned subsidiaries.

And if I don't see them, no one else sees them. I mean, we have no staff at headquarters looking at this kind of thing.

We give them great responsibility on it. But we do want them to know how we calibrate the use of capital. And so far, I would say, it's really worked quite well.

Our managers don't mind being measured, and they like getting a — I think they enjoy seeing a batting average posted. And a batting average that does not include a cost of capital is a phony batting average.

Charlie?

CHARLIE MUNGER: Well, I certainly agree. (Laughter)

WARREN BUFFETT: And his name isn't even Buffett. I mean — (Laughter)

8. The two reasons for buying insurance

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Hi, my name's Dave Lancasam (PH) with Business Insurance Magazine.

The sum of property-casualty risk management experts are advising commercial insurance buyers to forge five- and 10-year policies with their property-casualty insurers to promote stronger partnerships with their insurers, as well as to maintain the smooth PC market of the past seven, eight years.

Do you believe this idea will take hold for most policyholders? And if so, what would be the implications for policyholders' costs and insurers' underwriting results?

WARREN BUFFETT: The question is about partnerships between, probably, commercial policyholders and their insurers. And there are a lot of ways of doing that by various retrospective plans or adjustable rates of various sorts, and self-insured retentions, and that sort of thing.

As a general matter, there are only two reasons for buying insurance. One is to protect yourself against a loss that you are unable or unwilling to bear yourself. And that is partly a — an objective decision. It's partly subjective.

For example, a manager that's terribly worried that his board of directors may second-guess him if he has an uninsured loss, is going to buy a lot more protection, probably, than the company really needs.

But he knows he's never going to have to go in front of his board of directors and say, "We just had a million-dollar fire loss."

And then the next question the director asks is, "Was it insured?" And then he doesn't want to answer no.

So, he may do something that is very unintelligent from the company's standpoint merely to protect his own position.

But the reason for buying insurance is, whether — and this is true of life insurance, it's true of property-casualty, it's true of personal insurance, it's true of commercial insurance — is to protect against losses that you're unwilling or unable to bear yourself.

Or the second reason, which occasionally comes up, is if you think the insurance company is actually selling you a policy that's too cheap, so that you really expect, over a period of time, to have a mathematical advantage by buying insurance.

Well, we try to avoid selling the second kind and to concentrate on selling the first kind.

And we think any company we can sell insurance to — and of course, we — much of the insurance we sell is to other insurance companies. I mean, we are a reinsurer, in very large part.

We are selling them insurance against a loss that they are either unable or unwilling to sustain.

And a typical case, you know, might be a company that had a lot of homeowners policies in California. And if those include earthquake coverage, they may not be able to sustain the kind of loss that is possible, even though they want to keep a distribution system in place that merchandises en masse to homeowners in California.

So, we will write a policy. They may take the first 5 million of loss, they may take the first 50 million of loss — depends on their own capabilities — but then they come to us.

And we are really uniquely situated to take care of problems that no else — that the companies can't bear themselves and that they can't find anybody else to insure.

But we really don't want to insure someone for a loss that they can afford themselves, because if we're doing that it may because they're dumb. But it may be because they also have a loss expectancy that's higher than the premium we're charging, which is not what we're trying to do in business.

I think that — I think probably, as compared to 30 years ago, that risk managers at corporations are probably more intelligent about the way they buy their insurance than many years ago. I think it's become a — I think they're more sophisticated and they've thought it through better.

But there's a lot of insurance — there's some — there's a fair amount of insurance bought that doesn't make sense. And there's a fair amount of insurance that isn't bought that should be bought.

There are certain companies that are exposing themselves in this country to losses which would wipe them out. And they prefer not to buy reinsurance because it's, quote, "expensive." But what they're really doing is betting on something that won't happen very often, happening not at all.

And if you take a huge hurricane on Long Island or you take a major quake in California, there are a number of companies that are not — that have not positioned themselves to withstand those losses.

And if you're a 63-year-old CEO and you figure, "I'm going to retire in a couple of years," you know, the odds are pretty good that it won't happen on your watch.

But the — it will happen on somebody's watch. And we try to sell reinsurance to those people. And usually, we do. But sometimes we don't.

Charlie?

CHARLIE MUNGER: Nothing to add. (Laughter)

9. "We can sustain shocks … that others can't"

WARREN BUFFETT: OK. Zone 5.

He's saving himself. He'll be dynamite when he gets going. (Laughter)

AUDIENCE MEMBER: My name is Hugh Stephenson (PH). I'm a shareholder from Atlanta, Georgia. My question involves the company's catastrophe lines of insurance.

It seems that there's a relative ease of entry into that business through Bermuda-based companies and others. And given the importance of that business to the overall company, I'm curious how the ease of entry into the business affects its long-term competitive position and its rates of return?

WARREN BUFFETT: Well, you're very right, there is an ease of entry into the catastrophe business. And, you know, it's sort of attractive for — it's particularly attractive for promoters.

Because if you start an insurance company to write earthquake insurance in California and you raise a few hundred million dollars, you'll either have essentially have no losses or, if you write enough of it, you'll go broke. And most years, you'll have no losses.

So, if your intention is to sell your stock publicly in a year or two, that — the odds are very good that you will have a beautiful record for a couple of years. And you can sell.

And, you know, maybe one time out of ten, you'll go broke. And nine times out of ten, you'll sell to somebody else who will eventually go broke.

And it — there is — there's real ease of entry. The only thing that may restrict that is that if the buyer is sophisticated enough to question the viability of that company under really extreme conditions, which is the only conditions that count when you're buying catastrophe insurance, that may restrict it.

The second thing is, of course, none of the people that have started up can offer anywhere near the amount of coverage that Berkshire has. Berkshire is really one of a kind in terms of its capital strength in the business.

I'm — I don't think any money in Bermuda that I can remember — I don't think Ajit's out there. But I don't think anybody has a billion of net worth. And you know, we have — at present, we probably have close to 13 billion of net worth and considerably more of value.

So we can sustain shocks, and we will sustain shocks, I should add, that others can't. And we try to get paid appropriately for that.

But when we say we can take a billion-dollar loss, we can take a billion-dollar loss. And we will have a billion-dollar loss at some point.

And anyone buying it knows we can take it, or something greater. And they should know that very few other — very few of our competitors can. So, there's competition.

We do an unusual proportion of our business with the eight or ten largest insurance — reinsurance companies and insurance companies in the world. So, we really have established with the people who understand the real risks of the business.

They come to Berkshire and — a lot more often than they stop in Bermuda, because they know that we'll pay. And they've been around long enough to know that, in the end, that's what really counts with an insurance company.

If the rates — if there were enough capacity at really ridiculous rates, I mean, in the end, we wouldn't be writing that business at that time. But I don't think that will happen. It certainly hasn't happened so far. And if it happens, you know, so be it. We'll all play golf until the loss occurs.

Charlie? (Laughter)

CHARLIE MUNGER: Nothing to add.

10. Graham's principles for high-tech stocks?

WARREN BUFFETT: Zone 6? Or did we do — yeah.

AUDIENCE MEMBER: Chairmen, most company Berkshire invest at this time are not high in — are not in high-technology sector. What we have seen in the last few years, that there seems to be a significant growth, both in sales and earnings of the high-technology area.

And also, what invest — what U.S. shareholder believe that the times are changing from a brand name to high-technology.

My question is, can someone apply your investment principle, business philosophy, and your discipline in life to build a portfolio of, say, five or six high-technology company? Let's call it Berkshire Hathaway Technology Fund? (Laughter)

WARREN BUFFETT: Well, I think it would sell. (Laughter)

The question about — Charlie and I won't be able to do it. We — Charlie probably understands high-tech. But you can see how hard it is to get any information out of him. So — (laughter) — he hasn't told me yet.

We try not to get into things we — that we don't understand. And if we're going to lose your money, we want to be able to come before you, you know, next year and tell you we lost your money because we thought this and it turned out to be that.

We don't want to say, you know, somebody wrote us a report saying if, you know, "This is what's going to happen," in some field that we don't understand and that, therefore, we lost your money by following someone else's advice. So, we won't do it ourselves.

At — I think that the principles — I think Ben Graham's principles — are perfectly valid when applied to high-tech companies. It's that we don't know how to do it, but that doesn't mean somebody else doesn't know how to do it.

My guess is that if Bill Gates were thinking about some company in an arena that he understood and that I didn't understand, he would apply much the same way of thinking about the investment decision that I would. He would just understand the business.

I might think I understand Coca-Cola or Gillette. And he may have a — he may have the ability to understand a lot of other businesses that seems as clear to him as Coke or Gillette would seem to me.

I think once he identified those, he would apply pretty much the same yardsticks in deciding how to act.

I think he would act — I think he would have a margin of safety principle that might be a little different because there's essentially more risk in a high-tech company. But he would still have the margin of safety principle on a — sort of adjusted for the mathematical risk of loss in his mind.

He would have — he would look at it as a business, not as a stock.

You know, he would not buy it on borrowed money. I mean, it — a bunch of principles would be carried through.

But our circle of things we understand is really unlikely to enlarge, maybe a tiny bit here or there. But if the capital doesn't get too large, the circle's OK.

And — but we will not —if we have trouble finding things within our circle, we will not enlarge the circle. You know, we'll wait. That's our approach.

11. USAir: "You don't have to make it back the way you lost it"

WARREN BUFFETT: Now, how are we set up for Zone 7? Can we do it out — yeah, here we are.

AUDIENCE MEMBER: Are you there? Hi, I'm Susie Taylor (PH) from Lincoln, Nebraska.

By way of explaining — we wrote down the value of USAir, reflecting our investment's current market value.

You had a good explanation in your report as to why the economics of the business are unattractive. And I presume, given the choice, we wouldn't do it over again.

WARREN BUFFETT: I think that's a fair assumption. (Laughter)

I should mention, anybody wanted to ask about USAir, we put them in the other room, just so you'll know why. (Laughter)

AUDIENCE MEMBER: And then the second part is better.

WARREN BUFFETT: But I'm watching you. I can see you on the monitor. (Laughs)

AUDIENCE MEMBER: And quoting from your profound statement, "You don't have to make it back the way you lost it."

WARREN BUFFETT: Right.

AUDIENCE MEMBER: Wouldn't it be a good idea to put that 89 million in something you are really behind as opposed to USAir?

WARREN BUFFETT: Well, that's a very good question. Because it is true that a very important principle in investing is you don't have to make it back the way you lost it. And in fact, it's usually a mistake to make — try and make it back the way that you lost it.

And we have — when we write our — an investment down, as we did with USAir at 89 million, we probably think it's worth something more than that. But we tend to want to be on the conservative side. But it's worth a whole lot less than we paid.

And the nature of that preferred, as well as other private issues we've bought, usually makes it quite difficult to sell. That's one of the things we know going in.

When we bought preferred, some people thought that we were getting unusually favorable terms. I haven't heard from them lately on USAir, but — (Laughter)

But one of the considerations in that is that, if you buy a hundred shares of a preferred that's being offered through a securities firm, from the same issuer, you can sell it tomorrow. And we are restricted, in some ways legally, and in other ways simply by the way that markets work, from disposing of holdings like that.

And we know that there's an extra cost involved to us if we should try to sell, or it may be impossible.

And that's not of great importance with us because we don't buy things to sell, but it's of some importance.

And we are not in the same position owning our Series A preferred of USAir as we would be if we bought a thousand shares or 5,000 shares of the Series B preferred, I believe it is, that trades on the New York Stock Exchange. That would be very saleable.

And our preferred could well even be saleable at a price modestly above what we carry it for, but it would require — it would not be very easy to do.

It might — if it were do — if we went about to do it, we could probably — assuming we could do it at all — we could probably get a little more money for it.

But it would not be easy to do, partly because of legal restrictions. Charlie and I are on the board. That complicates things.

We always know something that, just by being on the board, that the public doesn't know. So, that complicates things.

And in the end, we usually find that dealing with anything where we've got fiduciary obligations is, maybe, not practical at all. And if it is, it's probably more trouble than it's worth.

Charlie?

CHARLIE MUNGER: Well, it's certainly been an interesting experience, the USAir experience. (Laughter)

WARREN BUFFETT: Is that it, Charlie? OK. No, he —

CHARLIE MUNGER: I'd like to repeat that business about not having to get it back the way you lost it. You know, that's the reason so many people are ruined by gambling.

They get behind and then they feel they have to get it back the way they lost it. It's a deep part of the human nature.

And it's very smart just to lick it by will, and little phrases like that are very useful.

WARREN BUFFETT: Yeah, one of the important things in stocks is that the stock does not know that you own it. You know, you have all these feelings about it. You know, and — (laughter) — you remember what you paid, you know? (Laughter)

You remember who told you about it. All these little things, you know?

And it — you know, it doesn't give a damn, you know? (Laughter)

It just sits there. And it — you know, a stock at 50, somebody's paid a hundred, they feel terrible. Somebody else paid 10, they feel wonderful. All these feelings, and it has no impact whatsoever.

And so, it's — as Charlie says, gambling is the classic example. Someone builds a business over years. You know, that, they know how to do.

And then they go out some place and get into a mathematically disadvantageous game. Start losing it and they think they've got to make it back, not only the way they lost it, but that night. And — (laughter) it's a great mistake.

12. Beware of complicated fads and "high priests"

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: My name is Donald Stone. I'm from Riverside, Connecticut. I'm — this is my second shareholders meeting, ever, at age 61. So, I'm really very privileged to be here.

My first was Coca-Cola a week and a half ago. And there were only 200 people there. I'm trying to figure this out. (Laughter)

I think the rule is that the number of people present is in direct proportion to the price of the shares.

WARREN BUFFETT: Well, in that case, we won't split. (Laughter)

AUDIENCE MEMBER: OK.

Prefatory comment to my question: the November 24th, 1994 issue of Fortune Magazine had an article, a featured article, entitled "America's Greatest Wealth Builders," dealing with the concepts of market value added and economic value added.

It was with great glee that I noticed that Coca-Cola was number two on that list, second only to General Electric, and that Coca-Cola had done twice as well as Pepsi-Cola, number nine on the list, with one-third as much capitalization.

My question is this: whether the concept of market value added and economic value added, as such, or any of its variants, is a concept that's applicable and useful to Berkshire Hathaway as a whole, or in analyzing its line of business segments?

I'd really like to hear from Charlie Munger on this first. (Laughter) Because I've heard —

WARREN BUFFETT: So would I. (Laughter)

AUDIENCE MEMBER: I've heard —

WARREN BUFFETT: Charlie?

AUDIENCE MEMBER: I've heard that he's thought a lot about this particular subject.

WARREN BUFFETT: Right.

CHARLIE MUNGER: If Warren is using economic value added exactly the way they're now teaching it in the business schools, he hasn't told me.

Obviously, the concept has some merit in it. But the exact formal methods, I don't believe we use.

Warren, are you using this stuff secretly?

WARREN BUFFETT: No, we — (laughter) — in a sense, they're trying to get at the same thing we do. Or we're trying to get at the same thing they do. But I think it's — A, I think it has some flaws in it.

Although I think it generally comes out with the right answers, it sort of forces itself to come out with the right answers.

But I really don't think you need that sort of thing. I mean, I do not think it's that complicated to figure out, you know, where it makes sense to put money. You can make mistakes doing it. But in terms of the mental manipulations you go through, I don't think it's a very complicated subject.

And I don't think that — I think that the people marketing one or another fad in management tend to make them a little more complicated than needed so that you have to call in the high priest.

And, you know, it — if all that really counts is the Ten Commandments, you know, it's very tough on religious counselors and everything. (Laughs)

It doesn't take — it just doesn't make it complicated enough.

And I think there's some of that in — quite a bit of that — in management consulting and in the books that you see and all of that, that come out.

CHARLIE MUNGER: It's way less silly than the capital assets pricing model. So that, at least academia's improving. (Laughter)

WARREN BUFFETT: Really, yeah. The capital asset pricing model, which is — I don't know how much it's used now. Certainly — you know, they had these great waves of popularity. You get that in management. You get it in investing. I mean, real estate, you know, may have been popular, or international.

I — you can read Pensions & Investment magazine, which is a pretty good magazine. But you can just see these fads sort of going through. And then they have seminars on them and everything. And, you know, the investment bankers create product to satisfy the demand.

And there're these fads in management — I mean, obviously, listening to your customer and things like that, I mean, that is — nothing makes more sense. But it's hard to write a 300-page book that just says, "Listen to your customer." (Laughter)

And, you know, that's one of the things I liked about Graham's book. I mean, you know, he wrote — everything he wrote sort of made sense. He didn't sort of get into all the frills and try and make it more complicated than it really, truly is.

You know, I really didn't need to read the November issue — 1994 issue of Fortune — to know that Coca-Cola had added a lot of value. (Laughter)

We added about 4 billion-some of value to Berkshire. That's good enough for me. (Laughter)

13. Derivatives: "Potential for mistakes and mischief"

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: My name is Maurus Spence (PH) from Omaha, Nebraska. I have a two-part question on derivatives.

Does Berkshire Hathaway currently, or had they in the past, engaged in strategies involving derivatives?

If so, do you as CEO, fully understand these financial instruments? (Laughter)

WARREN BUFFETT: Whoever suggested that crazy notion? (Laughter)

AUDIENCE MEMBER: Finally, would Charlie care — you or Charlie — care to comment on the use of these by other financial institutions?

WARREN BUFFETT: The question about derivatives — the reason I inject that remark — in a Fortune article that all of you should read if you haven't, I suggested that the use of derivatives would be dramatically reduced if the CEO had to say in the report whether he understood them or not, and — (Laughter)

The answer to your question, though, is we have two types, I guess it would be, of derivative transactions, of very modest size. But that doesn't mean we wouldn't — if the conditions were right, we either wouldn't have them on a much greater scale now, or we wouldn't have done it in the past.

We have two types of transactions, and I do understand them. And there are times when there are things that we would want to do — not often — but there would be times when they could be best accomplished by a transaction involving a derivative security. And we wouldn't hesitate to do so.

We would obviously care very much about the counterparty, because that transaction is just a little piece of paper between two people. And it's going to cause one of the two to have to do something painful at the end of the period, usually, which is to write a check to the other person.

And therefore, you want to be sure that that person will be both willing and able to write the check. And so, we're probably more concerned about counterparty risk than most people might be.

Last year and the year before, I think I said that derivatives often combine borrowed money with ignorance, and that that is a rather dangerous combination. And I think that we've seen some of that in the last year.

When you can engage in, sort of, non-physical transactions that involve hundreds of millions, or billions, or tens of billions of dollars, as long as you can get some party on the other side to accept your signature, that really has — that has the potential for a lot of mistakes and mischief.

And if you've looked at the formulas involved in some, particularly I guess, interest rate-type derivative instruments, it is really hard to conceive of how any business purpose could be solved by the creation of those instruments.

I mean, they essentially had a huge, really, gambling element to them.

And I use that in the terms of engaging in a risk that doesn't even need to be created, as opposed to speculative aspects. They involved a creation of risk, not the transfer of risk, you know, not the moderation of risk, but the creation of risk on a huge scale.

And it may be fortunate that in the last year, half a dozen or so cases of people that have gotten into trouble on them have come out because it — that may tend to moderate the troubles of the future.

The potential is huge. I mean, you can do things in the derivative markets —

Well, I've used this example before, but in borrowing money on securities, the Federal Reserve of the U.S. Government decided many decades ago that society had an interest in limiting the degree to which people could use borrowed money in buying securities.

They had the example of the 1920s, with what was 10 percent margin. That was regarded as contributing to the Great Crash.

So, the government, through the Fed, established margin requirements and said, "I don't care if you're John D. Rockefeller," you know, "You're going to have to put up 50 percent of the cost of buying your General Motors stock," or whatever it may be.

And they said that maybe Mr. Rockefeller doesn't need that, but society needs that. They don't — we don't want a bunch of people on thin margins gambling, you know, essentially, in shares, where the ripple effects can cause all kinds of problems for society.

And that's still a law. But it means nothing anymore because various derivative instruments have made 10 percent margins of the 1920s, you know, look like what a small-town banker in Nebraska would regard as conservative, compared to what goes on.

So, it's been an interesting history. You know, like I say, perhaps the experiences of the last year — they've got everybody focused on derivatives. Nobody knows exactly what to do about them.

Berkshire Hathaway will — if we think something makes sense and Charlie and I understand it — we may find ways to use them to what we think will be our advantage.

Charlie, you want to add anything on that?

CHARLIE MUNGER: Well, I disapprove even more than you do, which is hard.

If I were running the world, we wouldn't have options exchanges. The derivative transactions would be about 5 percent of what they are. And the complexity of the contracts would go way down. The clearing systems would be tougher.

I think the world has gone a little bonkers. And I'm very happy that I'm not so located in life that I have to be an apologist for it.

You know, a lot of these people, I feel sorry for them. You know, they had great banks. And they have to go before people, sometimes even including their children and friends, and argue that these things are wonderful.

14. Salomon's murky future

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Good morning. I'm John Nugier (PH) from Kingsburg, California. And my question relates to Salomon.

And where — I'm just asking if you could take us out the next two or three years in your vision. It started out as a good investment. You got a good return on it, or your interest.

And it's clearly had some problems. And we have gotten in deeper and deeper as those problems have continued. And it doesn't look like it's superbright.

So, it — you must understand where it's going. But could you just give us where you see it going in the next two or three years?

WARREN BUFFETT: Well, no, I think it's very difficult to forecast where Salomon or, really, almost any major investment bank, slash, trading house will do over actually the next two or three months, let alone the next two or three years.

The nature of that business is obviously far more volatile than the blade and razor business. Now the — and the tough part is assessing over a longer period of time whether — because of volatility, it's much harder to assess whether — what the average returns might be from a business.

And the answer is, Charlie and I, probably, if we were to try and write the forecast for the next two or three years, we would not have a high — a feeling that we had a high probability of being able to predict what that company, or other companies in that industry either, would earn three years out or would probably have in the way of average earnings.

Our own commitment is to a $700 million preferred issue, which has five redemption dates starting in October 31st of this year and then every year thereafter.

On those dates, we can either take cash or stock. And that's an advantage, obviously, to have an option. Any time you have an option in this world, it's to an advantage — it's to your advantage.

It may be a very small advantage, but it's — giving options is generally a mistake, and accepting options is usually a good idea, if it doesn't cost you anything.

And we will — the other thing about options is you don't make a decision on them until you have to make a decision. But — so, we, in addition to that $700 million of preferred, which in our view is a hundred percent money-good — I mean, we'd like to own more of that.

But we also have about 6 million-odd shares of common, which we paid perhaps $48 a share for, or something in that area. In any event, considerably more than the present market of 35 or '6. So, we have a loss of probably 80 or $90 million, or some number like that, at market in the common.

The preferred has actually treated us fine. We've received $63 million a year.

Incidentally, by owning the amount of common we own, this probably isn't generally known, but — or recognized — if you own 20 percent of the voting power of a company, you have a somewhat different dividends-received credit. You have somewhat different tax treatment than if you own less than 20 percent.

So, until we own that common, we paid somewhat more tax on our preferred dividend than we now pay. It's not a huge item, but it's not immaterial, either.

Charlie?

CHARLIE MUNGER: Well, I certainly agree, it's hard to forecast what's going to happen in the big investment banking, dash — slash, trading houses.

I would like to say that Berkshire Hathaway was a large customer of Salomon long before we bought the preferred, and that we've had marvelous service over the years.

I think Salomon's going to be around for a long time, rendering very good service to various clients.

WARREN BUFFETT: We sold —

CHARLIE MUNGER: Satisfied clients.

WARREN BUFFETT: We sold our first debt issue of Berkshire, I think, in 1973, through Salomon. So, we've had an investing banking relationship for 21 or 22 years there. And actually, we'd done business with them before that in various other ways. So, it's a long-term relationship.

But there's no question about Salomon being around. The question — and that's why our preferred is absolutely money-good.

But the question is what the average return on capital will be. And we knew that was difficult to predict when we went in. And we found out it's even more difficult to predict than we thought.

15. Honoring mutual fund pioneer Phil Carret

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Thank you for the opportunity. Dick Jensen (PH) from Omaha, a fellow Nebraska University supporter.

A rather convoluted question: very interested in your recent purchase and your future intention of American Express. And as I understand the company, I know it's a rather involved and complicated and rather expansive company, insofar as it has its interest in many areas.

I know one of which, of course, is the credit card. But there's also the major part of the organization of IDS and others that I don't even know about.

And I wondered, what your hopes are for that investment.

And I also, just recently, as perhaps you have, became curious to know if you are personally acquainted with Mr. Phil Carret, I believe, his name is. And how about the purchase of his firm in your future? Thank you.

WARREN BUFFETT: Dick, I think Phil Carret is here today. Phil?

CHARLIE MUNGER: He's right back there.

WARREN BUFFETT: Phil, would you stand up? There he is. (Applause)

Give him a hand.

Phil is 98. I first met him in 1952, 43 years ago. He attends every eclipse around the world. And you can run into him in some very strange places.

Wrote his first book on securities, I believe, in 1924. I — am I right on that, Phil? Yeah.

And wrote an autobiography here, recently.

Probably the greatest long-term investment record in this country's history. And — but I think — I, you know, my impression is that Phil sold part, or a good bit, of Pioneer some years ago, which he managed for decades, many decades.

In fact, I first learned about Phil when I was leafing through Moody's Banks and Financial Manual 40-odd years ago, and I saw this company with this great record and with some securities that looked terribly interesting.

So, we got in touch. And he was out in Omaha and we got acquainted. It — so, anybody that can get Phil to talk to them, listen carefully. I advise that.

16. Cards are key to future of American Express

WARREN BUFFETT: The question about American Express: we own just under 10 percent of American Express. And obviously, even though you mentioned they're in a number of businesses, the — by far, the key, the most important factor in American Express's future for a good many years to come — a great many years to come — will be the credit card.

And that is a business that has become, and will forever, probably, become ever more competitive. I mean, I followed it since — I think I met Ralph Schneider at the Diners' Club in the late 1950s.

And American Express entered into the credit card business out of fear. I mean, they were worried about what the credit card was going to do to their traveler's check business. Traveler's check business had been originated back in 1890-something, I believe.

And that was, in turn, building off of the old express business where, I think, it was Henry Wells and William Fargo, they would chain themselves to the express boxes as they delivered them through the — to the West.

And they decided that maybe issuing traveler's checks would a little easier — (laughter) — than carrying all this stuff around.

So, that — the traveler's check was the — evolved out of the express business.

And the credit card business with American Express arose out of fear of what — particularly Diners' Club at the time. They were all terrified of Diners' Club, which got this — got the jump on everybody.

And they became enormously successful with it. And the American Express card, as you know, had a terribly strong position in what they called the "travel and entertainment" part of the card business.

And of course, the banks entered in on a big scale. And Visa's been enormously successful.

So, the card has a strong franchise in certain areas, like the corporate card. Although people like First Bank System are very aggressive in going after them there.

The card — but the card has a significant franchise, but it does not have the breadth of franchise that it had many years ago.

For a while, it was "the" card. And now it's "the" card in certain areas, but nothing like as broad an area as before.

It has certain, very important, advantages and economic strengths and it has some weaknesses. And you have to suss those, in deciding where it'll be in the year 2000 or 2005.

And we think that the management of American Express thinks well about the question of how to — how you keep the card special in certain situations. And they've reacted to the merchant backlash for higher discount fees, I think, in an intelligent way.

So, we'll see how it all plays out. But the key — IDS, which has now been renamed, but is a very big part of American Express — it accounts for close to a third of their earnings — but the real key will be how the card does over time.

Charlie?

CHARLIE MUNGER: Nothing to add.

17. "Corruption won" in stock option accounting rule

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Hi, my name is Philip King (PH) from San Francisco.

And my question has to do with how the FASB has caved in on the stock option proposal.

And the people opposed to the proposal argue that it would hurt capital formation for companies and that the cost of stock options is already reflected in shares outstanding, in fully diluted calculations.

And I was curious, what is your feelings about what's happened?

WARREN BUFFETT: Well, as those of you have followed this issue — FASB did cave, and they were — they hated it. I mean, they knew they were right. Matter of fact, most of the, what are now, I guess, the big six auditing firms, many years ago, sided with the position.

But in my opinion, the auditing firms caved to their clients, in that respect.

In terms of capital formation, I would argue that the most intelligent form of capital formation follows from the most accurate form of accounting.

I mean, it — if all the companies with — whose names began with A through M didn't have to count depreciation and all the ones with N through Z did, or something, you know, that might help in capital formation for companies that were — had names with A thru M. And incidentally, they probably all change their names.

But I don't think that bad accounting is an aid to capital formation. In fact, I think probably over time, it distorts capital formation.

Because if we were to pay all of the shareholders with — I mean, all of the people who worked for Berkshire Hathaway — in stock, and therefore record no wage expense, you know, we might be able to sucker in a bunch of people who thought the earnings were real.

But that would not be a great step forward for capital formation, in my view.

I really think that — you know, I've talked privately to a number of managers about this. And they understand it. But they, you know, they prefer the present situation. And they used a lot of muscle in Washington many years ago.

And I think I have this authenticated now. This fellow — mathematics professor — sent me some material after I'd written this. I try to get a little proof after the fact when I can.

I believe it was in the Indiana legislature, where a legislator introduced a bill to change the value of pi, the mathematical symbol pi, to three. Because he said that it was too difficult for the schoolchildren to work with this — (laughter) — complicated 3.14159.

And he was right. I mean, it was difficult. And I — and Congress, in connection with the stock option question, received all kinds of pressure to, in turn, pressure FASB and the SEC to not count stock option costs as part of compensation.

I've never met anybody that wanted to be compensated that felt that, if he received his present salary plus an option, he was not getting compensated more than if he just received a salary. So, he thought it was compensation.

And I will tell you that if we'd been issuing options over a period of time at Berkshire for things unrelated to the performance of the entire business, that we would've had a cost, perhaps measuring in the billions of dollars, whether it was recorded or not.

So, it goes back to Bishop Berkeley's question of whether a tree that falls in the forest and doesn't make a sound, you know, when — et cetera.

But it — I think it is — I really think that it makes you a bit of a cynic about American business when you see the extent to which a group has pressured — even to the extent of talking about financial — withdrawing financial support from the Financial Accounting Standards Board — the degree to which they've pressured people to make sure the value of pi stays at three instead of 3.14, simply because it was their own ox that was being gored a bit.

In any event, it's — it looks like it's all over now for some time. In fact, now they're pressuring them to even weaken further the standards that have been set. So, self-interest is alive and well in corporate America.

Charlie?

CHARLIE MUNGER: Yeah, I think dishonor won. And I think that — I think it is quite important for a civilization to have sound engineering and good accounting.

And it is a very regrettable episode, leading politicians — leading venture capitalists.

I think to some extent, it's an indictment of the educational system, that this thing could be so widely looked at, and so wrongly.

WARREN BUFFETT: It's bad enough people want to cheat on their accounting. And they do cheat on their accounting. But to want it to be endorsed as the system —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — is really kind of disgusting.

CHARLIE MUNGER: Yeah, corruption won.

WARREN BUFFETT: Well, put us down on undecided on that and we'll move on to zone 6. (Laughter)

18. Why there's no video of Berkshire meetings

AUDIENCE MEMBER: Good morning, Mr. Buffett, Mr. Munger, Mike Lee-Chin from Hamilton, Ontario.

Could you consider availing a videotape of this meeting to us, the shareholders?

CHARLIE MUNGER: I didn't quite get that.

AUDIENCE MEMBER: Would you consider availing this videotape of the shareholder — this particular shareholder meeting to us, the shareholders?

CHARLIE MUNGER: Distributing a videotape?

WARREN BUFFETT: A transcript or a videotape?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah, we've had that suggested a number of times. It's a good suggestion, and we've considered it.

The thing we're worried about, in connection with that, is discouraging attendance.

I mean, it — (laughter) — we'd hate to have two people here asking questions and then send it out to tens of thousands. So — (laughter) — in the end —

CHARLIE MUNGER: Particularly if it might make sales go down at the jewelry store.

WARREN BUFFETT: Yeah. (Laughter and applause)

Since we were just attacking hypocrisy in American business, Charlie felt like he should add that to my comments. (Laughter)

But we — it's a close call on that because we would like everybody —

Of course, we try to cover a great many subjects in the annual report. But we like the idea of the meeting — answering a lot of shareholders questions.

We don't want to discourage attendance. And it's fun to have everybody come in and ask questions.

And the chances are, if we had far fewer people, we would have, you know, far more — far fewer — good questions. So that the quality of the meeting is enhanced, I think, by having a lot of people come.

But you've come a long way, so I can understand why you might be interested in a transcript. (Laughs)

I apprentice that. Thank you.

AUDIENCE MEMBER: — or no. Is that a yes or a no?

WARREN BUFFETT: It's — (Laughter)

CHARLIE MUNGER: It was a no.

WARREN BUFFETT: It's a no.

AUDIENCE MEMBER: OK. (Applause)

WARREN BUFFETT: Most everything we say is a no. But we have various ways of getting there. (Laughter)

19. Berkshire meetings boost Borsheims' sales

WARREN BUFFETT: OK. Zone 7 from the other room, I can see you.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger.

I was wondering if you could tell us what the sales at Borsheims were yesterday and how it compared to a year ago?

WARREN BUFFETT: Well, I can tell you how it compared to a year ago. They were 15 percent above a year ago. And a year ago it was 40-odd percent above the year before. And I forget how much that was before.

So, we keep setting records. But we haven't announced any numbers. But it's a pretty good size number. You're a sporty crowd.

AUDIENCE MEMBER: Thank you. (Laughter)

20. An "idiot" could successfully run Berkshire

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Good morning. My name is Patrick Terhune from Fort Lauderdale, Florida.

And first of all, I see, per your request, there are a lot of people who wore red in honor of the Cornhuskers. (Applause)

Of course, my team was the — or is the Miami Hurricanes. And I've got my green and orange on under my clothes. So — but if we were to lose, I'm glad we lost to Nebraska and Tom Osborne.

I've got a request for Warren and Charlie, and that is, recognizing that the value, both intrinsic and extrinsic, of Berkshire Hathaway, is the result of your combined skills in acquiring growth companies and with your prudent and expert investing of the company's capital for growth, I'd like to know if you have a plan — a succession plan — to be executed in the event, God forbid, something happens to one or both of you, which would remove your input to the strategic decisions.

I sincerely hope you're in the process of developing individuals to carry forward your collective visions and to manage the company's resources as effectively and as profitably as is being done now.

WARREN BUFFETT: Well, I appreciate that question. And the answer is, obviously, we do care enormously about that because both Charlie and I — in addition to a lot of other reasons, but in — we both have a very significant percentage of our net worth in Berkshire.

And neither one of us has figured out how to sell it all exactly, you know, 15 minutes before we get hit by a truck. So, we will not have the jump on the rest of you.

And therefore, our continuing interest will go — financially — will go well, well beyond our deaths.

And it will — in terms of foundations or something like that, it will go to organizations that we care very much about having maximum resources available to.

So, we do have some plans. We don't name names or anything of the sort.

It's not quite as tough as you might think because we have a collection of fabulous businesses. Some of them owned totally, some of them owned in part.

And I don't think razor blade sales or Coca-Cola sales are going to fall off dramatically the day Charlie or I die. It — we've got some great businesses. And then same is true of the wholly-owned businesses.

So the question is more that of allocating capital in the future. And you know, that's a problem for Charlie and me right now, simply because of the size with — it's not easy to find things to do that make sense with lots of money.

And sometimes a year will go by and we don't find anything. And other times a year goes by, and we think we found something, but it turns out we were wrong.

So, it's not easy. But we think we will have some very smart people working on that.

And we don't think it will be the end of the world if they don't find anything the first year, because the businesses will run very well.

We have a big advantage in that, as contrasted to virtually almost every other company, we, now and in the future, are willing — eager — to buy parts of wonderful businesses or all of them.

I mean, most managements have a — most investors are limited to buying parts of businesses. And most managers, psychologically, are geared to owning all of something that they can run themselves.

We — you know, it's like, I think Woody Allen said some years ago, the advantage of being bisexual is it doubles your chances of a date on Saturday night. (Laughter)

And we can go either direction, in that respect. (Laughter)

And our successors will also. So very — Charlie, you want to add anything?

CHARLIE MUNGER: I think few business operations have ever been constructed to require so little continuing intelligence in corporate headquarters. (Laughter)

An idiot who was willing just to sit here would have a very good record long after the present incumbents were dead.

WARREN BUFFETT: I think that's true.

CHARLIE MUNGER: Yeah. I think it would be a little better if Warren would keep alive, in terms of allocating the new capital. I don't think we'll easily replace Warren.

But, you know, we don't have to keep getting rich at the same rate we have in the past. (Laughter)

WARREN BUFFETT: That's a tie vote. (Laughter)

21. Decisions so obvious that exact numbers aren't needed

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Hi, this —

WARREN BUFFETT: (Inaudible)

AUDIENCE MEMBER: — Keith Briar from San Francisco.

I have a question. When you're valuing the companies and you discount back the future earnings that you talk about, how many years out do you generally go? And if you don't go out a general number of years, how do you arrive at that time period?

WARREN BUFFETT: Well, that's a very good question. And it's — I mean, it's the heart of investing or buying businesses, which we regard as the same thing, but —

And it is the framework in which we operate. I mean, we are trying to look at businesses in terms of what kind of cash can they produce, if we're buying all of them, or will they produce, if we're buying part of them. And there's a difference. And then at what discount rate do we bring it back.

And I think your question was how far out do we look, and all that.

Despite the fact that we can define that in a very kind of simple and direct equation, you know, we are — we've never actually sat down and written out a set of numbers to relate that equation.

We do it in our heads, in a way, obviously. I mean, that's what it's all about.

But there is no piece of paper. And we never — there never was a piece of paper that shows what our calculation on Helzberg's or See's Candy or The Buffalo News was, in that respect.

So, it would be attaching a little more scientific quality to our analysis than there really is, if I gave you some gobbledygook about, "Well, we do it for 18 years and stick a terminal value on and do all of this."

We are sitting in the office thinking about that question with each business or each investment. And we have discount rates, in a general way, in mind.

But we really like the decision to be obvious enough to us that it doesn't require making a detailed calculation.

And it's the framework. But it's not applied in the sense that we actually fill in all the variables.

Is that a fair way of stating it, Charlie?

CHARLIE MUNGER: Yeah. Berkshire is being run the way Thomas Hunt Morgan, the great Nobel laureate, ran the biology department at Caltech.

He banned the Friden calculator, which was the computer of that era. And people said, "How can you do this? Every place else in Caltech, we have Friden calculators going everywhere."

And he said, "Well, we're picking up these great nuggets of gold just by organized common sense, and resources are short, and we're not going to resort to any damn placer mining as long as we can pick up these major aggregations of gold."

That's the way Berkshire works. And I hope the placer mining era will never come.

Somebody once subpoenaed our staffing papers on some acquisition. And of course, not only did we not have any staffing papers, we didn't have any staff. (Laughter and applause)

22. "Something will happen" and we want to be ready

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: I'm Tom Morrow (PH) from Laguna Beach, California. And the question I have to ask pertains to the issuance of the new stock.

And again, as Charles mentioned, is there some potential gold mine out there that you have specifically in mind with the — some large acquisition that you have specifically in mind at this time, without revealing any strategic secrets?

WARREN BUFFETT: Yeah. There are things we would like to do. Whether we ever get a chance to do them or not is another question. But you know, I will be surprised if, in the next five years, we haven't used some preferred stock one time or another.

As I mentioned in the report, we had one last year that if we'd done it, it would've involved the issuance of maybe a billion dollars' worth of — no, more than that, I'm sorry — a couple billion dollars' worth of preferred.

That one isn't going to happen, in my view. I mean, it — there's one chance in a hundred it'll — it could happen or something of the sort — but, probably, it isn't going to happen.

On the other hand, we want to be prepared for it. Something will happen. That's always been our experience.

You know, we have sat through some dry spells. And this is true in both the stock market and the acquisition business.

You know, I closed up the partnership in 1969 because there was nothing that made sense to do. And I'm glad I did because that situation prevailed in '71 and '2.

But in 1973 and '4, you know, there were all kinds of things to do.

And that will happen from time to time. People will behave, particularly in markets, just as foolishly in the future as they have in the past. It'll come at unexpected times. But we will get a chance to do something.

Now, that's more of a cash-type purchase, obviously, in the market. But we will get a chance to use the preferred.

And we will try to think about big things. We may not find them. But Charlie and I, the larger something is, the more interested we are.

23. Big assets make float more flexible

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Jim Moss (PH) from Los Angeles.

I was reading through your annual report. And to me, an eye-popping number in there was the amount of float in 1994, at a cost of less than zero — I think it was $3 billion.

And I was wondering if there are any restrictions on your investment of that money, or can that go into your marketable equity securities?

WARREN BUFFETT: The question relates to — we have that long table we put in — we introduced about four years ago or so in the annual report, that shows the amount of float and the cost of float.

And that's a very important table. It — in terms of our operating businesses, that's probably the most important piece of information in the report.

And that float is, as you noted, well over $3 billion now — last year, because of various favorable factors, including the fact that our super-cat business was favorable, but also, because our other insurance businesses did very well — amazingly well.

The cost of that float, which is money that we're holding that eventually — does not belong to us, but will go to somebody else. The cost of that float was less than zero, and that is a very valuable asset.

And the question is, how much flexibility we have in investing that, which I think was the core of your question.

The answer is we have a lot of flexibility. We are not disadvantaged by that money being in float, as opposed to equity, really, in any significant way.

Now, if we had a very limited amount of equity and a very large amount of float, we would impose a lot of restrictions on ourselves as to how we would do it, because we would want to be very sure that we were in a position to distribute that float, in effect, to policyholders, or claimants, or whatever it may be at the time that was appropriate.

But we have so much net worth that, in effect, that float is just about as useful to us as equity money. And that means quite useful. It's a big asset of Berkshire's.

24. Not feeling threatened by Beardstown Ladies

WARREN BUFFETT: Let's see, we've got zone 5.

AUDIENCE MEMBER: Susan Scott (PH) from Madison, Wisconsin.

On a more serious note, are you beginning to feel threatened by the success of the Beardstown Ladies? (Laughter)

WARREN BUFFETT: Which lady?

CHARLIE MUNGER: I —

WARREN BUFFETT: Which lady was that? I —

CHARLIE MUNGER: I didn't get it.

WARREN BUFFETT: I got everything except what lady that was.

AUDIENCE MEMBER: The Beardstown Ladies, the investment group?

WARREN BUFFETT: Oh, that group. Yeah, the best-seller. Yeah. I have not read that book. I hate to admit that to an audience of shareholders, that I —

This is a book that's — I think it's probably number, I don't know, seven or eight or something like that on the Times best-seller list, and been up there for a couple of months now.

It's a group — an investment group — that, apparently, is sharing with the world their secrets of success.

I'm always suspicious of people when they're sharing with the world any great ideas on investments. But we are not threatened at the moment, no. (Laughter)

25. Economics of the moat and the castle

WARREN BUFFETT: Zone 6.

WARREN BUFFETT: Mike Assail (PH) from New York City.

In the mistake du jour section of the annual report, you mentioned a fundamental rule of economics that you missed. I'd like to know the two or three most important fundamental rules of economics you habitually get right.

In other words, what are the fundamental rules of economics you used to make money for Berkshire?

And I'm not talking about Ben Graham's principles here, but rather, rules of economics which may be found in an economics textbook. Thank you.

WARREN BUFFETT: We — Yeah, we try to — I mean, we try to follow Ben's principles, in terms of the attitude we bring toward both investing and in buying businesses.

But the most important thing you can — you know, what we're trying to do is we're trying to find a business with a wide and long-lasting moat around it, surround — protecting a terrific economic castle with an honest lord in charge of the castle.

And in essence, that's what business is all about. I mean, you want to be the lord of the castle, yourself. In which case, you don't worry about that last factor.

But what you're trying to — what we're trying to find is a business that, for one reason or another — it can be because it's the low-cost producer in some area, it can be because it has a natural franchise because of surface capabilities, it could be because of its position in the consumers' mind, it can be because of a technological advantage, or any kind of reason at all, that it has this moat around it.

And then our — then what we have to decide is — all moats are subject to attack in a capitalistic system, so everybody is going to try and — if you've got a big castle in there, people are going to be trying to figure out how to get to it.

And what we have to decide — and most moats aren't worth a damn in, you know, in capitalism. I mean, that's the nature of it. And it's a constructive thing that that's the case.

But we are trying to figure out what is keeping — why is that castle still standing? And what's going to keep it standing or cause it not to be standing five, 10, 20 years from now. What are the key factors? And how permanent are they? How much do they depend on the genius of the lord in the castle?

And then if we feel good about the moat, then we try to figure out whether, you know, the lord is going to try to take it all for himself, whether he's likely to do something stupid with the proceeds, et cetera. But that's the way we look at businesses.

Charlie, you want to add anything?

CHARLIE MUNGER: Well, I think he wants it translated into the ordinary terms of economics. The honest lord is low agency cost. That's the word in economics.

And the microeconomic business advantages are, by and large, advantages of scale — scale of market dominance, which can be a retailer that just has huge advantages in terms of buying cheaper and enjoying higher sales per square foot.

So you're — by and large, you're talking economies of scale. You can have scale of intelligence. In other words, you can have a lord with enough extra intelligence that he has a big advantage. So you're — by and large, you're talking scale advantages and low agency costs.

WARREN BUFFETT: Yeah, to some extent, Charlie and I try and distinguish between businesses where you have to have been smart once and businesses where you have to stay smart.

And, I mean, retailing is a good case of a business where you have to stay smart.

But you can — you are under attack all of the time. People are in your store. If you're doing something successful, they're in your store the next day trying to figure out what it is about your success that they can transplant and maybe add a little something on in their own situation. So, you cannot coast in retailing.

There are other businesses where you only have to be smart once, at least for a very long time. There was once a southern publisher who was doing very well with his newspaper. And someone asked him the secret of his success. And he said monopoly and nepotism. (Laughter)

And I mean, he wasn't so dumb. I mean, he didn't have any illusions about himself.

And if you had a big network of television affiliates station 30 years ago, there's still a major difference between good management and bad management. I mean, a major difference.

But you could be a terrible manager and make a fortune, basically. Because the one decision to own the network TV affiliate overcame almost any deficiency that existed from that point forward.

And that would not be true if you were the first one to come up with some concept in retailing or something of the sort. I mean, you would have to be out there defending it every day.

Ideally, you know, is you want terrific management at a terrific business. And that's what we look for.

But as we pointed out in the past, if you have to choose between the two, get a terrific business.

Charlie, any more?

CHARLIE MUNGER: No.

26. Compliments for Helzbergs of Kansas City

WARREN BUFFETT: Let's see, zone 7, I believe is next?

VOICE: No questions from zone 7.

WARREN BUFFETT: OK. How about zone 1?

AUDIENCE MEMBER: Paul Miller (PH) from Kansas City.

First, I'd like to comment on your purchase of Kansas City-based Helzberg Jewelers. You commented about Barnett Helzberg and his — what he's done, retailing-wise.

For those of us in Kansas City, you've also picked up Barnett and Shirley Helzberg, who are the first family in philanthropy in Kansas City.

And for the shareholders in this room, the Helzbergs are wonderful people. And to have them added to this group of companies says miles about Warren Buffett and that they pick companies based upon their management and their people.

So, kudos to Berkshire Hathaway for picking up the Helzbergs, and thanks to the Helzbergs for everything they've done to Kansas City. Now, my — (Applause)

WARREN BUFFETT: Appreciate that. (Applause)

27. Putting a value on the subsidiaries

AUDIENCE MEMBER: My question relates to value. We can look in the annual report, and we can all see the purchase of a Washington Post, for instance, for $10 million that has a value today of 420 million.

But discerning the value of the other consortium of non-publicly traded businesses, the Nebraska Furniture Marts, the Borsheims, et cetera — the value of their purchase price over the years versus their value today, how can we understand that value and how is it reflected in the annual reports?

WARREN BUFFETT: Yeah, well we try to — that's a good question. We try to give you the information that we would want in answering that question, in the annual report.

Part of it, we do in those pages where we say it's not according to GAAP accounting. But there's a lot of useful information in there.

We're not — we don't stick a number on each company. But we try to give you enough information about the capital employ, the margins, and all of that sort of thing on the bigger businesses that you can make estimates that are probably just about as good as ours.

WARREN BUFFETT: Charlie and I would not need more information than is in the report to come up with a pretty good idea of what the controlled businesses are worth. And there's no information we're holding back that we think would be of any real importance in evaluating those businesses.

But you're right, it's a lot easier with marketable securities than it is — at least in terms of current numbers — than it is with the wholly-owned businesses.

The wholly-owned businesses, generally speaking, some of them are worth a whole lot more than we've — than they're carried on the books for. And we feel pretty good about, essentially, all of them.

But they're — they've turned out remarkably well, I would say that, over the years. And my guess is that they keep working pretty well.

We have managers in a number of those businesses here. I'm not going to introduce them all because we have so many that it would take a considerable period of time.

But you named The Washington Post. In the front row there, close to the front row, we have Don Keough, would you step up, of Coca-Cola? (Applause)

And we have Kay Graham for the Post. (Applause)

And Tom Murphy from Cap Cities. (Applause)

CHARLIE MUNGER: Is Paul Hazen here, too?

WARREN BUFFETT: And I'm going to try and do — well, there's a whole bunch more. I don't want to get — but I — but those three were sitting together and I was struck by the fact that if — those three combined, we have about 6 1/2 billion of profit in, so far. (Laughs)

So, I would say that that's a — (Applause) —

Those are three businesses that have been fantastic. And like — I emphasize "so far" because we'd like to be able to name a bigger number in the future.

But we have a group of managers, both at the controlled companies and at the partly-owned companies, that have just created incredible value for Berkshire.

I mean, Charlie and I sit around and read the paper every day and a lot of magazines and things, watch OJ Simpson or whatever it may be. (Laughter)

And these people are out there creating a ton of value for us. So, we're not going to change it. That —

28. Salomon Brothers culture clash

WARREN BUFFETT: Now, let's see. I think, zone — is it zone 2 now? Or is it — yeah.

AUDIENCE MEMBER: Hello. I'm Tim Palmer (PH) from Dillon, Colorado. I have a question for you regarding Salomon.

In the past week, there's been an article in The New York Times, The Wall Street Journal, and I believe it's Businessweek, that were rather unflattering, as far as what's going on with the management and your selection. There seems to be a — somewhat of a cultural clash there.

I don't know that to be a fact. But I wondered, number one, how you keep yourself open to bad news before it's news.

And what is going on in Salomon there, the compensation plan, et cetera? How do you think that, culturally, is going to work out?

WARREN BUFFETT: Charlie and I are always — we're more interested in bad news, always, than good news. We figure good news takes care of itself. And one — we only give a couple of instructions to people when they go to work for us.

And one of them is to think like an owner. And the second one is to just tell us the bad news immediately, because good news takes care of itself. And we can take bad news, but we don't like bad news late.

So, I would say, in connection with Salomon, that there is, and has been, some culture clash. And there probably almost always would be a culture clash in a business where there is that amount of tension.

Whether it be the entertainment business, or the investment banking business, or the sports business, there's going to be a certain amount of tension when — between compensation to the people that work there and compensation to the owners.

And I think there's been some — that strain has existed at Salomon from the day I was first there and far before that. I mean, I — that was no surprise. It's understandable.

You're seeing a tension, actually, in the airline business between the people that work there and capital. And it's produced terrible results in the airline business. And the people that work there have been able to — and I'm not talking about USAir specifically, although that's a case. But it goes beyond that.

They have had contracts, which were, as I pointed out in the report, were executed in an earlier age, which, essentially, will not allow — in many cases — capital to receive any compensation. And that produces a lot of tension.

You don't have contracts like that in the investment banking business or Wall Street, generally. But you have that same sort of tension.

And changing a culture around, A, takes time and, B, probably takes some change in people. I mean, I don't think that's a great surprise if you expect to do it.

I have — I don't think you can find two better people than Bob Denham and Deryck Maughan. They're smart, they're high-grade, they're willing to work very hard. And there will be people that buy into the arrangements they want to have. And there are people that won't.

Not all of the people that have left, by a long shot, are leaving of their own volition, but most of them are. But some aren't. I mean, there — Salomon lost a lot of money last year. And many of the people that have left were not responsible for some of those losses, but some of the people were.

So, that is not something where you announce names in the paper. But some people are leaving because they can make more money elsewhere. And some people are, maybe, leaving because we think we can make more money without them. (Laughter)

Charlie?

CHARLIE MUNGER: Yeah, I don't think the tensions that have been commented on within Salomon are all that unusual. I think they pretty well exist everywhere on Wall Street. And even in the banks, which have tried to imitate Wall Street. I just think it comes with the territory.

WARREN BUFFETT: I don't know what percentage of the Goldman Sachs partners left this year, but they had tensions that were produced, obviously, when they had a bad year. And they're going to have a bad year from time to time. Everyone's going to have a bad year.

But it — the partners — the general partners — of Goldman Sachs, in the year ended November 30th, 1994, did not do well. They may have not done anything at all. And they'd made some very big money in prior years. And they'll probably make some very big money in subsequent years.

But in the year when they didn't make any money, it was a lot of turnover. And maybe some of that turnover, also, was not all at the volition of the general partners that you read about leaving. I don't know the facts in that case.

But there's a certain amount of tension that exists in Wall Street under any circumstances. And when you aren't making money, there's a lot of tension.

29. Best edition of Ben Graham's "Security Analysis"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Yeah. My name is Michael Johnson. I'm a native to Omaha, and however, my family and I are Americans living abroad in Dhahran, Saudi Arabia.

My question is related to intrinsic value and Ben Graham's "Security Analysis."

I read a book earlier this year by Janet Lowe, who said that you were more toward the first or second editions of "Security Analysis" and not so much toward the fourth.

Yet, the fourth edition seemed to move more toward growth and value being kind of joined at the hip, like you've said in your last few annual reports.

And so, if I'm a person who's always studying security analysis like I do — I think I spend more time with that — do you think I need to get those first editions? Or is the fourth edition kind of more of what you've moved toward, with your comments such as value and growth are joined at the hip?

WARREN BUFFETT: Janet Lowe is here, incidentally, today. She wrote a very good book on Ben Graham. I recommend that any of you that haven't read it, go out and buy a copy.

The — I still prefer the — I think the second edition is cheaper to buy than the first edition, by some margin. And I think it's basically the same book. So, I — that's the one I would recommend. I — it isn't because of differences on value and growth.

I just think that the reasoning is better and more consistent throughout the second edition, which is really the last one that Ben was the hundred percent — along with Dave Dodd helping him in various ways — was responsible for writing.

So, I think that the book has gotten away, to quite an extent, from both Graham's thinking and from his way of expressing himself. So I really — but I have no quarrel with anybody that wants to read later editions at all.

I do think, probably, the second edition, if you're a real student of security analysis and you read and understand that, you'll — you should do all right.

In terms of — a lot of the mistakes that were made, in terms of junk bonds and accounting and all of that sort of thing, were covered in 1934 in that first edition, and subsequently in 1940 in the second edition. There's a lot of meat in there.

Later on, you know — I must admit, I didn't read the last edition as carefully as the earlier ones. But it struck me, it was — it — what was said was not as important and it wasn't said as well. And it was more expensive. (Laughter)

Charlie, you have any thoughts on that?

CHARLIE MUNGER: No.

30. Why Berkshire doesn't sell businesses

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes, Jeff Peskin (PH) from New York City.

And I was — I have a question on the annual report where you say that, obviously, going forward, due to the size of Berkshire, the returns going forward probably won't match the returns of the past.

And then you go on to state that one thing that may hinder that is the fact that you don't really like to sell companies that you own.

And I would just like to know what the reasoning is in that, if you've got a company or investment that you don't think is going to do as well as where you can put the money going forward. What really the reasoning is for holding on and not redeploying the money elsewhere?

WARREN BUFFETT: Yeah. I'll just correct you just slightly. A, I didn't say we'd probably do worse than the past. I said we will do worse than the past. I mean, there's no way we can match percentage numbers of the past.

That, you know, we would — in a period that would not take that long, we would — assuming we paid out nothing — we would gobble up the whole GDP, which is something we may think about, occasionally, but — (laughter) — we don't really expect to accomplish. The —

But — and the second point, that relates to size. That does not relate to our unwillingness to sell businesses, because that unwillingness has existed for decades. But the size has not existed for decades.

The size is — you know, doubling 12 billion or so is harder than doubling 1 billion-2, which was harder than doubling 120 million. I mean, there's no question about that.

So, eventually — well, already it will be a drag on performance. It doesn't mean that the performance will be terrible, but it does mean that 23 percent is an historical figure. It has no predictive value.

The unwillingness to sell businesses, like I say, goes back a long way. That is not what — that —

If that hurts performance, it's peanuts. That's simply a fact — a function of the attitude Charlie and I have, is that if we want to live our lives, we find it a rarity when we find people in the business that we want to associate with. When we do find that, we enjoy it.

We don’t see any reason to make an extra half a percent a year or 1 percent a year — don’t try us on higher numbers. But the — (laughter) — we don’t see a reason to go around ending friendships we have with people, or contact, or relationships. It just doesn’t make any sense to us. It —

We don’t want to get committed to that sort of activity. We know we wouldn’t do it if we were a private company.

Now, in Berkshire, we feel we’ve enunciated that position. We want to get that across to everybody who might join with us because we don’t want them to expect us to do it.

We want them to expect us to work hard to get a decent result, and to make sure that the shareholders get the same result we get, and all of that sort of thing.

But we don’t want to enter into any implicit contract with our fellow shareholders that will cause us to have to behave in a way that we really don’t want to behave.

If that’s the price of making more money, it’s a price we don’t want to pay.

There’s other things we forgo also, but that is the one that people might disagree with us on. So, we want to be very sure that everybody understands that, going in. That’s part of what you buy here.

And it may — I don’t think it’ll hurt performance that much anyway. But to the extent that it does, it’s a limitation you get with us.

Charlie? (Applause)

CHARLIE MUNGER: I don’t think there’s any way to measure it, exactly. But my guess is that, if you could appraise something you might call the character of the people that are running the operating businesses in Berkshire, many of whom helped create the businesses in the first place, and are leading citizens in their community, like the Helzbergs —

I don’t think there’s any other corporation in America that has done as well as we have, if you measure the human quality of the people who are in it.

Now, you can say we’ve collected high-grade people because we sure as hell couldn’t create them. But one way or another, this is a remarkable system. And why would we tinker with it?

WARREN BUFFETT: If you want to — (applause) — attract high-grade people, you probably ought to try and behave pretty well yourself.

I mean it’s just — besides, it wouldn’t be any fun doing the other. I mean, it — I was in that position, a little bit, when I ran the partnership back in the ’60s.

And I really — you know, people were coming into partnership with me. And my job was to turn out the best return that we could. And I found that if I got into a business, that presented certain alternatives that I didn't like. So, Berkshire's much more satisfactory in that respect.

31. Focus on Graham's three principles

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: John Rankin (PH), Fort Collins, Colorado. Thanks for having us.

In the book, "Warren Buffett Way," the author describes the capital growth model that you've used to evaluate intrinsic value in common stock purchases.

My question is, do you also still use the formula Ben Graham described in "The Intelligent Investor," that uses evaluating anticipated growth, but also book value?

It seems to me that fair value is always a bit higher when using Mr. Graham's formula than the stream of cash discounted back to present value that is in "Warren Buffett Way" and also that you've alluded to in annual reports.

WARREN BUFFETT: Yeah, we've tried to put in the annual report pretty much how we approach securities. And book value is not a consideration — virtually, not a consideration at all.

And the best businesses, by definition, are going to be businesses that earn very high returns on capital employed over time. So, by nature, if we want to own good businesses, we're going to own things that have relatively little capital employed compared to our purchase price.

That would not have been Ben Graham's approach. But Ben Graham was — Ben was not working with very large sums of money. And he would not have argued with this approach, he just would've said his was easier. And it is easier, perhaps, when you're working with small amounts of money.

My friend Walter Schloss has hewed much more toward the kind of securities that Ben would've selected. But he's worked with smaller amounts of money. He has an absolutely sensational record. And it's not surprising to me at all. I mean, when Walter left Graham-Newman, I would've expected him to do well.

But I don't look at the primary message, from our standpoint, of Graham, really, as being in that — in anything to do with formulas. In other words, there's three important aspects to it.

You know, one is your attitude toward the stock market. That's covered in chapter eight of "The Intelligent Investor." I mean, if you've got that attitude toward the market, you start ahead of 99 percent of all people who are operating in the market. So, you have an enormous advantage.

Second principle is the margin of safety, which again, gives you an enormous edge, and actually has applicability far beyond just the investment world.

And then the third is just looking at stocks as businesses, which gives you an entirely different view than most people that are in the market.

And with those three sort of philosophical benchmarks, the exact — the evaluation technique you use is not really that important. Because you're not going to go way off the track, whether you use Walter's approach — Walter Schloss's — or mine, or whatever.

Phil Carret has a slightly different approach. But it's got those three cornerstones to it, I will guarantee. And believe me, he's done very well.

Charlie?

32. Don't believe projections

CHARLIE MUNGER: Yeah. To the extent that the method of estimating future cash flow requires projections, I would say that projections, while they're logically required by the circumstances, on average, do more harm than good in America.

Most of them are put together by people who have an interest in a particular outcome. And the subconscious bias that goes into the process, and its apparent precision, make it — makes it some — well, it's fatuous, or dishonorable, or foolish, or what have you.

Mark Twain used to say a mine is a hole in the ground owned by a liar. And a projection prepared in America by anybody with a commission, or an executive trying to justify a particular course of action, will frequently be a lie.

It's not a deliberate lie, in most cases. The man has gotten to believe it himself. And that's the worst kind.

So, I don't think we should — projections are to be handled with great care, particular when somebody has an interest in misleading you.

WARREN BUFFETT: Charlie and I, I think it's fair to say, we've never looked at a projection in connection with either a security we've bought or a business we've bought. We've had them offered to us in great quantities.

Now, the fact that we voluntarily turn them away when people try to thrust them upon us — I mean, it — the very fact that they are prepared so meticulously by the people who are selling the businesses, or by the executives who are presenting to their boards and all of that sort of thing, you know, I mean, either we're wrong or they're wrong.

It’s a ritual that managers go through to justify doing what they wanted to do in the first place, in about nine cases out of ten.

I have never, you know, I have never met an executive who wanted to buy something that said, “Well, I had to turn it down because the projections didn’t work.” I mean, it’s just — it’s never happened.

And there will always be somebody that will come up with the projections that will satisfy the guy who’s signing his paycheck or will sign the deal that provides the commissions.

And they will pass those along to whomever else they need, the bankers or the board, to approve it.

It is total nonsense. I was recently involved in some — in a situation where projections were a part of the presentation. And I asked that the record of the people who made the projections, their past projections also be presented at the same time. (Laughter)

It was a very rude act. (Laughter)

CHARLIE MUNGER: It was regarded as apostasy.

WARREN BUFFETT: It — but believe me, it proved the point. I mean, it was a joke, I mean. So, we’ll leave it at that.

33. First question when looking at an investment

WARREN BUFFETT: We’re going to have another — one more question, maybe. And then we’ll take a break.

And Charlie and I will be eating up here. The ones who want to stick around can stick around. And the ones who are in the other room, undoubtedly there will be seats in here to fill.

So, we’ll sort of regroup in 10 or 15 minutes. And then we’ll go on as long as that group lasts.

So, let’s take one more from zone 6. And then we’ll take a break.

AUDIENCE MEMBER: Hello, my name is Peter Bevelin from Sweden.

What is the absolutely first question you ask yourself when you look at a potential investment? And do you and Mr. Munger ask yourself the same first question?

WARREN BUFFETT: Yeah. Well, I think — I don’t ask myself whether Charlie’s going to like it because — (laughter) — that will be a tough one.

No, the first question is, can I understand it? And unless it's going to be in a business that I think I can understand, there's no sense looking at it.

There's no sense kidding myself into thinking that I'm going to understand some software company, or some biotech company, or something of the sort. What the hell am I going to know about it? I mean, you know, I can — so that's the first threshold question.

And then the second question is, you know, does it look like it has good economics? Has it earned high returns on capital? You know, does it strike me as something that's likely to do that? And then I sort of go from there.

How about you, Charlie?

CHARLIE MUNGER: Yeah. We tend to judge by the past record. By and large, if the thing has a lousy past record and a bright future, we're going to miss the opportunity. (Laughter and applause)

Afternoon Session - 1995 Meeting

1. Banks are in our circle of competence

WARREN BUFFETT: OK, we're ready to start here with a question from zone 1, if you'll take your seats, please. We've got to —

AUDIENCE MEMBER: Mr. Buffett, I'm Brian Murphy (PH) from Clearwater, Florida.

I'd like to ask you a question concerning your present thinking behind your acquisitions of banks, such as PNC and SunTrust, particularly in light of the fact that banks were selling so cheaply in 1990 and now many have tripled in price.

And it would appear from recent publications and the financial literature that you've become much more interested in banks at these higher prices, relative to the 1990 valuations. Could you comment on your thinking there?

WARREN BUFFETT: Yeah, we really have no different — there's no difference in the criteria we apply to banks than to other businesses. And a couple of publications have, maybe, made a little more of that than is warranted, because I doubt if there's more than a couple percentage points difference in —

And we don't think of it that way, incidentally. And we do not have a lot of sector — we don't have any sector allocation theories whatsoever.

So, we simply apply the same criteria when looking at banks that we would at any other business that —

There — incidentally, there — sometimes, you should know, that there's — I would say that maybe half, or maybe even a little more, of the reports about our activities are — in the press are erroneous. Now, some are accurate, too.

And then, of course, some are way out of date. I mean, we get confidential treatment on our — on the filings we make with the SEC as to our holdings, so they're published well over a year after we've filed them.

And therefore, there have been a couple of stories in the last month or two as to something we've bought. And of course, if you read the story carefully, we bought it a year and a half ago, maybe. And we may have sold it, we may have bought more, all kinds of things.

So that, I'd be careful about press reports, generally.

We've — we actually — we bought a bank for Berkshire in 1969, the Illinois National Bank and Trust of Rockford. We've had an interest in the banking business.

We feel it's something that we can — that falls within our circle of competence to evaluate. That doesn't mean we'll be right every time, but it — we don't think it's beyond us to understand the banking business. And so, it's — we look at businesses in that area.

Charlie?

CHARLIE MUNGER: Nothing to add.

2. Buffett always plans to write a book "six months from now"

WARREN BUFFETT: OK. And do we have zone 2?

AUDIENCE MEMBER: Larry Myers from Omaha.

Warren, two quick questions, the first one very brief. Do you have any timetable regarding when you will write your own book about your career and philosophy?

WARREN BUFFETT: Yes, my timetable's always been six months from now. (Laughter)

The answer on that is I've thought about doing it a few times, and I think about it. It always seems to me there's way more interesting things yet to happen than have happened so far, and I don't want to — I know I won't write a second one, so I keep postponing it. That's my rationale on it, anyway.

3. Coca-Cola "doing exactly the right thing" with its cash

AUDIENCE MEMBER: Thank you. Second question concerns dividends. Last Friday night, by coincidence, on Louis Rukeyser's weekly television show, the special guest was Philip Carret.

And Mr. Carret made the statement that his favorite American stock is Berkshire Hathaway. And one of the major reasons he stated was that, "Berkshire has never paid a dividend, as we all know," and consequently, you had superior utilization of the extra cash.

Now, if you extend that reasoning, could it also be a beneficial policy if Coca-Cola and Gillette stopped paying dividends and utilized the cash in other ways?

WARREN BUFFETT: Well, it depends what they could use the — how they would use — utilize the cash, what they could use it for. Those are more focused enterprises than Berkshire, at least in terms of products.

And they — I think — I commend managements that have a wonderful business for utilizing cash in those wonderful businesses, or in businesses that they understand and that will also have wonderful economics, and for getting the rest of the money back to the shareholders.

So, Coca-Cola, in my book, is doing exactly the right thing with its cash when it both — when, A, it uses all the cash that it can, effectively, in the business to expand in new markets and all of that sort of thing.

But then beyond that, it pays a dividend which distributes cash to shareholders, and then it repurchases shares in a big way, which returns cash on a selective basis to shareholders, but in a way that benefits all of them.

So, we — you will benefit from us not paying dividends just as long as we can use the — every dollar we retain — to produce more than a dollar of value, and of market value over time.

Whether we can continue doing that, you know, how long we can continue doing that, I can't promise you, but that is the — that's the yardstick by which the decision is made.

And that is the yardstick, I think, by which Coca-Cola's making the decision, too. And I think that they deserve great credit for exercising the discipline to quit when they — using cash — when they've run out of the opportunities to use it well, and then to use it — then to further deploy it advantageously by repurchasing shares.

I think one of the things I admire about my friend, Bill Gates, he's got 4 1/2 billion of cash in Microsoft, and very few managements can stand having 4 1/2 billion of cash and not doing something unintelligent with it.

So far, it's made sense for us to retain everything we earn, and I think it'll make sense for a while longer, but it may not make sense indefinitely.

Charlie?

CHARLIE MUNGER: I hope it lasts a long time. (Laughter)

4. Why is Wall Street compensation so high?

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: My name is Dan O'Neil from Santa Fe, New Mexico.

And I would ask — like to ask you a more specific question about Salomon Brothers, which is, why do we pay our employees there so much?

WARREN BUFFETT: Why what?

AUDIENCE MEMBER: Why do we pay our employees there so much money? The conventional theory seems to be that there's just a different pay scale on Wall Street than the rest of the world.

And it's based on the idea that traders are smarter than — that some traders are smarter than others, and, in some supernatural way, are able to receive signals that the future is sending back to the present. And how do we know that that isn't just an urban legend like alligators in the New York City sewers?

Another theory would be that the large amount of shareholders' capital allows the traders to capture inefficiencies that are in the market in the same way that the house does in Las Vegas.

I mean, if we owned a casino, it wouldn't make any difference if we hired Albert Einstein or Forrest Gump to run the blackjack table, and we would pay them the same. And I wonder which theory you think is closer to the truth.

WARREN BUFFETT: Well, you put it well. (Laughter and applause)

In the end, of course, you end up paying at a, what you think, at least, is a market rate. And to some extent, the market tests you out by whether people leave because they can get a higher rate.

But the limiting factor on that should be that you pay them a market rate as long as you are getting a market rate on capital. But it's harder to measure the market rate on capital in a short period than it is to measure the market rate on compensation.

So, the — a good many of the people that have left — but far from all — have left because they felt that they would obtain — presumably — because they would obtain greater compensation elsewhere.

The market was working in that way, just as it works in entertainment that way and it works in the athletic field that way.

And whether it — when it works that way, it leaves a return for capital that's adequate, is an open question. I mean, I haven't looked at the figures on all the baseball teams, but I've seen some of them. And certainly, in some of the smaller markets, I mean, the books were not phony.

I mean, it is very hard to pay market rates for ballplayers in Kansas City and still make money running a ball team, where you've got a smaller television market and all of that of the big cities.

So, in the end you're going to have to pay market rates to retain people, but part of that will also depend upon the period over which they measure their — what they are going to be paid.

I mean, if you want to look at Goldman Sachs last year, they were paid nothing. Does that mean that everybody will leave because they can get paid something someplace else? No, because 80 percent of the partners, or 90 percent of the partners, have a longer time horizon than that. And they have an anticipated earnings figure in mind when comparing it with what they're being offered elsewhere.

If you have a situation where market rates, you know, exceed the earning capacity of the business, then at some point, capital will flow away from the business.

In the airline industry, which I use as an example, the market rate — most — well, the — in terms of the bigger airlines, people are not being paid market rates, they're being paid contractual rates. Well, you can't blame anybody for that.

If you have a contract that entitles you to X and the current market is a half of X, you're going to hang onto that contract very aggressively. And like I say, you don't blame anybody for that, it's just if you end up in that condition, though, you've got a real problem.

And if you have the same problem that you have if the market is higher than — or a similar problem — the one you have if the market is higher than one that you can sustain in your own business.

My guess is that there — that, in effect, Salomon has put in a more Goldman Sachs-like system because, essentially, it created, to a degree, a partnership within it. That —

To have that work, A, over time, the partners have to earn good money or it won't work, but, B, you have to have people that have a partnership mentality in it. And if you change from one culture to another, you are not going to get a hundred percent acceptance of any new system.

Charlie?

CHARLIE MUNGER: Yes, it was kind of a bad break to put in a new compensation system and then have a very bad year. In the very nature of things, people are going to blame the compensation system subconsciously.

And then, two, I think that Wall Street generally has more envy-jealousy effects than are typically present elsewhere.

5. Buffett on the "real" advantage of being rich

I have a friend whose grandmother used to say that she couldn't understand why people got into envy-jealousy, because it was the only one of the sins that you could never possibly have any fun at. And — (Laughter)

But generally speaking, on Wall Street I think a lot of people have had the wrong kind of grandmothers. (Laughter and applause)

WARREN BUFFETT: Yeah, I've commented from time to time that — what's his name? Robin Leach has it all wrong on "Lifestyles of the Rich and Famous," because he's presenting all these wonderful things that will happen to you if you get rich.

But they really aren't that all that wonderful, these fancy houses and boats and all that. The real advantage of being rich, as I explain to people, is that it enables you to hate so effectively.

That if you're terribly rich, you know, and — but your brother or whomever, cousin or somebody, is getting a little more attention in the world or something of the sort, you can hate in a very major way.

You can hire accountants and lawyers to cause him all kinds of trouble. If you're poor, you just snub him at Thanksgiving and don't show up or something of the sort. (Laughter)

But I've noticed that these rich people, particularly when they inherit great amounts of money, sooner or later they start — frequently — they get very antagonistic toward siblings, or cousins, or whatever it may be.

And they really can — they can hate in a way that — or get envious in a way that the rest of us really can't really aspire to. So, that's the benefit that hasn't appeared on Robin Leach lately, but I —

But you see that — you see a little of that in the athletic field and the entertainment field, and perhaps even on Wall Street, that making a million dollars a year looks great until this guy that sits next to you that can't possibly be as smart as you is making a million-two. And then the whole world, it turns into a very unfair place. (Laughter)

6. "It's never a policy of ours to hold a lot of cash"

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Good afternoon. My question is simply about the cash and cash equivalents that are shown on the balance sheet this year versus last year.

In my thinking, cash equivalents is always something good to have around in case of a big market drop, being able to make opportunistic buys, as I know you've referred to "Mr. Market" getting manic-depressive at times.

Is there something that is less than obvious here that I'm not seeing? Or is the position not there now, should that happen in the marketplace?

WARREN BUFFETT: Cash at Berkshire is a residual. I mean, we would like to have no cash at all times. We also don't want to owe a lot of money at any time.

But we — if we have cash around, it's simply because we haven't found anything we like to do, and we hope — always hope —- to deploy it as soon as possible.

We never are thinking about whether the market's going to go down or something of the sort, or whether we might buy something even cheaper. If we like something, we'll buy it.

And when you see cash on our balance sheet of any size, that's an acknowledgement by Charlie and me that we have not found anything, in size anyway, attractive at that point. It's never a policy of ours to hold a lot of cash.

7. Newspaper business is "exceptionally good," but not as good

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: David Winters, Mountain Lakes, New Jersey. I'll stand up.

David Winters, Mountain Lakes, New Jersey.

Years ago, you said you loved the newspaper business and then, over time, I guess, it — said it declined a bit in how much you loved it. And I'm kind of wondering how you feel about it now, and if you can prognosticate a little bit for us at all?

WARREN BUFFETT: Well, I used to love it in two respects. I loved the economics and I loved the activity, both. The activity — the love of the activity has not diminished.

The economics are still exceptionally good compared to virtually any business in the world. They aren't quite as good as they were 15 years ago.

So, they have — I wrote about that a couple of years ago, whereas what was — seemed almost the most bulletproof of franchises is still an exceptionally good business, but it isn't quite as bulletproof as might've been the case 10 or 20 years ago.

I still think it's about as interesting a business as there is in the world I'm in. But if you're talking pure economics, the — I can't think of many other businesses that, if I just owned one asset over my life, that I would rather own than a newspaper in a single-newspaper town.

But I wouldn't have quite the feeling of absolute certainty that I had — that I would've had 10 or 15 years ago.

Charlie?

CHARLIE MUNGER: Yeah, I think it's obvious, I — the newspaper proprietors are getting a touch of paranoia for the first time.

I mean, they worry about the electronic revolution, they worry about the fact that young people, you know, don't read. It's not as much fun going to newspaper conventions as it used to be.

WARREN BUFFETT: They're still making exceptional money. I mean, that's the interesting thing.

CHARLIE MUNGER: Ah, but they — I've heard you say a dozen times, "People don't seem to care what floor they're at, just whether the elevator is going up or down."

WARREN BUFFETT: That's right, that is true. (Laughter)

People feel better when they're on the second floor of an elevator that's just come from one than they do when they're on the 99th floor coming down from a hundred, there's no question about that.

They have this projection. And of course, it's particularly the case where they've been in a business where the money — the profits — were automatic, because they start thinking about, you know, questions of whether they really have the ability to make a lot of money, absent this favored position.

And that's not something they've had to dwell on before. So, it can make them uncomfortable.

They're all screaming about newsprint prices. We'd probably scream about them a little bit, too.

I mean, if you compare being in the newsprint business over time to being in the newspaper business, I mean, it's a joke.

And newsprint prices, if you — you can graph them from any point, you know, 15 or 20 years ago, or 10 years ago, and the price of the newspaper, the price of advertising has gone up more.

I mean, it is interesting to hear them yelling foul, because they have moved a lot in the last 12 months and they'll move some more in the next six months. But believe me, it's better to be in the newspaper business than the newsprint business.

8. Buffett's semi-hostile takeover of Berkshire

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: Mr. Buffett, my name is Liz Pruce (PH), I'm from New York City.

I was wondering, on your acquisition criteria — I know part of that is that Berkshire Hathaway won't participate in unfriendly takeovers. I wondered how that philosophy may or may not apply to your role as a member of the board of several other companies.

WARREN BUFFETT: That's an interesting question. And I haven't been on the board of any company where the CEO has brought to the board the question of a hostile takeover.

Can you think of anything I'm forgetting? No, and — but there's no rule that that can't happen.

So, I don't know exactly what I would do if that came along. That's a very good question.

I used to be — I used to have a whole different attitude on that. I mean, in effect — we actually — if you go back 40 years, we bought, in effect, control of companies.

Well, in the case of Berkshire, Malcolm Chace, the chairman, was all in favor of us buying our stock in Berkshire. But Seabury Stanton, the president, would not have been in favor of it, and Seabury was the — was managing the business.

So, it wasn't hostile, but Seabury would not have been in favor of it. It would — but Malcolm would've been.

So, I don't know what the situation would be today if somebody walked in Gillette or Cap Cities, or someplace like that.

I don't think it's going to happen, but I have not — I don't have any policy on it at this point.

What do you think we'd do, Charlie?

CHARLIE MUNGER: I don't think our behavior is totally predictable. (Laughter and applause)

WARREN BUFFETT: And he's right. (Laughter)

9. Comparing investing styles of Ben Graham and Phil Fisher

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Yes, Neil McMahon (PH), New York City, also a Sequoia shareholder.

Ben Graham investing encouraged turnover. Looking at Berkshire's holdings, concentration and long-term, are you still a 15 percent Phil Fisher and 85 percent Graham?

WARREN BUFFETT: I don't know what the percentage would be. I'm a hundred percent Ben Graham in those three points I mentioned earlier, and those really count.

I am very — I was very influenced by Phil Fisher when I first read his two books, back around 1960 or thereabouts. And I think that they're terrific books, and I think Phil is a terrific guy.

So, I think I probably gave that percentage to — I think I first used it in Forbes one time when Jim Michaels wrote me. And I think I, you know, it was one of those things. I just named a number.

But I think I'd rather think of myself as being a sort of a hundred percent Ben Graham and a hundred percent Phil Fisher in the points where they don't — and they really don't — contradict each other. It's just that they had a vastly different emphasis.

Ben would not have disagreed with the proposition that if you can find a business with a high rate of return on capital that can keep using more capital on that — that that's the best business in the world. And of course, he made most of his money out of GEICO, which was precisely that sort of business.

So, he recognized it, it's just that he felt that the other system of buying things that were statistically very cheap, and buying a large number of them, was an easier policy to apply, and one that was a little more teachable.

He would've felt that Phil Fisher's approach was less teachable than his, but his had a more limited value because it was not workable with really large sums of money.

At Graham-Newman Corp — Graham-Newman Corp was a closed-end fund — oh, it was technically an open-end fund, but it had $6 million of net worth. And Newman and Graham, the partnership that was affiliated with it, had 6 million. So, you had a total pool of 12 million.

Well, you could go around buying little machine tool companies — stocks in machine tool companies, whatever it might be, all statistically cheap. And that was a very good group operation.

And he had — you have — if you own a lousy business, you have to sell it at some point. I mean, if you own a group of lousy businesses, you better hope some of them get taken over or something happens. You need turnover.

If you own a wonderful business, you know, you don't want turnover, basically.

Charlie?

CHARLIE MUNGER: What was interesting to me about the Phil Fisher businesses is that a very great many of them didn't last as wonderful businesses.

One of his businesses was Title Insurance and Trust Company, which dominated the state of California.

It had the biggest title plant, which was maintained by hand, and it had great fiscal solvency, and integrity, and so forth. It just dominated a lucrative field.

And along came the computer, and now you could create, for a few million dollars, a title plant and keep it up without an army of clerks.

And pretty soon, we had 20 different title companies, and they would go to great, big customers like big lenders and big real estate brokers, and pay them outlandish commissions by the standards of yore, and bid away huge blocks of business.

And in due course, in the State of California, the aggregate earnings of all the title insurance companies combined went below zero — starting with a virtual monopoly.

WARREN BUFFETT: From what looked like a monopoly.

CHARLIE MUNGER: So, very few companies are so safe that you can just look ahead 20 years. And technology is sometimes your friend and it's sometimes your bitter enemy.

If Title Insurance and Trust Company had been smart, they would've looked on that computer, which they saw as a cost reducer, as one of the worst curses that ever came to man.

WARREN BUFFETT: You can — it probably takes more business experience and insights, to some degree, to apply Phil Fisher's approach than it does Graham's approach. If you —

The only problem is, you may be shut out of doing anything for a long time with Ben's approach, and you may have a lot of difficulty in doing it with big money.

But if you strictly applied, for example, his working capital test to securities, you know, it will work. It just may not work on a very big scale, and there may be periods when you're not doing much.

Ben really was more of a teacher than a — I mean, he had no urge to make a lot of money. It did not interest him. So he was — he really wanted something that he thought was teachable as a cornerstone of his philosophy and approach.

And he felt you could read his books sitting out here in Omaha and apply — buying things that were statistically cheap, and you didn't have to have any special insights about business or consumer behavior, or anything of the sort.

And I don't think there's any question about that being true, but I also don't think you can manage lots of money in accord with it.

10. Munger's sales of Berkshire shares

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Hi, Rob Pitts, shareholder from New York City.

This is a question for Mr. Munger. I've noticed, in the insider sales activity sheets, that you've been a rather consistent seller of your Berkshire stock over the last few months.

Wondered if you would comment on why you're doing this, especially in light of the prospective tax change in capital gains, where it might be reduced, which would obviously be beneficial to you and beneficial to Berkshire by reducing its deferred tax liability?

CHARLIE MUNGER: I've given away a fair amount of Berkshire in the last couple of years and I've also sold some. I gave away the Berkshire because I thought it was the right way to behave, and I sold some because I had uses for the money. (Laughter and applause)

WARREN BUFFETT: He doesn't know anything I don't know. I (Inaudible) it's selling, I'd checked that, but — (Laughter)

11. When a company's accounting is confusing, stay away

WARREN BUFFETT: Zone 3?

Charlie has a very high percentage of his net worth in Berkshire, as do I.

Go ahead. I'm sorry, go ahead. I don't think it's working, quite —

AUDIENCE MEMBER: Hello?

WARREN BUFFETT: OK.

AUDIENCE MEMBER: Hi, Gorem Pulich (PH) from New York City.

I have a two-part question, first part very short. I think a lot of people have difficulty valuing businesses because of some convoluted accounting schemes that are out there.

Do you have any suggestions, in terms of books, or something you can read, where you can sort of make sense of some of the accounting stories that are going around?

WARREN BUFFETT: Well, that's a good question. Abe Briloff used to write for Barron's quite frequently on various accounting machinations, and Barron's has continued that somewhat.

But you're right that there are people out there who will try to paint pictures with accounting that are something far from the economic reality. And sometimes, the rules of accounting themselves lead to that.

I would say that when the accounting confuses you, I would just tend to forget about it as a company. I mean, it's probably — it may well be intentional, and in any event, you don't want to go near it.

I — we have never had any great investment results from companies whose accounting we regarded as suspect. I can't think of a one. Can you, Charlie?

CHARLIE MUNGER: No.

WARREN BUFFETT: It's a very bad sign.

CHARLIE MUNGER: I made a short sale once that worked out well — (laughter) — in a case like that.

WARREN BUFFETT: It really — accounting can be a — accounting can offer you a lot of insight into the character of management.

And I would say there's a lot — you know, there's a — you run into a fair amount of bad accounting. I used to call it creative accounting. And you'd probably run into a lot more, if it was allowed.

But some companies have been able to push their auditors pretty far, and I would be very skeptical of anything that looks suspicious to you.

I think there have been — there've been a couple of things written, but I can't think of where they've appeared, where people talk about the questions of, you know, what —

Obviously, if some prepaid expense, deferred asset accounts start building up suspiciously high, and inventories look out of line, you know, with sales and, particularly, the trend of them and all that, you want to look twice at companies like that.

Life insurance, you know, frequently, you know, we see weak accounting in. You can — when you don't have a product where revenues and expenses are being matched up on something close to cash in the short-term, you have the opportunity for people playing games with numbers.

And some people have learned how to do that very well, and they've sometimes created long-lasting stock manipulation or promotion schemes that have enriched themselves, or they've enriched the managers or the creators of it, at the expense of the public, over time.

If you ever get suspicious about accounting, just go onto the next company.

12. Lloyd's of London has slipped in recent years

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes. Miss Wasserman (PH) from Chicago.

In order to understand the reinsurance business a little better, can you explain your relationship with Lloyd's of London in the marketplace, how you — which is probably the leader in the field?

How often do you compete directly, or if you've ever done reinsurance business for them, since they've had losses in recent years, and how you see the industry changing as their economics changes?

WARREN BUFFETT: Well, Lloyd's, which is not an insurance company, as you know, but a — well, originally it was a place — it was a coffee house, but people think what — it's a place where a large number of syndicates operate and congregate in a given physical location. And it's had a history for larger, more exotic risks over time.

Lloyd's has lost its relative position to a fairly significant degree in the last 10 or so years, partly because — well, in significant part, because of bad results, which had the other effects of causing capital to withdraw and people who backed the syndicates to become unhappy.

So, Lloyd's is still an important competitive factor in the reinsurance business and in certain specialized kinds of primary insurance. It's a very — you know, it's very important factor.

But it's not the factor it was 10 or 15 years ago. And I'm not sure how Berkshire's capital compares with the capital of all those syndicates at Lloyd's, but it's certainly changed in its relative importance in the last five or 10 years.

And the ability of Lloyd's to attract capital with the problems they had has been diminished, although they're working on that problem.

But we regard Lloyd's as a competitor just like we would regard any one of a number of reinsurance companies as competitor.

But we also do business with a number of syndicates at Lloyd's, and we'll probably do a lot of business over the next 10 years with various syndicates.

Charlie?

CHARLIE MUNGER: Yeah, Lloyd's is a very interesting institution because it had this reputation for integrity, what they paid off in — what, the San Francisco fire, and so on, and so on.

But I would argue that 10 or 15 years ago, a lot of slop and folly got into Lloyd's, in certain syndicates particularly.

And too many commissions coming off the top as the same risks circulated around the system. Too much fine tailoring and three-hour lunches with fine wines. And it wasn't right, and they got in a lot of trouble.

WARREN BUFFETT: Actually, in the history of Berkshire, the most significant insurance problem we ever had was in connection with Lloyd's almost — or certain syndicates of Lloyds — almost 20 years ago.

And as Charlie said, they had this terrific reputation — behavioral reputation — over centuries. And I think that they coasted for a while on that. And we had a behavioral problem with — in one situation. And it was very expensive to us. So, we may have gotten an early lesson in what was coming.

There are a lot of different syndicates at Lloyd's, and there are different people running them, and they have had different standards of behavior, to some extent. And people who assumed that, because they were dealing with Lloyd's, that they would have no problems of any kind have found out otherwise.

But they will continue to be a major force in insurance, and they will get by their present troubles, and they'll probably come out of it better structured than they went in.

13. We'll keep a dollar if we can make more than a dollar of value

WARREN BUFFETT: Was that zone 5 that we did there?

AUDIENCE MEMBER: Christopher Jones (PH) from Scottsdale, Arizona. I had a couple of questions for you.

You've mentioned several times today about the difficulty and the frustration that you both have in trying to find capable companies to acquire, or acquire parts of, in the United States.

And I realize that, of course, when we own Coca-Cola and Gillette we are a part of the global environment.

But it's surprising to me that there haven't been any global franchises or global managements that have been interesting to either of you that — and I realize, in the past we've owned some pieces of some.

So, I was — questioned, because of the size of Berkshire now, might we see something more of a global flavor to the portfolio?

And second question, you've also addressed the intelligent use of cash as something that you look for in management.

Many management teams now are buying back their own shares because they can't find anything cheaper or better in the marketplace.

Does your current philosophy of not buying back your own shares suggest that maybe you think Berkshire's overpriced at these prices?

WARREN BUFFETT: Well, we have never bought back shares. I — we actually bought a few back in the '60s — but we basically have never bought back shares, although there were plenty of times when we thought it would be quite attractive to do it.

But we've also felt that if we could create more than a dollar of market value by — and maybe well over a dollar of market value — by retaining a dollar, that on balance that that would work out better over time.

As long as we can find ways to use the cash, which, overall, we feel will turn dollar bills into something larger than dollar bills, we will — we'll keep retaining the money.

And we won't measure that on whether we can find anything this week or this month, but we'll certainly measure it based on whether we can find anything in a couple of years, always.

We've had dry spells. Actually, right now, there's a little more going on than usual. But we've had dry spells a lot of times over a 20-odd year period. And you know, as I said, I wound up the partnership during one dry spell.

So that — it will be measured — it's measured partly on what's going on now, and it's measured partly on the expectancy.

And I don't think, whether our stock was selling at X or three-quarters of X right now, would make a lot of difference. But it would make a difference if we thought we couldn't find things to do with the money externally.

14. "Not too likely" we'll buy a business outside the U.S.

WARREN BUFFETT: The question about nondomestic operations, as you mentioned, we've got almost $8 billion in Coca-Cola and Gillette combined, and Coke has 80 percent-plus of their earnings from non-U.S. sources, and Gillette has maybe two-thirds or thereabout.

So, you can argue that almost 40 percent of the net worth of Berkshire — 35 to 40 percent — is operating outside the United States, just in those two investments alone.

In terms of buying a business outright, we don't preclude buying a non-U.S. domicile business. But it's not too likely that it'll happen.

We'd like to do it, particularly if it were large and if we understood it. But are we as likely to get a fix on a Helzberg's of Europe as we would a Helzberg's in the United States? You know, I doubt it.

I just don't know whether we would develop as much confidence in understanding the scene in which they operated, and understanding the management, and all that. But we might.

It would have to be a pretty simple business, and it would have to be a business where we thought we really understood the moat for a long time.

And it would have to be a business where we could establish a rapport with the management, despite coming from somewhat different backgrounds. It's not impossible, but I would say it's, you know, it's less than likely.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

15. Buffett: my growing fame isn't a distraction

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: Hi there. My name is Lee Debroff (PH) from Morgantown, West Virginia.

Ever since the Salomon debacle, it appears that you have attracted more and more media attention.

In this regard, there have been numerous displays that would appear to be distractions from the actual business of investing. To wit, we have watched as you attended Bill Gates' wedding in Hawaii, and bought a personal computer, and now wear striking designer ties. (Laughter)

And yesterday —

WARREN BUFFETT: Bill would've invited me to the wedding even if I hadn't have been at Salomon. (Laughs)

AUDIENCE MEMBER: Yesterday, we got those pennants during the rainout.

A very serious question, now that you've become this media darling, how can you assure us that you're still keeping your eyes concentrated on the proverbial ball? (Laughter)

WARREN BUFFETT: Well, I do get more mail than I used to, so we've developed a little more of a system on that. But I just — I do what I like to do.

Just take speeches, I probably get asked to make, maybe, 20 times as many speeches as I would've been asked to make 10 years ago, but I make the same number. You know, I've got the — I've got my own selection process for what I do on that.

And it's the same way, you know, I'm invited to, you know, I don't know how many dinner tributes, et cetera. And you know, they basically — I don't change the way I — what I do, because I don't want to change the way —

If I wanted something else — if, while I was building Berkshire, that was being done to end up in some other spot, I'd have been there by now. And it just doesn't change anything.

It does change the volume of mail, but I've got that so that that is not a big distraction.

Pardon me?

WARREN BUFFETT: Oh, I'll remain in Omaha. Yeah, there's no question about that. I mean, I — if I hadn't wanted to be in Omaha, I would have figured out ways to change, and it would have been very easy to change decades ago.

I think it's — we've got a lot of people here who aren't from Omaha, but that's their problem. I mean — (Laughter)

CHARLIE MUNGER: I have been watching Warren for a long time, and people who are concerned that he will change have a huge appetite for needless worry. (Laughter)

WARREN BUFFETT: The odds that I will change are about as good as the odds that Charlie will change. (Laughter)

The mail thing is a, you know, you wish you didn't — that there was an easier way to handle it.

But you essentially can't answer all the letters you get, it's that's simple. And that's about the — once you get past that and get a form letter that takes care of it, that takes care of it.

16. Decline in GEICO's return on equity

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Yes. I'm Samuel Park (PH) from Tulsa, Oklahoma.

My question is regarding GEICO. I noticed that, for the last five years, their return on equity has come down every year. Is this something that signifies change of a business, or just temporary things?

WARREN BUFFETT: Question is about GEICO's return on equity?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yes. Well, it's true, it has come down to some extent. The — GEICO's growth is, more or less, a function of, basically — I mean there's a natural rate of growth there.

And the growth in capital has been greater than the growth rate in premium volume and in invested assets, so that achieving the same success on underwriting and achieving the same success on investments will produce a lower return on capital unless they buy in stock, which they have done fairly significantly. But that's limited by availability, too, but —

It's a very good business. But it's not a business where, if you double the capital, you can double the earnings easily.

Charlie?

CHARLIE MUNGER: I have nothing to add.

17. No comment on Guinness investment

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name's Mark Hake (PH) from Scottsdale.

And I think your question — my question — about foreign equity investment was pretty much answered by the other gentleman.

But I noticed that you had made an investment in Guinness in the past. And can you comment on that? Do you — is it still owned? And if not, why not?

WARREN BUFFETT: We don't comment on purchases and sales of securities or ownership, unless either we're legally required to, or they hit this threshold level where we report annually.

And we move the threshold level up as our assets move up. We don't move it up as a percentage of assets. So that we used, as a cutoff this year, 300 million, I believe, of market value as to where we reported.

Now, if we'd owned the same amount of Guinness — which I'm not saying that we did — but if we owned the same amount of Guinness on December 31st, 1994, it would not have hit that threshold as we had on December 31st, '93. It would not have hit that threshold.

And we really don't want to get in the business where we are talking at all about what we're buying or selling. We get a lot of speculation on that, but it's of no use to Berkshire to be talking about purchases or sales.

If we were acquiring a piece of land downtown and we bought a quarter of what we intended to buy, for example, we would not feel we were benefitted by a front-page story in the paper saying that we were acquiring land.

And it — we are not in the business of giving investment advice, basically. We'll talk about our principles.

So, the only conclusion you can come to about Guinness, or anything else that does not show up on our list at year-end, is that we did not own $300 million's worth at market value at that time.

18. Buffett's Berkshire shirt isn't available

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Yes, Mr. Buffett. My name is Don Bresca (PH), I'm from Boston, Massachusetts.

Recently I've noticed you wearing an IZOD shirt with Berkshire Hathaway in the middle — there was a fist grasping cash. Is that the new insignia?

And the second question is, is that shirt available to stockholders? (Laughter)

WARREN BUFFETT: The shirt is not available. That shirt was a gift from someone, and the shirt is not available to stockholders. But you can draw your own conclusions, the meaning of it. (Laughs)

19. No matchmaking for Mrs. B and Phil Carret

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes. I'm Lyle McIntosh from Missouri Valley, Iowa, about 25 miles up the road.

And Warren, recognizing this is corn country, and I farm, and there's several other farmer shareholders, this meeting hits right in the middle of corn planting.

Could you move it back about three weeks? (Laughter)

And also, I noticed [mutual fund pioneer] Phil Carret was on "Wall Street Week" Friday night. I'm sorry I don't know his marital status, but if he is available have you thought about introducing him to Mrs. B. [Nebraska Furniture Mart founder Rose Blumkin]? (Laughter)

WARREN BUFFETT: Well, Mrs. B., incidentally, was out working yesterday. I went out and dropped by to see her about 4 o'clock, and she was doing fine.

She will be 102 late this year, and my guess is she will be working on her 102nd birthday as well. But I'll let Phil and Mrs. B. handle their own affairs, in that respect. (Laughter)

CHARLIE MUNGER: He's probably a little too young for her. (Laughter)

20. "We're open to buying anything"

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Well, I'm Ken Donovant (PH), a Cincinnati investor.

You've addressed the subject of your feelings about buying entire foreign corporations.

I wonder if you'd say something about, or is Berkshire looking for opportunities to buy, we'll call them near-franchise companies, that might be based overseas — buying a stock interest or a part interest? And also, how do you feel about fixed-debt investments of overseas companies?

WARREN BUFFETT: Debt investments, was that?

AUDIENCE MEMBER: Yes. Well, the first part was buying a stock investment rather than a whole company.

WARREN BUFFETT: Right.

AUDIENCE MEMBER: And the second part was debt investments.

WARREN BUFFETT: Yeah. Well, we're open to buying anything. When you say, are we looking at them, I've never been quite sure how we look at things anyway. I mean, they just seem to sort of pop up from reading or something of the sort.

But we're — it's less likely we end up doing it, for some of the reasons I've given earlier. But we have bought stock in companies that — aside from Guinness, that are domiciled outside of the United States. And we would have — we could conceivably buy debt instruments.

We don't buy a lot of debt instruments anyway, so it'd be very unlikely.

But we will do anything we think makes sense at Berkshire, that's compatible with the way we want to operate. And certainly, we don't care where — the domicile is not that important.

Charlie?

21. Helzberg has unusually good sales for jewelry retailer

WARREN BUFFETTL OK, zone 5, is it?

AUDIENCE MEMBER: Scott Spilcovich (PH), New York City.

My question is regarding the Helzberg acquisition. Can you comment on things such as the acquisition price, your sales and profit expectations, and how much debt was on the books at the time of the acquisition?

WARREN BUFFETT: This is in reference to which acquisition?

AUDIENCE MEMBER: Helzberg.

CHARLIE MUNGER: Helzberg.

WARREN BUFFETT: Well, we have not put out the figures on Helzberg's, and we won't be.

But we evaluate — the sales have been published at about 280 million for the year that ended in February, and there'll be considerably more in the current year.

But we have not put out the figures. I can tell you that, obviously, that we think that, in terms of the amount we are laying out in terms of shares and/or cash — we think, over time, that it's going to be a very decent acquisition.

It's the same line of reasoning we've applied in other businesses. Retailing, as I mentioned earlier, is the kind of business where you have to stay smart over time, and we have a terrific manager, a fellow named Jeff Comment, who's going to be running it.

And his record is extremely good, and I would bet the record would stay good.

It earns good returns on invested capital or we wouldn't be buying into it. We always look for good returns on capital.

And a lot of companies in the jewelry business do not get good returns on capital. I mean, it's not an industry that — where most of the participants are prosperous.

It takes unusual sales per square foot compared to competitors to succeed in that, and we have one operation that does that in spades at Borsheims, and then a different type of operation that does it at Helzberg's.

The typical jewelry store operation is not a very good business, but we think we've got two good operations.

Charlie?

CHARLIE MUNGER: Yeah, we frequently find that owners of entire businesses have schizophrenia. They want to sell their business for a little more than it's worth, taking stock, so they don't have to pay taxes.

And they want the stock to be the kind of — to be in a kind of business that will make just one dumb acquisition — theirs, and thereafter will guard the stock like gold, making no more dumb acquisitions. (Laughter)

Needless to say, the world is not that easy. And I think over time, we've made acquisitions that were fair on both sides, and averaged out, they've worked well for Berkshire.

And I think a company that behaves that way is giving the best long-term value to the private owner who wants to sell. You do not want to sell your business for stock to a firm that likes issuing stock.

22. Insurance float important in estimating intrinsic value

WARREN BUFFETT: Zone 6?

VOICE: That was six.

WARREN BUFFETT: Where do we have the mic? Oh, there. I don't think it's on.

AUDIENCE MEMBER: Can you hear me now?

WARREN BUFFETT: Yeah, sure.

AUDIENCE MEMBER: Jack Glanding (PH) from Knoxville, Tennessee.

I have a question which may not be appropriate for the officers of Berkshire to answer, but I think I'll ask it anyway.

You focused on intrinsic value in your annual report, and you suggested that by reviewing the grey pages in the back that one could come up with a — possibly come up — with a value of intrinsic value for Berkshire.

I've made an effort to do this, and I think I come up with a price-to-earnings ratio somewhere around 21, which seems to be a little overvalued.

I'd like to ask you, Mr. Buffett, if you would care to divulge what you believe is the intrinsic value of Berkshire?

And if you're not willing to do that, do you consider the price of Berkshire at this level to be fair?

WARREN BUFFETT: I — every year I get asked that, in one form or another, and I always say that I don't want to spoil the fun for those of you who are working out the intrinsic value for yourself.

You have all the numbers that we have that are key to it.

And I would say that there are some important factors besides P/E. I mentioned earlier that I thought that the page where we describe float, for example, is probably as important a page as there is in the report.

And then the question is, you know, what do you do with the capital as you allocate it over time? And obviously, that makes a difference in intrinsic value, too.

But I would say in a general way that I — and this has been true virtually all of the time that — I think — I would say that the intrinsic value of Berkshire in relation to its — actually, I'll put it the other way.

The price of Berkshire in relation to its intrinsic value, I think, probably offers as much value as, or more, than the majority of stocks that I see. But I don't want to go any further than that.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

The — your story about the fun of working it out, though, there's a famous English headmaster who used to say to each graduating class, he said, "Five percent of you are going to become criminals, and I know just who you are.

"But I'm not going to tell you, because I don't want to deprive your lives of a sense of excitement." (Mild laughter)

WARREN BUFFETT: We'll explain that later on. (Scattered laughter and applause)

There is a lot more to — there's more to intrinsic value, as we've discussed earlier, than just adding up what you think you can sell the pieces for at any given time, because it is a prospective figure. It is future cash discounted back to the present. And capital allocation is a good part of that.

What you expect the float to do, for example, over time, would not — that would lead to a large swing in possible numbers relative to value.

I mean, if — when we bought National Indemnity in 1967, when it had whatever it had, 15 or 20 million in float, we didn't see it then.

But if we could have foreseen the eventual development of float over time, it might have turned out that the intrinsic value of National Indemnity was many multiples of what most people might have thought at the time, and probably what we thought at the time.

23. Hagstrom book had "some effect" on Berkshire's stock price

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Richard Ducheck (PH) from Melbourne, Florida.

I have a two-prong question, first on the stock. As we all know, the first month this year we ramped up about 25 percent and then we pulled back, I guess, about 20.

Just wondering your thoughts on that, if specifically you attribute that to the books perhaps, or institutional buying or, you know, what explanation you might have for that. And second —

WARREN BUFFETT: I would say — I'll answer that first. I would say [Robert] Hagstrom's book ["The Warren Buffett Way"] undoubtedly had some effect on that. It's impossible to measure, but that book sold a lot of copies. And my guess is that that had some effect.

AUDIENCE MEMBER: OK. More so than institutional buying? Because I've heard rumors like Fidelity and whatever were buying —

WARREN BUFFETT: I can't — I just don't know the — I don't know how to separate out the variables, but I would say that the book was certainly a factor at that time, and it's unreasonable to assume that it had no effect.

CHARLIE MUNGER: Well, a lot of the buying came in in odd lots, so —

WARREN BUFFETT: A lot of odd lot activity, yeah.

CHARLIE MUNGER: Certainly looked like book buyers. (Laughter)

24. Buffett doesn't understand Microsoft, despite his friendship with Gates

AUDIENCE MEMBER: Secondary question, I'm an electronics engineer by profession. So, the technology sector is of prime interest to me, and I think we'll all agree, at least the last six to eight months has been phenomenal for the technology sector.

And I also see that you're somewhat befriending Mr. Gates, inviting him into your house, et cetera.

Is there a possibility down the road apiece of you doing some type of purchase of Microsoft, or acquiring that? Or is there something — (laughter) — you two could work out together?

WARREN BUFFETT: I bought a hundred shares one of the day — first day — I met Bill, and that was the end of it. I just want to be sure I got his reports from that point on. This is personal, not in the — not in Berkshire.

There's no chance we'll be in businesses we don't understand, and I won't understand it.

AUDIENCE MEMBER: No, you're quite clear on that. I just thought maybe there'd be an exception, because apparently —

WARREN BUFFETT: Well, if you made an exception, he would be a good guy to make — a very good guy — to make an exception with. But I don't think I'll make an exception.

25. Business schools should study Mrs. B's success

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name is (inaudible) from Arlington, Texas.

Mr. Buffett and Mr. Munger, what possibility to use these two great minds for a long term in life, by either taking apprenticeship in Berkshire or open a school?

CHARLIE MUNGER: I didn't follow that one. Warren, you handle it.

WARREN BUFFETT: Is it a question of what —?

AUDIENCE MEMBER: What the possibility of using these two great minds of yours to educate a new generation as a long-term investment in this country, either through apprenticeship in Berkshire for young people or open a business school?

CHARLIE MUNGER: Well, let me try that one because I have a demonstrated record of nonperformance. (Laughter)

I have had great difficulty enabling my children to know what I know. (Laughter)

And Warren, maybe you have failed less. (Laughter)

WARREN BUFFETT: My children, in many ways, are a lot smarter than I am. So, I've had different experience, Charlie. (Laughs)

No, I think you can — you know, I've mainly learned by reading myself, so I don't think I have any original ideas that — I've certainly got a lot —

I mean, I've talked about reading Graham, I read Phil Fisher, and I've gotten a lot of ideas myself from reading. And in my own case, I mean, talk about your parents having influences, you know, my parents had an enormous influence.

So, I think you can learn a lot from other people. In fact, I think, if you learn reasonably well from other people, you don't have to get any new ideas or do much on your own. You can just apply the best of what you see.

CHARLIE MUNGER: Generally speaking, I think we always get a group of wise people after sifting millions. But I don't think anybody's invented a way to teach so that everybody is wise.

It's extraordinary how resistant some people are to learning anything. (Laughter and applause)

WARREN BUFFETT: Really, what is astounding is how resistant they are when it's in their self-interest to learn.

I mean, I was always astounded by how much attention was paid to Graham — I mean, he was regarded 40 years ago as the dean of security analysts —but how little attention was paid, in terms of the principles he taught. And it wasn't because people were refuting them, and it wasn't because people didn't have a self-interest in learning sound investment principles. It's just this incredible resistance to thinking or change.

I mean, I quoted Bertrand Russell one time as saying — who said that, "Most men would rather die than think. Many have." (Laughter)

In the financial sense, that's very true. It's not complicated. I mean, human relations, you know, usually aren't that complicated, but — and certainly it's in people's self-interest to develop habits that work well in human relations, but an amazing number of people seem to mess it up one way or another.

CHARLIE MUNGER: How much has Berkshire Hathaway been copied, either in investing America or corporate America? I'm not saying we deserve to be, necessarily. But people don't want to do it differently than they're presently doing it.

WARREN BUFFETT: You might argue that Mrs. B. [Nebraska Furniture Mart founder Rose Blumkin], having started what you may have seen out there this weekend, with $500 in 1937, you know, without a day in school in her life, and building that into a great enterprise, you might say, "Well, that is something to study."

I mean, is it because she couldn't speak English when we got — you know, she got over? Maybe we can explain to people — I mean, what is there to learn from seeing somebody create an incredible success like that in a competitive business?

She didn't invent something that the world had never seen before. She didn't have a lock on some piece of real estate that protected her from competition.

You know, all of these — and yet, she accomplished something that virtually no one has accomplished.

Now, why aren't business schools studying her? You know, why are they talking about EVA, you know, economic value added, as we talked about earlier? I mean, here is a success. Something has made her a success.

You know, is it something — is it a 200 — and she's very smart — but is it a 220 IQ? No, it isn't. It's a very smart woman, but it's not something that's incapable of being replicated in the habits and the way of thinking. But who is studying her?

I mean, they present her as a curiosity. But if you go to any of the top 20 business schools, you know, there's not one page that's being given to anybody to study what is an incredible success. And I just — I find that very interesting that — and to some extent, you know, I've seen it in the investment world.

There's this — for one thing, the high — you know, it's probably a little discouraging to a professor of management at some major business school that has gone on to get his doctorate and everything, to think he has to come and hang around the Furniture Mart — (laughter) — study a woman in a golf cart, I mean — (Laughter)

But you could — they'd be better off if they did.

26. Do what you like now, not later

WARREN BUFFETT: Where were we on that? What zone are we on, four, are we? Wherever it is. Zone 3 maybe, huh?

AUDIENCE MEMBER: Yes, thank you. I'm Jim Ludke (PH) from Phoenix, Arizona.

And I haven't been to one of your annual meetings for about 10 years now. The last one was down at the Red Lion Inn by the water. And I congratulate you on your popularity.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: I wish I had bought more stock then. (Laughter)

But like Charlie, I too, have been giving mine away for charitable purposes. So, your beneficial effects have reciprocated and rippled throughout the economy. I congratulate you.

WARREN BUFFETT: No, I congratulate you.

AUDIENCE MEMBER: What do you think has changed — well, one thing is that Ben Graham — commenting on what you just said — I'm a student of Ben Graham, and he said it never ceased to amaze him how widely read he was and least followed.

But how have you changed in the last 10 years? Much, if any? Or none at all? Or —

WARREN BUFFETT: Well, we'll let Charlie — he's been watching me. (Laughter)

CHARLIE MUNGER: I'd say about one stone. (Laughter)

Takes one to know one. (Laughter)

WARREN BUFFETT: If we'd wanted to change, we would have changed a long time ago.

I mean, I've never believed much in this theory of, you know, if I have 2X instead of X that I'm going to do this or that, or I'll take this job I don't like now, and I'll get one I like later on, or —

It doesn't make that much sense to me. I mean, there aren't that many years around, so you ought to be doing what you like at the present time, and Charlie and I have always followed that pretty well.

27. "We let .400 hitters swing the way they want to swing"

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Peter Borma (PH), Chicago.

Every year, you have your operating companies send a check back to Omaha. What percentage do the heads of the operating companies keep as a bonus, and how do you set that figure?

WARREN BUFFETT: Well, we have different bonus arrangements at different companies. It would be a big mistake, with businesses with as many different economic characteristics, or as varying economic characteristics existing, as they do at Berkshire, to try and have some formula approach that paid managers in all of these different businesses based on a simple formula of one kind.

So, we have, I think, four businesses where they own a part of it. And we have varying arrangements with the various businesses.

Some businesses, capital employed is unimportant. There simply isn't a way to employ a lot of capital. So, we do not have a capital charge, even, at those businesses. We don't believe in going through a lot of machinations if it's going to involve peanuts at the end.

So, some businesses have a capital charge, some businesses don't have a capital charge. If they use a lot of capital, they're going to have a capital charge, is what it amounts to.

Some businesses are easy businesses, some businesses are tougher businesses. So, we have different thresholds where things kick in based on that.

We simply sit down and try and figure out, in the case of each business, what makes sense. And that usually isn't very hard to figure out.

I mean, we want something that's fair. The best managers, we aren't going to change their behavior much by the compensation thing. We may a little bit, in terms of teaching them how we think about capital employed.

But in terms of their enthusiasm for the business, imagination, and marketing, and all that, basically we usually buy businesses with those people in place.

But it would be — A, it'd be wrong not to treat people fairly, and they would resent it if they weren't treated fairly, too, understandably.

So we try to have a system that rewards the things that we want to have rewarded, and treats them fairly in a way that they understand they're treated fairly.

And I don't think we have any two businesses that have the same arrangement. They're different in each case.

Incidentally, that applies in their policies, too. We don't get into — very seldom, I should say, maybe once or twice — but they have different arrangements in terms of compensating their employees.

Some of our businesses have budgets, some of them don't. We don't have any budgets that come up to headquarters. We let .400 hitters swing the way they want to swing. And some of them, you know, have a little different swings than others, but overall, they're extremely effective.

And they feel, and we want them to feel, like they own their own business. If they felt — if somebody that's independently wealthy sold us a business and we started telling them how to swing, they would tell us what we could do with it very quickly, because they don't need that in life.

So, what we have to do is create a situation, or maintain a situation, where they are having more fun doing what they're doing than anything else they can do in life, and that's what's we're designing for. And then we have to treat them fairly in respect to that.

Charlie?

CHARLIE MUNGER: Nothing to add.

28. "Foreign exchange baffles me, frankly"

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Roger Hill from Racine, Wisconsin.

Gentlemen, a little change of pace. Could we get your opinion on the present situation with international exchange? Do you think we have a dollar problem, or is — the Japanese have a yen problem?

WARREN BUFFETT: Well, I'm going to let Charlie answer that. (Laughter)

CHARLIE MUNGER: I have no comment. (Laughter)

WARREN BUFFETT: That's probably — that's a very good question, but the trouble is anytime I say, "That's a very good question," it's probably because I don't know the answer.

And I — you know, I don't know the answer to that. Foreign exchange baffles me, frankly.

I mean, you know, I think in terms of purchasing power parity, because that's a natural way to approach it. But purchasing power parity does not work very well as a guide to how exchange values will behave in any shorter, medium, or maybe even long term, because the world adapts in different ways.

Sometimes it adapts by high rates of inflation to a sinking currency. Usually it does. It hasn't done that in respect to ours, but we're only sinking relative to a couple of other important currencies.

I don't have a great answer for you on that, sorry.

29. We don't look for small stock bargains anymore, but they exist

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: Hi, I'm Howard Winston (PH) from Cincinnati, Ohio.

First, I wanted to thank you and Charlie for sharing your time with us today.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: My question is, you've repeatedly said that you see many wonderful stock ideas but can't invest because they're too small.

Given that many in the audience today have a lower dollar investment threshold — (Laughter)

WARREN BUFFETT: "Do these stocks have names?" (Laughter)

AUDIENCE MEMBER: Yeah. Well said. (Laughter)

WARREN BUFFETT: Well, the answer to that is that we don't look anymore. We assume that there are a reasonable number of opportunities as you work with smaller amounts of capital because it's always been true.

I mean it was — over the years, as I looked at things, clearly, you run into companies that are less followed as you get smaller. And there's more chances for inefficiency when you're dealing with something where you can buy $100,000 worth of it in a month, rather than 100 million.

But that is not because I am carrying around in my head the names of 25 companies that we could put 100,000 in. I just don't look at that universe anymore. I —

Sometimes, people send me annual reports, or I get letters from managers and they say, you know, "I've got this wonderful thing." I look — I usually know ahead of time, but I mean, I would first look at the size. And if the size isn't right — and it isn't going to be virtually any time — I don't look any further, because there's just no time to be looking at all kinds of smaller opportunities.

I do think, if you're working with very small amounts of money, that there almost always are some significant inefficiency someplace — to find things.

I've mentioned to some people, when I started out, I actually went through all of the Moody's manuals and the Standard and Poor's manuals page by page.

And you know, it was probably 20,000 pages, but there were a lot of things that popped out, and none of them were in any brokerage report or anything of the sort. They were just plain overlooked, and you had to —

You could find out about them, but nobody was going to tell you about them. And my guess is that continues to be true, but not on anything like the scale it was then.

Charlie?

30. Early Buffett cigar butt: Delta Duck Club

CHARLIE MUNGER: Well, I can remember when you bought one membership in some duck club that had oil under it, when you were young.

WARREN BUFFETT: Yeah, that was a company called Atled —

CHARLIE MUNGER: When you get down to one duck club membership, well, you're really scavenging for cigar butts. (Laughter) But —

WARREN BUFFETT: Not a bad cigar butt. There were 98 shares outstanding. It was the Delta Duck Club. And the Delta Duck Club was founded by a hundred guys who put in 50 bucks each, except two fellows didn't pay, so there were only 98 shares outstanding.

They bought a piece of land down in Louisiana, and one time somebody shot downward instead of upward, and oil and gas started spewing forth out of the ground. (Laughter)

So, they renamed it Atled, which is Delta spelled backwards, which was — sort of illustrated the sophistication of this group. (Laughter)

And a few years later, they were taking up — at $3 a barrel oil — they were taking about a million dollars a year in royalties out of the place. And the stock was selling at $29,000 a share, and it was earning $10,000 a share —

No, it was earning about $7,000 a share after-tax, about 11,000 pretax, and it had about 20,000 a share in cash. And it was a long-lived field.

So, you know, I use that sometimes as an example of efficient markets, because somebody called me and offered me a share of it, and those things, you know — is that an efficient market or not?

You know, 29,000 for 20,000 of cash, plus 11,000 of royalty income at 25 cent gas and $3 oil? I don't think so.

You can find things out there. I'll give you hunting rights on all my duck clubs in the future. (Laughter)

31. Secret to avoiding lawsuits: "You can't make a good deal with a bad person"

WARREN BUFFETT: Zone 1.

Don't think the mic —

AUDIENCE MEMBER: How do Berkshire and Berkshire companies protect themselves against lawsuit-happy lawyers? And is it possible for American businesses to survive the financial and time-consuming costs of dealing with lawyers?

WARREN BUFFETT: Well, that's a good question and we've probably had less litigation than any company, you know, with a $25 billion market value in America.

But it's, you know — we were sued one time at Blue Chip Stamps — what was it for, Charlie, and how many billion by some guy?

CHARLIE MUNGER: Lots.

WARREN BUFFETT: Yeah. It was — you know, there — you cannot protect yourself against lawsuits, and there are certainly a lot of frivolous ones we've — like I say, we have — it's not been a drain on our time or money — but particularly time — to date.

And I think one thing you'd have to do is, if you ran into anything of that sort, you would not pay and you would make life as — try to make life comparably difficult for the other party as they made it for you. But that has not been our experience so far.

Charlie?

CHARLIE MUNGER: Yeah. Well, I can tell an Omaha story on that one which demonstrates the Berkshire Hathaway technique for minimizing lawsuits.

When I was a very young boy, I said to my father, who was a practicing lawyer here in Omaha, “Why do you do so much work for X,” who was an overreaching blowhard — (Laughter) — “and so little work for Grant McFayden,” who was such a wonderful man?

And my father looked at me as though I was slightly slow in the head. And he said, “Charlie,” he said, “Grant McFayden treats his employees right, his customers right, everybody right.

“When he gets involved with somebody who’s a little nuts, he gets up from his desk, and walks to where they are, and extricates himself as soon as he can.” And he says, “Charlie, a man like Grant McFayden doesn’t have enough law business to keep you in school. (Laughter)

“Ah, but X,” he said, “he’s a walking minefield of continuous legal troubles, and he’s a wonderful client for a lawyer.”

Now, my father was trying to teach me, and I must say it worked beautifully, because I decided that I would adopt the Grant McFayden approach.

And I would argue that Warren independently reached the same approach very early in life. Boy has that saved us a lot of trouble. That is a — it is a good system.

WARREN BUFFETT: You can’t — yeah, we basically have the attitude that you can’t make a good deal with a bad person. And you can — that means we just forget about it.

I mean, we don’t try and protect ourselves by contracts, or getting into all kinds of, you know, due diligence, or —

We just forget about it. We can do fine over time, dealing with people that we like, and admire, and trust.

So we have never — and a lot of people do get the idea, because the bad actor will tend to try and tantalize you in one way or another, and —you won’t win. It just pays to avoid them.

We started out with that attitude, and you know, maybe one or two experiences have convinced us, even more so, that that’s the way to play the game.

32. Why there’s just one Borsheims store

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: I’m Clarence Cafferty from Long Pine, Nebraska.

I’d like to know if we can get another .400 hitter by starting another Borsheims store someplace in this United States.

WARREN BUFFETT: Well, it's an interesting question about both the Borsheims and the [Nebraska Furniture] Mart. I mean, they — and of course, they're owned — as you probably know — historically, by the same family. I mean, it was Mrs. B.'s sister's family that bought Borsheims, but, in effect, started it virtually from scratch.

And the — both of those institutions offer this incredible selection, low prices brought about by huge volume, low operating costs, and all of that.

Operating multiple locations, you would get some benefit, obviously, from the name and the reputation.

But you would lose something, in terms of the amount of selection that could be offered. There's $50 million-plus at retail of jewelry at Borsheims' one location.

Well, when someone wants to buy a ring, or a pearl necklace, or something of the sort, they can see more offerings at a place like that than they possibly could at somebody who is trying to maintain inventory at 20 or 50 locations.

Similarly, that gives us a volume out of a given location that results in operating costs that, again, can't be matched if you have an enormous number of locations.

So, I think those businesses tend to be more successful in that particular mode as one-location businesses.

Now, a Helzberg's will be bringing merchandise to people all over the country at malls. And they will do — through that mode of operation, they perform that exceptionally well.

But Borsheims can't be Helzberg's, and Helzberg's can't be Borsheims. They're both going for two different — in a sense, two different customers, to some degree.

Sol Price, Charlie's friend who started the Price Club, the first big wholesale club, said that part of his success was due to figuring out the customer he didn't want. I think that's right, isn't it, Charlie?

CHARLIE MUNGER: Right.

WARREN BUFFETT: You have to figure out what you're good at and who you really can offer something special to. Borsheims offers something very special to people, but in part, it comes about through being at one location.

You can see more of almost any kind of jewelry you want there than you're going to see virtually any place in the world. And that will bring people there, or it will bring male people there.

And that gives you operating costs that are many — oh, 20 percentage points — off of what somebody else will be doing without that pulling power.

And that, in turn, enables you to offer the lower prices, which keeps the circle going. I mean, it's very hard to replicate something like that. And trying to do it in 10 spots probably wouldn't work well.

But it's a question you ask yourself as you go along, obviously, when you — McDonald's certainly did well by deciding to open a second store. I mean — (Laughter)

33. Factors boosting reported return on equity

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Warren, I'm Frank Martin from Elkhart, Indiana.

You have written extensively on the subject of the immutability of return on equity for American industry, as a whole, being stuck in the 12 to 13 percent range.

What forces do you see, since we're above the mean, to cause that number to regress to the mean over time?

WARREN BUFFETT: Yeah, it's true, it has been higher in the last few years. Although Fortune's got some interesting figures in the current issue, on the 500, that shows decade by decade what the return has been on the Fortune 500 group — which is a shifting group, of course.

And it's tended to stick, although I would say it was more between 12 and 13 than 11 and 12, probably, in that one.

The return, to some extent, in certain business has gotten a big kick because they finally put the health liabilities on the balance sheet, and therefore reduced equity.

So if you — anything you do that tends to pull down equity, if it doesn't change your ability to do the same sales volume — it's leveraged American business, in effect, by putting the health liabilities on the balance sheet.

It may be wrong. It may be that business can earn 15 percent or so. But I think competitive factors tend to, over time, keep pushing that number down, somewhat.

And 12 or 13, when you think about it, is not bad at all. I mean, it's a level, with 7 percent interest rates, that allows stocks and equity to be worth much more when employed in equity than elsewhere in the world.

But if I had to pick a figure for the next 10 years, I would pick some figure between 12 and 13, but that doesn't mean I'd be right on it.

Charlie?

CHARLIE MUNGER: Yeah. I think all of those published averages overstate what's earned anyway. They're the biggest companies, they're the winners, they're the ones whose stock sells at high multiples, so they can issue it to other people for high-earning assets.

And many of the low-return people are constantly being dropped out of the figures. Now, you can say that was true in the past, too. But it would be remarkable to me if, on average, American business earned 13 percent on capital after taxes.

WARREN BUFFETT: Those figures, incidentally — it isn't a huge item, but it's not totally insignificant. They don't show as a cost, for example, the cost of stock options.

And the American shareholders pay that, so the American shareholder has not gotten the returns on equity shown by those numbers, although it's not a huge factor.

But I wouldn't be surprised if it was, you know, two or three-tenths of a percent just for that one cost that's omitted.

If you let me omit my costs, I can show a very high return on equity. (Laughter)

34. Return on capital at Berkshire subsidiaries

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Jeff Peskin (PH) from New York. And I have a question for you.

It's really more of an observation, in that you've written about when you look at acquiring a business, you look a lot at how they allocate capital.

And my question is, once you acquire a stake in a company, do you find that, just by the fact that you are helping doing the allocation of capital and doing the compensation, that that alone makes a company have a lot higher return?

Or is there some benefit by the fact that you own, or some major shareholder, owns a big slug of the company that also allows a company to increase its return on capital?

WARREN BUFFETT: Well, that's a good question. The answer is sort of, some of the time, some of the places. It's the —

There's no question, in a business that earns a high rate on capital, that doesn't have natural ways to employ that money within the business, that we actually may contribute significantly to the long-term results of that business by taking the capital out.

Because if they don't have a place to use it, nevertheless, they might well use it someplace. And we have the whole universe to spread that money over.

So we can take the money that's earned in some operating business and we can buy part of the Coca-Cola Company with it, and buy into another wonderful business, whereas very few managements probably would do that. So, there's an advantage there.

Now on the other hand, Helzberg's, for example, will probably grow very substantially. They'll probably use all the capital they generate. Maybe they'll even use more. Well, they don't really need us for that. I mean, they would've done that under any circumstances.

We may actually give them the ability to grow even a little faster because if a company — and this is not the — these are not the Helzberg's figures — but if a company is earning 20 percent on equity but can grow 25 percent a year, you know, they're going to feel equity strains at some point. And we, obviously, would love the idea of supplying extra capital that would earn 20 percent on equity.

So, there can be some advantage to having us as a parent, in terms of sending capital to the business, as well as taking capital from the business.

We also, I think, can be helpful in some situations, in that once we are there, a lot of the rituals — particularly in a public company — but a lot of the things that people waste time doing in business, they don't have to do with us.

I mean, there's an awful lot of time spent in some businesses just preparing for committee meetings, and directors meetings, and all kinds of things like that, show-and-tell stuff. And none of that's needed with us. We won't go near them.

And so, we really free them up to spend a hundred percent of the time thinking about what is good for the business over time. If they have extra money, they don't have to worry about what to do with it.

If they need extra money for a good business, it'll be supplied. So, there are some advantages that way. And I guess —

Charlie, can you take it any further?

CHARLIE MUNGER: Yeah. I think our chief contribution to the businesses we acquire is what we don't do.

(BREAK IN RECORDING)

35. "Advanced math is of no use" in investing

AUDIENCE MEMBER: — it's hard to continue to grow at the rate you've grown in the past because the company has gotten so big. And I'm wondering if you could elaborate a little bit on that.

And my second question, which is totally unrelated, but I've also read where you're very good with numbers, with working things in your head. And I'm totally a rookie when it comes to economics and accounting and things like that, but I'm very good with numbers and keeping things in my head.

And I'm wondering if there's some way a mathematician who knows very little about the business world, what I could read or what I could do to learn how better to invest and how you did that.

WARREN BUFFETT: Well, going to the first question, when you say it's going to be hard — it's going to be impossible. I mean, now that's the answer. We cannot compound money at 23 percent from a $12 billion base.

We don't know how to do that, and it would be a mistake for anybody to think that we could come close to that. We still — we think we can do OK with money, but we did not start with a $12 billion base.

And we've never seen anybody in the world compound numbers like that, at that rate. So, we'll forget it — that part of it, but there are intelligent things we can be doing.

The second part of the question, I don't think any great amount of mathematical aptitude is — not aptitude, but mathematical knowledge is a — advanced math is of no use in the investment process.

And understanding a mathematical relationship, sort of an ability to quantify — a numeracy, as they call it, I think that's generally helpful in investments because something that tells you when things make sense or don't make sense, or sort of how an item in one area relates to something someplace else.

But that doesn't really require any great mathematical ability. It really requires sort of a mathematical awareness and a numeracy. And I think it is a help to be able to see that.

I mean, I think Charlie and I probably, when we read about one business, we're always thinking of it against a screen of dozens of businesses — it's just sort of automatic, and —

But that's just like a scout in baseball thinking about one baseball player against an alternative. I mean, you only have a given number on the squad and thinking, you know, "One guy may be a little faster, one guy can hit a little better," all of that sort of thing. And it's always in your mind, you are prioritizing and selecting in some manner.

My own feeling about the best way to apply that is just to read everything in sight. You know, I mean, if you're reading a few hundred annual reports a year and you've read Graham, and Fisher, and a few things, you'll soon see whether it kind of falls into place or not.

Charlie?

CHARLIE MUNGER: Yeah. I think the set of numbers — the one set of numbers in America that are the best quick guide to measuring one business against another are the Value Line numbers.

WARREN BUFFETT: I'd agree with that.

CHARLIE MUNGER: That stuff on the log scale paper going back 15 years, that is the best one-shot description of a lot of big businesses that exists in America. I can't imagine anybody being in the investment business involving common stocks without that thing on the shelf.

WARREN BUFFETT: And, if you sort of have in your head how all of that looks in different industries and different businesses, then you've got a backdrop against which to measure.

I mean, if you'd never watched a baseball game and never seen a statistic on it, you wouldn't know whether a .300 hitter was a good hitter or not.

You have to have some kind of a mosaic there that you're thinking is implanted against, in effect. And the Value Line figures, you know, they cycle it every 13 weeks. And if you ripple through that, you'll have a pretty good idea of what's happened over time in American business.

CHARLIE MUNGER: By the way, I pay no attention to their timeliness ratings, or stock ratings.

WARREN BUFFETT: No, none of that means anything. It's too bad they have to put that there, but that —it's the statistical material, not the —

CHARLIE MUNGER: I would like to have that material going all the way back. They cut it off about, what, 15 years back?

WARREN BUFFETT: Yeah, but I save the old ones. (Laughter)

CHARLIE MUNGER: Yeah. But you know, I wish I had that in the office, but I don't.

WARREN BUFFETT: Yeah, we — Charlie and I — maybe even, I do it more — we tend to go back. I mean, if I'm buying Coca-Cola, I'll probably go back and read the Fortune articles from the 1930s on it or something.

I like a lot of historical background on things, just to, sort of, get it in my head as to how the business has evolved over time, and what's been permanent and what hasn't been permanent, and all of that. I probably do that more for fun than for actually decision making.

But I think it is — I think if you think about if — we're trying to buy businesses we want to own forever, you know, and if you're thinking that way you might as well see what it's been like to own them forever, and look back a ways.

36. Management made the difference for Wells Fargo

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: I'm Stewart Horejsi from Salina, Kansas.

When you first bought part of Wells Fargo a few years back, I looked at it and I couldn't tell it was any better than any of the other banks. I think, now, anybody that would look at it can tell it's better than almost any bank.

Now you've bought PNC Bank, and again, I can't see how it's distinguished from any of the other banks. (Laughter)

What did you see in PNC Bank that made you select it over all the other banks that were available?

WARREN BUFFETT: (Laughs) Well, we're not going to give any stock advice on that. So, I think that going back to Wells, it was very clear that, if you —

I knew something about Carl Reichardt, and to a lesser extent at that time, Paul Hazen, from having met them and also from having read a lot of things they said.

So, they were different — they were certainly different than the typical banker. And then the question was, is how much did that difference make, in terms of how they would run the place?

And they ran into some very heavy seas, subsequently. And I think, probably, the difference — I probably think those human differences that were perceived earlier are what enabled them to come through as well as they did. But that's about all I can say on banks.

CHARLIE MUNGER: You know, you might add to that slightly, because that Wells Fargo thing is a very interesting example. They had a huge concentration of real estate lending, a field in which people took the biggest —

It was the biggest collapse in 40 or 50 years in that field, so that if they had been destined to suffer the same sort of average loss per real estate loan that an ordinary bank would've suffered, the place would've been broke.

So, we were basically betting that their real estate lending was way better than average. And indeed, it was. And they also handled it on the way down, way better than average.

So, you can argue that everybody else was looking at this horrible concentration of real estate loans and this sea of troubles in the real estate field, and in bankers to the real estate field. And they just assumed that Wells Fargo was going to go broke.

And we figured, no, that since their loans were way higher quality, and their loan collection methods were way higher quality than others, that it would be all right. And so, it worked out.

WARREN BUFFETT: Yeah, we couldn't have told that — if we hadn't gone a little further, though, than just looking at numbers, we would not have been able to make that decision.

37. Nothing "magic" about a positive shareholders' equity

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: David Carr, Durham, North Carolina.

Tambrands and U.S. Tobacco are two companies which are primarily single-focus product companies, that seem to possibly have some barriers to growth in unit sales and pricing, and have employed a strategy of returning cash to shareholders through stock repurchases.

Both companies have, at times — when they thought the stock was at a discount to intrinsic value — used debt to accentuate the repurchases.

Those companies recently have talked about problems with going into a negative shareholders — a negative stake to shareholders' equity position — through the use of additional debt to repurchase more shares, at a time when both companies believe their stock's very cheap. And they appear to have the type of long-term cash flow that would at least allow that.

Would you comment on the, at least, accounting treatment and the stated shareholders' equity, and if you think that should be a real concern for management in those areas?

WARREN BUFFETT: What was the first company, besides U.S. Tobacco?

AUDIENCE MEMBER: Tambrands.

WARREN BUFFETT: Do you want to?

CHARLIE MUNGER: Tambrands?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah, I don't think there's anything magic about whether shareholder equity is positive or negative. The — Coca-Cola has a shareholder equity of $5 billion. It has a market value of 75 billion or so.

Now, they're not going to do it and I'm not going to recommend it, but if they were to spend $10 billion buying in their stock they would have a negative shareholders' equity of 5 billion. They would — their credit would be sound.

I mean, if somebody else were to buy the company for 75 billion, they'd have 5 billion of tangible assets and 70 billion of intangible assets.

And there is nothing magic about a company having a positive shareholders' equity. And it isn't done very often. And I can't even think of a case where it's been done, but it may have been.

But I see no — I see nothing wrong with a company having a negative shareholders' equity, although it may be prohibited by the state in which they're incorporated, in terms of repurchasing shares at a time that would produce that. You'd have to look at the state law on that.

But anytime a company in an LBO, or something, is bought out at some very large number over book value, in effect, they're creating a negative— if they borrow enough money on it — they're creating a negative shareholders' equity, in terms of the previous shareholders' equity. And it's just a fiction, as to the numbers between the two organizations.

You should buy in your stock when you don't have a use for the money. And that could be management specific. I mean, some managements might have a use for the money if their field of capital allocation were large enough, whereas another management that was more specialized in their own business might not.

But once a company has attended to the things that are required or advantageous for the present business, we think reacquisition of stock is a very logical thing to consider, as long as you don't think you're paying more than the intrinsic value of the business in doing it.

And obviously, the bigger the discount from intrinsic value, the more compelling that particular use of money is.

Charlie?

CHARLIE MUNGER: I've got nothing to add. Generally speaking, maybe Coca-Cola can have a negative equity, but I don't think it would be a good idea for General Motors. I think there is something to be said for a positive shareholders' equity.

38. Looking for winners in competitive credit card business

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Edward Barr, Lexington, Kentucky. I had a two-fold question.

Number one, you mentioned American Express earlier. And I was curious as to whether the fact that credit card usage is only 10 percent of all transactions, and that may continue to grow for some time going forward, was a factor in your decision?

And the other part of the question pertains to the durability and permanence of the banking franchise with regard to alternative delivery channels that may appear over the next few years, including the possibility of the Microsoft/Intuit merger.

WARREN BUFFETT: Well, the specific number you mentioned about credit card usage and so on, that's not a big factor with us. We think credit cards are both here to stay and likely to grow, to some extent.

Although at some point you start reaching limits, at least in terms of outstandings [outstanding credit card debt] that people are — that make any sense.

But the credit card field is a very big field. The question is, is who's got the edge in it? Because everybody is going to want to be in it, and they already are. And there are a lot of different ways you can play the game if you're in the credit card business.

And you better have some way of playing one part of the game, preferably a large part. But you better have some way of playing one part of the game better than others or natural capitalistic forces are going to grind you down.

I mean, it's a business that people are willing to change their minds about what they do in. I mean, if you offer somebody a credit card that gives them some advantages that don't exist on their earlier card, people are quite willing to shift cards.

So, you need some kind of an edge in some particular segment of the market. So, the growth aspects overall of the market were not a big — are not a big factor with us.

It's really a question of figuring out who's going to win what game, and who's going to lose what game.

And what was the second question again on that?

39. Expect big changes in banking over next 20 years

AUDIENCE MEMBER: The second question pertained to the permanence and durability of the banking franchise.

WARREN BUFFETT: Oh yeah, sure.

AUDIENCE MEMBER: And whether alternative delivery channels over the next few years may erode the durability of that, including the Microsoft/Intuit merger.

WARREN BUFFETT: Well, that's a good question. You're certainly seeing the value of bank branches diminish significantly. It used to be a point of enormous pride with managements, in how many branches they had.

And it was, you know, often political influence and everything else was called into obtaining branch permits.

The world will change in banking, probably in some very major ways, over a 20 or 30-year period. Exactly what players will benefit and which ones will be hurt, you know, is a very tough question.

But I would expect — I would not — I don't think I'd expect really significant change in banking over the next five years, but I'd certainly expect it over the next 20 years.

And there are a lot of people that have their eye on that market, including Microsoft, as you mention.

It may be to their advantage to hook up with the present players. I mean, I know it's certainly something that gets explored. But they may figure out a way to go around the present players, too. And that's one investment consideration.

Charlie?

CHARLIE MUNGER: Yeah. The interesting player that went around the rest was Merrill Lynch. Merrill Lynch went heavily into banking with its cash management accounts. And I don't think it's the only innovation that'll come along.

WARREN BUFFETT: What's the name of that book?

CHARLIE MUNGER: You know, I'd forgotten, that's a marvelous book.

WARREN BUFFETT: Yes, there's a great book.

CHARLIE MUNGER: Maybe Molly remembers. What was that book you gave me? It was the history of the credit card.

WARREN BUFFETT: Was it Joe Nocera's? Yeah, Joe Nocera was the author. I don't remember the title ["A Piece of the Action: How the Middle Class Joined the Money Class"]. But it came out about six months to a year ago. It's a terrific history of the credit card business.

And if you read that you will get some idea of the amount of change that can occur in something like, you know, the movement of money. And my guess is that if there's another edition of it in 20 years, there'll be plenty more to write about. So —

CHARLIE MUNGER: By the way, that is a fabulous book. Most of the people who are here will not be able to put it down. I mean, for a book about an economic development, it captures the human background in a very interesting way.

40. No comment on SunTrust and PNC moats

WARREN BUFFETT: Is it zone 4? That seems far away for zone 3. Yeah.

AUDIENCE MEMBER: I was — Adam Engel (PH) from Boulder, Colorado.

I was wondering if you could comment on the moat you see around the castles of SunTrust and PNC.

WARREN BUFFETT: Well, I don't think I should comment on specific holdings like that. But — so I would say you would look at those in a general way very much as you'd look at banking operations first.

And then you'd try and figure out what are the specific strengths or weaknesses of both organizations. But there, again, I don't want to spoil the fun for you.

Charlie?

CHARLIE MUNGER: Nothing to add.

41. "Wiseass" comment on Salomon that Munger wishes hadn't occurred

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: My name is Bob McClure (PH). I'm from the States but I live in Singapore.

About a week ago, in the Asian Wall Street Journal, a remark was attributed to Mr. Munger, specifically that owning Salomon Brothers was like owning a casino with a restaurant in the front. (Laughter)

The casino, eluding to the proprietary trading, and the restaurant, to the so-called client-driven business. If that attribution is correct or accurate can you —

Charlie Munger: Well, I don't think —

AUDIENCE MEMBER: — elaborate on why you view the business in that way?

CHARLIE MUNGER: I don't think it's entirely correct, but I have a pithy way of speaking on occasion. (Laughter)

And I frequently speak in a way that works with an in-group, but wouldn't necessarily work everywhere else.

And every once in a while, when you take one of those wiseass comments — (laughter) — out of context — why, I very much wish that it hadn't occurred. (Laughter)

This was such a case. (Laughter and applause)

WARREN BUFFETT: It won't stop him in the future, though. (Laughter)

Or me.

42. National debt isn't scary now, when compared to GDP

WARREN BUFFETT: Zone 6? Or are we in 5? Which one are we in? Kelly? Or —

AUDIENCE MEMBER: Mr. Buffett, I'm Randall Bellows (PH) from Chicago.

And the two questions I have, since you're answering questions so far afield, are, if you were to look at the balance sheet of the United States of America, is the national debt as frightening as — that it appears to be?

And secondly, in terms of redeployment of capital, if Coca-Cola is such a wonderful investment, as it returned so much, why not redeploy some capital in purchasing additional shares of Coca-Cola?

And finally, thank you for letting Jane do that portrait of you. And if it's good, we'll do Mr. Munger next. Thank you.

WARREN BUFFETT: First question about the U.S. balance sheet, it — the net national debt is about — it would be about 60-odd percent of GDP.

CHARLIE MUNGER: Without counting unfunded pensions.

WARREN BUFFETT: Yeah, but that's — but also with a claim on the income, in effect, of future citizens, which was an asset, too, that you could set up the —

But that figure, I think, at the end of World War II, may have been — I know it was around at least 125 percent, may have been 150 percent or so, of GDP. So we have sustained —

Now, the interest rate on that debt was much lower. A lot of it was at 2.9 percent because that's what savings bonds paid.

But that level of debt, which I don't advocate in relation to GDP, turned out to be quite sustainable. And as a matter of fact, it drifted down year after year for a long time until the early '80s, when it started rising again. And now it's actually fallen a little bit in the last few years, the ratio of debt to GDP.

There are a lot of measurements of how much debt is too much and all of that. But, probably, I think that if I had to look at one single statistic, I would look at that ratio, just like I would look at a ratio of debt to income for an individual.

Then you'd get into the question of the stability of the income and to whom it is owed.

But I do not think that the level of debt, relative to the economy, is of anything that's of a frightening nature. I like the idea of it trending downward a little bit over time rather than trending upward. And if it keeps trending upward, it can get awkward.

Although, it's — I think, in Italy, I think it's close to 150 percent now. And you start getting to 150 percent, and talk 8 percent interest rates, and you're talking 12 percent of GDP essentially going to interest.

If you were to put a balance sheet of the country together, it's kind of interesting, because you would have this 4 billion of net debt on the liability side, and you'd also have a lot of pension obligations, as Charlie mentions, on the liability side.

But you've got a lot of assets, too. You've got a 35 percent interest — profits interest — in all the American corporations. I mean, the government, if it has a 35 percent tax rate, really owns 35 percent of the stock of American business. They own a significant part of Berkshire Hathaway.

We write them a check every year. We don't write you a check every year, but we write them a check. We plow your earnings back to create more value for their stock, in other words, the taxes they get.

CHARLIE MUNGER: Are you trying to cheer these people up? (Laughter)

WARREN BUFFETT: But what would you pay to have the right, today, to receive all the future corporate tax payments made by all the companies in the United States, the discounted value? You'd pay a very big number.

What would you pay to have a right to take a percentage of the income of every individual that makes more than X in the United States, and also the right to change your percentage as you went along? That's a very big number, too. (Laughter)

So, you've got a very big asset there that — and you've got some very big liabilities, too. But the country is very solvent.

And I would not like to see debt rise at any rapid rate. I wouldn't like to see it rise at all, but I wouldn't like to see it, particularly, rise at a rapid rate, because that sets a lot of things in motion, if it's rising as a percentage of GDP.

But if you tell me that 20 years from now the national debt will be $10 trillion, but that it'll be the same percentage of GDP, does that alarm me? Not in the least. I mean, I expect it to increase and I think there's some arguments why — even, why it may be advisable to have it increase.

But I don't think it's a good idea to have it take up more and more of your income, because that sets a lot of other things in motion.

So, I welcome what's happened in the last couple of years, which is to see it decrease modestly from the trend that existed the previous 10 or 12 years.

Charlie?

CHARLIE MUNGER: Well, generally I think that you're right, that it isn't all bad. And to the extent that it is bad, a great nation with a capitalistic economy will stand quite a bit of abuse on the political side. It's a damn good thing, too, because — I don't think we should be terribly discouraged.

If there's anything that's really going to do the country in it'll be what I call a "Serpico effect," where you start rewarding what you don't want more of, and it then just grows, and grows, and grows. But I don't think that's necessarily a bad fiscal result, it's just a bad result.

WARREN BUFFETT: Berkshire owes 7 or 800 million — or whatever it is now, in debt, and we owe another 3 billion-some of float. You know, those numbers would've sounded very big to me 25 years ago, but — and yet we're one of the most conservatively financed operations you'll find.

Ten years from now we may owe more money, and it may be a smaller percentage still. I mean, you can't talk about debt levels without relating it to the ability to pay debt. And this country is probably in better financial shape now than it was in 1947.

43. Coca-Cola as "measuring stock" to evaluate alternatives

Zone 1. What, there was a second — was there a second question that I didn't answer on that? Or —

AUDIENCE MEMBER: (Inaudible)

WARREN BUFFETT: Oh, in terms of repurchasing shares. Right.

CHARLIE MUNGER: No, you said, "Why don't we buy more?"

WARREN BUFFETT: Well, we think about it.

CHARLIE MUNGER: We did, not long ago —

WARREN BUFFETT: Yeah, we did. We bought more last year, and it's not a bad measuring stick against buying other things.

But there's — I would not rule out Berkshire buying more. I don't have any plans to do it right now, but I wouldn't rule that out at all because it's — if I'm going to look at another business I will say, you know, "Why would I rather have this than more Coca-Cola?"

CHARLIE MUNGER: Well, there he is saying something that is very useful to practically any investor, when he said, "Use this as a measuring stick," in terms of buying other things. For an ordinary individual the best thing you have easily available is your measuring stick.

If it isn't — if the new thing isn't better than what you already know is available, it hasn't met your threshold, then that screens out, you know, 99 percent of what you see, and it's an enormous thought conserver. And it is not taught in the business schools, by and large.

WARREN BUFFETT: No, and that's why we think it's slightly nuts when big institutions decide, because everybody else is doing it, to put 4 percent of their money in international equities or 3 percent in emerging growth countries — some damn thing like that.

I mean, the only reason to put the money in there is if they've measured against what they're already doing.

And if they measure it against what they're already doing and they think it's a screamingly good idea to leave 97 percent in the other place and put 3 percent in, you know, I mean, it just doesn't make any sense whatsoever.

But it’s what committees are talked to about and what keeps investment managers going to conferences and everything, so —

CHARLIE MUNGER: They’re deliberately using a technique that takes away the best mental tool they have. And you can say this is nuts, and you’re right.

And I think {German philosopher Friedrich] Nietzsche said it pretty well when he said he laughed at the man who thought he could walk better because he had a lame leg.

I mean, they literally are blinding themselves and then they’re teaching our children how to do this in our own business schools. Very interesting, don’t you think?

And all Warren says is, deciding whether to do something, just compare the best opportunity you have. If that one is better and you’re not taking it, why would you do this just because somebody tells you you need 2 percent in international equities?

44. Buy Berkshire or let your money manager loose?

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Hi, my name is Mark Wheeler (PH), I’m from Portland, Oregon. And I have a few eggs in your basket. My grandmother always said, “Don’t put all your eggs in one basket.”

I have a question, and I think you answered this a couple of years ago in one of your reports about Little Abner’s investment approach.

Suppose I had $100,000 and I decide to buy four or five more of your shares, and that was sort of a buy and hold thing for four or five years.

And also I have a money manager — I’ve already got one — and he does pretty well – 10, 15 percent.

But he churns the assets all the time. You know, every time I turn around all this mailbox full of paperwork. And I guess my question is, how can I arrive at which is a better deal for me?

In other words, to buy Berkshire, which I like, and obviously I’m here, so I’m interested in it, or hang onto my money manager, who just seems to be churning the hell out of the account?

WARREN BUFFETT: Well, it’s better than having a broker churning the hell out of the account. (Laughs)

He had a little less incentive if he’s getting a management fee.

But I can’t answer your question as to which decision you should make in that case.

But I would say that if — you're right, in the sense that, if you buy Berkshire, you should only think about buying it for a very long period of time.

We have no idea what Berkshire is going to do, either intrinsically or in the market, in the next year. And you know, we care about the intrinsic part of it. We don't care about the market aspect. We do care about building intrinsic value.

And you know, in the end, we don't think — well, when we own Berkshire, we don't think of all our eggs being in one basket, I mean, because we have got a lot of good businesses.

But if you're talking about some, you know, lightning from someplace, the huge liability suit or something like that hitting one corporate entity, we're one corporate entity. But if you think about it in terms of the business risk implicit in an entity, we have a lot of different good businesses.

In fact, we probably have as decent a collection of good businesses as any company I can think of.

But your money manager will also undoubtedly have the advantage of working with, probably, with smaller sums, too, and that gives him a bigger universe of opportunity.

We're not set up, taxwise, perfectly, as compared to an individual working with their own capital. We're set up, taxwise, fine for somebody that's going to sort of own it forever. But we're not set up, taxwise, as well for somebody that's going to own it a year or something of the sort.

Charlie? Anything?

CHARLIE MUNGER: Nothing to add.

45. "We like people who are candid"

WARREN BUFFETT: Zone what? Oh, back there. I don't think it's on. OK.

AUDIENCE MEMBER: I'm Jeff Johnson (PH). I'm grateful to be here from Tulsa, Oklahoma.

I have two questions. First, I was hoping you could explain, or offer an opinion as to why investors in property-casualty insurance companies are willing to accept traditionally below-average type of returns.

Second question relates to an answer you gave me yesterday, that being that intuition or gut feeling has nothing to do in your — in making investment decisions.

I was wondering if there is anything subjective in yours and Mr. Munger's assessment of whether or not you like someone, and how it is that you determine whether or not you like the lord of the castle?

WARREN BUFFETT: Well. I don't know. Charlie, do you want to answer that second part?

CHARLIE MUNGER: Well, we spoke about agency costs. And there are two different kinds of agency costs. One, the guy favors himself at the expense of the shareholders, and the other is he's — he does foolish things. Or he's not trying to favor himself, he just is foolish by nature.

Either way, it's very costly to you, as the shareholder. So, you have to judge those two aspects of human character, and they're terribly important.

And on the other hand, there are some businesses so good that they'll easily stand a lot of folly in the managerial suite. And I — much as we like perfect people, I don't think we've always invested with them.

WARREN BUFFETT: No. But generally, we like people who are candid. We can usually tell when somebody's dancing around something, or where their — when the reports are essentially a little dishonest, or biased, or something. And it's just a lot easier to operate with people that are candid.

And we like people who are smart, you know. I don't mean geniuses. But that — and we like people who are focused on the business.

It's not real complicated, but we generally — you know, there may be a whole bunch of people in the middle that we don't really have any feeling on one way or the other, and then we see some that we know we don't want to be associated with, and some that we know we very much enjoy being associated with.

CHARLIE MUNGER: Averaged out, we've been very fortunate.

WARREN BUFFETT: Very lucky.

46. Difficult to get capital out of a sub-par business

CHARLIE MUNGER: And your other question, you said, why is it that these investors accept below-average results? Well, in the nature of things, approximately half the investors are going to get below-average results. They didn't exactly accept it in advance. It's just the way it turned out.

WARREN BUFFETT: And the money tends to be fairly captive, once it's in a company. I mean, it takes a lot — if you have a business that gets subnormal returns over time, there's a big threshold in terms of either a takeover, or a proxy fight, or something like that to unleash the capital.

So, money that's tied up in an unprofitable business, or a sub-profitable business, is likely to stay tied up for a good period of time.

Eventually something will probably correct it. But capitalism does not operate so efficiently as to move capital around promptly when it's misallocated.

We are in a better position to do that when Berkshire owns a company. And obviously, we're in no position to do it — because it involves something we don't want to do — if we own it through some other enterprise. We just sell to somebody else who takes another — who takes our chair — at the table, in effect.

47. Focus on future, not current, earnings

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Hi, Philip King (PH) from San Francisco.

I've got another question about valuation — more specifically, the relation of P/Es to interest rates.

I understand that you don't want to lay down a rigid formula for valuation, but I also know that you don't want people to think that a multiple of 20 times earnings is cheap, or a multiple of five times earnings is expensive.

So, Benjamin Graham, he devised a central value theory that valued the average stock at an earnings yield that's about a third above bond yields.

In other words, that would work out to maybe 11 times earnings, currently. And I know that you've compared the average business to a 13 percent bond that's worth roughly book at 13 percent interest rates, and worth perhaps roughly twice book at 6 percent interest rates.

So, given current interest rates of 7 to 8 percent, as they are now, that would tend to imply that stocks are worth perhaps 12 to 13 times earnings.

And yet, the acquisitions that I've seen in the private market have gone out at more like 17 to 20 times earnings. And I'd like to know, what do you think is the rough range of multiples that make sense?

WARREN BUFFETT: Yeah. Well, it isn't a multiple of today's earnings that is primarily determinate of things. We bought our Coca-Cola, for example, in 1988 and '89, on this stock, at a price of $11 a share. Which — as low as 9, as high as 13, but it averaged about $11.

And it'll earn, we'll say, most estimates are between 230 and 240 this year. So, that's under five times this year's earnings, but it was a pretty good size multiple back when we bought it.

It's the future that counts. It's like what I wrote there, what Wayne Gretzky says, to go where the puck is going to be, not where it is.

So, the current multiple interacts with the reinvestment of capital and the rate at which that capital's invested, to determine the attractiveness of something now.

And we are affected in that valuation process to a considerable degree by interest rates, but not by whether they're 7.3, or 7.0, or 7.5. But I mean, we'll be thinking much differently if they're — long-term rates are 11 percent or 5 percent. And — but we don't have any magic multiples in mind.

We're thinking — we want to be in the business that 10 years from now is earning a whole lot more money than it is now, and that we will still feel good about the prospects of the business at that time.

That's the kind of business we're trying to buy all of, and that's the kind of business that we try and buy part of. And then sometimes we buy others, too. (Laughs)

Charlie?

CHARLIE MUNGER: We don't do any of that rigid formulaic stuff.

WARREN BUFFETT: There's a general framework, that you can call a formula, in our mind. But we also don't kid ourselves that we know so much about the specifics that we would actually make a calculation, in terms of the equation.

When we bought Coke in '88 and '89 we had this idea about what we thought the business would do over time, but we never reduced it to making a calculation.

Maybe we should, but I mean, it just — we don't think there's that kind of precision to it.

We think it's the right way to think in a general way. And we think, if you try to — if you think that you can do it to pinpoint it, you're kidding yourself.

And therefore, we think that when we make a decision, there ought to be such a margin of safety that it ought to be so attractive that you don't have to carry it out to three decimal places.

We'll take a couple more and then we'll have to leave. We've got a directors — we have one directors meeting a year and we don't want to disappoint them.

48. USAir was mistake, despite five years of dividends

WARREN BUFFETT: Zone 4? (Laughs)

AUDIENCE MEMBER: Yes, I'm Roy Christian from Aptos, California.

I wanted to ask one question about USAir, which has not been questioned much at this meeting.

When you were on television talking about the losses there, it was funny how so many of my friends or, maybe, acquaintances came forward to tell me this piece of startling news. And, you know, I tried to stand up for you, a little bit. And at least —

WARREN BUFFETT: It was a mistake. (Laughter)

You should've just taken a dive. (Laughter)

AUDIENCE MEMBER: Well, at least I wanted to point out to them —

WARREN BUFFETT: No —

AUDIENCE MEMBER: — that you did have dividends over a period of —

WARREN BUFFETT: Right.

AUDIENCE MEMBER — about five or six years, and that that money was reinvested, maybe at a better return than USAir.

So, that it wasn't quite the disaster that was pictured on television when you spoke about it, or the impression that all my friends — or I should call them acquaintances — pointed out to me.

Just a comment, I guess, is what I'm asking for.

WARREN BUFFETT: Yes. Well, you're right, it could've been worse. But it was a mistake. But we received five years, I guess — yeah, it'd be five years of dividends at a good rate while we got it.

But it's like somebody says, "It isn't the return on principal that you care about, it's the return of principal." And we —

But we're better off — we're a lot better off, obviously, than if we'd bought the common [stock], and we're even better off than if we bought some other stocks.

But it was still a big mistake on my part. But keep standing up for me. I need all the help I can get on this one. (Laughter)

49. Charlie's and Warren's book recommendations

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Hi, I'm Chris Stabru (PH) from New York.

Charlie, in addition to the book that you mentioned on credit cards, are there any other books you have been reading that you'd recommend to us?

And Warren, are there any books that you have been reading that you'd recommend? I know you're a fan of Bertrand Russell. Any favorite one or two of his books?

WARREN BUFFETT: Been a long time since I've read those, though. I mean, I read a lot of Russell, but I did that a — he hasn't written much in the last 10 or 15 years. (Laughs)

Charlie?

CHARLIE MUNGER: There's a textbook which is called, I think, "Judgment in Managerial Decision Making." And it's used in some of the business schools, and it's actually quite a good book.

It's not spritely — it's not written in a spritely way that makes it fun to read, but there's a lot of wisdom in it. It's something like Braberman [Max Bazerman]. But it's "Judgment in Managerial Decision Making."

WARREN BUFFETT: Since taking up computer bridge, which is 10 hours a week, it's really screwed up my reading. (Laughter)

It's a lot of fun, though.

50. Despite "awkward to disadvantageous" per share price, Berkshire won't split stock

WARREN BUFFETT: Zone 6? We'll take a couple more and then we'll —

AUDIENCE MEMBER: Yes. I am Dick Leighton from Rockford, Illinois.

This is the first annual meeting that I've attended and it's been very beneficial to me. I've been extremely impressed with the number of people here, but even more so with the number of young people who have come.

And I would like very much to be able to bring my grandchildren as shareholders, but I find it difficult to get shares into their hands with the current per unit value.

WARREN BUFFETT: That's the nicest introduction to the stock split question we've had. (Laughter)

It really is, too.

AUDIENCE MEMBER: I thought you would appreciate that. (Laughter)

Obviously you understand the question. I understand the position you've taken over the years and the fact that it adds no value to make the split.

In this case, however, it could be a tax savings to many of us who would like to get stock shares into the hands of other family members.

Should I just go to work on my congressman to change the tax code, or would you consider a change? (Laughter)

WARREN BUFFETT: Well, that's a very valid question. And there's certainly a couple of areas, one of which you've just mentioned.

And I had someone else mention to me that they had their Berkshire in an IRA account. And now they were getting into the mandatory payment arrangement, and it didn't work well, in terms of using the Berkshire — although I think they could sell it and then pay out a percentage of it.

There are certain aspects, primarily of gifting, where it is anywhere from awkward to disadvantageous to have the price per share on a stock that exists with Berkshire.

And you know, we're aware of it, we've thought about it, and we've got our own personal situations even, sometimes, that are involved in that. I've got one in the family, which we've worked — figured out ways around.

The disadvantage, of course, is that you saw a little even earlier this year of what a book ["The Warren Buffett Way"] can do.

We want to attract shareholders who are as investment-oriented as we can possibly obtain, with as long-term horizons.

And to some extent, the publicity about me is negative, in that respect. Because I know that if we had something that it was a lot easier for anybody with $500 to buy, that we would get an awful lot of people buying it who didn't have the faintest idea what they were doing, but heard the name bandied around in some way.

And secondly, to the extent that ever created a market that was even — that was stronger — you then would have people buying it simply because it was going up. We got a little bit of that going on this year.

There are a lot of people that are attracted to stocks that are going upward. It doesn't attract us, but it attracts the rest of the world to some degree.

So we are almost certain that we would get — we don't know the degree to which it would happen — we are almost certain we would get a shareholder base that would not have the level of sophistication and the synchronization of objectives with us that we have now. That is almost a cinch.

And what we really don't need in Berkshire stock is more demand. I mean, that is not — we don't care to have it sell higher, except as intrinsic value grows.

Ideally, we would have the stock price exactly parallel to change in intrinsic value over time because then everybody would be treated fairly among our shareholders.

They would all gain or lose, as the company gained or lost, over their ownership period. And anything that artificially stimulated the price in one period simply means that some other period's shareholders are going to be disappointed.

I mean, we don't want the stock to sell at twice intrinsic value, or 50 percent above intrinsic value. We want the intrinsic value to grow a lot.

And I don't think there's any question, but that we would get a worse result in that aspect if we introduce splits in, because then people would think about other possibilities that might give the stock a temporary boost.

We — they had a tabulation in Businessweek a couple of months ago on turnover on the exchange. We were at 3 percent, and I don't think anybody was, that I saw on the list, was under double digits and bigger numbers.

But those are people who are simply, you know, their shareholders leaving frequently, and new shareholders coming in with shorter-term anticipations. We have wanted this to be as much like a private partnership as we can have, with everybody having the ability to buy it.

We don't think the minimum investment is too high to — in this investment world. I mean, there are all kinds of investment opportunities that are limited to 25,000 or 50,000, and that sort of thing.

But the problem of making change, you know, in terms of gifts or — you know, that I wish I had a better answer for, because I think that is a —

CHARLIE MUNGER: My grandchildren pay me the difference between $20,000 and the current price. And I think that's a very reasonable way for them to behave, particularly when they are, sometimes, they're only six weeks old. (Laughter)

WARREN BUFFETT: You need a spouse's consent to make it — to work with 20, obviously.

But most of the things can be solved, but I'll admit it isn't as easy to solve as if we just had a stock denominated in lower dollars per share.

I do think that once you get a shareholder base that is — has got — that has different objectives or expectations or anything, you can't get rid of it. I mean, you can keep a shareholder base like Berkshire, but you can't reconstruct it if you destroy it in some way.

And it's important to us who we're in with. I mean, it enables us to — I think it helps us in our operation. I think it even may — in some cases, it may even help us in acquisitions, in terms of who we attract.

It may — for all I know, it may hurt us someplace, too, that I don't know about. But I don't think so, because I think we can design — particularly with a preferred stock — we can design something to satisfy somebody who might have in mind a different denomination of security.

CHARLIE MUNGER: Look around you. Are we really likely to do a lot better? This is a good bunch.

Morning Session - 1996 Meeting

1. Welcome

WARREN BUFFETT: Just a little early, but I think everyone's had a chance to take their seats.

I must say, this is the first time I've seen this program. They told me they'd surprise me, and they certainly did. (Laughter)

Marc Hamburg, our chief financial officer, who is now known around the office as CB, was in charge of putting all this together. And we — I want you to know, we have no multimedia (inaudible). (Applause)

This entire meeting is handled by a regular staff. We have no public relations department, or investor relations, or multimedia department, or anything of the sort. So, everybody just pitches in. And Marc will, forevermore, be in charge of the pregame ceremonies. (Laughter)

We have a very large crowd today. I hope everybody has found a seat, either in this main room or in the three overflow rooms. I think we can handle around 5,400. And historically, 62 percent or just about exactly 62 percent, every year, of the people who request tickets have come to the meeting.

And if that percentage holds true today, we have just filled the rooms. And we will have a problem in the future, which we haven't figured out the answer to yet. But we've got another year.

The way we'll run the meeting is that we'll get the business out of way — out of the way — at the start. And we'll talk about the Class B issuance, then, too. So, it'll take a little longer than historically has been the case.

And, then, we'll have Q & A for — until about noon. We'll have a short break at noon. There'll be sandwiches outside, which you can buy. (Laughter)

And Charlie and I will have a couple of sandwiches up here at the podium.

And, then, we will stay around until about 3 o'clock to answer more questions. And at that time, after noon, I'm sure everybody in the overflow rooms will be able to find a seat here in the main room.

But people have come from great distances to attend this meeting. So, we really want to get a — give everyone a chance to get their questions asked. And Charlie and I are delighted to — but we'll have to break it up at three, no matter what. But we'll be delighted to stick around.

You can leave anytime, obviously. As I've explained in the past, it's much better form to leave while Charlie is talking. (Laughter)

But the — feel free to do that. And then at noon you'll get a chance to do it en masse.

We have buses available to take you to — if you have any money left at all after yesterday — to take you to other business establishments of Berkshire, locally.

So that will be the plan. I hope everyone does get their questions answered.

We've got a system where we break this room into six zones. And we have a couple of zones in other rooms. And then this afternoon, everybody will be able to be here in the main room. So, that is the procedure.

I'm sure you recognize Charlie Munger, the vice chairman of Berkshire Hathaway, who also had not seen that movie before. (Laughs)

And showed — we were — I think Marc was afraid to show it to us. But in any event — (laughter) — we will go on.

I thought you might be interested. This is a list of people that came in for tickets. And we had, in addition to 99 from Canada and, of course, the U.S., we had Australia, the Channel Islands, England, Greece, Hong Kong, Israel, Portugal, Puerto Rico, Singapore, Sweden, and Switzerland.

I'm not sure all of those people are with us today. But they did send for tickets. And I've met a number that did come in from a distance.

2. Election of directors

WARREN BUFFETT: So, with that introduction, I will call the meeting to order.

I'm Warren Buffett, chairman of the board of the directors. And I do welcome you to this meeting. I hope everybody has a good time this weekend.

And I'd like to introduce the directors, in addition to myself and to Charlie.

Now, you don't get quite your money's worth this year from our directors. They've — collectively, they've lost 100 pounds since last — our last meeting. I think they've been trying to live on the director's fees. (Laughter)

We have with us Howard Buffett — let's stand. (Applause)

Susan T. Buffett. (Applause)

Malcolm G. Chace III. (Applause)

And Walter Scott Jr. (Applause)

Along with us today are partners in the firm of Deloitte & Touche, our auditors, Mr. Ron Burgess and Mr. Craig Christiansen (PH). They're available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings.

Mr. Robert M. Fitzsimmons has been appointed inspector of elections at this meeting. He will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg. Proxy cards have been returned through last Friday representing, it says "number to come." (Laughter)

VOICE: There's another script.

WARREN BUFFETT: Ah, OK, there's another — oh, yeah. Here's the script on that one: 1,041,567 Berkshire shares to be voted by the proxy holders, as indicated on the cards. That number of shares represents a quorum. And we will therefore proceed — directly proceed — with the meeting.

We will conduct the business of the meeting, then adjourn the formal meeting. After that, we will entertain questions that you may have.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott Jr. who will place a motion before the meeting.

WALTER SCOTT JR.: I move that the reading of the minutes of the last meeting of shareholders be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICE: I second the motion.

WARREN BUFFETT: The motion has been moved and seconded. Are there any comments or questions? We will vote on this motion by voice vote. All those in favor say, "Aye."

VOICES: Aye.

WARREN BUFFETT: Opposed? Motion's carried.

Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at the meeting?

ROBERT M. FITZSIMMONS: Yes. I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first-class mail to all shareholders of record on March 8, 1996, being the record date for this meeting, there were 1,193,512 shares of Berkshire Hathaway common stock outstanding with each share entitled to one vote on motions considered at the meeting.

Of that number, 1,041,567 shares are represented at this meeting by proxies returned through last Friday.

WARREN BUFFETT: Thank you. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the two items of business provided for in the proxy statement, he or she may do so.

Also, if any shareholder that's present has not turned in a proxy and desires a ballot in order to vote in person on those two items, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish two ballots to you, one for each item.

Will those persons desiring ballots please identify themselves, so that we may distribute them?

First item of business at this meeting is to elect directors. And I'll recognize Mr. Walter Scott Jr. to place a motion before the meeting, with respect to election of directors.

WALTER SCOTT JR.: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace III, Charles T. Munger, and Walter Scott Jr. be elected as directors.

WARREN BUFFETT: Is there a second?

VOICE: I second the motion.

WARREN BUFFETT: Are there any other nominations? Is there any discussion?

I learned a lot in China. We did so — (Laughter)

The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections.

Will the proxy holders please also submit to the inspector of elections a ballot on the election of directors, voting the proxies in accordance with the instructions they have received?

Mr. Fitzsimmons, when you're ready, you may give your report.

ROBERT M. FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast not less than 1,040,667 votes for each nominee. That number far exceeds the majority of the number of all shares outstanding.

The certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed in the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcom G. Chace III, Charles T. Munger, and Walter Scott Jr. have been elected as directors.

3. Why Class B shares were created

WARREN BUFFETT: The second item of business of this meeting is to consider the recommendation of the board of directors to amend the company's restated certificate of incorporation.

The proposed amendment would add a provision to the restated certificate of incorporation authorizing the board of directors to issue up to 50 million shares of a new Class B common stock, with each Class B share having economic rights equivalent to 1/30th of a share of the current common stock, and with 1/200th of the vote, and to re-designate the company's current common stock as Class A common stock and to make each share of Class A common stock convertible into 30 shares of the new Class B stock at the option of the holder.

I think, before we get into moving that motion — I think this would be a good time to have discussion and take your questions regarding the issuance of the Class B. And I should give you a little background.

I think many of you know the background on this. But over the years, we've had probably half a dozen people, one time or another, propose that the creation of an all-Berkshire investment company or unit trust.

In other words, an entity that would hold nothing but Berkshire stock, and then would parcel out its own shares in smaller denomination pieces to the public.

And we have generally discouraged that because we felt that there was considerable potential for abuse in such an arrangement.

And our discouragement has been successful up until last fall, when there was one — there were two proposals — that went as far as submission to the SEC for clearance, that involved unit trusts.

And these unit trusts would've owned nothing but Berkshire shares and, then, been sold to the public in small denominations, probably with a minimum investment of around a thousand dollars or so.

And holders of those trusts would've bought into an entity that had a defined life, but that had considerable, in the way of costs and some tax consequences, that they might not anticipate when they came in.

And Charlie and I were worried that a combination of Berkshire's past record — which cannot be repeated — and high sales commissions, and a low denomination, and a lot of publicity about Berkshire and myself, which, as you've seen this morning, we attempt to discourage (Laughter) —

The — that the — a great many people would end up buying these unit trust holdings without any idea, really, of what they were buying, and with unrealistic expectations as to the future.

And that that would, in turn, create a considerable demand — because these unit trusts would go out and buy Berkshire shares — that would create a considerable demand against a fixed supply, much of which is almost unavailable because people have a low tax basis and are reluctant to sell, and I hope they're reluctant to sell for other reasons.

And that the very action of the creation of these, and that push on the demand, would — might very well create some speculative spurt in the stock, which in turn, would induce people who had been approached about the trust to feel they were missing even more of a good thing by rushing in.

Rising prices in certain kinds of markets create their own kind of demand. It's not a sustained demand. And it's a demand that the reversal of which, later on, when people become disillusioned, can cause a lot of problems.

But that potential was there with a flood of buyers with unrealistic expectations, high commissions, and a fixed supply. So, we attempted to dissuade both of the promoters.

One backed away and then came out a few months later with something that was a combination of Berkshire and some other securities, which were at least thought to be in our portfolio.

And we started hearing from people that it was clear had no understanding of what they were buying, or the costs involved, or the potential tax implications, or anything of the sort.

So, at that time, we faced — we had to make a decision, and we had to make it rather quickly, as to what would be the best solution to this problem that, in turn, wouldn't create the same sort of thing that we felt had potential harm when being done by these promoters.

Obviously, we considered a split of the stock. But we were worried that a split would send out signals to all kinds of people who want to believe in things that may not be too believable about future performance and that they would look at it as some grand chance to buy in at a lower price.

Of course, it wouldn't really be a lower price in relation to value. But it would be a lower denomination.

And that, again, against a fixed supply, might very well have created the same kind of problem, maybe even a greater problem, than would occur with the unit trusts.

So, we came upon the idea of the Class B shares, which would create a supply that would match the demand for, in effect, split shares, and that would be offered in a way that did not create special inducements, or to create false inducements to people thinking of buying.

And one of the things we did was we stuck a commission on it, on the issuance of the Class B shares, that was about as low as any I've ever seen in many years in Wall Street, because we did not want salespeople to have a great inducement — we — to go out and sell the shares.

We wanted anyone that was interested to read the prospectus, and think about it, and make their own decisions.

And we did another thing, which is quite counter to the normal commercial approach, which is that we said we would issue as many shares as people wanted to buy.

And, you know, you do much better in this world if you're selling something, to say "only one to a customer," and "you have to get in early," or "you have to know somebody in order to get shares." And many new issues are sold that way, and it's very effective.

I mean, you know, it's like those old stories in Russia where there'd be lines, and people would get in them without knowing what they were going to buy when they got to the front of the line.

And that's a very effective selling tool. And it's one that Wall Street is not unfamiliar with.

But we decided that, to reduce any of that feeling that you have to get in early, or only the big guy's going to get it, or something of the sort, that we would announce loud and clearly that we would have shares available for everyone that wanted.

So, there was no reason to assume that — it couldn't be a hot stock, in effect. And we've done various other things.

So, I — our hope is that the Class B shareholders that we attract are of the same quality as the people in this room, that they have an investment attitude where they feel they are buying into part of a business, that they expect to stay with it for the indefinite future, maybe the rest of their lives.

And they do not think of it as a little piece of paper that may be hot because it's a new issue or something of the sort.

It lets the people who are happy with the present shares stay in exactly the same position, which is what I'm going to do, what Charlie will do.

We have made the B very slightly disadvantageous, in two respects, to the A. It has a lower vote, and it will not participate in the shareholder contributions programs.

There were reasons for both of those, but in addition to the — the explicit reasons, there also is the desire that the B not be made fully — it's just a slight bit inferior —but it's not fully as attractive as the A, because we did not want to do anything that pushed everybody into converting into the B.

If that started in a big way, the B would then enjoy the better market, and it would create its own dynamic where it made sense for everybody to do it.

So we have left it so there's no reason for you, if you own the A, to convert to the B, unless you wish to sell or give away some portion of your holding that would be less than a full A share.

And it will be convenient for that reason. But beyond that, there should be no incentive.

If the B should trade slightly above 1/30th of the price of the A, there will be arbitrage activity that will keep that from being anything other than a negligible amount.

It, of course, could trade well below 1/30th because the B is not convertible into the A.

Charlie, would you like to add anything before we start taking questions on this? And I —

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: — I encourage everyone to ask.

Charlie, as you will note during the meeting, does not get paid by the word. (Laughter)

But we — I encourage every — anyone to ask any question. There are no bad questions about this. I mean, it — last year, we talked about a preferred issue. And people had very valid questions.

I might take those two points of difference between the A and B, just to start with, on the shareholder-designated contributions program, which was $12 a share last year.

In addition to wanting the A to have a very small edge over the B, which would be a reason for not having the B participate, it also would get very impractical, in terms of taking $12, and dividing it by 30, and soliciting the names of charities and to designate contributions.

We can handle the present program fairly efficiently. But we would not want to be sending out checks for a dollar or two, and it would get very inefficient.

So, we have told prospective B holders that that's not going to happen. And so, they're fully informed coming in.

In connection with the vote, the issuance of the B does create more votes outstanding. So, absent any change in the situation, through the issuance of shares which we are not particularly eager to issue, the vote — my vote — will be diluted, somewhat, by this.

And, frankly, I had no desire to create a lot more shares which would dilute the vote of the Buffett family. It will be diluted, somewhat, by this action because we will have all the present votes outstanding, plus some votes from the B.

If there is a lot of conversion to the B, it is true that our holding will go up, percentage-wise. But I see no reason why people really should convert. So, I don't think that's likely. I think, in the end, it'll stay very much the same.

And as I mentioned earlier, we want there to be a slight disadvantage to the B.

In all other respects, we will treat the B just as the A. We have a problem with numbers at this annual meeting. We're going to have to do something next year. And we haven't figured it out yet, either.

But the suggestion was made by someone that maybe the B would get second-class seating or something. We're not going to have any of that. (Laughter)

But from this point forward, with the point — with the exception of two things we put in the prospectus, the B shares will be treated, in every way, as equivalent to A. There —

So, with that, and with Charlie's reluctance to elaborate, we have a six-zone system in here. And then we have another two zones in the overflow rooms.

So, if there are any questions in zone 1, somebody — just raise your hand and somebody will bring a microphone.

Zone 1 is over there. Two is back in the corner. Three, four, five, and six. So it just goes right around clockwise. Just raise your hand and somebody will bring a microphone to you.

4. Class B IPO price is the same for everyone

WARREN BUFFETT: We've got a question, I think, in zone 1.

AUDIENCE MEMBER: Good morning. I'm Marshall Patton (PH) from Bandera, Texas.

And when the price is struck on the Class B shares, those of us who buy our shares through computer programs, do we have assurance that, whoever we buy from, that that will be the price that we pay for these shares?

WARREN BUFFETT: Yeah, the — well, the price — there'll be a price established, probably, Wednesday night or thereabouts of this week. And everybody will pay the same price. And a very high percentage of that price, incidentally, will come to Berkshire.

I mean, there is a very, very low underwriting spread, compared to any other offering.

Now, once the initial offering is — everybody will pay the same price: large institutions, the buyer of one share will pay the same price.

Subsequently, the stock will, we expect, will be listed on the New York Stock Exchange, probably, Thursday morning. And we have the world's greatest specialist here, I believe, Jimmy Maguire, who handles the trading, now, of the common and will handle the trading of both the A and B.

Jimmy, are you here? Do you want to stand up? Just so — there he is. The world's greatest specialist, Jimmy Maguire. (Applause)

I think he leads the singing of "Wait 'Till the Sun Shines, Nellie," too, annually. You can see him on CNBC occasionally, and the Nightly Business Report. I want to give equal time here. The —

But Jimmy will be trading both classes of stock starting Thursday. As I say — as I said, the — it will be impossible, after the first few days, it would be impossible for the B to sell much above 1/30th of the A, because people would buy the A and sell the B if more than a very small — with even the smallest of arbitrage differentials.

But there will be markets in two shares and — in two classes. They will both trade in 10-share lots. That will be the round lot — so-called round lot. Usually the round lot on the New York Stock Exchange is 100 shares. But in the case of both Berkshire shares, the round lot will be ten shares.

Now, I read one or two press accounts that said, therefore, the minimum purchase is ten shares. That's not true. The minimum purchase of each stock — each class of stock — is one share. I mean, you can buy one share or two shares. Or you can sell one share or two shares.

And you have an odd lot differential, just as you would if you were working with less than 100 shares of a company whose stock traded in 100 share round lots. But there's no minimum size in the case of either share.

And you will see, when they get mechanics straightened out, and they may have a little bit trouble with it, but you will see Berkshire A and Berkshire B in — quoted in the papers. And I think that you're — that it'll be quite clear after Thursday what is going on, on that.

I don't know about the computer purchases. But I don't that — certainly, in terms of the initial offering, that will be through one of, I think, 137 people — or brokers — in the selling group. And it's the same, no matter who you deal with.

5. Downside of Berkshire unit trusts

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name is David Hendel (PH). I'm from Boca Raton, Florida.

To your knowledge, will this program effectively discourage the unit trusts?

WARREN BUFFETT: Well, it's certainly designed to. And I think the answer to that is yes, because I see no way that a unit trust — either in connection with the initial offering or with the subsequent trading — I see no way that the unit trust could offer people as an efficient and inexpensive way of participating in Berkshire as direct purchase of the B.

Bear in mind, if a unit trust were established, it would have to buy Berkshire shares in the market. So, it would have the costs that people have in buying shares. And, then, on top of it, it would superimpose these other costs. And in addition to the initial commission, they even had a valuation fee.

That was a job I wanted to have because every — (laughter) — three months or however often, maybe every day, somebody, their job was to evaluate this trust value which involved the great skill of being able to locate it alphabetically — (laughter) — in the newspaper.

The figure was left blank as to what the evaluator's fee would be. But I had a feeling that it was one of the more cushy jobs available. (Laughter)

There was an added problem, too. I mean, if these unit trusts started and did not get off the ground very far, they could've become something in the way of orphans. And they certainly would've become expensive to operate.

And, then, with Berkshire paying nothing in the way of dividends, but with the trust incurring expenses, including this evaluator's fee, among others — but with the trust incurring expenses, they would have to sell small amounts periodically to pay the expenses. And that would create tax consequences for every unit trust holder.

I mean, people would not know what — we felt they would not know what they were getting into.

The more serious problem is that somebody would flash our past record in front of them or show them some chart on Berkshire's stock price and say, "You know, this is your chance to do the same thing." And it, obviously, isn't — wouldn't have been.

And — but based on what we have seen, right now, we anticipate the offering being 350,000 shares. But the extent to which the number of tickets involved, that even seeking out informed purchasers only, there's very substantial demand.

So I think if you widen that circle to include uninformed, it might have been quite an experience.

I think the answer is that we will not have a problem with the unit trusts in the future.

6. No plans for Class B secondary offering

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: I'm Adam Ingle (PH) from Boulder, Colorado.

In terms of the number of shares that you're going to issue, B shares, do you plan to just look at the book on Wednesday and issue enough to totally satisfy the demand? And do you have any plans to do a secondary if it starts becoming a hot number?

WARREN BUFFETT: Yeah. Well, I think what we plan is to tailor the size of the offering to fit the demand that appears Tuesday night or Wednesday morning, or whenever the exact moment will be on that. But the offering will be designed to do that.

Like most offerings, I would anticipate that the underwriter will — and this is a supposition at the moment — but I — it's frequently done — would sell some more shares than the initial offering with the intention of creating some short position in the security.

And, then, they have an option to take — from the company — for 30 days up to 15 percent of whatever we initially sell, which protects them on their short position. But the short position also helps in terms of having an orderly market in the stock, subsequently.

But we will, essentially, tailor the size of the issue to the demand as it appears to us midweek.

We have no plans for any secondary offering. I think this has been sufficiently publicized. There's a large network of selling group members. So that people that are interested, but wanted to buy in a smaller denomination, will have had their chance.

I think there will be a — well, present indications, there'd be 350,000 shares out. There would be a fairly large — a large — number of holders based on what we're seeing.

So, the market should, starting Thursday morning on the exchange, there should be, in my opinion, a reasonable market based on that kind of quantity and the number of people buying. And so, I anticipate nothing subsequently.

7. We don't think Berkshire shares are "undervalued"

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Can you hear me?

WARREN BUFFETT: Yep.

AUDIENCE MEMBER: My name's Tom Conrad (PH). I'm from McLean, Virginia, and I (inaudible) to this meeting and tell all my friends and family members to buy it last week. But I've been reading in some publications that you said that you would not advise your friends and family members to buy it at its current pricing.

And I'm just concerned, if I go out and run and tell them why you're saying — what your feeling would be, should I go tell my friends and family members? — (Laughter)

WARREN BUFFETT: I think I'll leave that one up to you. What I said — (laughter) — I said, at present prices, Charlie and I do not think Berkshire stock is undervalued. And that, now that is not what's gotten reported sometimes. I mean, sometimes people have said we thought it was overvalued.

We did not — if you look at the prospectus or if you look at the — if you look at the prospectus, you will see that what we said was we do not think it's undervalued.

Now, I find it somewhat entertaining that people regard that as kind of an amazing statement by somebody making a public offering.

But if you think about it a bit, can you imagine a management that goes out and says to the world, "We are selling you something — in a new stock — and it's way undervalued."

What do you say to your present shareholders if you go out and say to the public, "We're selling you something that's worth a dollar, and we're going to sell it to you for 80 cents?" Now, that would leave me very unhappy.

So, I feel that any management that is talking about selling their stock and they say it's very undervalued, either doesn't know what's good for their present shareholders or they may have their tongue in cheek.

We would not be selling — we would not sell a part of your interest in Berkshire at a price which we did not feel was adequate for the present shareholders. It's that simple.

If we sell 1 percent of the company, and 350,000 shares is close to that figure of B, we are selling 1 percent of your ownership in See's Candy. We're selling 1 percent of your ownership in GEICO. We're selling 1 percent of your ownership in The Buffalo News. Those are all valuable assets.

We have no intention of selling 1 percent, or 10 percent, or the hundred percent of any of those entities at a price that is not fair to present shareholders.

That doesn't mean it's unfair to new shareholders, but we're not going to — we would not be selling the stock if we thought it was undervalued.

I'm not sure what we would've done if we'd had that position when the unit trust came along. But we have — and put in the prospectus — but we are not selling any of our shares. Frequently, on a new offering you see present holders. But, you know, I have very close to 100 percent of my net worth in Berkshire and it leaves me quite happy.

I've got a trust I run set up in 1964. I'm the sole trustee. I can do anything in that trust I want. And I'm freed by the person who set up the trust of responsibility for a concentration of investments. And I have some members of my family who are beneficiaries of that trust.

That trust owns nothing but Berkshire Hathaway stock. That doesn't bother me at all. That — I'm not recommending purchase. But I'm perfectly happy owning Berkshire.

But we do not want — (applause) — we do not want people to think, when they buy into Berkshire, that they're buying something that's undervalued, because it's not.

And we say in that fourth caveat on the prospectus that we want people to buy it only if they expect to be holders for a very long time.

Charlie and I expect to be holders for a very long time. And, in fact, you may see us up here sometime where we don't know who the guy next to us is. (Laughter)

But we'll put on an act, though. (Laughter) The — we —

You know, that is our attitude toward Berkshire. We do not want people to come in who think it's going to be a hot stock or selling for more a year from now, because we don't have the faintest idea whether it's going to be selling for more or less a year from now. Never have had.

We do think that to the extent that Berkshire attracts a special class of shareholder that really looks at themselves as owning a part interest in a business, like they'd own a part of a farm or part of an apartment house, and they expect to hold it, really, for the rest of their lives, we think that it's a perfectly sensible thing to do because we're doing it ourselves. But we don't want to go beyond that.

8. No plans for the Class B proceeds

WARREN BUFFETT: I'm not sure whether we got zone 4. Can we go back there?

AUDIENCE MEMBER: My name is Gordon Shepherd (PH) from Montreal.

I wondered whether you had any plans for what to do with the money? (Laughter)

WARREN BUFFETT: Well, the answer to that is in the prospectus, but the — we have no immediate plans for the money. But we've faced that situation a number of times.

I mean, the money — the inflow of money and outflow of money should not be, in our view, attempted to be matched too carefully in this world, because you get investment and business opportunities at times that differ from the times that funds come in.

And one of the most important disciplines in running a business or managing investments is that — is to not get your — not to try to coordinate your actions simply with the availability of cash.

Over time, we found a way to use money. It's much tougher for us to run 17 billion than it was when we had 20 million in the business. There's no question about that. And we pointed that out many times. And it'll get tougher still if we get larger, which I hope we do.

But the fact that, if 400 million comes in on this offering or whatever, that's really no different than 400 million coming in in some other manner.

And when our float grows, we take in more money. When our earnings are retained, we take in more money. When we have — I forget what the check would've been on the Cap Cities transaction, but it was certainly well over a billion dollars that came in on a single day.

So, money's fungible, and we have to keep looking for bigger and bigger things as we go along. And that's what we do focus on.

But it doesn't bother me to take it. It wouldn't bother me if we weren't taking it. It wouldn't bother me if we took in three times as much. It doesn't make a lot of difference.

And we will have — we — the constant challenge for Charlie and me is to allocate capital is we go along. And it's a nice challenge. (Laughter)

9. Discouraging buyers with unreasonable expectations

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Hi there. Lee Debroff (PH), long-time shareholder, I think, going back a number of years now to when it was a little more intimate affair. Not quite sure whether I should look at you in the TV here or in real life, on stage. But anyway, I'm on the very right of you.

And I see all the guards around you, and I see all the security and that sort of thing. And then, I see this offering of the Class B. And I sort of wonder whether, from your perspective, you feel you might be in the same boat that the pope and the president are?

And I mean this absolutely sincerely, because I don't think that you have, perhaps, as good a handle as some of us do on the renown that you carry outside of Omaha, Nebraska. People who have no idea what investments are about are fully aware of who you are.

And when they see this offering, I think you may find that there are substantially more people who are interested in just having a piece of you for the sake of saying they have a piece of you than having absolutely any idea what they're doing.

And I notice that on — I try to read the fine print here — on page 14, first paragraph, second line, that you indicate some 50 million shares of Class B common stock may be offered.

And so, I'd like you to comment on this situation that you find yourself in, where you may be, perhaps, out of touch with the popularity that you have.

WARREN BUFFETT: Well, my first reaction: maybe I should tell my barber we could save the clippings and sell them. (Laughter)

The — I don't think it's quite as extreme as you say.

But, you know, I — in relation to the 50 million first, we have to authorize enough shares, because we are going to allow every share of class A — or present common stock — but the class A, to convert to B.

So we have to have the shares authorized to take care of 30 times the present one point almost two million shares. So, 36 million shares, in effect, are reserved for the present common stock. And, as long as we were authorizing it —

Well, we need that much, or we wouldn't have the shares actually available if everybody came around to convert. That's not going to happen. But we still have to be prepared for it.

We have no plans to issue a lot of shares. The — but the point you mention, which I think you stressed a little more than I would've, but the — that is what we were worried about, in terms of the unit trusts.

There are people that think that it can all happen again from this kind of a base which, you know, is mathematically a joke. And Charlie and I would settle for one whole lot less, you know, right today.

And we have done everything we can — I mean, if we hadn't done this, the unit trusts would've moved forward. And I think they would've cashed in on that phenomenon you suggested.

And in a few years, you know, it would not — I would've been in a somewhat different position because people can get very disillusioned if they have hopes that aren't realized.

And we have done everything possible, I think, to filter out those who might have an unrealistic belief.

And everyone should read a prospectus before they buy shares, and —

I think we have tailored — we've designed what we're doing about as well as we can to moderate that phenomenon you're talking about. There may be a few come in but not too many.

Charlie, do you have any thoughts on that?

CHARLIE MUNGER: Well, if we only issue the amount we're now talking about, it's sort of a non-event around Berkshire. It'd be 1 percent —

WARREN BUFFETT: Yeah. It's 1 percent.

CHARLIE MUNGER: — or something like that of the —

It solves the problem of these disreputable followers — (laughter) — and 1 percent, what does it matter? (Applause)

WARREN BUFFETT: Wait, you heard that remark, referring to Charlie earlier, about all I want to know is where I'm going to die, so I'll never go there. (Laughter)

Well, we think about that, in terms — we believe in reverse engineering.

And how do we keep people from buying it, who really are going to be unhappy, you know, a few years later?

You know, it's a little like singing country songs. You all — you should sing them backwards. That way, you get your home back and your auto back and — (laughter) — your wife back, and —

10. Almost like buying direct from Berkshire

WARREN BUFFETT: Zone 6? Have we got —?

VOICE: There was a hand over here, wasn't there? Here. Right here.

AUDIENCE MEMBER: Good morning. I'm Rena Lowie (PH) from Chicago, proud to be here. At mic —

WARREN BUFFETT: Where are we? Oh, over here. OK.

AUDIENCE MEMBER: I have a question that's been asked me, and I really don't know. Several people wanted to know if they could buy directly from the company.

WARREN BUFFETT: The answer to that is no. But Salomon Brothers is the underwriter of the issue. They have a hundred and, I think, 37-or-something broker-dealers, all — virtually all — the major ones in the country, in the selling group.

The cost to the company of doing this are really very, very low compared to any issue I've seen. When AT&T had their spinoff — or sale of Lucent — which was close to a $3 billion deal — you know, their percentage costs were more than double what our costs will be, for example, on this offering of Berkshire.

So, it's almost as if you're buying it — a Class B holder — is buying it from us, in terms of the, what I would call the frictional costs involved of getting the issue done. In fact, if we handled it ourselves, it might cost more.

But the company, itself, is not a broker-dealer. And it's — it would require a whole group of different hoops to jump through in order to have a direct issue. It will be sold only through broker-dealers.

11. All-Berkshire mutual fund for retirement plans?

WARREN BUFFETT: Zone 7?

This will come in from another room. Here we are.

VOICE: There aren't any questions in zone 7.

WARREN BUFFETT: No questions in zone 7. Zone 8?

VOICE: No questions from zone 8.

WARREN BUFFETT: OK. Then, we'll go back to zone 1.

AUDIENCE MEMBER: Mike Rocker (PH) from Flint, Michigan, God's country.

I noticed in the press, when this issue of the unit trust was going on, that there apparently also were some people trying to form mutual funds to carry Berkshire stock, which I kind of thought was a good idea, because there's one potential class of Berkshire owners that could only own Berkshire stock via either an open-end mutual fund or a closed-end mutual fund.

And that is those thousands of teachers and hospital employees whose future retirement money is in 403(b) plans that are limited to investing in mutual funds only. And so, I wonder if, first of all, if you were aware of that? And if so, if you considered that? And if not, if you might?

WARREN BUFFETT: Well, the answer is I wasn't aware of that. So it wasn't considered.

There are, of course, some mutual funds that own Berkshire shares. But there's no all-Berkshire fund, outstanding.

I would say this: that if the law was set up to, in some way, to restrict investments of this group you're talking about to options that involve mutual funds but that don't involve individual stocks, I would think it might even be regarded as a way around it, if a fund owned nothing but one stock.

Because, if you can't buy General Motors directly under, I assume, the relevant rules or statutes on that, it would seem that a fund that owned nothing but General Motors might be regarded as a way of getting around that.

But the answer is that it was not considered. I don't know where the rules are derived, whether there — whether they can be changed by some organization or they're part of some statute.

But if they're part of some organization, by a vote of their directors, they might be able to allow purchase of individual stocks within those plans that you describe. But if not, it does seem to me that an all one-stock fund is — might be regarded as simply a way around the rules.

12. Suggestion for Class B symbol

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Alan Rank, Pittsburgh, Pennsylvania.

Have you determined what the symbol will be for the Class B?

WARREN BUFFETT: The symbol? No, we haven't.

AUDIENCE MEMBER: May I make a suggestion? As a broker, the stocks that have come out and given theirselves Class A and Class B cause massive confusion.

If there'd be any way to make symbol something like BRB and just keep it a simple, three-letter symbol, it aids people both in following it on the tape on CNBC. As brokers, four-letter symbols on the New York restrict a lot of things we can do as far as punching them in.

If there's any way you could keep the symbol for the B a simple one, two or three-letter symbol, it would be greatly appreciated.

WARREN BUFFETT: Well, thanks for the suggestion. Now, the exchange has generally been exceptionally cooperative in trying to work with us. I mean, a 10-share trading unit is no piece of cake for them.

And I'm sure, at times, that they have wished we were a little more like some of the other companies that list on the exchange. But they've been very cooperative and helpful. And we are — they'll — they listen to things we suggest. We listen to things they suggest.

So, we will try to do whatever facilitates things at the exchange and the reporting of prices. And it's nothing we will try to impose on them, believe me.

I have no favorite name that I'm looking for. So, we'll see what they — what ideas they have. And we'll include that suggestion.

13. Not expecting big change in Class B offering size

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Paula Finster (PH) from Tulsa, Oklahoma. Very glad to be here. I'm one of those few second generation, finally finagled a ticket out of my dad. (Clears throat)

Three years ago —

WARREN BUFFETT: Her dad has a soda fountain, incidentally. If you're ever in Tulsa, be sure to see him. (Laughter)

AUDIENCE MEMBER: He certainly does. And you're certainly invited to come back. (Laughter)

I was here three years ago for the movie theater. And considering the growth — I know you won't leave your beloved Omaha — but maybe you could build a stadium with — that's covered — (laughter) — considering the growth — (Buffett laughs) — with adequate parking. (Laughter)

Here's my question. You said there's going to be unlimited offering, as much as they want. This question is not designed to get a rise out of Mr. Munger, however —

WARREN BUFFETT: That's not easy to do. (Laughter)

AUDIENCE MEMBER: Understood, considering the bridge game of yesterday.

Anyway, my question is, you're authorizing up to 1 percent. What happens if it goes bananas, as zone 5 suggested, and it goes greater?

You said this 1 percent is yours. Is the next 1 percent yours? Is the next 1 percent ours? Do — I know we are limited partners. And you're a controlling partner. But how far does this ballgame go?

WARREN BUFFETT: Well, in terms of the size of the offering, it — whatever the size of the offering, it affects everybody economically the same. I mean, our shares are no different than the ones than the people in this room.

So, we do not care, from an economic standpoint, whether the issue turns out to be approximately 1 percent or whether it was 1 1/2 or 3/4 of 1 percent.

It simply — as long as we're not selling the stock below its true value, we are not going to be hurt by it. So, that —it's inconsequential to us. We're not going to be helped in any significant way by a large sale.

The — it would appear, to me —we're just a few days away from the offering, and it's been out there awhile.

So, I would doubt if there's huge changes. But I don't know the answer to that. I mean, that could depend on what happens in the general stock market.

But I don't think you'll see any huge change in the offering. If there were a big change, we, obviously, would very promptly let the SEC know. The SEC has wanted us, as we have seen changes in demand as we've gone along, promptly change the size of the offering. And the covering page gets modified.

And we've done that. Every day as indications come along, we've tried to be responsive to their instructions on that. And the 350,000 shares is our best estimate, as of last Friday, and —

We'll look at it the next day or two. But I don't think it's going to change dramatically. I don't know, though. I don't want to — I'm giving you a definitive answer on that. But it's just my — it's a strong impression. Thank you.

14. Only Class B questions

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Mike Assail (PH) from New York City with a question for Charlie —

WARREN BUFFETT: Good.

AUDIENCE MEMBER: — about his investment models.

I'd like to know the most useful models on industry consolidation, vertical integration, and models which explain the special cases when it makes sense to invest in retailing stocks —

WARREN BUFFETT: Ah, well, I think —

AUDIENCE MEMBER: — and if —

WARREN BUFFETT: — I don't want to interrupt you now, but I think we'll save those to the general question and answer. This is only on the issuance of the Class B right now.

AUDIENCE MEMBER: Oh. Sorry, sorry.

WARREN BUFFETT: But we're glad to have that question later on.

AUDIENCE MEMBER: Sorry.

WARREN BUFFETT: It'll give Charlie time to figure out the answer for one thing. (Laughter and applause)

We'll go through all of the questions regarding the Class B. And, then, we'll have a vote on the class —authorization of the Class B. And, then, we'll get into general questions and answers.

15. Do B shares penalize Class A shareholders?

AUDIENCE MEMBER: Sir —

WARREN BUFFETT: Somebody over there — we'll take another one from zone 4 if there's somebody — monitor.

AUDIENCE MEMBER: Mark Findidi (PH) from Connecticut. I'll apologize ahead. This isn't meant to be an impudent question or — in any way, shape, or form.

Do you think that the issuance of the B, in any way, might — in an effort to protect the folks who might be out there suckered in by the trust, if you will — in any way penalizes the A shareholders, either, one — or might penalize them — either, one, financially or, two, philosophically in the BRK experience?

I don't mean that in any kind of elitist fashion, because I don't think you've ever propagated that. BRK doesn't propagate that. But clearly, there's a room full of people — or rooms full of people — who have made a commitment financially to show that their philosophy is with you. Does that get diminished?

The other part of the question is the trusts, as you portrayed them, didn't sound terribly attractive. In a longer term, would they, perhaps, have ultimately failed as folks realize that they hadn't gotten into what they thought?

WARREN BUFFETT: Well, they might've. But I think the rub off would've been on us rather than the promoters of the trust — might've been on the promoters, too. But in terms of the failure of the trust, I don't mean failure in an absolute sense, but in terms of disappointing their investors.

I really think if tens of thousands or hundreds of thousands of people had come into something that was sold as being an all-Berkshire-type trust, if people came away disappointed in some years, I think they would tend to project that disappointment upon Berkshire fully as much as the promoter who sold the trust, who they might not even be able to find at that time.

The first question, you know, this — I don't think — we wouldn't be doing this if we thought it would hurt present shareholders, we — as much as we might detest something else that was going on. And we designed it so it — we felt that it wouldn't hurt present shareholders.

In terms of them having a philosophy — the new shareholders having a philosophy similar to the present ones — we've tried to filter those out coming in.

But I intend, after the offering, to send out a booklet, you know, kind of like freshmen at college, you know, orientation, greetings to Siwash U.

And we'll send it to everybody, new shareholders and the old shareholders, explaining our philosophy, just as an orientation course on the company. And we'll get that out, probably, in a month or so after the offering settles down.

I don't see any reason that — you know, Berkshire has evolved over a long period of time. We had 12 shareholders at the annual meeting 15 years ago. And it — we seem to be able to retain the same class and group of shareholders, in terms of people who really understand the business. It's a different group than you find at other companies.

And I think we can — as long as we've had this filter in effect, operating as new people join us, I think we can keep it.

Charlie?

CHARLIE MUNGER: Yeah. If the offering went wild and you issued 3 percent of the company, new, you're also taking in a billion-odd dollars. It is a — it's a non-event for us. (Laughter)

WARREN BUFFETT: He's very excitable. Don't say anything to him. (Laughter)

16. Berkshire can't match previous gains

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Ed Johnson (PH) from Park City, Utah.

As you receive the proceeds of the Class B sale and generate other cash, are you seeing opportunities out in the marketplace to continue to provide the kinds of returns that we've been fortunate enough to experience in the past?

WARREN BUFFETT: With or without the sale of the B, we don't see things to do that can maintain anything close to the average returns of the past. We've tried to convey that.

And it becomes a mathematical absurdity. Money just won't compound at that rate in this world, absent extraordinary inflation. It certainly won't compound in real terms.

So, absent the issue of the B, we are not looking at them. We're not seeing things. We're not hoping to find things that match some of the things that we have found in the past, relative to the capital base we've had in the past.

But we have that problem with or without the B. And it has not changed in any, even very minor degree, by the issuance of the B.

We are looking for things all of the time. Anytime we find anything that makes sense to us, we will do it.

The harder part is to make sure that we don't do something when we don't find something that makes sense. I mean, that's the bigger worry.

And when we find them, you know, they'll come along. And you never have — you never know when it's going to happen.

We run into businesses — I described a little bit of that in the annual report — almost by accident that we've had — contracted to make one purchase this year. The people who run it are here today. And it came about because I was attending a birthday party. And, you know, I'll go to more in the future. (Laughter)

So, things have not ended around here. We'll find interesting things to do over time. But they can't remotely be as profitable as the things we've found in the past, simply because of the large capital base.

17. Not expecting volume spike for B shares

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: Hi. I'm Matt Zuckerman from Miami.

I don't know, I think Charlie is the same class as Ev Dirksen. You know, $3 billion, we'll soon be talking about real money. (Laughter)

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: The two questions I have, basically, are, one — number one, referring to the gentleman over here before who commented on your popularity, which will definitely affect the stock, don't you think —?

And the second part of that is that even my wife's beautician has put in for some shares of this stock, and he represents a small tip of a large group who are probably doing the same thing on the one hand, so that there's going to be a large popular demand for the stock, which probably is not reflected in the numbers that the selling brokers are getting from institutions.

And number two, mutual funds themselves, in order to lend some panache or glamour or whatever to their portfolios will certainly be sucking up Berkshire stock after this.

And have you taken all of this into consideration when you decided upon the number of shares to go — that you're sending out, number one?

And number two, that the reaction, at least in the first 14 days, of the public to the shares, which will probably be in the range of $1,100, might not send the B shares up high enough to make a very, very interesting spike in the price of the A stock.

WARREN BUFFETT: Well, I — we've considered what you're talking about. I think that the issue has been well enough publicized that the demand will largely be reflected on the books of the underwriter in a day or two.

And I see no reason at all for a spike in the stock. I mean, the way we've designed it should really prevent that. We — and we tell people not to expect it.

If any institution wants to buy it, if any individual wants to buy it, they're going to have a chance to do it.

And I don't see any reason why there should be some huge influx of people immediately subsequent to the offering that didn't hear about it during the offering period.

It's interesting. I think most of the demand will be retail and smaller holdings, not so much institutional.

The — most new offerings are done in a manner where the idea is to have far more demand than supply, and therefore cause people to, maybe, order stock they didn't even want, and just on the idea that this restricted supply will cause a big jump the first day, whether, you know — you've seen Yahoo or a number of other offerings.

I think — I don't personally like that sort of distribution arrangement because you'll find that 30 to 40 percent of the issue will, perhaps, trade the first day. Well, I think — and, perhaps, at a lot higher price.

I think there's something a little wrong with that kind of an offering, because the company obviously isn't getting the proceeds that are equivalent to what people are willing to pay. And favored customers get the chance to flip the stock and really are getting paid an exorbitant underwriting fee themselves, even though they're called purchasers, because they sell it the first day.

We will be very interested in seeing the volume in the B stock the first couple of days, relative to the amount of the issuance.

And I will be disappointed and I'll be surprised if the trading volume in the B stock the first couple days, related to whatever the size of the issue is, turns out to be anywhere near as high as with most new issues.

I think that we will have a better success in finding people who really want to own it and who did not buy it to flip it, I think, by this method of distribution. But we'll have a test of that. We will see what happens in trading volume.

And I invite you to look at the volume and compare it to the amount we issue and, then, look at that relative to other new issues this year and just see how successful we were in finding real investors rather than people who were buying it to sell it to somebody else the next day.

18. Buffett's visibility and safety concerns

WARREN BUFFETT: Let's see, was that zone 6? I guess we go to zone 1.

(Long pause)

CHARLIE MUNGER (quietly to Buffett): Maybe we can vote.

WARREN BUFFETT (quietly to Munger): Yeah, but I don't want to cut off —

VOICE: Uh —

WARREN BUFFETT: Charlie says maybe we can vote, but I do — I want people to have their questions — (Applause)

It just encourages him when you do that. (Laughter)

I want to be sure people get their questions answered on this. I don't want to prolong it beyond —

If you feel your question has been 95 percent answered by an earlier question, I hope you'll skip asking it.

But we do want to have people that have questions about it answered, because I can tell by commentary and letters I've received that some people have genuine concerns. Yes?

AUDIENCE MEMBER: My concern — oh, my name is Jan Anglin (PH). I'm from Southern Indiana. And this is my first Berkshire meeting.

WARREN BUFFETT: Good.

AUDIENCE MEMBER: I did have a concern about the B shares that's less business and more — I guess it would be concerned with your and Mr. Munger's personal safety.

I often see your picture in the newspaper. And I certainly don't mind seeing it on financial magazines, but now, it's kind of, like, proliferating. I don't like the idea that you are so visible. (Laughter)

That bothers me. It's — I mean, do you understand what I'm saying?

WARREN BUFFETT: No. I understand exactly.

AUDIENCE MEMBER: This isn't —

WARREN BUFFETT: It's occurred to me. (Laughter)

I appreciate that, and I — but the answer is there's no other way, I mean, if —

AUDIENCE MEMBER: OK.

WARREN BUFFETT: — over time

AUDIENCE MEMBER: But can —

WARREN BUFFETT: — in terms of what happens. And —

AUDIENCE MEMBER: So —

WARREN BUFFETT: — as it grows, you get more visible, basically.

AUDIENCE MEMBER: Oh, I know. But along with the B shares and things, can you, kind of, like, be quotable but less available for photos? (Laughter)

WARREN BUFFETT: Well, I normally am. I — if you've noticed, in terms of interviews or anything of the sort, I do not do them. I've been invited to go on all of the news shows. And I, basically, don't do it.

Frankly, with the shareholders, I feel differently about this group. I'm delighted to see everybody come here. And I enjoy getting together with the shareholders. (Applause)

I think the real protection is, if we'd done something that had caused the stock to balloon way up and then come way down, I might have had to be a little more careful. (Laughter)

CHARLIE MUNGER: I think she has a very good idea. Having seen that acting — (Laughter)

I think hereafter, maybe you should be the voice of Mickey Mouse. (Laughter)

WARREN BUFFETT: I do appreciate the sentiment out of everybody. And there is a — it is unavoidable, to a fair degree. Although, Charlie may have thought I wasn't pushed into those acting jobs.

19. Class A "forever" convertible to Class B

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: This Joe Greer (PH) from Omaha, Nebraska of all places. (Laughter)

Regarding the conversion privilege, is there a time limit on the converting from the A to a B?

WARREN BUFFETT: No. That's a good — I'm glad you asked that question.

The first five days or so after issuance — business days — there's no conversion. But after that, you'll be able to convert until judgment day. It's forever convertible from A to B. But it's not convertible from B to A.

So there's no need to convert it until you have a reason to do so. It — and as I've pointed out, there's a very slight disadvantage in converting. And I wouldn't — until I had a need, I would not convert it.

20. How to convert Class A shares to B

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Scott Dowling from Redmond, Washington.

Kind of related to this question, as an A shareholder, I can only see really two reasons to convert A shares into B shares, one of them being gifting reasons.

In regard to that, how does one convert A shares into B?

WARREN BUFFETT: Yeah. That — yeah, there are instructions on that in the proxy statement as to how that — I guess it's in the annual report, too, that it describes how to do it.

But, basically, you get in touch with the Bank of Boston to do that and proceed from there. Or if you have your shares with a broker, you would instruct your broker to do it.

21. Class B price meant to discourage unreasonable expectations

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Good morning. I'm Ruth Owades from San Francisco.

I wondered, how did you decide that the ratio of the Bs should be 30-to-1 instead of 300-to-1 or something in between?

WARREN BUFFETT: Yeah. We wanted to have something that was roughly — would trade, initially, at least, in the thousand-dollar range.

We thought it very unlikely that anyone would find it commercially feasible to set up a trust that offered units that were denominated much below that.

So, that's as low as we felt we had to go. And we did not want to signal, in any way, that, you know, some sort of last chance, or something like that, to get in for some very low sum for people that, you know, just had some wishes that they could turn a hundred dollars into 100,000 or something.

I get letters from people that, you know, think that somehow that can be done. It can't be done.

And we don't want to appeal subliminally or any other way to people who harbor those hopes.

I'm sympathetic with them. But we don't have the answer to that. So, we went down to the level to match the unit trusts.

22. B shares will increase book value, but not intrinsic value

WARREN BUFFETT: Zone 5?

We'll try and do — we'll try to end the questions on the B fairly soon. But I don't want anybody that feels that they've got a — got some reservations about this — not to have a shot at asking their question.

AUDIENCE MEMBER: My name is Bob McClure (PH). I live in Singapore.

And the way I figure it, the sale of the B shares at the price they will probably be sold, will give an immediate boost to the book value of Berkshire Hathaway. So, as far as I'm concerned, the more the merrier.

Can you give us your thinking on that, the accounting treatment, how this will affect the book value of Berkshire?

WARREN BUFFETT: Well, any sell — shares we sell at the equivalent per A share of in the range of 33,000 or thereabouts, where the stock is selling now, will increase the book value per share.

But that does not mean it increases the intrinsic value per share.

I've said many times in the report, we use book value as a proxy in tracking movement of intrinsic value. But it does not represent anything like intrinsic value per share.

And the key is not what it does to book value per share, but what it does to intrinsic value per share. And, you know, we believe the intrinsic value is materially higher than the book value.

We don't spoil your fun by ever giving you a number. But — (laughter) — we do not regard the fact that it increases the book value per share as being any kind of a determinant in deciding to issue the shares.

But it will have that consequence mathematically. The key is the relation to intrinsic value.

23. "The facts are out on what we do"

WARREN BUFFETT: Zone 6?

VOICE: I think there was a question over here.

WARREN BUFFETT: Any questions in six?

VOICE: Behind you.

AUDIENCE MEMBER: Your problem seems to be that you've attracted a fair number of potential shareholders that don't have a way of estimating intrinsic value or developing expectations about what Berkshire's future prospects are.

Now, do you have any suggestions about how they might do that, short of the general guidance that you can't continue to compound your intrinsic value at the same high rate that you have in the past because of your asset base, and that you don't believe the share is undervalued?

WARREN BUFFETT: Yeah. Well, we'll probably talk more in the general question and answer period about our various businesses, but we simply try to give you all of the information about our businesses in a large, general way that Charlie and I consider important and that we would want if our positions were reversed.

I can assure you that if all Charlie and I knew about our businesses, what we've publicly disclosed, it would not change our estimates from what they might be from being intimately involved with the businesses. The facts are out regarding what we do.

So, you are in the same position to the extent that you have followed our kind of businesses and understand industry conditions and all of that.

And we'll continue to do that. We essentially regard you as our partners. And we tell — we try to tell you exactly what we, as partners, would want to know if you were running the place. And we'll continue to do that.

We won't tell you a number because we don't know the number. We have a range in our mind. Things change that range over time. And we'd probably get in all kinds of trouble if we tried to put out that range.

And Charlie and I would not come up with exactly the same range. But they'd be pretty close. We'll talk more about that a little later.

24. Shareholders approve Class B shares

WARREN BUFFETT: We do have questions now from zone 7 and 8 in the other room. So, we'll take on zone 7, please.

VOICE: I guess you've answered our questions in seven.

WARREN BUFFETT: Oh, took care of zone 7. How about zone 8?

VOICE: No questions from zone 8.

WARREN BUFFETT: Oh, OK. (Applause)

I think, at this point, we can move on to general questions after we have this vote.

And then, if you have another question or two that comes up during the general question and answer period, I'll be glad to — we'll be glad to work those in at that time.

So, we are now at the point: is there a motion to adopt the board of directors' recommendation?

WALTER SCOTT JR.: I move the adoption of the amendment to the fourth article of the restated certificate of incorporation that's set forth in exhibit A of the company's proxy statement for this meeting.

VOICE: I second the motion.

WARREN BUFFETT: The motion has been made and seconded to adopt the proposed amendment to the certificate of incorporation. It says here, "Is there any discussion?" but I'm not going to say that. We are ready to act upon the motion.

If there are any shareholders voting in person, they should now mark their ballot on the proposed amendment to the certificate of incorporation and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections a ballot on the proposed amendment, voting the proxies in accordance with the instructions they have received?

Mr. Fitzsimmons, when you're ready, you may give your report.

ROBERT M. FITZSIMMONS: My report is ready. The ballot of the proxy holders received through last Friday cast not less than 970,495 votes in favor of the proposed amendment. That number far exceeds the majority of the number of all shares outstanding.

The certification required by Delaware law regarding the precise count of the votes, including the votes cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Mr. Fitzsimmons.

The amendment to the certificate of incorporation, as set forth in exhibit A to the proxy statement for this meeting, is approved.

After adjournment of the business meeting, I will respond to questions that you may have that relate to the business Berkshire but do not call for any action at this meeting.

Anyone have any further business to come before this meeting before we adjourn? If not, I recognize Mr. Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT JR.: I move this meeting be adjourned.

VOICE: I second the motion.

WARREN BUFFETT: The motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say, "Aye."

VOICES: Aye.

WARREN BUFFETT: All opposed say, "No." The meeting's adjourned. (Applause)

25. Berkshire is more than its breakup value

WARREN BUFFETT: Now we'll to move to a — to general questions. And we'll do it by the same zone system.

As I said earlier, any of you are free, obviously, to leave at any time. We will break formally at noon and reconvene about 15 minutes later, after you've all had a chance to buy a sandwich, and you can — (Laughter).

Those in the other rooms can come in here. And we will go from then until about 3 o'clock.

So, we'll start in with zone 1.

AUDIENCE MEMBER: I'm Will Jacks (PH) from Chicago. I'm sort of representing Benjamin Graham today, the question he might ask.

You talked earlier about how you — about the value of your shares, the A shares, let's say, because the B is tied to the A.

But — and I know it — I don't expect a complete answer, but generally, how would you go about placing a value on the A shares?

WARREN BUFFETT: Yeah. Well, that's obviously a key question. As I've said, we try to give you the information.

But I think people, to the extent they've made a mistake in the past in valuing Berkshire — and they have made this mistake over time, including many commentators, including some institutions — is to look at it as simply a breakup value to our businesses.

I mean, you know, you can — you could do the same with General Electric, we — a magnificently run operation by Jack Welch. But I don't think the way you should look at a business like General Electric is to think about what would happen if they sold each division today, paid the taxes, and then distributed the proceeds.

And that has tended to be the case with many people looking at Berkshire, looking at it on a static basis. And that is not the way that Charlie and I have looked at it over time.

It lends itself a little more to that kind of analysis because we have a lot of money in marketable securities. But we have a lot of money in other things, too.

And the question of Berkshire, in valuing the intrinsic of any business, of course, is what is going to be the stream of cash over many years in the future — in fact, all of the years in the future, discounted back at an appropriate interest rate. I've talked about that in the past in the annual report.

Berkshire is a collection of businesses. And some of which we own in their entirety, some of which we own part of. And some of those businesses have very interesting dynamics to them.

And they — the value of our insurance business, for example, if you go back 26 — what was it? Twenty-eight years or so since we — 29, I guess — since we bought it from Jack Ringwalt. We paid 8.7 million, I believe, 8.4 — 8.7 million for two companies that Jack controlled.

If you had the foresight at that time to — and I didn't, but — if you had the foresight at that time to see what that would develop out of that insurance business, you would've come to the conclusion that their value to us was going to be far, far greater than the value at which they were then carried on our balance sheet. They were part of a business which had enormous potential.

And that's been, probably, the most significant asset that's been developed at Berkshire. But right now, we have over seven — right at 7 billion — over 7 billion — of float that's been developed from our insurance business.

We couldn't foresee that 25 or 30 years ago. But it would've been a big mistake to think in terms of the book value of that business being representative of its actual value to us over time, if it was run right.

And that situation probably prevails today.

So, it's a — Berkshire is a group of, on balance, very fine businesses to which we hope to add.

The intrinsic value will be affected by the job we do in allocating capital. It'll be affected by the job our managers do in running their businesses. It'll be affected by some items that we don't foresee now and, perhaps, have no control over.

But it is not measured, essentially, by what we could sell each separate business for and pay the tax on now. We haven't run it that way. We've run it so that we get the use of a lot of capital at very low cost.

Between deferred taxes and our insurance float, we have some 12 billion or so on the liability side that we think will be a very low cost. And that's — doesn't show as an asset, but it can be quite valuable.

Charlie, you want to —?

CHARLIE MUNGER: No. I don't think I've got anything to add to that.

WARREN BUFFETT: Oh. I was all set to write it down, too. (Laughter)

26. Buybacks at what appear to be high stock prices

WARREN BUFFETT: Zone 2, please.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, I'm Tim Medley from Jackson, Mississippi.

My question is an allocation of capital one. You've indicated that one thing you like in companies is a willingness on the part of management to repurchase its own shares.

I wonder if you would talk for a minute about your own frame of reference on repurchases when it appears that the current price of the stock is rich in relation to its intrinsic value.

And some have said that, with the right company, ongoing repurchases of stock should be made, irrespective of the price.

So, would you speak for a moment, as to how you think it pencils out when the current price of the stock is rich in relation to its intrinsic value?

WARREN BUFFETT: Yeah. If you're repurchasing shares above a rationally calculated intrinsic value, you are harming your shareholders, just as if you issue shares beneath that figure, you are harming your shareholders.

That's a truism. Now, the tough part of that, of course, is coming up with the intrinsic value.

And, for example — a good example might be Coca-Cola.

I think a number of people might have thought Coca-Cola was repurchasing shares at a very high price, because they'll look at book value or P/E ratios. But there's a lot more to intrinsic value than book value and P/E ratios. And anytime anybody gives you some simplified formula for figuring it out, forget it.

You have to understand the business. The people who understood that business well, the management, have understood and been very forthright about saying so over the years, that by repurchasing their shares, they are adding to the value per share for remaining shareholders.

And like I say, people who didn't understand Coca-Cola, or who thought mechanistic methods of valuation could — should take precedence, really misjudged the value to the Coca-Cola Company of those repurchases.

So we favor — when you have a wonderful business — we favor using funds that are generated out of that business to make the business even more wonderful. And we favor repurchasing shares if those shares are below intrinsic value.

And I would say that if it's a really wonderful business, we probably come up with higher intrinsic values than most people do.

We have great respect, Charlie and I with — I think it's developed over the years — we have enormous respect for the power of a really outstanding business. And we recognize how scarce they are. And if a management wishes to further intensify our ownership by repurchasing shares, we applaud.

We own — we just went over 8 percent of the Coca-Cola Company, probably, in the last three or so months, by a very tiny fraction. But we had a second purchase one time.

But our percentage interest in the Coca-Cola Company has gone up significantly through their repurchases. And we are better off because they have bought those shares at what looked like, to some people, perhaps, high prices. And we thought they were wrong at the time, and I think now it's been indicated or proven.

So, I urge you, if you're trying to decide on the wisdom of repurchases, or of share issuances, that you don't think in terms of book value. You don't think in terms of specific P/Es. You don't think in terms of any little model.

But you think in terms of what would you really, A, pick businesses you can understand and, then, think what you really would pay to be in those businesses. And that's what counts over time, is whether the repurchases are made at a discount from that figure.

And I would say with the companies that we own shares in, we — our interest in GEICO went from 33 or so percent to 50 percent over a 15-year or so period, simply through repurchases. And we benefitted significantly.

So, did every other shareholder, I might add, that stayed with the company. And we benefited in no way disproportionate to them.

But that was a very wise action on their part. And there too, they were all — usually buying that stock at at least double book value. And you could compare it to other insurance stocks and say, "Well, that's too much to pay."

But GEICO wasn't an insurance company that was comparable to other insurance companies. It was a very different sort of business. And they were very wise, in my view, to be following that course of action.

Charlie? No?

27. B shares won't dilute value of A shares

WARREN BUFFETT: Zone 3?

VOICE: That's you.

AUDIENCE MEMBER: Oh, sorry. I'm Elaine Cohen (PH) from San Diego.

I'm a little confused about how the B shares are going to be moving if they're at 1/30th of the A shares when they get out on the market.

Are they always going to be 1/30th of the A shares? And if they are, is that going to dilute the earnings of the A shares? Could you just explain that?

WARREN BUFFETT: Yeah. It won't dilute the earnings or value of the A shares as long as we use the money reasonably effectively that is produced.

As I mentioned earlier, if it happens to be 1 percent, you'll own 1 percent less of all these other things — on the other hand, will have close to $400 million more of cash. So, it will not — in our view, it will not dilute the value of the A.

I expect, over time, that the B, a very large percentage of the time, will be selling very close to a 30th. But it could sell for less than that ratio. It can't sell for any significant amount more than that ratio, or arbitrage will eat away at any slight premium. I think that takes care of that.

28. No "secret formulas" for Wells Fargo

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Mr. Buffett, my name is Hugh Stephenson. I'm a shareholder from Atlanta, Georgia.

My question involves the company's interest in Wells Fargo. As you know, Wells Fargo, like most banks, has a very expensive branch system for deposit-gathering and servicing their customers.

As I guess you know, they also have moved more into branches in supermarkets and in online banking that seems to have the potential to very significantly reduce their costs, relative to the branch system.

Would you comment on how you think that might play out and how significant it might be?

WARREN BUFFETT: Well, the question — you're right. Wells Fargo has been a leader in moving into supermarkets. They've got a couple different formats they've used. And they've been a — they've certainly been a leader in the online banking services.

Unfortunately, in banking, you know, it's a little hard to have any secret formulas. Coca-Cola has 7X down there in the vaults of the, what used to be the Trust Company of Georgia, now SunTrust. But in the banking business, anything you do, your competitors can copy.

Nevertheless, there's a — there is an advantage. And sometimes it can be a quite — a significant advantage in being first and learning more about different distribution methods. And I think Wells Fargo has done a terrific job in learning that.

I think they've got some advantages. They — but they aren't advantages that other people can't work at copying and chipping away at.

But it's a good management. They've done a very good job of seizing on that particular trend in supermarkets.

And as such, they are — they have the potential, perhaps, for having a relatively low-cost deposit-gathering operation. And every other bank in the world will be looking, noticing how that works, not only there but at other banks, to figure out whether they can copy it.

Charlie? OK.

29. GEICO benefits from being entirely owned by Berkshire

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: My name's Alan Parsow from Omaha.

Berkshire has increased the rate of growth in its insurance float in excess of 20 percent a year since 1967.

In regards to GEICO, its rate of growth, what is its historic rate of growth been in its insurance float? And what impact will it have on the rate of growth in the overall Berkshire insurance float?

WARREN BUFFETT: Well, I would say that GEICO is a huge plus to Berkshire. Now, we owned 50 percent of it before. I mean, we've had a — we've benefitted from our GEICO investment in a big way, ever since 1976. So, it's not entirely a new benefit that's coming in.

We paid a good price for GEICO, but it is a terrific company. It has outstanding management. It has a low-cost method of distribution, which is very difficult for people to — I mean, everybody wants to have that. But they — very few come close to it.

The management is focused on bringing costs down even further and widening that competitive moat.

GEICO — I personally think that, just from what I see, that GEICO — I would think GEICO's growth rate is likely to be greater, at least, in the future, that I can see, over where it has been in the past. But it's been perfectly satisfactory in the past.

I think there are some advantages to it being part of Berkshire, in that there are costs attached to bringing new business on the books. And we care not at all about reported quarterly earnings.

GEICO was relatively insensitive to those before. And that's a compliment when I say that. But they had some more pressure on them in respect to reported earnings than they will have, as part of Berkshire.

And I think there's some really big opportunities, in terms of what can be done with GEICO as part of Berkshire.

So, I think five years from now, you'll be very happy with the fact that we own a hundred percent of GEICO.

And I think you will see that as marvelous a company as GEICO was independently — as an independent company — it will flourish maybe even a bit more as being part of Berkshire.

Not because we bring anything to the party. I mean, the management will continue to run it autonomously. But there's — there are some advantages for it in being part of a larger enterprise.

30. Berkshire businesses worth more than book value

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Mr. Buffett, my name is Steven Tuchner. I'm a shareholder from Toronto, Canada. And my question concerns the valuation of Berkshire shares.

Given the large number and dollar size of the private businesses recorded at historic cost, which Berkshire owns, shouldn't the multiple to book that the stock trades at, essentially, expand over time to reflect the increases in intrinsic value of the private holdings?

And I cite Buffalo News on the books at, essentially, I think around zero. And even GEICO now will be on the books at, probably, between 3 and 4 billion — worth more than that — as examples of the disparity between intrinsic value and book value?

WARREN BUFFETT: Most of the businesses that we own all of, or at least 80 percent of, are carried on the books at considerably less than they're now worth.

And with some of them, it's dramatic, although it's not dramatic compared to a $40 billion total market valuation for Berkshire. It's dramatic relative to the carrying price.

Because when we bought See's Candy for an effective $25 million in 1972, it was earning 4 million, pretax. It earned over 50 million, pretax, last year. When we bought the Buffalo News, it was making nothing. Paid 30 and a fraction million. And it's now earning, maybe, 45 million. And we've got a number of businesses. And GEICO's worth more than we carry it for because of the accounting peculiarities of the first 50 percent.

So, it is true that, overwhelmingly, our businesses are worth something more than intrinsic value — than book value — and, in many cases, very substantially more, although that's reflected in the market price of our stock.

I don't think you can go from year to year and trace the intrinsic value precisely by changes in book value. We use changes in book value as a very rough guide as to movement, and sometimes I comment.

There have been certain annual reports where I've said our intrinsic values grew more than the proportional change in book value, and there's been others where I've said I thought it was roughly the same.

So, I don't think you can use it as a — stick some multiplier on it and come up with a precise guide — a precise number. But I do think it's a guide to movement.

Our insurance business, though, is the most dramatic case of dollar difference between book value and intrinsic value. I mean, the number has gotten very big over time there. I personally think it will tend to get bigger, because I think GEICO will grow, and I think our other businesses will do well.

The trick, of course, is to take the new capital as it comes along — and not from the issuance of the B, because that's relatively small compared to the amount of capital we will just generate from operations.

Our float will grow from year to year. Our earnings will be retained. And we've got to go out and find things to do that three or five years from now that people say, "Well, that's worth more than the book value." And that's a job. It's a tougher job than it was. But it's kind of fun.

31. Not expecting B shares to affect price of A shares

WARREN BUFFETT: Zone 7?

AUDIENCE MEMBER: Yes. My name is Jim Elliot (PH). I'm from Minneapolis.

I wonder if you could help me with an upside scenario where the B shares, after they're issued, are limited and there's not a significant reissue afterwards. The A shareholders are somewhat reluctant to convert. And you have a run on the B shares where, let's say, it goes to $2,000 a share.

Do we then have the tail wagging the dog, where the 2,000 command a $60,000 price on the A shares? And, you know, what — does the — this arbitrage take care of that? Or —

WARREN BUFFETT: Well —

AUDIENCE MEMBER: — what do we do in that case?

WARREN BUFFETT: If there is demand for the B that pushes the price up somewhat, it will produce conversion from the A. I mean, the only way the B will be able to get — we'll just pick a figure — if it were to get to $1,200 — there is no way that the A could be selling appreciably below 36,000.

And I don't think — I think that introducing the B into the equation, may mean — it will mean — that there will be some people who like a lower denomination stock and come in.

But it takes a lot of that to, in an appreciable way, affect $40 billion worth of what is now A stock.

So, you know, if there were incremental demand of a hundred million dollars a year or something like that, that's a little more than the demand that might otherwise go into the A. But I do not see it producing anything in the way of a big movement.

But you're quite correct in that there's no way that the B stock can go up and not really force some conversion from the A. It'll — I think it'll be minor.

32. World Book Encyclopedia business won't be sold

WARREN BUFFETT: Zone 8?

AUDIENCE MEMBER: Hello. This is Rick Merliof (PH) from Oakland, California.

I wanted to ask you about World Book Encyclopedia. World Book seems to me to be an example where Berkshire has invested in technology without necessarily intending to.

I would expect that in five or 10 years it's going to be real tough to sell a paper encyclopedia, because at that time, you'll probably be able to buy the computer and the electronic encyclopedia for less than the paper encyclopedia.

Up till now, I haven't had the impression that World Book has been as aggressive as its competitors in marketing and developing its electronic product.

It's been the highest price that I have seen of the competition. It's — it asked at least — a year ago, its list price was 600 and the competition was 8,200.

You sold as low as a hundred on special promotions. But it — I don't think that was the list.

A year ago, you were still selling by direct sales. I have not yet seen it in a mass market software store. I've never seen it bundled with a computer.

And I have seen one newspaper review of electronic encyclopedias that mention the World Book print version but didn't seem to be aware that a World Book electronic version was available, which it was at that time.

In terms of the product itself, we have both the World Book and the Grolier's at our house. The Grolier's came with the computer. And both encyclopedias, in this last year, solicited us to buy an upgrade. World Book was asking $85. Grolier's was asking 30.

But in addition, I ended up buying only the Grolier's, because it addressed my biggest disappointment on the original version of both of them, which — it's sort of a — in a way, a minor issue. But I thought it was relevant for kids doing school reports.

Neither one allows you to print out a very big percentage of the pictures in the encyclopedia. They have a lot of pictures. But you can't print them. And you can get a color inkjet printer for under 200 bucks these days, so it's real practical to print things out.

The World Book made no mention of having any improvement in this area. The Grolier's said you can print out almost all the pictures. And I have found — since we got the upgrade — I found that to be true.

So, I'm concerned that — I'm not an expert on this, but I don't think World Book is as aggressive in either developing or marketing its electronic encyclopedia.

So, my question is, do you plan to become aggressive in this area and a leader in the electronic technology? Or have you considered selling your electronic business and just getting out of it?

WARREN BUFFETT: Yeah. We won't sell the electronic business. That, I can tell you.

You're quite correct. Some of the technical stuff I'm not very good at. I have a little trouble turning on the light switch.

But the — (laughter) — in terms of the bundled product, which is the encyclopedia that is offered with the purchase of a new computer, there's no question that that's become a large business in units.

It's not so large in terms of dollars, because those units, bundled with an original equipment sale, are very low. Actually, Encarta's probably — well I'm sure has sold, you know, many, many millions of units bundled with a new encyclopedia. It doesn't necessarily produce a lot of dollars. But it produces a lot of units out there.

We, at World Book — Encyclopedia — some of you may not have noticed, but Encyclopedia Britannica has, within the last couple of weeks, announced the cessation of direct distribution of the print product.

And unit sales of encyclopedias — print encyclopedias — in the country have gone down very significantly in the last few years, as they have at World Book.

We changed the — we are in the process of changing, and have already changed in some parts of the country — the distribution system because we are going to see what can be made to work, if anything, in the direct distribution.

There are some indications that we may be able to make money in that business but with a different cost structure than before. And it — well, we'll know more about that. We're not that far along, because we changed the distribution within the last — or partially changed it — within the last few months.

We — it's not easy to figure out how to make money in either the electronic or print encyclopedia end of the business. And we have some ideas in the electronic end that we'll know a lot more about in about six months or so, but I can't really — I don't want to go into any detail on those at present.

I've got the electronic product myself. It's a first-class product. We've got ideas about how to make it an even better product. And we have taken a lot of costs out of the print end of the business. We'll be putting some of those into the electronic end. But we've taken a lot of costs out.

It may well be that it'll be a workable business for us, even though it isn't for anybody else, but the jury's still out on that.

It is not the business it was five years ago. And I don't think it will be the business that it was five years ago, because the world is changed in some ways on that.

But we're — we will not sell World Book. That I can just — I'll state that unequivocally. We will not sell electronic World Book. We are in the business to stay.

But we are groping a bit in terms of figuring out a configuration that will produce decent profits for us and sell a lot of World Books in the process.

Charlie?

CHARLIE MUNGER: We don't have any way of avoiding declines in some of our businesses some of the time.

Blue Chip Stamps once sold stamps at the rate of $120 million year. Now, it's about $200,000 a year. So, we lose some. (Laughter)

WARREN BUFFETT: We were in the windmill business many years ago. (Laughter)

We try to make — you know, we think plenty about the problems. But there are industry problems.

I was in anthracite coal at one time, too. Street railways. I've seen them all.

But World Book is a first-class product. It's a product I use, a product Charlie uses. And there is — through an electronic means, you can deliver information at costs far, far less than — I mean, unbelievably less — than was the case not that many years ago.

And the world, in many forms, will be adjusting to that, not just in encyclopedias. And it affects some of the businesses we're in. And it's something we think about. But it's very unlikely that Charlie and I are going to be smarter than the rest of the world, in terms of the electronic world.

I mean, we are looking at it as something where we're looking for the obvious, and something that is within our capability of doing something about. But we're not trying to beat people at their own game, where we're not very good at the game.

33. Protecting public shows "tremendous integrity"

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Mr. Buffett, Richard Charlton from Canada. One of the highlights of — good afternoon, Mr. Munger, also. (Laughter)

One of the highlights, for me, in coming to the annual meeting for the past seven or eight years was the way that you dealt with the question that was inevitably asked by a new shareholder as to why you will not split your shares.

I know how much it has meant to you to keep the shares trading in an exclusive way. And you have been my mentor for the last 17 years.

And I think that what you're doing in splitting these shares in order to protect the public, and indirectly, Berkshire shareholders, but mostly to protect the public, is just another expression of your and Mr. Munger's tremendous integrity.

And you're setting a fantastic example for corporate America. And I salute you, sir. And I thank you very much. (Applause)

WARREN BUFFETT: Thank you. Thank you.

34. "The fairer, the better" for Berkshire's stock price

WARREN BUFFETT: Well, I hate to leave zone one after that, but we'll go on to zone 2. (Laughter) Thank you.

AUDIENCE MEMBER: Wesley Jack from Oklahoma City, Oklahoma.

As a stock broker, I can say I definitely don't like UITs and I appreciate your plan for the B shares.

But as long — with the rest of the shareholders, what we hope — that the shares go up in value in the future. Don't you see a problem with them coming back with this idea in the future?

WARREN BUFFETT: On the unit — you mean on the issuance of unit trusts?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Oh, I don't see any problem because the B will be out there. And it is a superior product, whatever its absolute merits may be. On a relative basis, it is a superior product to anything that is going to carry a big commission to a salesperson and a lot of annual costs.

So, I think — my guess is we've taken care of that problem. I wish it hadn't come up, but it — I would think that it would be very difficult for anyone to honestly offer a product — a derivative-type product — through a unit trust that would be superior to buying the product that will be available.

CHARLIE MUNGER: I think he's afraid that the B will go up to the place where the whole story comes again. And I must say that if that were to happen, we'd like it. (Laughter)

WARREN BUFFETT: Well, we'd like it, only if it reflected underlying values, but — (Laughs)

CHARLIE: Yeah.

WARREN BUFFETT: Yeah. We have a very strange attitude on that. I mean, most managements feel that the — on the price of their shares — that the higher, the better. And that's an understandable feeling. But the trouble is the game isn't over at any time.

We really feel the fairer, the better. Our goal is that every shareholder participates in the progress that Berkshire makes, during — as a business — during their holding period. In other words, we don't want one party getting wealthy off the other. We want them to share based on the gain in value of the business.

And to the extent that the stock got way overvalued or way undervalued, you know, that may make one party — in the first case, the seller, in the second case, the buyer — very happy. But there's somebody on the other side of the transaction.

In economics, you know, the most important question — maybe important beyond economics, too — but whenever somebody tells you something, you know, the first question to ask yourself is, "And then what?" And we tend to do that around Berkshire.

And so, the stock going up is not an end of itself, because it's — the next question is, "And then what?"

And to the extent that the stock goes up because the intrinsic value goes up, everyone is getting their fair share of the pie as they go along.

To the extent it exceeds that in some way, the selling shareholder gets a benefit. But the entering shareholder is at a disadvantage. And we really like the idea of the price tracking intrinsic value over time.

And we think that, by having the right kind of shareholders and by communicating with them properly and following the right kind of policies, that we can come as close to that as is attainable in a world where markets, essentially, are fairly volatile. And so far, I think it's worked out pretty well that way.

But the intention is to — and the goal — is to keep it that way.

One thing to remember: in the end, the owners of businesses, in aggregate, cannot come out anyway better than the businesses come out.

I mean, you can — the businesses are the — and not just our businesses, I'm talking about all American business — the profitability of American business determines the profitability of what the owners of American business have, and you can forget all about the little ticker symbols and everything else.

The owners suffer to the extent that they have some extra costs imposed in broker's commissions, fees, all kinds of things. That diminishes the return from the business. But no one has figured out yet how to perpetually have owners do better than their businesses.

And our idea is to have them do it as they go long in proportion to the gain that occurs during their tenure as a shareholder. And that isn't easy to do. And it's not attained perfectly. But that's the goal as we go along.

35. Insurance float: "Above all, get it cheap"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Maurus Spence. And I have a serious question and, then, a less serious question first.

The less serious: you said that you and Charlie had lost, between you, a hundred pounds. I was curious who had lost more?

WARREN BUFFETT: No, no. I said the board had lost a hundred pounds. (Laughter)

I have some members of the board who would take umbrage of the fact that they weren't included in that total. (Laughter)

AUDIENCE MEMBER: OK, Who lost —?

WARREN BUFFETT: Charlie and I, we're pretty close at the moment, aren't we? Modesty prevents — (Laughs)

AUDIENCE MEMBER: I must say you're both looking very good, anyway.

WARREN BUFFETT: We're feeling good.

AUDIENCE MEMBER: I was wondering who lost the most and what your diet secrets were. (Laughter) And, then, the more serious question was about float.

You touched on this a little bit earlier. But you've often said that your insurance business is probably the most important business that you own.

On page 12 of the annual report, you said, "We have benefitted greatly to a degree that has not been generally understood, because our liabilities have cost us very little."

I was wondering if you could describe this a little bit better so we can understand it.

WARREN BUFFETT: Yeah, the — Charlie and I have lost about the same amount, at about 20 pounds each.

The insurance business provides us with float. And float is money that we hold that doesn't belong to us.

It's like a bank having deposits. A bank has deposits. The money doesn't belong to it. But it holds the money.

Now, when a bank holds deposits, on everything except demand deposits, there's an explicit cost, an interest rate attached to it. And, then, there are the costs of running the system and gathering the money which is — also must be attributed both to demand and time deposit.

So there's a cost to getting what they would call deposits and we could call float.

In the insurance business, a similar phenomenon takes place in that policy holders give us their money at the start of the policy period. And therefore, we get the money paid in advance for the product.

And secondly, it takes time to settle losses, particularly in the liability area. If you bang up a fender on your car, you — it's going to get settled very quickly, so there's — but if there's a complicated injury or something, it may take some years to settle. And during that period, we hold the money.

So, we have, in effect, something that is tantamount to the deposits of a bank. But whereas the deposits of a bank, it's quite easy to calculate the approximate cost, in the case of the float that the insurance company has, you don't really know what the cost of that float is until all your policies and losses — policies have expired and your losses have all been settled. Well, that's forever, in some cases.

So, you're only making an estimate, as you go along, of what that float is costing.

To date with Berkshire, in the 29 years we've been in the business, it appears — never certain, because you don't know for sure what's going to happen — but it appears that our float has not cost us anything, in — on average.

There’s been years when we’ve had an underwriting loss when there’s a cost. There’s been years when we had an underwriting profit. And so, we had a reverse cost.

So we have obtained that float on very advantageous terms over the years. Far more than — fully as important as that— it’s important to get it at a low cost, in our case, no cost. But the other important thing is that we’ve grown it dramatically.

And so, we’ve gotten more and more money without having any cost attached to it. And if we still had our 16 — or 17 million, I guess — of float that we had in 1967 and it was no cost, it would be very nice.

But 17 million of free money is worth something, but it’s not worth a ton.

Having seven billion, if we can achieve that as free money, it’s worth a lot of money. And that growth has not, probably, generally, been appreciated fully in connection with Berkshire nor has the interplay of how having zero-cost money, in terms of affecting our gain in value over time.

People have looked at — always looked at our asset side, but they haven’t paid as much attention to the liability side. Charlie and I pay a lot of attention to that.

And, I mean, this — it’s not entirely an accident that the business has developed in this manner. And we have intentions of trying to make it continue to develop in this manner, and in that manner, in the future. But we’ve got competitors out there, too.

Float, per se, is not a blessing. We can show you many insurance companies that thought it was wonderful to generate float. And they have lost so much money in underwriting that they’d be better off if they’d never heard of the insurance business.

But, you know, the job is to get it, get it in increasing quantities, but above all, get it cheap. And that’s what we work at.

And you do that in the business through having some kind of competitive advantages. You won’t do it just by having an ordinary insurance company. The ordinary insurance company is not a good business.

We have it, in certain respects, because of our attitude toward the business. We have it because of our financial strength gives us certain competitive advantages, and we have it in the case of GEICO, because of a very low-cost operation.

And it’s us — up to us — to try and figure out ways to maximize each one of those competitive advantages over time.

We've built those advantages. I mean, in 1967, we were not looked at that way in the insurance business. We were — we've built a position of competitive strengths. And in the case of GEICO, they had it without us. But we have bought into it over time.

It's a very important asset. And you ought to pay a lot of attention over the years as to what is happening in — with that asset as to both growth and costs. And that will aid you in calculating intrinsic value.

Charlie?

CHARLIE MUNGER: Nothing to add.

WARREN BUFFETT: OK.

36. Intrinsic value isn't above current stock price

WARREN BUFFETT: Zone 4 is the next.

AUDIENCE MEMBER: Henry Neuhoff (PH), shareholder, Dallas, Texas.

My guess is that you consider the intrinsic value of the shares to be more than that represented by the price.

WARREN BUFFETT: By more than represented by what?

AUDIENCE MEMBER: More than represented by the current price of the shares.

If that be the case, what would be your thoughts about Berkshire repurchasing its own shares?

WARREN BUFFETT: Yeah, no. We have said we do not consider Berkshire undervalued at this price. We didn't say we thought it was overvalued. But we said we did not consider it undervalued.

So, a repurchase based on our estimate would not be in the interests of shareholders.

It's conceivable it could be at some time, but we do not think that's the case. We think intrinsic value far exceeds book value, but we do not think it exceeds present price.

We're not selling any shares, though, either. (Laughter)

(Break in tape)

37. Complications from "street name" shareholders

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: My name is Carlos Lucera (PH). I'm from Idaho. And my question relates to street names.

Our stock at Berkshire Hathaway is in a family limited partnership. And in addition to that, it's in a street name.

Now, what is the reason, and the rationale behind the reason, for street name shares not being able to participate in the charitable contributions by Berkshire Hathaway?

WARREN BUFFETT: Yeah. We submitted a request for ruling to the IRS — I don't know, 15 or so years ago, in connection with the shareholder-designated contribution program.

And the ruling we received specifies record holders and not street name holders. Now, that doesn't mean that a different ruling might not be obtained.

But frankly, when we get into the multitude of indirect holdings and the problems we have with those indirect holdings in other respects, I think it would be a bit of a nightmare for us to attempt to get that program extended through — into street name holders.

I think the costs would far exceed the benefits. And I think that it is the situation, and anybody with it in street name can move it into their own name if they want to.

So I think, with very small amount of effort on the part of an individual shareholder, it would offset an enormous set of problems that we would encounter at Berkshire.

We can handle the present system. We've got 12 people there. And they run the annual meeting. They make movies. They do all kinds of things. (Laughter)

And it would be — it would be very tough and — you know, if an extra 10,000 shares participated, it'd be $120,000 of contributions. I just don't think it would be worthwhile.

Our ruling doesn't presently cover the subject, in any event. It's something we've thought about.

Charlie?

CHARLIE MUNGER: Yeah. I think even if they changed the ruling, we wouldn't change the policy. It would be, administratively, very difficult.

WARREN BUFFETT: We run into other problems, in terms of people getting their material — just the material on the annual meeting.

And we've heard from a number of shareholders that they can't get it from their broker, and they're — they don't know what the B is all about because they didn't get their proxies. And it just — street name posed more problems.

Although, we have a — now we have — probably have more than — forget about the B. We have more than twice as many, I believe, holders in street name as in direct ownership. Although, the number of shares is far, far — I mean it's — it'd be less than 20 percent of the shares. But it's probably double the number of holders.

38. No "look-through earnings" in annual report

WARREN BUFFETT: Zone 7?

AUDIENCE MEMBER: Good afternoon. My name is Bill Guerra (PH). I'm from the San Francisco Bay area. I've owned your shares for many years and appreciate the good job you've done.

However, in this year's chairman's letter — you developed a concept a few years ago called look-through earnings.

WARREN BUFFETT: Right.

AUDIENCE MEMBER: And I failed to see that this year. And I'm wondering if that no longer is a valid concept or why you refrained from showing the data?

WARREN BUFFETT: Yeah. That's a good question. I should have actually covered that in the annual report, in terms of mentioning — because I've talked about it, and we'll talk about it in the future.

And we do have a goal on look-through earnings of $2 billion in the year 2000. And that's going to be adjusted upward to allow for the fact there are more shares outstanding. It'll be the same basic goal.

But there were two reasons that it was skipped this year. And like I said, I should've mentioned it.

One was it was the longest letter we've ever had. And having that section in there would've elongated it even a bit more. And that, coupled with the fact — and this is the important part of it — we had major changes in our — the composition of the company — immediately after the end of the year.

So, our Capital City stock disappeared. At the time it disappeared, we didn't know whether it was going into cash, or all Disney stock, or a combination.

We had the acquisition of the other half of GEICO where, even now, the accounting treatment isn't clear. And I felt that —

The look-through earnings last year were fine. But I felt that, by the time I got through explaining all of the adjustments you would have to make for the transactions then pending, that adding it to the — to already the longest letter I've written, would've slowed things down a lot and not been particularly helpful.

It will be back in this year, this upcoming report, and future reports, because it's a very important concept. And it's something that we're focused on.

It's just that last year's number — it would've been a mess by the time I got through trying to explain it.

You know, I normally — the accounting stuff, I know, puts a lot of you to sleep. But believe me, it isn't so much fun writing it either. (Laughter)

So, I skipped it this year. We'll have it next year. And the number would've been OK last year, but there would've been a lot of asterisks attached.

39. Discount rate for estimating intrinsic value

WARREN BUFFETT: Zone 8, please.

AUDIENCE MEMBER: Yes. Mr. Buffett, good morning. My name's Ed Walzak (PH) from New York. I'm a student and an admirer of your investment philosophy. I have a question.

In determining a company's intrinsic value, you seem to write or indicate that you project out a company's owner earnings for a number of years, and then discount that back by prevailing rates.

My question is, how much of a premium, if any, to prevailing risk-free rates do you demand when you discount back the owner earnings of a company?

Or stated differently, for example, today, with loan rates at about 7 percent, if you did the same exercise with Coca-Cola, at what rate of interest would you discount back their owner earnings?

WARREN BUFFETT: Yeah. We get asked that question a lot. And we've answered it to some extent in past annual reports about what discount rate to use.

We basically think in terms of the long-term government rate.

And there may be times, when in a very — because we don't think we're any good at predicting interest rates, but probably in times of very — what would seem like very low rates — we might use a little higher rate.

But we don't put the risk factor in, per se, because essentially, the purity of the idea is that you're discounting future cash. And it doesn't make any difference whether cash comes from a risky business or a safe business — so-called safe business.

So, the value of the cash delivered by a water company, which is going to be around for a hundred years, is not different than the value of the cash derived from some high-tech company, if any, that — (laughter) — you might be looking at.

It may be harder for you to make the estimate. And you may, therefore, want a bigger discount when you get all through with the calculation. But up to the point where you decide what you're willing to pay — you may decide you can't estimate it at all. I mean, that's what happens with us with most companies.

But we believe in using a government bond-type interest rate. We believe in trying to stick with businesses where we think we can see the future reasonably well — you never see it perfectly, obviously — but where we think we have a reasonable handle on it.

And we would differentiate to some extent. We don't want to go below a certain threshold of understanding. So, we want to stick with businesses we think we understand quite well, and not try to have the whole panoply with all different kinds of risk rates, because, frankly, we think that'd just be playing games with numbers.

I mean, we — I don't think you can stick something — numbers on a highly speculative business, where the whole industry's going to change in five years, and have it mean anything when you get through.

If you say I'm going to stick an extra 6 percent in on the interest rate to allow for the fact — I tend to think that's kind of nonsense. I mean, it may look mathematical. But it's mathematical gibberish in my view.

You better just stick with businesses that you can understand, use the government bond rate. And when you can buy them — something you understand well — at a significant discount, then, you should start getting excited.

Charlie? (Laughter)

CHARLIE MUNGER: Yeah. The discounts were once greater than we now see.

WARREN BUFFETT: That's all you're going to get, folks. (Laughter)

40. See's Candies not going fat-free anytime soon

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Hi. Warren, it's Peter Newman, Nick and Racky's son. You can't see me because I'm on your hard left over here.

And by the way, Racky says to send her love to you —

WARREN BUFFETT: Great.

AUDIENCE MEMBER: — and Susie.

I'm going to take a cue from something that the guy who asked the questions about the World Book —

I know you're loathe to, normally, interfere in the running of your individual corporations, because they do so well on their own. And I am particularly fond of See's Candy and their products. And you may or may not know that we have a chocoholic in our family, as you do in yours.

WARREN BUFFETT: Yeah. Makes good chocolate syrup, too. (Laughs)

AUDIENC MEMBER: Yeah, I won't mention who.

However, when I was in there this Christmas buying some gifts, I noted that, with the exception of the little candy canes, there's nothing in that store that is fat-free.

And we are facing a trend — (laughter) — in the world, especially in dessert items and ice cream and candy items, of fat-freeness.

And I just thought that, perhaps, it would be a word — worth a word to management to consider expanding the hard candy line.

WARREN BUFFETT: Well, we look at a lot of things. One of the problems, as you probably know, for example, in using aspartame is it doesn't interact well with heat. And so that's been sort of tough.

Now, Charlie and I have kept getting our regular boxes of candy during this weight loss-program. And we've — (laughter) — devoured them.

And candy, you know, it may be, on average, a hundred and — depends on whether it's a sugar product or not.

But, take the lollipop, it'd be about 110 calories per ounce. But there's — that's one and a half, or one and a quarter lollipops, or something like that.

Most things are, you know, in that hundred per ounce to 150 per ounce range. So, candy is not a specific no-no.

If we can find something that the customer likes, that makes them think they're getting skinnier by eating it — (laughter) — you know, that will be a breakthrough.

And we look forward — and we test everything that comes along. I can assure you. (Laughter)

In fact, Charlie and I may be the main testers.

Chuck Huggins is here today — and if you've got any ideas on it — who runs See's. Done a terrific job of running See's ever since we took over in 1972. He'd appreciate ideas.

But we are looking for things that appeal to the consumer that taste good and that they'll go for. I mean, just as is, you know, the Coca-Cola Company, in terms of carbonated soft drinks. So, it's a constant subject.

And, you know, there were high hopes on aspartame originally. But it just hasn't panned out in terms of candy. And I've read a few articles about the fat-free stuff.

Well, it should be the fat substitute, which didn't get me too excited about trying it. But I'm not sure whether some of you read those articles or not. We'll keep looking, Peter, I appreciate it.

41. GEICO's price: "We gulped a few times and paid it."

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger.

As an aspiring shareholder, I'm very happy and proud to be here. Maybe I can encourage Mr. Munger to respond to my question this morning.

In regards to your purchase of the other half of GEICO, would you comment on your reasoning behind paying the premium above market value and why you, instead, did not purchase shares in the open market?

CHARLIE MUNGER: Well, we couldn't have purchased very many shares in the open market at the quoted price. And the price we paid, with the large number of shares we got, we thought was a very satisfactory price.

WARREN BUFFETT: Yeah. We — what Charlie said is a hundred percent right. We also had a restriction that we agreed to many, many years ago — almost 20 years ago — as to the number of shares we would own without the consent — of the directors and, I believe, the Insurance Department.

So, we actually had some special restrictions on us in the case of GEICO. But if we hadn't have had those restrictions, we'd have behaved in exactly the same manner.

And we didn't think we could buy it any cheaper than that price. And we gulped a few times and paid it. And I think we will be happy that we did, as it's turning out.

GEICO is doing very well. It — I mean, I knew it would do well. But I feel very good about it.

42. Newspaper business is still good, but not as good

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Mr. Buffett, my name is David Lowe (PH) from Ventura, California.

My first Berkshire meeting, and I want to mention that I'm very intrigued at the influence you have over the shareholders here. I note that the first beverage they ran out of in the lobby was Cherry Coke. (Laughter)

My question is about The Buffalo News. You say, in the letter for the '95 report, that the newspaper industry has lost another notch in its economic attractiveness. Can you elaborate on that?

WARREN BUFFETT: Yeah. The — what you are seeing in newspapers is a circulation trend that has been prevalent for a long time, in terms of newspapers per household.

But that has been declining, and that — daily newspapers — and that I would say the trends of the last couple years are somewhat worse, in that respect.

I would say that the ability to price, both at the circulation and advertising level, is — has weakened a bit in recent years — not dramatically, but it's weakened a bit.

At one time, newspapers really — daily newspapers in single-newspaper towns were probably as attractive, economically, as any business you could find. I mean, it — a large percentage of advertisers had very little choice, in terms of using them as an advertising medium.

People had less options, in the way of learning what was going on around them other than the daily newspaper. So, the — they started from a position of extraordinary strength.

They still have a very strong position. And I've tried to emphasize that in the report. I mean, they're a bargain at the price they sell for. They give you all kinds of information with very low price. And they're a magnificent way for most merchants to reach their customers.

But they are not — they do not have the exclusive advantages, in many cases, that they had 15 or 20 years ago.

Third-class mail has become more of an option. People have more ways of obtaining information. As we talked earlier, information can be processed electronically and delivered at far lower cost than people dreamt of 20 years ago.

So, all of those things eat away a little bit. It's still a very fine business. But those — I don't see anything that will reverse those trends. I don't think that they will necessarily accelerate.

But I think that, if the only thing you owned in life was a daily newspaper in a single-newspaper town 20 years ago, you would feel slightly less secure today than you did at that time. But you'd still be a lot better off than owning virtually any other business.

Charlie?

CHARLIE MUNGER: Nothing to add.

43. "Outside information" in annual reports

WARREN BUFFETT: How about zone 4?

AUDIENCE MEMBER: Mr. Buffett, my name is Hutch Vernon. I'm from Baltimore, Maryland.

I know that you read lots and lots of annual reports. And I'm curious what you are reading for, if you would share that with us.

But I'm more curious — because I think I know what you're reading for — if there are any disclosures — any further disclosures — that you would like to see companies make in their financial reporting, or that the SEC require in financial reporting or proxies or other communications with their shareholders? And that would be for both you and for Mr. Munger.

WARREN BUFFETT: Yeah. The main thing that they can't mandate in annual reports: I really like to have — I like to know as much as I can about the person that's running it and how they think about the business and what's really going on in the business.

In other words, I would like to have a report that would be identical to what — if I owned half of a company but was away for a year, and I had a partner who owned the other half — when I came back, that he would tell me about what had taken place during the past year and what he foresaw coming up and all of that.

I — that is what I think the purpose of the report is. Now, the SEC mandates a lot of information, and —

VOICE: — side on?

WARREN BUFFETT: — some of that is helpful. But there's an intent behind the report. I mean, if it's a sales document I'm, you know, I'm less interested. I'm — and —

I don't see any way to mandate what I'm talking about. But that's the kind of report I'm looking for.

What I'm trying to do as I read reports, A, I like to understand just generally what's going on in all kinds of businesses.

If we own stock in a company and in an industry, and there are eight other companies that are in the same industry, I want to own or be on the mailing list for the reports for the other eight, because I can't understand how my company is doing unless I understand what the other eight are doing.

I want to have the perspective of, in terms of market share, what's going on in the business or their margins or the trend of margins, all kinds of things that I can't get unless I know —

I can't be an intelligent owner of a business unless I know what all the other businesses in that industry are doing. And so, I try to get that information out of a report.

If I'm thinking about investing in a specific company, I try to size up their business and the people that are running it.

And over the years, I have found reading a lot of reports to be quite useful in terms of making business decisions at Berkshire.

If we own all of a business, I want to own shares in all of the competitors just to keep track of what's going on. And I want to be able to intelligently evaluate how our managers are doing that. And I can't do that unless I know the industry backdrop against which they're working.

It's amazing, you know, what — how well you can do in investing, really, with what I would call outside information. I find inside information — I'm not sure how useful that is.

But outside information — there's all kinds of information around, as to businesses. And you don't have to understand all of them. You just have to understand the ones that you're thinking about getting in. And you can do it, if you just — nobody will do it for you.

You can't read — in my view — you can't read Wall Street reports and get anything out of them. You have to do it yourself and get your arms around it.

I don’t think we’ve ever gotten an idea, you know, in 40 years from a Wall Street report. But we’ve gotten a lot of ideas from annual reports.

Charlie?

CHARLIE MUNGER: What I find is that it takes a long time to read the annual report even if it’s a comparatively simple business, because if you really are trying to understand it, it’s not a bit easy.

WARREN BUFFETT: Yeah. I would say that, on average, in a business we’re really interested in, even though we know what to skip, to some extent, and what to read, I mean, it’s going to be 45 minutes or an hour on a report.

And if there are six or eight companies in the industry, that’s going to be six or eight hours, perhaps, and then their quarterlies and a lot of other —

I mean, it — the way you learn about businesses is by absorbing information about them, thinking, deciding what counts and what doesn’t count, relating one thing to another. And, you know, that’s the job.

And you can’t get that by looking at a bunch of little numbers on a chart bobbing up and down about a — or reading, you know, market commentary and periodicals or anything of the sort. That just won’t do it. You’ve got to understand the businesses. That’s where it all begins and ends.

44. “Berkshire is not a one-man show”

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Mr. Buffett, my name is Hank Strickland (PH). I’m from Fairfax, Virginia, which, if it were a city, would be the tenth largest in the United States. I’m here as a stockholder. And my daughter, who’s also my broker, is here with me.

We were also out there Friday night when we watched you warming up for the beginning of the ballgame. And we noted that you didn’t drop the ball. You seemed to be able to get it to the guy that was warming you up.

We noticed your first pitch, which I had difficulty characterizing as either being a passed ball or a wild pitch.

WARREN BUFFETT: It was a premature sinker, actually. (Laughter)

Very hard to hit, I might add. (Laughter)

AUDIENCE MEMBER: And, then, you moved spritely into the stands, did a lot of picture taking, photo opportunities, signed autographs, vaulted over a rail or two. And we noted, with great enthusiasm, your fitness.

Now that all having been said, many people would characterize Berkshire as a one-man company, with all due respect to Charlie. And many of this audience here, I'm sure, are retired or semi-retired. It's not unthinkable that, perhaps, you might want to retire, or for good — God's sakes —

WARREN BUFFETT: It's unthinkable. I don't want that one to go by. (Applause)

AUDIENCE MEMBER: Or for something — something worse could happen. And for those of us —

WARREN BUFFETT: That would be the worst, I think — (Laughter)

AUDIENCE MEMBER: Well I —

WARREN BUFFETT: I think death would be second. (Laughter)

AUDIENCE MEMBER: I could think of some things some of us might want to do to protect our sizeable investments, say, having owned Berkshire since Blue Shamp — Blue Chip Stamp days. But anyway, we could put in a stop order, might take out an insurance policy.

We might ask Charlie to masquerade as Warren after you've moved on. Those don't seem like very attractive options. So, I'm very serious now.

How would you respond to the question of a stockholder that's really concerned about Berkshire being a one-man show?

WARREN BUFFETT: Yeah. Well, Berkshire is not a one-man show. It's a two-man show, in terms of capital allocation. There's no question about that, at present.

But it's run by many managers that are doing an outstanding job and that don't need any guidance from Charlie or me as they go along.

But I might say that, you know, I will die with all of my Berkshire stock, essentially. And that will — stock will be held, either in the family or in a foundation, depending on the order of death, for a long time thereafter.

So, there's no one that's more concerned about the subsequent management issue than I. I mean, this is not something that ends, at all, on my death. And it doesn't end for the Buffett family or The Buffett Foundation. So, it's a subject that Charlie and I have both thought about.

The most likely situation — you got to get away from the idea that it's a one-man show because, right now, we've got 33,000 people working for Berkshire out there, you know, as we speak.

And I'm sitting around, you know, watching movies about myself or something. I mean, you can see how vital I am to the place. (Laughter) So the — but the question —

And the other thing we do, besides allocate capital, is we do identify these managers. And hopefully, we make it attractive for them to stay and work for Berkshire.

But that — you know, that doesn't require 150 IQ or anything to do that. It does require a certain sensitivity to why people want to get up in the morning and do what they do.

And when I'm not around, the logical, at some point — it depends on exactly when it happens, again. But Charlie's a little older than I am. And it's likely that it will be broken into a two-person function again, but not exactly the way Charlie and I function.

And that is that there will be someone in charge of investments and capital allocation. I mentioned Lou Simpson's position, because he is younger than I am, in the annual report, and then someone in charge of operations. And we have that person in the organization now.

Now, I don't know what the situation will be when I die, because it could be in 20 minutes or it could be in 20 years. And when that — so, I can't specifically name the individuals.

We have the individuals now for both those functions. We'll have the individuals for the same functions 20 years from now. I don't know whether they'll be the same people.

But it's quite a logical way to run the business. GEICO was run that way and still is run that way and has been for some years.

It's always struck me as terribly illogical, the way property-casualty insurance companies are run, because they've been dominated by the underwriting side of the business. And here they have this important investment side, but it's always been — virtually every company's been subservient to the underwriting.

And GEICO, very logically, set up a co-CEO arrangement some years back where — originally Bill Snyder before that — but Tony Nicely ran the underwriting end of the business and Lou Simpson ran the investment side.

And those are two very different functions. Same person, logically, doesn't fit both functions in most cases. I mean, it's a rarity when the same person happens to hit for both functions.

So GEICO worked very well that way. Still works that way. Lou runs investments. Tony runs underwriting.

And Berkshire — slightly different — it's a variant on it. But, essentially, at Berkshire headquarters, you need someone overseeing and not meddling in them too much, but making sure you've got the right manager and you're treating him fairly.

You need someone on the operating side. You need someone on the investment/capital allocation side. We've got those people now. And we'll have them, you know, whenever it happens, too.

That's the — that is the structure. And we've got some very good businesses.

And, you know, nobody's buying See's Candy because they think I'm sitting in some office in Omaha. And no one's buying a GEICO insurance policy because, you know, my name is there as chairman or CEO. The businesses are marvelous businesses. They'll continue very well.

And there will be a capital allocation problem then just like there is now. And there will be the problem of keeping good managers in place and treating them fairly. And that's a solvable problem.

So, that's the future as seen from Kiewit Plaza.

Charlie?

CHARLIE MUNGER: Yes. If you just run your mind through all the assets, I think you will quickly decide that there are large momentums in place that would do very well without us.

I mean, is Coca-Cola going to suddenly stop selling because some manager's dead at Berkshire Hathaway?

You know, are the people going to stop using Gillette razor blades? Is GEICO suddenly going to stop being intelligently run? Are — is the Nebraska Furniture Mart going to try any less hard?

So, the existing assets, you can argue, have been lovingly put together, so as not to require continuing intelligence at headquarters. (Laughter)

And what — there would be a disadvantage in that I think it would be unreasonable to expect that a successor would be as good at making new investments as Warren has been in the past. Well, that's just too damn bad. (Laughter and applause)

WARREN BUFFETT: The sympathetic ear over here. (Laughter)

45. Buffett doesn't answer individual letters

WARREN BUFFETT: Let's see, where are we? Zone 6 now?

AUDIENCE MEMBER: Mr. Buffett, I'm indebted to Walter Schloss for introducing me to you some 40 years ago. And finally in the early '80s, I became a stockholder.

My question is, now that you've expanded headquarters 9 percent from 11 people to 12 people — (laughter) — do you now more frequently answer letters from stockholders?

As a specific, had you looked at my letter from January 1986? (Laughter)

WARREN BUFFETT: We haven't gotten to January yet. (Laughter)

AUDIENCE MEMBER: Relating to Cap Cities/ABC and talk radio, the problem that occurred last month at cape — Cap Cities might have been prevented.

WARREN BUFFETT: You should get a form letter from us. But the — we do not — A, we do not get into the activities of our investee companies.

I mean, it — if people are unhappy about Coca-Cola or Gillette, and they shouldn't be — (laughs) — but if they happen to be, they should talk to the companies themselves. I don't interject myself into the management or operations of the investee companies.

In terms of questions about Berkshire — I put in the annual report a few years back — just running Berkshire takes up a fair amount of time, in terms of keeping track of a lot of businesses.

And it doesn't need to take up as much time as it does with me. But I enjoy it. But the — I feel that the annual report, the annual meeting, are the time to take up everything on shareholder's minds. And so, I don't answer one-on-one questions.

I get all kinds of letters. They want career guidance. They want advice on their business. I mean, there's a million letters that come in.

And it would really be — it would take a significant amount of time, that otherwise would be spent on Berkshire, to reply to that sort of thing. I may note them, in terms of what I address in subsequent annual reports.

But the annual meeting and the annual report, I feel, are the best ways to communicate with shareholders. And I really don't do it the rest of the year, although you will get some form reply or you should get some form reply on it.

AUDIENCE MEMBER: Thank you.

WARREN BUFFETT: Thanks. It's noon now. And I'd like to give everybody a chance to visit our other stores and everything. But we will be back here at 12:15.

Afternoon Session - 1996 Meeting

1. Investing with "the two wealthiest guys"

WARREN BUFFETT: OK, if we've got a monitor over in zone 1, we're ready to start.

AUDIENCE MEMBER: Yes. Thank you very much. My name is Maria Nicholas Kelly (PH). I'm from Tacoma, Washington.

And my husband and I have rather different investment approaches. And in 1988, he bought me one share of Berkshire, so that I could learn something about investing. We both started about that same time.

And he has chosen to invest in, let's say, about 40 different stocks and buying and selling, and doing rather well for us, frankly.

My approach is more simple. And basically, I finally figured out last year that I should invest in the companies of the two wealthiest men in the world.

So — (laughter) — I decided we should buy, monthly, more Berkshire and Microsoft. So, then this year — and so, we've been able to do that.

This year, we read in your report that Berkshire is selling "at a price at which Charlie and I would not consider buying it," so my husband has challenged my investment strategy. (Laughter)

I know that you are an honest man. And while you may not — (laughter) — you may not recommend to "my partner, Charlie," to buy more Berkshire at this time, do you recommend that I continue — (Buffett laughs) — my rather automatic investment buying of Berkshire?

And I wanted — I think I know the answer. But I wanted my husband to hear it from the horse's mouth. (Laughter)

WARREN BUFFETT: I think you're using me here. (Laughter)

AUDIENCE MEMBER: But —

WARREN BUFFETT: Well, I — we don't recommend selling it, but we don't recommend buying it, either. We are neutral on that subject.

And I hope you continue to be in with the two wealthiest guys. I like the other fellow, too. (Laughter)

AUDIENCE MEMBER: Thank you.

WARREN BUFFETT: Yeah.

2. American Express has "slipped" in credit cards

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Mr. Buffett, I am Harriet Morton from the Emerald City [Seattle], the same area, the land of Microsoft. And I have a couple small questions.

The first one is, recognizing your lack of interest in technology or sense of familiarity with it, I'm wondering if you'd give a few comments on Bill Gates as a manager.

But the second one, dealing with a business that you're familiar with, has to do with American Express.

Would you comment on American Express' strategy to deal with their declining market share in the credit card industry and the rising importance of debit cards? Thank you.

WARREN BUFFETT: I'm not sure I got that entirely, Charlie. Did you? I mean, I got the part about American —

CHARLIE MUNGER: She wanted you to comment on Gates as a manager and American Express as — with the problems in declining in market share.

WARREN BUFFETT: Well, the first part is very easy. You know, Bill Gates is, you know, one of the great managers of all time and is an exceptional business talent who loves his business.

And when you get that combination and a high energy level and, now, an heir to leave it to, I don't think you do much better than that.

American Express has, you know — has slipped over from where they were 20 years ago, obviously, in the credit card business. And I think they may have taken their customer a little bit for granted for a while.

I think [CEO] Harvey Golub is very focused on correcting that and has made some progress. But the credit card business is a very different competitive struggle now than it was 20 or 25 years ago.

Interestingly enough, American Express, itself, backed into the business. Because they were worried about what was going to happen to their traveler's check business, originally.

And they saw Diners Club come along. A fellow named Ralph Schneider and — started it. And they saw the inroads that were being made. So, the credit card was a reactive move. And for a while, they really dominated the field. And of course, they still dominate the travel and entertainment part of it.

But credit cards are going to be a very competitive business over time. And you need to establish — American Express needs to establish — special value for its card in some way, or it gets more commodity-like.

It's not an easy business. But their franchise — they've got a strong franchise. It is not what it was 20 years ago, relative to the competition.

3. "A lot of mediocrity" among CEOs

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Good afternoon. My name is John Weaver. I'm a shareholder from Bellingham, Washington.

You have discussed what a wonderful business is. One of the criterias in your acquisition, page 23 of your annual report, is management.

Could you discuss how you decide what good management is and how you decide whether you have a good manager?

WARREN BUFFETT: The really great business is one that doesn't require good management. I mean, that is a terrific business. And the poor business is one that can only succeed, or even survive, with great management. And —

But we look for people that know their businesses, love their businesses, love their shareholders, want to treat them as partners. And we still look to the underlying business, though. We —

If we have somebody that we think is extraordinary, but they're locked into one of those terrible businesses, because we've been in some terrible businesses, and you know, the best thing you can do, probably, is get out of it and get into something else.

But there's an enormous difference, frankly — there's an enormous difference in the talent of American business managers.

The CEOs of the Fortune 500 are not selected like 500 members of the American Olympic track and field team. And it is not the same process. And you do not have the uniformity of top quality that you get with the American Olympic team in any sport. You do not get that in top management in American business.

You get some very able people, some terrific people, like a Bill Gates, that we just mentioned. But you get a lot of mediocrity, too.

And the test — I think, in some cases, that it's fairly identifiable, who has done an extraordinary job. And we like people that have batted .350 or .360, in terms of predicting that they're going to bat over .300 in the future.

And some guy says, you know, "I batted .127 last year. But I've got a new bat or a new batting coach," you know, some management consultant has come in and told them how to do it, supposedly.

We're very suspicious of that. So we don't like banjo hitters who suddenly proclaim that they can become power hitters.

And then we try to figure out what their attitude is toward shareholders. And that isn't uniform, either, throughout corporate America. It's far from uniform.

We still want them to be in a good business, though. I would emphasize that.

We feel that — I mean, I gave the illustration of Tom Murphy in the annual report.

I mean, no one had either the ability — no one could top his ability or integrity, in terms of the way he ran Cap Cities for decades. I mean, and you could see it in 50 different ways.

I mean, he was thinking about the shareholders. And he not only thought about them, he knew what to do to forward their interests, and —

In terms of building the business, he only built it when it made sense, not when it did something for his ego or to make it larger alone. He did it when it was in his shareholders' interests.

And they're not all Tom Murphys. But when you find them, and they're in a decent business, you want to bet very heavily and not make the same mistake I made by selling out once or twice, too. (Laughter)

4. "Diversification is a protection against ignorance"

WARREN BUFFETT: Zone — was that zone 3 or —? Yeah, zone 4.

AUDIENCE MEMBER: Yeah, my name is Mark Hake (PH). I'm from Scottsdale, Arizona.

And I am very interested in your policies on diversification and also how you concentrate your investments.

And I've studied your annual reports going back a good number of years, and there's been years where you had a lot of stocks in your marketable, equitable securities portfolio. And there was one year where you only had three, in 1987.

So, I have two questions. Given the number of stocks that you have in the portfolio now, what does that imply about your view of the market in terms of, is it fairly valued, that kind of idea?

And second of all, whenever you — it seems that, whenever you take a new investment, you never take less than about 5 percent and never more than about 10 percent of the total portfolio with that new position. And I wanted to see if I'm correct about that.

WARREN BUFFETT: Yeah. Well, on the second point, that really isn't correct.

We have positions which you don't even see, because we only listed the ones above 600 million in the last report. And obviously, those are all smaller positions.

Sometimes, that's because they're smaller companies, and we couldn't get that much money in. Sometimes, it's because the prices moved up after we'd bought them. Sometimes, it's because we may be selling the position down, even. So there's nothing magic.

We like to put a lot of money in things that we feel strongly about. And that gets back to the diversification question.

You know, we think diversification is — as practiced generally — makes very little sense for anyone that knows what they're doing.

Diversification is a protection against ignorance.

I mean, if you want to make sure — (laughter) — that nothing bad happens to you relative to the market, you own everything. There's nothing wrong with that. I mean, that is a perfectly sound approach for somebody who does not feel they know how to analyze businesses.

If you know how to analyze businesses and value businesses, it's crazy to own 50 stocks or 40 stocks or 30 stocks, probably, because there aren't that many wonderful businesses that are understandable to a single human being, in all likelihood.

And to have some super-wonderful business and then put money in number 30 or 35 on your list of attractiveness and forego putting more money into number one, just strikes Charlie and me as madness.

And it's conventional practice, and it may — you know, if you all you have to achieve is average, it may preserve your job. But it's a confession, in our view, that you don't really understand the businesses that you own.

You know, I base — on a personal portfolio basis — you know, I own one stock. But it's a business I know. And it leaves me very comfortable. (Laughter)

So you know, do I need to own 28 stocks, you know, to have proper diversification, you know? It'd be nonsense.

And within Berkshire, I could pick out three of our businesses. And I would be very happy if they were the only businesses we owned, and I had all my money in Berkshire.

Now, I love it — the fact that we can find more than that, and that we keep adding to it. But three wonderful businesses is more than you need in this life to do very well.

And the average person isn't going to run into that. I mean, if you look at how the fortunes were built in this country, they weren't built out of a portfolio of 50 companies. They were built by someone who identified with a wonderful business. Coca-Cola's a great example. A lot of fortunes have been built on that.

And there aren't 50 Coca-Colas. You know, there aren't 20. If there were, it'd be fine. We could all go out and diversify like crazy among that group and get results that would be equal to owning the really wonderful one.

But you're not going to find it. And the truth is, you don't need it. I mean, if you had — a really wonderful business is very well protected against the vicissitudes of the economy over time and the competition.

I mean, you know, we're talking about businesses that are resistant to effective competition. And three of those will be better than 100 average businesses.

And they'll be safer, incidentally. I mean, there is less risk in owning three easy-to-identify, wonderful businesses than there is in owning 50 well-known, big businesses. And it's amazing what has been taught, over the years, in finance classes about that.

But I can assure you that I would rather pick — if I had to bet the next 30 years on the fortunes of my family that would be dependent upon the income from a given group of businesses, I would rather pick three businesses from those we own than own a diversified group of 50.

Charlie?

CHARLIE MUNGER: Yeah, what he's saying is that much of what is taught in modern corporate finance courses is twaddle. (Laughter and applause)

WARREN BUFFETT: You want to elaborate on that, Charlie? (Laughter)

CHARLIE MUNGER: You cannot believe this stuff. I mean, it's modern portfolio theory and — yeah, it's —

WARREN BUFFETT: It has no utility. But you know, it will tell you how to do average. But, you know, I think anybody can figure out how to do average in fifth grade. I mean, it's just not that difficult, and —

It's elaborate. And you know, there's lots of little Greek letters and all kinds of things to make you feel that you're in the big leagues. But it — (laughter) — there is no value added. (Laughs)

CHARLIE MUNGER: I have great difficulty with it because I am something of a student of dementia — (laughter) — and I have —

WARREN BUFFETT: And we hang around a lot together. (Laughter)

CHARLIE MUNGER: And I get ordinarily — classified dementia, you know, on some theory, structure of models. But the modern portfolio theory, it involves a type of dementia I just can't even classify. (Laughter)

Something very strange is going on. (Buffett laughs)

WARREN BUFFETT: If you find three wonderful businesses in your life, you'll get very rich. And if you understand them — bad things aren't going to happen to those three. I mean, that's the characteristic of it.

CHARLIE MUNGER: By the way, maybe that's the reason there's so much dementia. If you believed what Warren said, you could teach the whole course in about a week. (Laughter)

WARREN BUFFETT: Yeah, and the high priests wouldn't have any edge over the laypeople. And that never sells well. (Laughter)

CHARLIE MUNGER: Right.

5. Downsizing is sometimes needed to correct excessive hiring in the past

WARREN BUFFETT: OK, zone — what, 5, are we over there?

AUDIENCE MEMBER: Yes. Good afternoon, Mr. Buffett, Mr. Munger, board of directors.

Wanted to ask, in looking ahead, do you see the trends of extensive outsizing, the offshoring, the downsizing, the expendable workforce, the rightsizing, the diminished commitment to company loyalty, and the greater emphasis on the short term, quick buck, bottom line versus your commitment to the long-term investment affecting your pool of investment possibilities and your decision processes?

And do you possibly think of creating new companies on your own?

WARREN BUFFETT: Well, I think that the trends you talk about, and the attention devoted to them, could have some effect, just in terms of how the public and Congress may feel toward business.

Historically, you know, every industry, at all times, is interested in downsizing or becoming more efficient.

Now, if the industry is growing, you can achieve efficiency by doing more work, or turning out more output, with the same people.

But you know, if you go back 150 years and look at the percentage of people in farming, for example, farming has downsized from being a very appreciable percentage of the American workforce to a very small percentage. And essentially, that's released people to do other things.

So, it's in the interest of society to get as much output in anything as it can per unit of labor input. It's very difficult on the individual involved.

And you know, it's no fun — I guess it's no fun being a horse when the tractor comes along, or a blacksmith, and when the car comes along. But the —

So, I don't quarrel with the activities. I quarrel, sometimes, with how it's done. And I do think there's been a certain lack of, in certain cases, some empathy or sensitivity in terms of the way it's being done.

You should try to make your businesses more efficient. We hope we're not in businesses that will require us to lay off people over time, because we hope that physical output grows, and that we become more productive and can keep the same number of people to get greater output.

Dexter Shoe has done a great job of that over time. They've become more and more productive. But they've sold more shoes instead of selling the same number of shoes and letting people go. But sometimes, industry trends —

I mean, at World Book, we have fewer people than we had a year or two ago. And we didn't — we don't have any answer to that.

Over time, we got out of the textile business. I wish we didn't have to. But we did not know how to run a textile company in New England and compete effectively.

Like I say, I would — I love avoiding those businesses. And to the extent we can, we will.

I mean, GEICO is going to add people over time. And I think Berkshire Hathaway's going to add people over time.

But I can't — but it is in the interest of society to do jobs more effectively. It's also in the interest of society, it seems to me, to take care, in some way, of the people that are affected by that activity. And either — in some cases, it may be retraining.

But in other cases, you know, it doesn't work so well if you're 55 years old, and you've been working in a textile mill all your life, and all of a sudden the guy that runs the place can't make any money out of selling your output. I mean, that's not the fellow's fault that's been working at the textile mill for 30 years.

So, there's a balance in that. I think that the attention that's come about lately, I think there's — to some degree, it was a media fad based on some particularly dramatic examples at a couple of companies.

I don't think there is more displacement going on now, as a percentage of the labor force, annually, than there was 10 years ago, in terms of reconstituting what people do. But it's gotten a lot of attention lately.

There could be a backlash on that, in terms of corporate tax rates or a number of things. And we might feel it in that direction.

We want, at Berkshire, to do everything as efficiently as we can. Part of that, in a big way, is not taking on a lot of people we don't need.

A lot of the mistakes that are being corrected now are because people got very fat. And their businesses got very fat in the past and took on all kinds of people they don't need. We see that in a lot of businesses that we're exposed to.

And as long as they're very prosperous, really, no one does very much about it. And then when the time comes, they all of a sudden find out they can get way more output.

The oil companies are a classic example. You know, the people, probably, actually needed to produce, refine, and market oil probably hasn't changed that much. But if you look at the employment relative to barrels produced, refined, and marketed, it's gone down dramatically over 20 years ago.

To me, it just means that they weren't being run that well 20 years ago. And it never should've occurred in the first place.

We don't want to take on more people than we need in any of our businesses, because we don't want to lay people off, either.

Charlie?

CHARLIE MUNGER: Well, if you put it in reverse, you'd say, name a business that has been ruined because it was over-downsized. I cannot think of a single one.

But if you asked me to name businesses that were half-ruined, or ruined, by bloat, I mean, I could just rattle off name after name after name.

It's gotten fashionable to assume that downsizing is wrong. Well, it may have been wrong to let the business get so fat that it eventually had to downsize.

But if you've got way more people than are needed in the business, I see no social benefit in having people sit around half employed or unemployed.

WARREN BUFFETT: You're very likely to compete against some guy, at some point, who doesn't have more people around than needed in the business, too. But it doesn't change. For the people involved, they've got real problems, and —

CHARLIE MUNGER: Warren, can you name one that has been ruined by over-downsizing? There must be one, but —

WARREN BUFFETT: Well, it's like Eisenhower said about Nixon. Give me a week, and I'll come up with something. (Laughter)

6. No layoffs at insurance operations due to reduced volume

WARREN BUFFETT: How about zone 6?

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, I'm Walter Kaye of New York City.

WARREN BUFFETT: We're glad to have you here, Walter.

AUDIENCE MEMBER: What?

WARREN BUFFETT: We're glad to have you here. Walter's been a good friend of ours.

AUDIENCE MEMBER: Thank you very, very much. You just make me more of an egomaniac, a humble egomaniac, by saying that.

I don't know if Mr. Munger's wife is here and Mrs. Buffett is here, but back East, where I come from, in New York, they say, "When people — when men are successful, it's their wife's doing. But if they're a failure, it's because they're lazy." (Laughter)

But anyhow, I just wanted to, again, thank you very much. You've done such great things for our family. It's absolutely incredible.

And to those of you who don't know these two gentlemen, besides being financial geniuses, and you all know Mr. Buffett and, somewhat, Mr. Munger, too, they're the finest human beings you'll ever meet. I mean, just the way they explained this downsizing is the most intelligent thing that I've ever heard.

And eventually, like, you know, these people eventually find work. They have to be reeducated and everything like that.

But one point of business I'd like to ask you, if you don't mind. I have been noticing that there has been a tremendous amount of new capital going into reinsurance carriers.

And I was wondering if you could make a few comments about that, if you think that will affect the reinsurance business — have any effect on the insurance business in general, because, as you know better than I, we're still in a very soft market.

And there isn't a month that goes by that I don't hear of some new reinsurance carrier, whether in Bermuda or London or somewhere. Thank you.

WARREN BUFFETT: OK. Walter knows more about insurance than I do. But I'll, nevertheless, comment on that.

There has been a fair amount of capital. And there was a rush of it about, I'd say, maybe three years ago into the reinsurance business.

But there has been capital come in, and that is negative for our business. I mean, because any capital that's brought in, basically, will get employed.

We are willing, at Berkshire — and we do it — we are willing to sit on the sidelines in the reinsurance business.

We'll offer quotes. But somebody that — will cut those prices substantially, if they've got a lot of capital and want to keep busy. And if you've got a lot of capital in this business, or if you attracted a lot of capital, you will do something. You might like to do something smart, but if need be, you'll do something dumb.

You'll rationalize it, so you think it's smart. But you will do it. You won't just sit there and write the shareholders at the end of the year and say, you know, "We asked you for $300 million last year. And we'd like to report that it's all safely in a bank account at Citicorp." It just doesn't work that way.

So they will go out and do something. People don't like to sit around all day and do nothing.

And that means that prices will get cut under certain circumstances. And those circumstances — that's happening now.

We will — at Berkshire, we do have a rule about downsizing on that. We have promised people, at all of our insurance operations, that we will never have layoffs because of a drop in volume. We do not want the people who run our insurance business to feel they have to write X dollars in order to keep everybody there.

We can afford some overhead around that's costing us a little money for lack of using it at full capacity, because it isn't that much, relative to the size of our insurance operation.

What we can't afford are people feeling some internal compulsion to keep writing business in order to keep their job. So, we have a strong policy on that.

And if the business falls away, in terms of price, we won't be doing business. But we will be around to do business in a big way when the circumstances reverse.

They reversed in the casualty business for a while in 1985 or thereabouts. And we did a terrific amount of business.

They reversed in catastrophe reinsurance four or five years ago, and we became very active in that, and —

We will have times that are very good for us in insurance. It's a lot like investments. If you feel you have to invest every day, you're going to make a lot of mistakes. It just — it isn't that kind of a business. You have to wait until you get the fat pitch.

And in insurance, it's similar. You do not — if we had a budget for premium volume for our insurance companies, it would be the dumbest thing we could do, because they would meet the budget.

They could meet any budget I set out. I could tell some operation that wrote a hundred million last year to write 500 million this year, and they would meet it, you know, and I would be paying the bills for decades to come, so —

It's a very illogical way to try and plan 8 or 10 percent-a-year growth.

Now, GEICO is a different story in that GEICO is a business that is the low-cost operator and can attract, from a huge pool, business at, I think, a very good rate of growth simply by letting people know what's available out there. So that is a business that I see growing under almost any circumstances.

But our reinsurance business will swing around enormously, in terms of volume, based on what the competitor is doing. And what the competitors are doing depends, to a great extent, on how much money they've got burning a hole in their pocket.

And right now, it's going one direction. But it will change, I mean, just like investment markets change, you know. I've been through at least a half a dozen periods where people think, you know, they're never going to get a chance to buy securities at intelligent prices. And it always changes.

In the insurance business, people that misprice their policies will pay the price for it. And the world will still need insurance. And we will still be there.

7. International expansion for GEICO would be dangerous distraction

WARREN BUFFETT: Zone 7? Oh, we don't have any. I guess we have everybody in here now, so we'll go back to zone 1.

AUDIENCE MEMBER: Mr. Buffett, salutations from Portugal. I am from Portugal. My name is Herculano Fortado (PH). I have been a shareholder of your company since it was traded on the NASDAQ.

And I hold the shares and went on accumulating year after year, whenever funds were available and were at my disposal.

Now, a little bit about my history. As a student, I am from India. I was born in India, of Indian parentage. And my parents were very modest and could not afford me higher education. I started my school —

WARREN BUFFETT: I think maybe you'd better just get to the question, though, if you will, please.

AUDIENCE MEMBER: Yes. And then started writing insurance, life insurance, for a company which was a subsidiary of American Life.

My question now is this. I am now living in Portugal, and I see that the European market is developing and Berkshire Hathaway is having a very big slice of insurance investments.

They don't seem to be operating in the new markets that are emerging in Europe, and as well as in countries like India or the Pacific area, where the human — two-thirds of human beings are living.

Is there a policy or a plan, on the part of Berkshire Hathaway, to diversify and internationalize their insurance business? This is my only question.

WARREN BUFFETT: Thank you.

The reinsurance business of Berkshire Hathaway is totally international. I mean, we deal with risks all over the world. We deal with companies all over the world.

And that's the nature of the reinsurance business, generally, although there might be some that would be more specialized to this country, but —

We are quite willing to take on risks around the world, although they have to be risks with a large premium. I mean, that's the nature of our reinsurance business. We're not in the retail end of the business.

But we do that worldwide. And we'll continue to do that worldwide, because there are huge risks that exist for primary insurers around the world. And they need somebody to lay them off on.

Now, whether they will pay the proper price is another question. And it may be a little more difficult, in a few jurisdictions, to do business than in others. But that's an international operation.

GEICO has two-and-a-fraction percent of the U.S. auto market. We have about 2 1/2 million policyholders. There are over a hundred million in the country.

And there is such an opportunity here that it would be diversionary to go into other countries with GEICO.

There's been a firm that was very successful over in England that introduced a somewhat GEICO-like operation about 10 years ago. And they did very well. They are now encountering more competition. And their results are falling off somewhat, but —

There's a huge potential for GEICO in this country. And I would not want the management of GEICO to be going off in other directions now, when there's so much to be done here.

I mean, three percentage points on our growth rate here, for example, you know, would be 75 million or so of volume. And that, in turn, would keep compounding over time. Well that — there's too much to do here before we set up some startup operation around the world.

And there are actually various problems in a lot of jurisdictions in — to run a GEICO-like operation — although I wouldn't say that that prevails every place. I mean, there could be opportunities. But the opportunity here in this country is huge. And the management of GEICO is focused.

I love focused management. The management of — if you read the Coca-Cola annual report, you will not get the idea that Roberto Goizueta is thinking about a whole lot of things other than Coca-Cola.

And I have seen that work time after time. And when they lose that focus — as, actually, did Coke and Gillette both, at one point 20 to 30 years ago somewhat — it shows up.

I mean, it — two great organizations were not hitting their potential 20 years ago. And then they became refocused. And what a difference it makes. It makes tens of billions of dollars' worth of difference, in terms of market value.

GEICO actually started — they started fooling around in a number of things in the early '80s, and they paid a price to do it. They paid a very big price.

They paid a direct price, in terms of the cost of those things, because they almost all worked out badly. And then they paid an additional price in the loss of focus on the main business.

That will not happen with the present management. Tony Nicely thinks about nothing else but doing — carrying the GEICO message to people who — that 97 1/2 percent or so that are not policyholders. And that will work very well for us over time.

Charlie?

CHARLIE MUNGER: We are indirectly in all of these emerging markets through Coca-Cola and Gillette. So, it isn't true that we're totally absent.

WARREN BUFFETT: No. Well, at Coca-Cola the international markets are 80 percent of profits — actually, a little more.

Gillette, I think they're about 70 percent or so. So, the — we love the international aspects of the Coca-Cola or Gillette businesses. And that's a very major attraction.

But the management of those companies is focused on that. But they are doing — they have distribution systems, and they have recognition, and they've got a lot going for them over there. But the beauty of it is that they're maximizing what they do have going for them, which was not the case 20 years ago.

They just sort of let it go more by default, and they started fooling around with a lot of diversification. And you know, basically, that has not worked that well. So, we like focus. We love focus.

CHARLIE MUNGER: Yeah, and doing it indirectly, as we've done, one can argue that we, thereby, do it a lot better. (Laughter)

WARREN BUFFETT: We won't explore the implications of that. (Laughter)

8. Shareholders boost Borsheims sales

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name's George Olson (PH). I'm from Atlanta, Georgia. I have a couple quick questions for you.

First of all, I'd like to have your comments on the USAir preferred that were — they're several quarters in arrears on.

And secondly, I was wondering about the Borsheims report from yesterday. You usually comment on that. (Laughter)

WARREN BUFFETT: Well, Susan Jacques, who runs Borsheims, called me this morning. And her voice was hoarse but happy, and — (Laughs)

Borsheims — that comparable day last year was the biggest day of the year. And it was about 60 percent up this year, so — I'm — you've done your part. (Applause)

CHARLIE MUNGER: We are starting a new custom at Berkshire Hathaway's annual meetings. A shareholder came up to me and asked for my autograph on his sales slip from Borsheims — (laughter) — which was a $54,000 watch.

Now, that is the kind of autographs we like to give. (Laughter and applause)

And so our message to you all is, "Go thou and do likewise." (Laughter)

WARREN BUFFETT: It wasn't a member of Charlie's family, incidentally. (Laughter)

9. USAir investment has improved, but was still a mistake

WARREN BUFFETT: The USAir preferred, as I mentioned in the annual report, it looks considerably better than it did 18 months ago or thereabouts.

But their fundamental problem — and Steve Wolf has said this — the new CEO of USAir — the fundamental problems are there. And they either address and correct those fundamental problems, or those problems will address and correct them. (Laughter)

And the — you know, their costs are out of line. Their costs are those that are relics of a regulated, protected environment. And they are not in a regulated, protected environment. And so far, they have not had any great success in correcting the situation.

Knowing Mr. Wolf, I'm sure he is, you know, focused entirely on getting that changed. And he will need to get it changed. And he — his record has been pretty successful at that.

So, we're a lot better off with our US Air preferred than we were 18 months ago, but it still is a mistake I made.

And we would've been a lot better off if I'd just, as Charlie says, gone out to a bar that night instead. (Laughter)

You got any comments, Charlie, on USAir? He doesn't want to comment. It may sound like it's his deal. (Laughter)

CHARLIE MUNGER: It's, plainly, worth a lot more than it was last year. (Laughter)

10. Newspapers may evolve, but won't disappear entirely

WARREN BUFFETT: And with that, we'll move to zone 3. (Laughter)

AUDIENCE MEMBER: Hi, David Winters, Mountain Lakes, New Jersey.

Without ruining my fun, can you give me a few hints about how I should think about calculating the intrinsic value — (Buffett laughs) — of the insurance businesses?

And secondly, I'm wondering about, not that you can foretell the future, either one of you, but with regards to newspapers, is there any concern that it goes the way of the printed World Book and Blue Chip Stamps?

WARREN BUFFETT: It could — I think it's very — I'll answer the second part first.

I think it's very unlikely — very, very unlikely, you know, down to a few percentage points, that newspapers will go the way of Blue Chip Stamps.

World Book is a different story. World Book has got — they have a reasonable shot at a decent future. But it's not automatic.

But the newspaper, it may be configured somewhat differently. It may get a different percentage of its revenue from circulation and advertising than it does. I mean, there may be some evolutionary-type changes in it. But it's still a bargain.

It is a bargain to anybody that is interested in their community. It's still a bargain to a great many advertisers.

We spend a lot of money advertising in newspapers in our various businesses. And we feel we are getting our money's worth, obviously. And it works.

But it just doesn't have the lock that it used to have on the business.

11. Why $7B of insurance float is better than $7B of cash

WARREN BUFFETT: Now, what was the other question about?

Did you want to repeat the first one?

AUDIENCE MEMBER: (Inaudible)

WARREN BUFFETT: Oh, yeah, the question about the insurance business, the intrinsic value.

I would say this. We have — I'm not going to give you a precise answer, but I will tell you this.

We have 7 billion, presently, of float. That's the money we're holding that belongs to someone else but that we have the use of.

Now, if I were asked, would I trade that for $7 billion and not have to pay tax on the gain that would result if I did that, but I would then have to stay out of the insurance business forever — total forever non-compete clause of any kind in insurance — would I accept that? And the answer is no.

Now, that is not because I would rather have 7 billion of float than 7 billion of net proceeds of free money. It's because I expect the 7 billion to grow.

And if I'd made that trade — that I'm just suggesting now — if I'd made that 27 years ago and said, "Will you take 17 million for the float you have, no tax to be paid, the float for which you just paid 8-million-7 when we bought the companies, and gotten out of the insurance business," I might've said yes in those days, but it would've —

CHARLIE MUNGER: Oh, you would've?

WARREN BUFFETT: Yeah. (Laughter) Yeah.

CHARLIE MUNGER: No, he keeps learning. That's one of his tricks. (Laughter and applause)

WARREN BUFFETT: That's probably true in this case. I'm not sure about other cases.

But it would've been a terrible mistake. It would've been a mistake to do it 10 or 12 years ago with 300 million.

It is not worth $7 billion to us to forego being in the insurance business forever at Berkshire Hathaway.

Even though it would all be, you know, it would be — if it were nontaxed profits, so we got the full 7 billion, pure addition to equity — we would not take it. And we wouldn't even think about it very long. So as Charlie says, that is not the answer that we would've given some time back. But it's a very valuable business.

It has to be run right. I mean, GEICO has to be run right. The reinsurance business has to be run right, National Indemnity, the Homestate Company. They all have to be run right. And it's not automatic.

But they have the people, the distribution structure, the reputation, the capital strength, the competitive advantages. They have those in place. And if nurtured, you know, they can become more valuable as time goes by.

12. Keeping more mortgages has increased Freddie Mac's risk a "tiny bit"

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes. I'd like to ask the chairman and Mr. Munger about Freddie Mac.

A few years ago, I think they were earning most of their money from the guarantee fees and the float. Now, they've got the huge balance sheet, a lot of short-term liabilities.

Do you think that's a more risky business now and that the spread might go away in some, you know, less-than-foreseen event?

WARREN BUFFETT: Charlie, I think he aimed that one at you. (Laughter)

CHARLIE MUNGER: It's probably slightly more risky, but I don't think they're taking horrible risks. It's still a very good business.

WARREN BUFFETT: Yeah, what the question referred to is that, formerly, Freddie Mac emphasized, normally, just the guarantee of credit and then passed all interest rate risk onto the market.

Now, they've retained, for their portfolio, a greater percentage of the mortgages that come through their hands.

I think they've structured the liabilities quite intelligently to handle what they call in the investment world "the convexity problem," but — which is that the borrower has the option of calling off the deal tomorrow or retaining it for 30 years. And that is a very disadvantageous contract to enter into, if you lend money.

They have done quite an intelligent job of attacking that by callable debt and various things. But you can't address a problem like that totally. There is no way to set up some model that satisfies that entire risk.

They've done a good job. But as Charlie says, the larger the portfolio, as compared to guarantee fees — because you've still got the — you got the credit risk on the portfolio, and you've added a little interest rate risk at the extremes.

And it doesn't keep us up nights, but it's a tiny bit riskier than it used to be.

13. Don't wait for downturn to buy a great company

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: (Inaudible) — I'm the guy who asked you my question, my family last year — (inaudible) — my mom. This guy said fine, so I — (inaudible) — (laughter).

I know you said do what you want. I just wanted to let you know that —

WARREN BUFFETT: Well, you did what you wanted. I mean, you followed my advice. (Laughter)

I'm batting 1.000. We'll see what you're batting next year. (Laughter)

AUDIENCE MEMBER: I had one quick question — (inaudible) — you said, if you have three great companies, wonderful businesses, they could last you a lifetime.

And I have — one thing that struck me in a way that — (inaudible) — great businesses get pounded down. And then you bet big on them, like American Express and Disney at one time.

And my question is, I have capital to invest, but I haven't yet invested it. I have three great companies, which I've identified: Coca-Cola, Gillette, and McDonald's.

And my question is, if I have a lifetime ahead of me, where I want to keep an investment for more than 20 or 30 years, is it better to wait a year or two to see if one of those companies stumble, or to get in now and just stay with it over a long time horizon?

WARREN BUFFETT: Yeah. Well, I won't comment on the three companies that you've named.

But in general terms, unless you find the prices of a great company really offensive, if you feel you've identified it —

And by definition, a great company is one that's going to remain great for 30 years. If it's going to be a great company for three years, you know, it ain't a great company. I mean, it — (Laughter)

So, you really want to go along with the idea of something that, if you were going to take a trip for 20 years, you wouldn't feel bad leaving the money in with no orders with your broker and no power of attorney or anything, and you just go on the trip. And you know you come back, and it's going to be a terribly strong company.

I think it's better just to own them. I mean, you know, we could attempt to buy and sell some of the things that we own that we think are fine businesses. But they're too hard to find.

I mean, we found See's Candy in 1972, or we find, here and there, we get the opportunity to do something. But they're too hard to find.

So, to sit there and hope that you buy them in the throes of some panic, you know, that you sort of take the attitude of a mortician, you know, waiting for a flu epidemic or something, I mean — (laughter) — it — I'm not sure that will be a great technique.

I mean, it may be great if you inherit. You know, Paul Getty inherited the money at the bottom, in '32. I mean, he didn't inherit it exactly. He talked his mother out of it. But — (laughter) — it's true, actually.

CHARLIE MUNGER: Close enough.

WARREN BUFFETT: Yeah, close enough, right?

But he benefitted enormously by having access to a lot of cash in 19 — in the early '30s — that he didn't have access to in the late '20s. And so, you get some accidents like that.

But that's a lot to count on. And you know, if you start with the Dow at X, and you think it's too high, you know, when it goes to 90 percent of X, do you buy?

Well, if it does, and it goes to 50 percent of X, it gets — you know, you never get the benefits of those extremes anyway, unless you just come into some accidental sum of money at some time.

So, I think the main thing to do is find wonderful businesses.

Is Phil Carret here? We've got the world —there's the hero of investing. Phil, would you stand up?

Phil is 99. He wrote a book on investing in 1924 ["Buying a Bond"]. (Applause)

Phil has done awfully well by finding businesses he likes, and sticking with them, and not worrying too much about what they do day to day.

There's going to be — I think there's going to be an article in the Wall Street Journal about Phil on May 28th, and I advise you all to read it. And you'll probably learn a lot more than by coming to this meeting, but —

It's that approach of buying businesses — I mean, let's just say there was no stock market. And the owner of the best business in whatever your hometown is came to you and said, "Look it, you know, my brother just died, and he owned 20 percent of the business. And I want somebody to go in with me to buy that 20 percent.

"And the price looks a little high, maybe, but this is what I think I can get for it. You know, do you want to buy in?"

You know, I think, if you like the business, and you like the person that's coming to you, and the price sounds reasonable, and you really know the business, I think, probably, the thing to do is to take it and don't worry about how it's quoted. It won't be quoted tomorrow, or next week, or next month.

You know, I think people's investment would be more intelligent, you know, if stocks were quoted about once a year. But it isn't going to happen that way, so —

And if you happen to come in to some added money at some time when something dramatic has happened — I mean, we did well back in 1964, because American Express ran into a crook.

You know, we did well in 1976, because GEICO's managers and auditors didn't know what their loss reserves should've been the previous couple of years.

So, we've had our share of flu epidemics. But you don't want to spend your life — (laughs) — waiting around for them.

14. "Change is likely to work against us"

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: I'm Joe Condon (PH) from London.

Both Mr. Buffett and Mr. Munger have addressed my question in annual reports and at previous meetings here. This is my first time. It has to do with investment in a few great, high-technology stocks.

I know your answer has been that, if you don't understand it, and I can't, after this performance, can't really believe that both of you don't understand most of the high-technology questions. But I'm thinking about not only Microsoft but, say, Pfizer and J&J.

All three companies, which have already proven that not only do they have a great product, proven management over 10 to 15 years, great market share positions, which are not easy to get into.

And I, frankly, don't see a big difference in the P/E ratios, for example, you could say, Coca-Cola, or, you know, against Johnson & Johnson or Pfizer, which are very powerful companies. I wonder if either or both of you would address that question again.

WARREN BUFFETT: Charlie, why don't you? (Laughter)

CHARLIE MUNGER: If you have something you think you understand that looks very attractive to you, we think it's smart to do what you understand. If — we've been unable to find companies that fit our slender talents.

We well might have been in the Pfizers and Microsofts and so forth. But we've never had to revert to it.

We don't sneer at it. Other people with more talent have found that a wonderful course of action.

WARREN BUFFETT: We generally look at businesses — we feel change is likely to work against us. We do not have great ability — we do not think we have great ability to predict where change is going to lead.

We think we have some ability to find businesses where we don't think change is going to be very important.

Now, at a Gillette, the product is going to be better 10 years from now than now, or 20 years from now than 10 years from now. You saw those earlier ads going back to the Blue Blade and all that. The Blue Blade seemed great at the time. But they keep — the shaving technology gets better and better.

But you know that Gillette — although they had that little experience with Wilkinson in the early '60s — but you know that Gillette is basically going to be spending many multiples the money on developing better shaving systems than exist now, compared to anyone else.

You know, they've got the distribution system. They've got the believability. If they bring out a product, and they say, "This is something that men ought to look at," men look at it.

And they found out here a few years ago that the same thing happened when they said to women to look at it in the shaving field. They wouldn't have that same credibility someplace else. But in the shaving field, they have it.

Those are assets that can't be built. And they're very hard to destroy.

So change — we think we know, in a general way, what the soft drink industry or the shaving industry or the candy business is going to look like 10 or 20 years from now.

We think Microsoft is a sensational company run by the best of managers. But we don't have any idea what that world is going to look like in 10 or 20 years.

Now, if you're going to bet on somebody that is going to see out and do what we can't do ourselves, I'd rather bet on Bill Gates than anybody else.

But that — I don't want to bet on anybody else. I mean, in the end, we want to understand, ourselves, where we think a business is going. And if somebody tells us the business is going to change a lot, in Wall Street, they love to tell you that, you know, that's great opportunity.

They don't think it's a great opportunity when Wall Street itself is going to change a lot, incidentally. (Laughter)

But they — you know, it's a great opportunity. We don't think it's an opportunity at all. I mean, we — it scares the hell out of us. Because we don't know how things are going to change.

We are looking, you know — when people are chewing chewing gum, we have a pretty good idea how they chewed it 20 years ago and how they'll chew it 20 years from now. And we don't really see a lot of technology going into the art of the chew, you know? (Laughter) So, that —

And as long as we don't have to make those other decisions, why in the world should we? I mean, you know, if I — all kinds of things, we don't know. And so, why going around trying to bet on things we don't know, when we can bet on the simple things?

Zone 1? (Applause)

I can see the shareholders like us sticking with the simple ones. They understand us, yeah.

15. We don't reveal more about our stocks than we have to

AUDIENCE MEMBER: Good afternoon, Warren. Jerry Zucker (PH), Los Angeles, California.

In the annual report, the second-largest holdings of unsecured securities are labeled, "Others."

Could you please expand on some of the holdings there? Like, do we still own PNC? And are we supposed to be buying Big Macs, as the press has reported?

WARREN BUFFETT: Yeah, well, actually, it's a very descriptive title, "Others." (Laughter)

We do that for several reasons. But one is that we have no interest in people buying Berkshire or looking at the Berkshire report or anything else, in order to generate investment ideas for themselves. Some people may do it, but we are not in that business.

Berkshire Hathaway shareholders are not being paid for that. There is no way it benefits the owners of the company.

So, we will not disclose, in the way of our security holdings, more than we feel we have to disclose in order to be fair about things that can be material to the company.

And we certainly have no interest in disclosing them to people who, essentially, want to use the information to try and figure out where our buying power may be, subsequently, or something of the sort.

So, we will keep raising the cutoff level. And you may see more and more in others.

And I will say this. There's a lot of speculation about what we do, in the press, and I'd say about half of it's accurate and about half of it's inaccurate.

And again, we leave to you the fun of figuring out which half is right. (Laughter)

Yeah, we hope you get a lot for your money in buying a share of Berkshire. But we don't want to act as an investment advisory service.

16. Buffett isn't worrying about the Y2K computer problem

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: David Coles, Appleton, Wisconsin.

Earlier, you made reference to the vicissitudes of time. What are the plans to ensure that all the computer systems and companies in which Berkshire has an interest will function correctly with dates of January 1st of the year 2000 and beyond?

And what will you do to reassure shareholders that we will not suffer serious business loss or failure due to incorrect handling of these dates by computer systems?

WARREN BUFFETT: Well, actually, I've got a friend that's quite involved in the — (laughter) — question of — no, I'm serious about that — the 2000 question with computers. But that's the kind of thing I don't worry about.

I mean, I will let the people who run the operating businesses work on that. And I'll work on capital allocation. And I have a feeling, one way or another, we'll get through it.

But like I say, we have — there are a lot of things at Berkshire we don't — (applause) — we don't spend a lot of time on a lot of things at the headquarters that other companies have whole departments on.

And our managers have not let us down. I mean, I must say that we've got a group at one business after another. And they focus on their business. And they mail the money to us in Omaha. And we're all happy. (Laughter)

Charlie?

CHARLIE MUNGER: I have the feeling that our people will be quite good at keeping the computer systems in order and with backups. I also have the feeling that few companies could handle a big computer snafu better than we could.

I have the feeling the Coca-Cola stock would be there. The Gillette stock would be there. The Nebraska Furniture Mart would be full of furniture and know the customers.

I don't think a computer crash is going to do us in.

WARREN BUFFETT: Yeah. You're correct, though, that that is a problem for the computer world. But as Charlie says, it'll hit other people a lot harder than it hits us.

Most of the things — we try to be in businesses that are fairly simple and that can't get all messed up.

And by and large, I think that we've got an unusual portfolio of those. And when it gets to our investees, you know, they're going to worry about those problems themselves.

We really worry about allocating money around Berkshire and having the right managers in place. That — if we can do those two right, everything else'll take care of itself.

17. Berkshire businesses are "way easier to predict"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: My name is Peter Bevelin from Sweden.

You have said that you like franchise companies, companies that have — that are castles surrounded by moats, companies that are possible to — you can have some prediction five, 10 years down the road.

But aren't businesses like See's Candy, the furniture business, the jewelry business, the shoe business, businesses that are hard to predict the future, five, 10 years down the road?

WARREN BUFFETT: What was that on the last part of that?

CHARLIE MUNGER: Aren't these businesses hard to predict five or 10 years down the road?

WARREN BUFFETT: Yeah, I think —

CHARLIE MUNGER: Things like shoe business and —

WARREN BUFFETT: I think they're far easier to predict than most businesses. I think I can come closer to telling you the future of virtually all of the businesses we have, and not just because we have them — I mean, if they belonged to somebody else — than if I took the Dow 30, excluding the ones we own, or you know, the first 100 companies alphabetically on the New York Stock Exchange.

I think ours are way easier to predict. There are fair — they tend to be fundamental things, fairly simple. Rate of change is not fast, so I feel pretty comfortable.

I think, when you look at Berkshire five years from now, the businesses we have now will be performing pretty much as we've anticipated at this time.

I hope there are some new ones, and I hope they're big ones. But I don't think that we'll have had lots of surprises in the present ones.

My guess is we'll have had one surprise. I don't know what it'll be. But I mean, you know, that happens in life. But there won't be a series of them.

Whereas, if you — if we were to buy — if we owned a base metals business or many retailing businesses I can think of, or an auto business, I'm not sure I'd know where we would stand in the competitive pecking order five or 10 years from now.

I would not want to try and come in and displace See's Candies, for example, in the business it does, or the Furniture Mart. It's not an easy job.

So, I don't think you'll get lots of surprises with the present businesses of Berkshire, but the key is developing more of them.

18. Eisner is "most important factor" in Disney's success

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: My name is Stafford Ordahl. I'm from Morris, New York.

I was just wondering if the surprise could be coming from Disney. Because it seems to me they've been coasting, up until very recently, on the efforts of a person that's no longer with the company, [Jeffrey] Katzenberg, who is one of those rare geniuses, like [filmmaker Steven] Spielberg, that has his finger on the pulse of the American people.

And that — they don't come along every day, even in Hollywood.

They might be a very different company now that all of his efforts are, so to speak, out of the pipeline.

WARREN BUFFETT: Yeah. Have you finished, or —?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah, I — Katzenberg is a real talent. I would say that, by far, I mean, by far, the most important person at Disney in the last 12 years, or whatever it's been, has been [CEO] Michael Eisner.

I mean, if you know him and what he has done in the business, there's no one — [former President and Chief Operating Officer] Frank Wells did a terrific job in conjunction with Eisner.

But Eisner has been the "Walt Disney," in effect, of his tenure. He knows the business. He loves the business. You know, he eats and lives and breathes it. And he has been, in my view, by far, the most important factor in Disney's success.

Now, they face competition. The money is in — you know, the big money is in the animated films and everything that revolves around that, because you go from films to parks to character merchandising and back. And I mean, it's a circular sort of thing, which feeds on itself. There's going to be plenty of competition in that.

I mean, they've — you know, you've seen what MCA and Universal's going to do in the parks in Florida. And you know what DreamWorks is going to do in animation. And now, you've got new technology in animation, you know, through [Pixar CEO Steve Jobs.] And there's a lot of things going on in that field.

So the question is, 10 years from now, what place in the mind — because it's a share of mind. You know, they call it share of market, but it starts with share of mind — and what place in the mind of billions of children around the world, and their parents, does Disney itself have, and their characters, relative to that owned by other organizations and other characters?

And it's a competitive world, so there will be people fighting for that. But I would rather start with Disney's hand than anyone else's, by some margin. And I would rather start with Michael Eisner running the place than with anyone else, by some margin.

So that does not mean that it can't become a much more competitive business. Because people look at the video releases of a "Lion King," and they salivate.

You know, you sell 30 million copies of something at whatever it may be, 16 or $17, and you can figure out the manufacturing cost. And you know, it gets your attention. And it gets your competitors' attention.

But going back, if I had to — if I thought the children of the world were going to want to be entertained 10 or 20 years from now, and I had my choice of betting on who is going to have a special place, if anyone has a special place, in the minds of those kids and their parents, I think I would probably rather bet on Disney.

And I would feel particularly good about betting on them, if I had the guy who has done what Eisner has done over those years presiding in the future.

Charlie?

CHARLIE MUNGER: Well, I think it helps to do the simple arithmetic. Suppose you have a billion children of low-middle income 20 years from now. And suppose you could make $10 per year per child, after taxes, from your position. It gets into very large numbers.

And — (laughter) — I don't know about your children and grandchildren, but mine want to see Disney. And they want to see it — (applause) — over and over and over again. They don't want to see Katzenberg. (Laughter)

WARREN BUFFETT: Well I —

CHARLIE MUNGER: I mean, in terms of the trade name. (Laughter)

WARREN BUFFETT: It's a pretty good trade name. I mean, when you think about names around the world, it's interesting that, you know, it's very hard to beat the name Coca-Cola. But Disney's got a — it's very, very big name.

And Charlie's point that they want to see them over and over again, and it's kind of nice to be able to recycle Snow White every seven or eight years. You hit a different crowd.

And — (laughter) — it's kind of like having an oil field, you know, where you pump out all the oil and sell it. And then it all seeps back in over seven or eight years. (Laughter)

19. Why Wall Street businesses are "tough" to manage

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: I'm Randall Bellows (PH) from Chicago. Thank you for this marathon question-and-answer period.

WARREN BUFFETT: We enjoy it. Thanks.

AUDIENCE MEMBER: Thank you. My question is on the security business, Wall Street firms, in general, and specifically, what you feel about Salomon at this time. Thank you.

WARREN BUFFETT: Well, we know more about the security business than we knew 10 years ago. (Laughter)

And it, you know, it is a tough business to manage.

There's a lot of money made in the business and then — throughout Wall Street, I'm talking about. There's, you know, there's very big sums of money made. And then the question is, how does it get divided up between the institution and the people there?

And you get to this question — I've often used the analogy of, you know, would you rather — if you're an investor, and you get a chance to buy the Mayo Clinic, you know, that is one sort of an investment. And if you get a chance to buy the local brain surgeon, that's another one.

You buy the local brain surgeon and his practice for X millions of dollars. And the next day, you know, what do you own?

And if you're buying the local brain surgeon, you would not pay any real multiple of earnings because he's going to have this revelation, several days later, that it's really him and not you there, with your little stock certificate, that's producing the earnings. And it's his reputation. And he doesn't care.

Can you imagine Berkshire Hathaway advertising brain surgery, you know, how much business we would do?

So — (laughter) — he owns the business, even though you've got the stock certificate.

Now, if you go to the Mayo Clinic, no one can name the name of anybody at the Mayo Clinic, unless you live within 10 miles of Rochester [Minnesota].

And there, the institution has the power. Now, it has to keep quality up and do all the things that an institution has to do. But whoever owns the Mayo Clinic has an asset that is independent of the attitude of any one person in the place the next day.

Wall Street has a mix of both. And there are some businesses that are more — where the value resides more in the institution. And there are some where the value resides more in the individuals.

We've got a couple of sensational people running Salomon. And they wrestle with this problem as they go along. And they seem to be wrestling considerably more successfully currently than was the case close to a year ago.

But it is not an easy business to run. And it's not an easy business to predict, unless you have a business that's very institutional in character, and there aren't many of those in Wall Street.

20. Not important if part of the market is "kind of screwy"

WARREN BUFFETT: Zone 6?

Sorry we got a — the microphone's over here.

CHARLIE MUNGER: (Inaudible)

WARREN BUFFETT: Yeah. Just raise your hand and the monitor will supply the microphone.

AUDIENCE MEMBER: Thank you. Howard Winston (PH) from Cincinnati, Ohio.

One question. Are you concerned about the rising valuations on the NASDAQ market, where companies trade at multiples of revenues instead of multiples of earnings?

WARREN BUFFETT: The rising value of what, did you say?

AUDIENCE MEMBER: The NASDAQ market —

WARREN BUFFETT: Oh.

AUDIENCE MEMBER: — where they trade at 10 times revenues or more, 30 times revenues, instead of 10 times earnings?

WARREN BUFFETT: Yeah. Well, we don't pay much attention to that. Because throughout the careers Charlie and I have had in investing, there have always been hundreds of cases, or thousands of cases, of things that are ridiculously priced, and phony stock promotions, and the gullible being led in to believe in things that just can't come true.

So that's always gone on. It always will go on. And it doesn't make any difference to us.

I mean, we are not trying to predict markets. We never will try and predict markets. We're trying to find wonderful businesses. And the fact that a part of the market is kind of screwy, you know, that's unimportant to us.

We tried, a few times, shorting some of those things in our innocence of youth. And it's very tough to make money shorting even the obvious frauds. And there are some obvious frauds.

It really is — it's not tough — it's not so tough to find the obvious frauds, and it's not tough to be right over 10 years. But it's very tough to make money being short them, although we tried a few times way back.

It's — we don't look at indicia from stocks in general, or from P/Es, or price-sales ratios, or what other things are doing.

We really just focus on businesses. We don't care if there's a stock market. I mean, would we want to own Coca-Cola, the 8 percent we own of Coca-Cola, or the 11 percent or Gillette, if they said, you know, "We're just going to delist the stock and we're never — you know, we'll open it again in 20 years?"

It's fine with us, you know. And if it goes down on the news, we'll buy more of it. So we care about what the business does. Yeah.

21. A business is more important than where it's based

WARREN BUFFETT: Norton, did — why don't you give him the microphone there?

AUDIENCE MEMBER: Thank you, Warren, for including me — (Buffett laughs) — out of order.

WARREN BUFFETT: It's good to have you here. Norton [Dodge] represents a family that came in nineteen-fifty —

AUDIENCE MEMBER: Six.

WARREN BUFFETT: Six! Yeah, that joined up with the partnership and has been with us ever since. (Applause)

AUDIENCE MEMBER: A very, very fortunate connection. (Laughter)

WARREN BUFFETT: Both ways, Norton, both ways.

AUDIENCE MEMBER: And —

CHARLIE MUNGER: Careful, Norton. We don't want you mobbed on the way out. (Laughter)

AUDIENCE MEMBER: But I might say that it all began with my father [Homer Dodge] discovering — thanks to a professor of finance that was also at the University of Oklahoma — Ben Graham, back in 1940.

And then later, when Ben Graham was about to retire, we were trying to find his protégé. And clearly, that was Warren. And so he belongs to that long tradition.

But the question I wanted to ask was, you've mentioned the very strong companies that Berkshire has that are really international companies, like Coca-Cola and the — Gillette.

But are you considering, or have you ever thought of considering, the foreign companies that are undervalued? Or have you, for some reason, not included that in your universe of companies to consider?

WARREN BUFFETT: We've looked at companies domiciled in other countries. And we continue to look at companies domiciled in other countries.

We wouldn't — you know, we're happy for the U.S. and for Atlanta that Coca-Cola's domiciled in Atlanta. But would we pass on it if it happened to be domiciled in England? No, we'd love it, if it were domiciled in England, too.

And we feel that the important thing is the business, not the domicile. Although, it's — A, we're more familiar, in a general way, with domestic companies that are domiciled here, although they make — they may make their money internationally.

And we feel a tiny bit more comfortable, just a tiny bit, in terms of understanding the nuances of taxes, and politics, and shareholder governance, and all of that in something where we've been reading and thinking about it daily than someplace where we've had a little less experience.

But we would love to find a wonderful business that is domiciled in any one of 30 or so countries around the world.

We look some. We don't look as hard as we look at domestic companies. We're not as familiar with them.

But I have read hundreds of annual reports of companies spread around the world. And we've owned a few, just a couple.

They're usually not as big, so just getting the kind of money in, in many cases, is more of a problem. But some of them are big.

And we do not have such a surplus of ideas that we can afford to ignore any possibilities. And if we can find something with a market cap, probably, of at least $5 billion or greater, that strikes us as having our kind of qualities, and the price is right and everything, we will buy.

22. We never reach "for an extra eight of a percent"

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Good afternoon, Mr. Buffett. I'm Nelson Coburn (PH) from Silver Spring, Maryland. I have one question I want to ask that hasn't come up here yet.

Where does the money sit that comes in, say, from dividends and whatever other income that comes into Berkshire, that you're waiting to invest someplace else? Is it get — someplace where it's taking in a profit? Or is it just sitting, gathering dust? (Laughter)

WARREN BUFFETT: Well, we only have about four or five commercial paper names we accept. We're very picky about where we put — the money all gets invested. We do not have anything sitting around in a safe or anyplace else. So it's all invested.

But we do not get venturesome, in the least, in terms of where our short-term money goes. So we only have, like I say, maybe four or five approved names on commercial paper, all of which I approve. I mean, if anything ever goes haywire on this, it's my fault.

Right now, we have, maybe, a billion and something in relatively short-term Treasurys. And we have a little extra in some commercial paper, maybe.

But you will never see us reaching for an extra eighth of a percent on short-term yields.

Some of you may remember the fiasco in the — in Penn Central, in the commercial paper market. And Penn Central, around 1970 or thereabouts, was paying a quarter of a point, as I remember, more than other commercial paper issuers.

And of course, they, one day, despite showing a positive net worth, I think, of a billion and a half or so, they said they had a lot of net worth but no cash. Turned out cash was more important. And so they defaulted.

Now, the interesting thing about doing that is, if you're getting a quarter of a point extra, and you came over on the Mayflower, and you landed, and you said, "Well, I'm going to apply myself to getting a quarter of a point extra on short-term money," and you didn't make any mistake until you got to Penn Central, you would — aside from the compounding aspect — you would be behind at that point.

And I don't like a business that you can do right for 300 years and then make one mistake and — (laughter) — be behind.

So we are very picky about short-term paper. But it is all invested. And when it's large amounts, it probably will be in Treasurys. A couple firms' commercial paper, we take.

23. Volatile earnings to be expected at Salomon

WARREN BUFFETT: Zone 2, please?

AUDIENCE MEMBER: My name is George Gotti (PH) from Zurich, Switzerland. I've got a question with respect to Salomon.

Salomon experienced quite a large volatility in profits and even revenues in the past years. What are your views on how this will develop in the future with respect to volatility in profits and revenues?

WARREN BUFFETT: I didn't get a hundred percent of that, Charlie. Want to —?

CHARLIE MUNGER: Yeah, well —

WARREN BUFFETT: I can see, he can hear. We make a great combination. (Laughter)

CHARLIE MUNGER: Well, you can see we aren't wasting much around the joint. (Laughter)

Salomon's earnings have always been volatile, at least all the time I've been around the place. And I don't think that that volatility will — is likely to disappear.

All that said, we very much like the people at Salomon. And they've done a ton of business with Berkshire over the years and in a whole lot of different capacities. And they've done it very well.

So we're high on the firm, as a customer. And the firms we like, as a customer, we think, maybe, other people will like, as a customer. And generally, we love it, volatile or no.

WARREN BUFFETT: If you — at Salomon, as well as other firms of that type, they mark their securities to market. And so the changes in those marks go through earnings daily, actually, but you see them quarterly.

Interestingly, if you took Berkshire over the last 30 years, and marked to market, as we do now for balance sheet purposes, but not for income statement purposes, because the rules are different in that case — if you did that, you would see enormous volatility, quarter to quarter, in Berkshire's figures.

You would — I don't think you'd necessarily have seen any down year. But you would've seen swings between a few percent and, perhaps, 50 percent or something.

And if you looked quarterly, you'd have seen a number of quarters of losses. And you would've seen some great upsurges, too.

The volatility would be extreme, if it had all been run through the income account. But accounting convention does not call for running it through the income account, in the case of Berkshire. And it does, in the case of Salomon.

But the nature of their business is volatile earnings. The nature of most Wall Street businesses is going to be volatile earnings. Some may follow policies that tend to make it look a little less volatile than it might actually be, even.

The real thing that counts is two things, really. I mean, it's running it so that the volatility never kills you in any way, and the second is having a decent return on equity over time. And I think that the people at the top of Salomon are very focused on that.

CHARLIE MUNGER: I think it's illogical for the credit rating agencies to mark down Salomon as much as they do because the earnings are volatile. But they're in a style business. And it's their game.

24. Very little interaction between Berkshire subsidiaries

WARREN BUFFETT: Zone — what are we? Zone 3 now? Yeah, zone 3.

AUDIENCE MEMBER: Yes. I have three quick questions.

Do you have any formal or informal way where the managements — I know that you don't interfere with the managements of the holdings — but where they can cross-pollinate ideas, for instance, you know, selling World Book through the GEICO channel or something like that?

WARREN BUFFETT: I'll answer that right now. There's very, very, very little of that, I — you know, maybe once in two or three years, maybe some idea might strike me as worth passing along. But I — they're doing fine running their own operations.

We don't do it within Berkshire, either. They really go their own way.

Now, they know what businesses we're in. And so they can always go directly to somebody else. But they don't need me to communicate.

25. Lloyd's of London reputation problems have helped Berkshire

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: My name is Mike Macey (PH) from Las Vegas, Nevada.

My question is this. There have been some recent news articles on the problems at Lloyd's. What effect, if any, do you see the problems at Lloyd's having on an increase in the Berkshire insurance or reinsurance business?

WARREN BUFFETT: Well, I think, probably, I think it's fair to say that the problems of Lloyd's have helped us because Lloyd's had a terrific reputation. It was the first stop and, usually, the last stop for all kinds of unusual risks and large risks 20 years ago.

And the fact that they have lost some of their luster in that period has helped us. And, you know, we didn't do anything to contribute to it, but it obviously benefits us, as a competitor, when questions develop about an organization which has been a premier player in the industry.

So, Berkshire probably possesses more capital than all of Lloyd's put together, and it has established a reputation for being willing to quote on very large risks very quickly and to do exactly what it says. And it might very well be that, in many cases, we would get a call before they would get the call now.

So we've been a beneficiary and, probably, in a fairly good-sized way, from their problems. And it's more difficult for them to make inroads on us now than would've been the case 10 years ago.

We have a — I don't like to lay it on too strong — but we do have a preeminent position in a certain area of really large-scale reinsurance that will be difficult for anyone else to replicate.

Now, they may not like our prices. There may not be demand for some of the things we can do. But if there is demand, we are very likely to get some very significant business out of that position. And we've seen it some in recent years. And we'll see it more in the future.

26. "We assume we'll be around forever"

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Mike Assail (PH) from New York City with a question for Charlie about the hundred or so models we ought to have in our head —

WARREN BUFFETT: Here we go.

AUDIENCE MEMBER: — mentioned at the end of the excellent "Worldly Wisdom" speech.

I'd like to know the most useful models on industry consolidation, on product extension, on vertical integration, and any models which explain the special cases when it makes sense to invest in retailing stocks. And if Warren has anything to add or subtract, I'd love to hear it. Thank you very much.

CHARLIE MUNGER: Well, I'm glad to answer such a modest question. (Laughter)

I spoke about having a hundred models in your head. But those are all great, big models of considerable generality that are useful over and over again.

Now, you're down into very complex sub-modeling when you get into a separate model for what's going to happen in industrial consolidations and retail and so on, and I'm not up to all those sub-models. (Laughter)

WARREN BUFFETT: The truth is, you know, we're up to a few. But we take the general models and, you know, plug them in. And sometimes, the light goes on. And sometimes, it doesn't. But if it does, they could be quite useful.

If you focus, you do see repetition of certain business patterns and business behavior. And Wall Street tends to ignore those, incidentally. I mean, Wall Street really doesn't seem to learn, for very long, business lessons.

It may not be to their advantage to learn it. Charlie would — that would probably plug right in to Charlie's model. It's —

CHARLIE MUNGER: You bet.

WARREN BUFFETT: Yeah. It's better, if you're out selling the future, it may be better to forget the past, if you're getting paid on selling it and not on betting your life on it in some way.

One situation at Berkshire that really is somewhat different than many companies: we assume, and unfortunately, it's in error, but we assume we'll be around forever.

So when we — in our insurance business, we assume we're going to be here to pay every claim. And we're not going to retire at 65 and hand over something to someone else. And there wouldn't be any sense paying games on accounting because it would catch up with us later on.

And whereas, in many businesses, I don't think they have quite the same horizon on things. They do at a Coca-Cola, or they do at a Gillette.

But many companies are thinking about what kind of — I think, I'm afraid that, more than you'd like — are thinking about what little pictures they can paint for the next four quarters or so. And that's easy to do.

But our problem is we're going to be around a lot longer, we think, than four quarters, so that's not an option available to us. And we have to — we really run it as if, in the year 2050 or something, somebody's going to look and say, "Did — how'd it work out?"

27. Compensation plans must include cost of capital

WARREN BUFFETT: Zone, where are we, 5 or 6? Wherever the microphone is.

Zone 5, we got a mic over there? Maybe that was — 6! OK, we'll go to 6.

AUDIENCE MEMBER: You state, in your letter —

WARREN BUFFETT: Could you have the microphone? Or do we have one in the — yeah. Want to bring him the microphone? Particularly for the people behind you, it's a little difficult.

AUDIENCE MEMBER: Glen Rollins (PH), Atlanta, Georgia.

You state, in your letters to shareholders, that with your wholly owned companies, you reward them at a higher rate when they release capital to you. And you, likewise, charge them a higher rate when they need capital. Could you elaborate on that?

WARREN BUFFETT: Well, we — some of our businesses don't need capital at all, or need so little that it doesn't make sense to build it into a formula.

So we have certain businesses, those are the best businesses, incidentally, that take — to take, essentially, no capital because it means that, if you double the size of the business, you don't need any more capital. And those are really wonderful businesses. And we've got a few of those.

But where our businesses do produce capital, we could have all kinds of complicated systems and have capital budgeting groups at headquarters and do all kinds of things.

But we just figure it's simpler to charge people a fair amount for the money and then let them figure out, you know, whether they really want to buy a new slitter or whatever it may be in their business.

And it varies a little bit. It varies on the history of when we came in. It varies on interest rates that they — but we generally will be charging people something in the area of 15 percent, in terms of working out compensation arrangements for capital.

Now, 15 percent pretax, depending on state income taxes, is only 9 to 9 1/2 percent after-tax. So you can say that isn't even enough to charge people, but we find that 15 percent gets their attention.

And it should get their attention, but it shouldn't be such a high-hurdle rate that things that we want to do don't get done.

Our managers expect to be running their businesses for a long, long time. So we don't worry about them doing something that works for them in the next year but doesn't work five years out or vice — you know, where they don't make longer plans, because they see themselves as part-owners of the business. But we want them to be owners with a cost attached to capital.

We think it's awful, frankly, the way businesses reward executives with absolutely no regard for the cost of capital. I mean, a fixed-price option for 10 years — you know, imagine giving somebody an interest-free loan for 10 years. You're not going to do it.

And if a company is retaining a significant part of its earnings, and you give out a fixed-price option for 10 years, you know, they can do nothing with it but put it in a savings account, and they'll make some money off of it. So it — we like attaching a cost to the capital.

If we had options for me and Charlie at Berkshire, which would not — it's not going to happen, but it would not be illogical. We have responsibility for the whole place.

You could have some kind of a compensation arrangement that worked in respect to how the whole enterprise fared, and it would make sense for the two of us.

It wouldn't make sense for the rest of our managers because they work on specific units. And you should have compensation arrangements that apply to those units.

But assuming you had it for the two of us — which we're not going to have, I want to assure you — but we would say the fair way to do that would be to have an option at not less than present intrinsic value.

Forget what the market price is. Because, believe me, it — the idea of having the more depressed your market price be, the better your option price be, does not make any sense.

So we would have it at not less than intrinsic value. And then we would have it step up yearly based on something relating to a cost to capital. Because we would say, "Why should we get free use of the shareholders' capital?" And we could work out a fair stock option.

That would be perfectly appropriate. We won't do it, but it'd be a perfectly appropriate way to have us compensated that involved an issuance, then an initial price of not less than intrinsic value, and involve carrying costs.

And then we would be in a position, still, not totally analogous to shareholders, because we wouldn't have a downside that you have, but we would at least have the carrying cost that you have of ownership.

And we work that through into our unit compensation plans by having a cost of capital that, like I say, tends to run about that 15 percent area.

And if people can give us money, we should be able to figure out a way to do something better than 15 percent pretax with it. That's part of our job, too. So we will pay them to give us back money.

CHARLIE MUNGER: Well, we really invented a more extreme system. And that is the executives can buy Berkshire Hathaway stock in the market for cash.

This is a — (laughter) — very old-fashioned system, but most of them — it doesn't take any lawyers, or compensation consultants, or — and most of them have done it. And most of them have done very well with it. I don't know why it doesn't spread more. (Laughter)

WARREN BUFFETT: People say they want their management to think like shareholders. Management, you know, they're compensating them. We're going to have them think like shareholders. It's very easy to think like a shareholder. Become one, you know? (Laughter)

And you'll think exactly like a shareholder.

CHARLIE MUNGER: Right, right.

WARREN BUFFETT: It's not a great — it's not a huge psychological hurdle to get over, if you actually write a check. (Laughter)

28. Unlike many movie companies, Disney makes money for shareholders

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: John Lichter from Boulder, Colorado.

Are there some worthwhile books that you could recommend to us?

And secondly, with respect to Eisner and Disney, how would you define Michael Eisner's circle of competence? And are you concerned that he might step outside it?

WARREN BUFFETT: Well, I would say that he has proven himself very good at understanding what Disney is really all about.

And you can look back to the predecessor management, between Walt and Eisner. And they didn't really do much with that, if you look at those years.

What is special about Disney? And how do you make it more special? And how do you make it more special to more people? I mean, those are the things that you want to — and you've got wonderful ingredients to work with when you're working with something like Disney.

I mean, it — you know, one of the advantages — we were talking about the Mayo Clinic and brain surgeons. The nice thing about the mouse is that he doesn't have an agent, you know. I mean, the mouse is yours. (Laughs)

He is not in there renegotiating and, you know, every week or every month and saying, you know — (laughter) — "Just look at how much more famous I've become in China," you know, or something. (Laughter)

So if you own the mouse, you own the mouse. And Eisner understands all of that very well. I would say he's been very skillful, in terms of how he's thought about it.

I worry about any manager. It has nothing to do with Michael Eisner. But Charlie and I worry about ourselves in terms of getting out of our circle of competence.

And we've done it. It is very tempting. And it's probably part of the human condition, in terms of hubris or something, that if, you know, that if you've — as Charlie would say, if you've — you know, if you're a duck floating on a pond, and it's been raining, and you're going up in the world, after a while, you think it's you and not the rain.

You know, that there — that you're some duck. (Laughter) But —

CHARLIE MUNGER: Right, right.

WARREN BUFFETT: And we all succumb to that a little bit.

But I think that Disney, Coca-Cola, Gillette — I think those companies are very focused. I think our operating units are very focused.

And I think that gives us a huge advantages over the managers that are getting a little bored and decide that they'd better fool around with this or that to show just how talented they really are.

Charlie?

CHARLIE MUNGER: Yeah. Eisner is quite creative. And he also distrusts projections. And that is a very good combination to have in the motion picture business. (Laughter)

WARREN BUFFETT: Yeah, Charlie was a lawyer for, what, 20th Century in the old —

CHARLIE: Yes.

WARREN BUFFETT: — days? Yeah, and he saw a little bit of how Hollywood operated. And it kept us out of buying any motion picture stocks for about 30 years. Every time I'd go near one, he'd regale me with a few stories of the past.

So it's a business where people are — can trade other people's money for their own significance in their world. And that is a dangerous combination, where if I can buy significance in my world with your money, you know, there's no telling what I'll do. (Laughter)

CHARLIE MUNGER: Part of the business reminds me of an oil company in California. And it was controlled by one individual. And people used to say, about it, "If they ever do find any oil, that old man will steal it." (Laughter)

The motion picture business, it's only about half of it that has normal commercial morals.

WARREN BUFFETT: Yeah, we're not applying that to Disney.

CHARLIE MUNGER: No.

WARREN BUFFETT: Disney is really — Disney's done an extraordinary job for the shareholders.

And they make real money out of movies. Most movie companies have — they make money for everybody associated with it, but not a lot has stuck to the shareholders.

Zone 2?

AUDIENCE MEMBER: I —

29. Book recommendations

WARREN BUFFETT: What? Oh, the books! Charlie, what are you reading these days? (Laughs)

CHARLIE MUNGER: Well, I'm almost ashamed to report because I've gone back and picked up the part of biology that I put up — should've picked up 10 or 15 years earlier. And if any of you haven't done it, it's a total circus, what they figured out over the last 20 or 30 years in biology.

And I — if you take [evolutionary biologist Richard] Dawkins, "The Selfish Gene" and "The Blind Watchmaker", I mean, these are marvelous books. And there are words in those books that are entering the English language that are going to be in the next Oxford Dictionary. I mean, these are powerful books. And they're a lot of fun.

I had to read "The Selfish Gene" twice before I fully understood it. And there were things I believed all my life that weren't so, and I think it's just wonderful, when you have those experiences. We always say, "It isn't the learning that's so hard. It's the unlearning."

WARREN BUFFETT: Yeah. I made the mistake of taking Charlie up to Microsoft in December. And he became friends with [Chief Technology Officer] Nathan Myhrvold.

And they are corresponding back and forth with increasing fervor and enthusiasm about mole rats. And they copy me on all these communications. So I'm getting to see this flow back and forth on the habits of mole rats.

I really haven't found a way to apply it at Berkshire. But I'm sure Charlie — (laughs) — has got something he's working on, on that. He's gotten very interested in biology lately.

I like — you know, I've always liked reading biography, but since the — the computer has changed my life. I now find myself playing bridge on the computer about 10 hours a week. And unfortunately, I didn't want to give up sleep or eating or Berkshire. So the reading has been kind of light.

On investment books, if you're asking about that, I would recommend the first two books that Phil Fisher wrote back around 1960, "Common Sense [Stocks] and Uncommon Profits" and the second one ["Paths to Wealth Through Common Stocks"]. They're very good books.

You know, I obviously recommend, first and foremost, [Benjamin Graham's] "The Intelligent Investor," with chapters eight and 20 are the ones that you really should read.

Two of the — well, all of the important ideas in investing, really, are in that book, because there's only about three ideas. And those — two of them are emphasized in those two chapters.

Actually, I think John Train's "Money Masters" is an interesting book.

I don't know. Can you think of any others, Charlie, that we want to tout? (Laughs)

CHARLIE MUNGER: I don't know. We have such a fingers-and-toes style around Berkshire Hathaway. (Laughter) So you sort of count.

WARREN BUFFETT: The three —

CHARLIE MUNGER: I've never seen — you know, Warren talks about these discounted cash flows. I've never seen him do one. (Laughter and applause)

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: If it ever —

WARREN BUFFETT: There are some things you only do in private, Charlie. (Laughter)

CHARLIE MUNGER: If it isn't pluperfect obvious that it's going to work out well, if you do the calculation, he tends to go on to the next idea.

WARREN BUFFETT: Yeah, it's sort of — it is true. You don't — if you have to actually do it on — with pencil and paper, it's too close to think about. I mean, it ought to just kind of scream at you that you've got this huge margin of safety.

I mentioned the three ideas. The three ideas, I should elaborate on. One is that — to think of yourself — to think of investing as owning a business and not buying something that wiggles around in price.

And the second one is your attitude, which ties in with that, the attitude toward the market, that's covered in chapter eight. And if you have the proper attitude toward market movements, it's an enormous help in securities.

And the final chapter is on the margin of safety, which means, don't try and drive a 9,800-pound truck over a bridge that says it's, you know, "Capacity: 10,000 pounds." But go down the road a little bit and find one that says, "Capacity: 15,000 pounds."

30. We'll do more in insurance, but we don't know what

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Yes, Chip Tucker (PH), Minneapolis.

Mr. Buffett and Mr. Munger, what market share does Berkshire have in super-cat insurance business? And what's your outlook for both the market growth in that business and the potential market share growth with — from Berkshire?

You answered a related question regarding GEICO's auto opportunities. Are there other insurance businesses potentially worth expanding into? Or is your focus on super-cat and autos opportunity enough?

CHARLIE MUNGER: You know, Warren can answer that question a lot better than I can.

WARREN BUFFETT: I — we don't — there wouldn't be any good market share figures in something like super-cat.

We know that, a couple years, and last year, I think, too, we had to be the biggest in terms of premium volume.

We simply take on so much more than anyone else will. And we were getting the calls on the big risks, you know, 400 million here or something of the sort. We had a quote we put out on a billion dollars on the New Madrid fault here a little while ago. Nobody else will be doing that.

So we got market share by our willingness to do large volume, by the fact that people knew we would pay subsequently, but we don't — while we know we were the largest, we can't give you any precise figures.

We also know we're slipping in that now, but that makes no difference to us. We'd only be interested if we were slipping in profitable markets.

And what was the second part of the question on that, Charlie?

AUDIENCE MEMBER: What other opportunities —

WARREN BUFFETT: Oh, what other opportunities in the insurance business?

We — just this year, we bought a very, very small company [Kansas Bankers Surety], the managers of whom are here, a very fine insurance company. It has a little niche.

It — I mean, it will never be huge or anything of the sort, but it's the kind of business that we can understand. And we like the people that run it. And we like the position they've achieved in the market. So we're delighted to be in it.

We are willing to think about a whole variety of things to do in insurance. But most of them, we find, make no sense. We'll be — we'll do other things in insurance over the next 10 or 15 years. It's just bound to happen, but I can't tell you what they will specifically be.

The biggest single thing we will do in terms of value, though, probably, is grow GEICO. But we will do other things. And who knows what they might be?

We have expanded some in the — it's a small business — the structured settlement business, from when we talked a year or two ago. And we are the preferred provider of structured settlements. Those are annuities, essentially, that are payable to people who are usually the victims of a very bad accident.

So they're very severely injured people, with injuries that will probably last for life. And so we will be making payments to people who are incapable of earning a living, may incur substantial medical bills, for many decades, sometimes, 50 or 60 years.

Those annuities are provided by our companies to other insurance companies and to these injured people, usually, with the approval of the injured person's attorney.

And when the advisors to the injured person think, "Who is going to be around in 50 years to pay money to this person who's been incapacitated," they frequently, and in our view, logically, think of Berkshire. So we have become much better known in that over the last couple of years.

It's not a big business. And it won't be a big business. But it's a perfectly decent business. And it's one where we have a competitive advantage over time.

We don't obtain the competitive advantage by price. We obtain the competitive advantage from the peace of mind that the injured party obtains from knowing that that check will be in the mail 50 years from now.

And that's the kind of business where we have some edge. And we'll find other things to do over time, but can't — I can't —

It isn't like we're looking at some specific area and saying, "We're focusing on this." We're aware, generally, of what's going on in the insurance business. And we're very ready to move when the time comes, so that we can do something intelligent.

31. People rewarded by capitalism need to help those who aren't

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, my family's been associated with Berkshire since 1968. So I ask this question with a great deal of respect for your integrity and your wisdom.

I work as an inner-city schoolteacher, where there is a rising and pervasive sense of hopelessness.

When I ask my students, "What would make you happy?" their predominant response is, "A million dollars." As some of the richest men in the world, I wonder what your response to them might be.

And as a second part of this question, the philosophical underpinnings of capitalism have largely ignored a systemic perspective involving issues of ongoing depletion of limited global resources exploited to sustain a market economy, widening gaps between the very wealthy and the severely impoverished, and an international view of America as a country whose primary values are greed and imperialism.

As we move into the 21st century, do you see a need to re-envision capitalist premises towards original notions of democracy, justice, and humanitarian concerns?

WARREN BUFFETT: I didn't get all of that.

CHARLIE MUNGER: Well — (laughter) — I will say this. I am higher on the existing social order than you are. (Applause)

I — there's always plenty wrong with a social order. And certainly, there are places where ours is a lot more broken than it used to be.

I don't think Warren and I have any wonderful solution to all the problems of the world. But wishing for a million dollars instead of some more tangible short step is the wrong frame of mind. That isn't the way we got our million dollars.

WARREN BUFFETT: But I don't — (Applause)

CHARLIE MUNGER: Warren might give a different answer, by the way. He's a —

WARREN BUFFETT: No, I would agree with the — I, you know — wishing for a job makes a lot of sense to me and figuring out how to get one and then going from there. But it —

There is and always has been — that doesn't mean it always should be — but there is a tremendous amount of inequality.

What you don't want is an inequality of opportunity. There will be a lot of inequality in ability.

A market system, like we have, churns out what people want. If they want to watch a heavyweight fight, and they want to watch Mike Tyson, they're going to pay him $25 million for getting in the ring for a few minutes.

And it produces what people like. And it produces it in abundance. And it's done very well in terms of production.

It is much better to be in the bottom 20 percent in this country now than it was 50 years ago. And it's better to be in the bottom 20 percent of this country than in any other country. But it still isn't very satisfactory.

The market system does not reward — it does not reward teachers, does not reward nurses — I mean, it does not reward all kinds of people who do all kinds of useful things in any way comparable to how it will reward entertainers, or people who can figure out the value of businesses, or athletes, or that sort of thing.

A market system pays very big for something that will entertain them. People want to be entertained a good bit of the day. And it pays better for people that will entertain than educate.

I think — I don't want to tinker with the market system. I don't think I should be telling people what they should want to do with their lives.

But I do think that it's incumbent on the people that do very well under that system to be taxed in a manner that takes reasonable care of anybody that is not well adapted to that system, but that is a perfectly decent citizen in every other regard.

And that is — you know, I don't want to start getting into comparable worth in terms of how I tax. But I do think that somebody like me, that happens to just fit this system magnificently, but wouldn't be worth a damn in Bangladesh or someplace, you know, because what I have wouldn't pay off there — their system would not reward that.

I think that we get from society — society provides me — this society provides me — with enormous rewards for what I bring to the game. And it does the same with Mike Tyson. And it does the same with some guy whose adenoids are right for singing or whatever it may be.

And I don't want to tamper with that. But I do think those people who are getting all kinds of claim checks on the rest of society from that — I think there should be a system that people — where people who are not well adapted to that system, but that are perfectly decent citizens in every other respect, do not really, you know, fall through the slats on that.

And I think progress has been made on that over the last 50 years. But I think we're far from a perfect society in that respect. And I hope, you know, more progress is made in the next 50 years.

I don't think the wishing for the million dollars, though — you know, it doesn't work that way. I think —

But if you are lucky enough to have something that the market system rewards, you do very well here. And if you're unlucky enough to have something it doesn't reward, you do better now than you would've 30 or 40 years ago. And you do better than in other countries.

But I can see where it seems very unjust to look at somebody else who has just a little different mix of talents that can achieve claim checks in a way that keeps them and the next five generations of their family in a position where they don't have to do very much.

CHARLIE MUNGER: I would say that I like a certain amount of social intervention that takes some of the inequality out of results in capitalism.

But I hate, with a passion, rewarding anything that can be easily faked. Because I think then people lie, and lying works, and the lying spreads. And I think your whole civilization deteriorates.

If I were running the world, the compensation for stress under workman's compensation would be zero, not because there isn't real stress. Because there's no way to keep the fakery out, if you reward stress at all.

WARREN BUFFETT: There was a great article, and this applies — (applause) — to an earlier question.

There was a very good article in Forbes about one issue ago that showed the occupational profile of the U.S. at a couple of different intervals, going back to 1900.

And one problem you can see, just by looking at that profile, is that, if you assume 20 percent of the — the bottom 20 percent — however you measure it, in terms of employability — whether it's measured by IQ, or interest in working, or energy level, or whatever you want to do — they fit, very well, most of the jobs that were available a hundred years ago.

In other words, you could do most of the jobs, of which there were many, with relatively unimpressive mental abilities. And as jobs have changed, the profile of people hasn't changed. So there are more people that end up on the short end.

Now, the good part of that is the society produces so much more that it can take care of those people, one way or another. Now, the trick is to take care of them and make them not only feel, but be productive and be part of the act, and —

We've got enough product to do that. But the country turns out way more output than 50 or a hundred years ago.

We don't have — we're not perfect at figuring out how to make the bottom 20 or 30 percent, in terms of abilities, fit a new, changing job profile.

I really recommend you look at that Forbes magazine. Because if you think through the implications of those charts, I think you'll see what social problems have to be attacked.

32. "No magic" to running a bank — just don't do "something foolish"

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Edward Barr, Lexington, Kentucky.

Earlier, you led us through a discussion of the competitive position of Disney. And you also discussed share repurchase.

I wondered if you could also lead us through a discussion of the competitive position of Wells Fargo, since they just effected such a large combination [with First Interstate], in addition with, perhaps, some discussion of their share repurchase, which is probably as large, in percentage terms, as any company I can think of at the present time.

WARREN BUFFETT: Well, Wells should repurchase their shares, if they feel that they're repurchasing them below intrinsic business value. And that's a calculation that they make.

And you should — have to ask the question of them what their calculus is of that. But that will determine whether that share repurchase program makes good sense or not.

The advantages of an in-market merger are — can be dramatic. Sometimes, it just causes a bank to do what they should've done anyway.

I mean, I'm not so — I'm not always as convinced that the economies come about through — totally through scale, as they are just from taking a hard look at how they run their business.

We may have in the audience today — he was here earlier — the CEO of the Bank of Granite, which is in Granite, North Carolina. And that bank earned 2.58 percent on assets, I believe, in the most recent quarter, annualized, and had a 33 percent efficiency ratio.

Now, that bank is 400 million or 500 million of assets. You know, it doesn't need to be 5 billion in order to get more efficient or anything of the sort.

It's got — it's so much more efficient than any of those larger banks that had to be put together to get those ratios that it makes you kind of wonder about the underlying rationale.

But I'm sure that Mr. [John] Forlines, who runs that bank, just focuses on — and he's been focusing on it for a lot of years — just doing the right things day after day. And it didn't take any in-market merger or anything of the sort to cause him to do that.

I recommend any of you in the banking business to get his report because there is nothing magic about the community of Granite, North Carolina.

Nor does he work under laws that are way different than the rest of bankers or anything of the sort. He just gets a record that — achieves a record — that makes all the rest of the records look silly.

We had a fellow over in Rockford, Illinois, in the bank we owned back in the '70s, Gene Abegg, whose brother is going to be 104. There was a fellow from Rockford here that got me to sign a note to Ed Abegg, who will be 104 soon. I wish Gene had lived to 104.

But Gene ran a bank in Rockford that, when banks — the best banks were earning one percent on assets, he earned two percent on assets. And he did it with way less leverage than anyone else and lower loan losses and big investment portfolio.

And there wasn't any magic about it. He just didn't do anything that didn't make sense.

And there's a lot of room for improvement in the banking business with or without mergers.

But I would say that Wells, on the record, has done an exceptionally good job of running their bank compared to other big banks. And I would say that those two operations put together will be run a whole lot more efficiently than if First Interstate had been run by — run on its own.

It's a business that can be a very good business, when run right, as the Bank of Granite or Illinois National Bank in Rockford proved. There's no magic to it. You just have to stay away from doing something foolish.

It's a little like investing. You know, you don't have to do anything very smart. You just have to avoid doing things that are ungodly dumb when looked at about a year later and — you know, airlines and that sort of thing. (Laughter)

And you know, that's the trick. It is not some great crystal ball game where you look into the future and see all these things that other people can't possibly see. I mean, what's complicated about Coca-Cola or Gillette or Wells Fargo, for that matter?

And that's — we like businesses like banking, if we've got somebody in charge of them that is going to run them right. We've got a — I don't know whether Bob Wilmers is here. But he runs First Empire, which we have a good-sized investment in. Bob just runs it right, you know?

I do not worry about surprises from Bob or First Empire. And he'll do things — if he can grow, and it's logical, he'll grow. And if it isn't logical to do something, he'll pass. He has no ego compulsions forcing him into some sort of action. And he runs a terrific bank.

Charlie?

33. We do "whatever comes along that makes sense"

WARREN BUFFETT: OK. Zone 5.

AUDIENCE MEMBER: Dorothy Craig (PH) from Seattle.

And I noticed, in the annual report, that your recent acquisitions doubled the revenue for Berkshire Hathaway. And it seemed astounding for me. I'm wondering how that's possible.

WARREN BUFFETT: Well, it's — for one thing, we started from kind of a small base. The — but we — the GEICO acquisition, you know, added 3 billion or so of revenues, and — actually more than that, a little more than that, but not much more. And RC Willey and Helzberg's probably added 600 million or so in the current year.

And since we were working off a base of 3 1/2 or so billion, those three acquisitions did double the revenues. We won't have many years when that happens. It's not any goal of ours to double the revenues or increase them 20 percent, even, or anything.

We just — we try to do whatever comes along that makes sense. And if there's a lot that comes along in one year that makes sense, we'll do a lot. And if there's nothing that comes along that makes sense, we'll do nothing.

So it's — there's a lot of accident in it. But last year, you know, a fair amount happened. And I'd love to see a lot happen next year. But we don't know at this point.

Charlie?

CHARLIE MUNGER: Nothing.

34. GEICO's Lou Simpson has more investing options now

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Oh me? Yes, my name is Victor Lapuma (PH). And I'm from the Virgin Islands. And my question is on the GEICO asset side.

One of the things that makes Berkshire unique is the high percentage in equity as opposed to fixed assets. And GEICO, as of the end of the year, looked like a typical insurance company with four times the fixed assets as equity assets.

And my question is, over time, will they have the same composite as Berkshire on the asset side?

And the second part of that question is, how are the asset allocations decisions being made at GEICO after the merger as compared to before the merger?

WARREN BUFFETT: The decisions at GEICO, which, as you say, is about 5 billion of marketable securities, have been made, and are being made, and will be made, by Lou Simpson. Lou has done a fabulous job of running the investments of GEICO since about 1979. And we're lucky to have him.

There are very few people that I will let run money running businesses that we have control over. But we're delighted, in the case of Lou. I mean, that's one in a thousand or something. But Lou has done a terrific job, will do a good job.

And the one thing we offer him, he has the ability to do whatever he wants to do with those assets now. He did not have that ability before GEICO became part of Berkshire. Because at that time, there were certain ratios that were necessary for — which were understandably necessary, that made sense.

With GEICO as a standalone entity, with its own net worth of a billion and a half or 2 billion, and doing 3 billion of business, it would've been inappropriate for him to take on a different configuration, beyond a certain point, in equities.

So he was constrained by the nature of the business he was in and its capitalization. That constraint no longer applies. So he, with that 5 billion, can do whatever he wants.

Now, if he does certain things, we would need to provide backup to GEICO, so that their policyholders would be protected under the most adverse of circumstances. But that's no problem for us.

We could do it by quota share reinsurance. We could do a lot of things. We could just guarantee their obligations. And we are in a position to do that.

We haven't done it yet because it's not — hasn't been necessary yet. But if it made sense — if Lou wanted to be 5 billion in equities and it made sense, we would arrange things so that the GEICO policyholders would be every bit as secure as under the most conservative of investment portfolios.

So Lou has another string to his bow now. And there may be a time when it gets used. He's been great under the old system. And he may be better under this system.

CHARLIE MUNGER: That's a very shrewd question. You're to be complimented.

WARREN BUFFETT: That means it's something we thought about — (laughs) — before, but you are to be complimented, right.

35. "Permanent holdings" probably won't be sold even if market overvalues them

WARREN BUFFETT: Let's see. Zone 1?

AUDIENCE MEMBER: Neil McMahon (PH), New York City.

Berkshire owns several companies — stock in several companies — which are called permanent holdings.

In the early '70s, we had a two-tier market, the one-decision stocks, high P/Es — 50, 60 times earnings.

If that were to reappear again, would Berkshire's companies still be permanent? Or is there a price for everything?

WARREN BUFFETT: Well, there are things that we think there's no price for. And we've been tested sometimes and haven't sold them, but —

You know, my friend, Bill Gates, says, you know, it has to be illogical at some point. The numbers have — at some price, you have to be willing to sell something that's a marketable security, forgetting about a controlled business.

But I doubt if we ever get tested on — there's only a couple of them in that category.

Actually, there — you know — I won't comment on that. (Laughs)

We really have a great reluctance to sell businesses where we like both the business and the people. So I don't think I'd count on seeing many sales. But if you ever attend a meeting here, and there are 60 or 70 times earnings, keep an eye on me. (Laughs)

Charlie?

CHARLIE MUNGER: The so-called two-tier market created difficulties, I would say, primarily because a lot of people or companies were called tier one when they really weren't. They just had been, at some time, a tier one. If you're right about the companies, you can hold them at pretty high values.

WARREN BUFFETT: Yeah, you can really hold them at extraordinary levels if you've got — it's too hard to find. You're not going to find businesses that are as good.

So then you have to say, "Am I going to get a chance to buy back the same business at a lot lower price? Or am I going to buy something that's almost as good at a lot lower price?"

We don't think we're very good at doing that. We'd rather just sit and hold the business and pretend the stock market doesn't exist.

That actually has worked out way better for us than I would've predicted 20 years ago. I mean, that mindset is — or 25 years ago — that mindset is — there's been a fair amount of good fortune that's flowed out of that that I really wouldn't have predicted.

CHARLIE MUNGER: But there, you're demonstrating your trick again, you know? Still learning. A lot of people regard that as cheating. (Laughter)

36. Buffett doesn't expect Gates will join Berkshire's board

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Yeah, Alan Rank, Pittsburgh, Pennsylvania.

Knowing your aversion to technology but your close affiliation with Bill Gates, Microsoft, have you ever considered either inviting him to be part of the Berkshire through the board, or being involved to maybe solve some of the problems with World Book and taking it to the new technology and expanding it?

And on the other end, you also love insurance and the float. Have you considered the other businesses that would have that similarity, such as cemeteries and funeral homes with their pre-need and their large cash reserves?

WARREN BUFFETT: The — Bill and I talked about the encyclopedia business some years ago. But he was pretty far down the line at Encarta, quite far down the line at Encarta, actually, before I even met him. So it wasn't — my guess is, if we had met earlier, that there might have been something evolve in that.

But he had put a lot of chips on Encarta and had done a good job with it. So it really wasn't — it wasn't a real option to work with him on World Book.

Bill also is very focused on his business. And I believe he's on the board of some biotech company in which he's got a significant investment.

But you will not see him on the boards of, at least I don't believe that you will, of American corporations — I think, if you look at the boards in the, say, up in the Pacific Northwest, where he had a lot of friends and knows the companies well and maybe grew up with some of the people.

But I don't think you'll see him on anything which really doesn't — which is just a business that doesn't grab him intellectually on something. I do think there's one biotech company that he's involved in that way. And you know, he'd be a terrific asset.

But he really focuses on Microsoft. He has his board meetings, as I remember, on Saturday. They last, you know, all day. And then he goes after the business that way. He's not —

I don't think he'd be interested on being on a bank board or an insurance company board because he just figures he's got other things to do with his time. And I think he's probably right. (Laughs)

37. Not all "float" businesses are attractive

WARREN BUFFETT: Zone 3? Oh, the question was about other kinds.

We've always had an interest in float businesses of one sort or another, but —

You know, Blue Chip Stamps was such a business, until it disappeared — (laughs) — one day, and we couldn't find it. We went — looked in the closet. We looked everywhere, out in the backyard. (Laughs) Where was it?

So we like that sort of business. But most of the float businesses, the costs are pretty explicit. And like I say, we don't like most insurance companies as float businesses. We are not interested in buying the typical insurance business, because we think the float will end up costing us too much.

We'd rather borrow money with an explicit cost attached to it rather than have the implicit costs of an underwriting loss with most companies.

But we're always — we are interested in businesses that provide cash rather than use up cash. We're willing to have them use cash, if the — if what they use will produce high enough returns. But we've got this bias toward things that throw off cash.

Charlie?

CHARLIE MUNGER: Well, if we go into the pre-need funeral home business, that'll be the day. (Laughter)

38. Expect a "better" market for Class A than Class B

WARREN BUFFETT: Zone 3. (Laughter)

AUDIENCE MEMBER: Charlie is a difficult act to follow. I'm Robert Keeley (PH) from Washington, D.C.

I have a brief comment and a brief question. The comment is that I think you may be considerably underestimating the interest there will be in purchases of Class B stock later this week and next week.

I have at least 10 friends in Washington who are aware that I'm a Berkshire shareholder and that I was coming to this meeting. And they've insisted that I report back to them tomorrow on just what happened with the Class B stock because they're very interested in buying some of it.

Now, that's anecdotal, to be sure. But if you take that ratio of 10 people to even the shareholders who are present here today, you're talking about tens of thousands of people who are going to be in that market.

And my question relates to liquidity. On page 18 of your annual report, you say, and I quote, "The prospect that most shareholders will stick to the A stock suggests that it will enjoy a somewhat more liquid market than the B."

Could you explain that? It seems to me that if most shareholders keep their A stock, do not convert it or sell it, that the B stock will be much more liquid. Maybe I don't understand liquidity.

WARREN BUFFETT: No, I think you do. You understand it. And I'll elaborate just a bit.

The — certainly, in the first week, I would expect the B stock to trade far more, although I hope it doesn't trade like most new issues trade in relation to the amount sold.

It's just the nature of a new offering that there's usually — there's always some flurry of activity. Sometimes, I think it's quite excessive. And I don't think it will be with Berkshire. But there will be some flurry of activity.

But longer range, let's just assume that there's $400 million worth of B stock. There will be 40 billion of A.

Now, admittedly, you know, I'm not going to do anything with my stock. And many people in this room have a very low tax basis and, except under very unusual circumstances, have no intention of doing anything with their stock.

So of that 40 billion, there's a very significant percentage that you might say is almost inoculated against reaction to market changes.

But there still is a very significant dollar value. There's a fair amount held by funds, for example.

And so the market value of what I would call the potentially tradeable A is likely to far exceed the market value of the potentially tradeable B. Now, it may be that all of the B is potentially tradeable, whereas, only a small portion of the A is.

But that 40-billion-to-400-million ratio, I think, almost ensures that, after the initial flurry, that the better market — and when I say, "better market," I mean the ability to move large dollar amounts in both directions with minimal movement of price — the better market — not by a huge margin — but the better market is likely to be in the A. And frankly, we hope that it is. We still hope there's a good market in the B, obviously.

But if you're talking 10 shares of the A, which is a $300,000 or so investment, I think that, two months from now — that it's likely to be that buying or selling $300,000 worth of A will have slightly less of a percentage impact than buying or selling $300,000 worth of B, but not by a significant amount.

But that's what I meant by that comment of having a slightly better market in the A than the B. And that's important from our standpoint because, if that situation became reversed and the B became the better market, then people would have a real incentive to convert from A to B over time, and eventually the B market would dominate.

We don't anticipate that happening. And I think the way we've arranged it, it won't happen. But it could happen.

Charlie?

CHARLIE MUNGER: Yeah, well, I think we've also created arrangements in the way we've written the prospectus and rewarded the selling brokers that tend to dampen demand, both individual and institutional. And we sometimes accomplish what we try to do. (Laughter)

WARREN BUFFETT: Zone 4? Don't ask us for a list of those, what we've accomplished. (Laughter)

39. Corporate return on equity will probably drop

AUDIENCE MEMBER: Dan Pico (PH), Sioux City, Iowa.

In the mid-'70s, you wrote an article on how inflation swindles the equity investor and that the average return on equity for corporate America would be like 12 or 13 percent.

Last year, the average was more like 20. Have the laws of economics been repealed or modified? Or if not, what sort of calamities might occur as we revert to the mean?

WARREN BUFFETT: Well, I have been surprised by returns on equity. There was a good article in Fortune about two issues ago. Well, it was in the "Fortune 500" issue, whenever that was. And it discussed the question of return on equity.

And it made some good points about how the introduction of putting post-retirement health benefits on the balance sheet tends to swell equity returns subsequently. In other words, it moves down the denominator in terms of total equity employed.

And there's been a lot of big-bath accounting, where there have been write-offs, so that counting that, I don't think it has gotten to 20 percent. But it's higher than — it's certainly higher than I anticipated when I wrote that article.

And I would say that it would seem very extreme to me, in a world of — like we're living in now — to have equity cap — returns on equity — close to the 20 — average close to the 20 percent rate over time. But it has surprised me, how high returns have been.

Now, you have had situations like at Coke, for example, where 25 years ago, they would not have repurchased stock. And so, they'd have piled up more equity in the business. And Coke's return on equity, if it had been following the policies of 1970 or '75, would be far less than it is now.

Coke really doesn't need equity. And so, it can earn extraordinary returns and very large dollar sums. To the extent that impacts the figures, that has some impact on them.

To the extent that General Motors sets up many, many billions of a reserve for post-retirement health benefits, that tends to make the returns on GM look a lot better than it did in the past, when it wasn't even recognizing those costs and, therefore, had an equity that really was much larger than the true equity.

So there have been some things happen like that. But all in all, I don't think, under any system of accounting, the 20 percent returns for American industry are in the cards.

Charlie?

CHARLIE MUNGER: Well, I agree. And I think that this business of having way more consolidation and the successful companies, like Wells Fargo, buying in stock, I think that's had a huge effect, too.

I don't think it's actually gotten that much — obviously, we had a long period of real growth and so on. And I think that, on average, business has earned higher returns on equity. But I think a whole lot of things have combined to goose the results. And I don't see how it could go much farther.

40. Buffett's investment doesn't reflect any real estate insights

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Yes. My name is Ted Elliott (PH) from Connecticut.

The press reported a recent investment you made in the real estate business. And I wondered if you would comment as to your outlook for that business.

WARREN BUFFETT: Well, that's just sort of an asterisk. I've got virtually everything in Berkshire, and I own a few municipal bonds outside and a few other things, but I don't want to buy anything that Berkshire's involved in. It just complicates life. And all the best things I like — (laughs) — are in Berkshire.

So every now and then, some little thing happens to hit the radar screen that is too small, really, for Berkshire. And I'd bought a hundred shares of that company back when I — it's called Property Capital Trust — I'd bought 100 shares of that back when we owned NHP, which had done a couple of deals with them. So I — my policy of reading every annual report in sight that can further my knowledge about anything, I bought 100 shares.

And then I happened to see a year or so ago, where they said they were going to liquidate. So having some money around, I bought that. But it's not based on any feeling about the real estate business, any sophisticated analysis of the company, or anything else. It's a minor personal investment.

I have no insights whatsoever. We've done a few things in real estate at Berkshire. But they've been large things. And there was a brief period when there were a couple things that were intelligent to do.

If we'd started a little earlier, there might've been a lot more things. But we started a little late. So we're doing nothing now. But we listen to things, occasionally.

But we're looking. We're basically looking for big things at Berkshire. And we haven't found anything in real estate in a long time. And we may never.

But who can tell? I mean, we've got our oar in the water. And the couple things we're in are working out fine. But they're not significant relative to Berkshire's size.

41. Berkshire's past growth not a yardstick for new investments

WARREN BUFFETT: We'll go to zone 6. And this is the last question because it's going to be 3 o'clock. And let's have zone 6.

AUDIENCE MEMBER: Hi, my name's Mike Nolan from New Jersey. My wife and I have been shareholders since 1984, and happy ones. Thank you both. Two questions today.

In the retail store industry, in light of Berkshire's outstanding 23 percent annual growth in book value per share and the industry's roughly 8 to 9 percent growth in equity over the last several years, we wonder, why would Berkshire exchange stock for securities such as these, when the growth and the net worth of the acquired companies, if they're anywhere near the industry average that you've acquired this year, are one-third or less?

To quote Barnett Helzberg from the annual report, "The diamond business is a very competitive industry."

WARREN BUFFETT: Well, all retail is competitive. And both of those companies have averaged a lot better returns on equity than the numbers you cite for the industry.

And the second point, you know, we have no way of making 23.6 percent in the future. So we do not use our historical — if we used our historical average as a yardstick for new investments, we would make no new investments because we don't know how to make 23.6 percent in the future.

But we like — we regard the retail business as a very tough business. We like the records of those companies, their market positions, and their managements. And when we find a business like that, and we feel very comfortable with the people running it, we will make the deal.

But we won't expect to make 23.6 percent on our money over time doing that.

I'd like to thank everybody for coming. You've, you know — (Applause)

Morning Session - 1997 Meeting

1. Buffett is losing his voice

WARREN BUFFETT: Good morning. I'm Warren Buffett, the chairman of Berkshire Hathaway, as you probably have gathered by now. (Laughs)

I had a real problem last night. I was losing my voice almost entirely. I don't want you to think I lost it cheering for myself this morning here. I think I'll do all right, but we've always got Charlie here to — he's always done the talking. I just move my lips, you know. (Laughter)

So I'd like to tell you a little bit about how we're going to conduct things. And then we'll go through a script that was written by the speechwriter for Saddam Hussein. It has all the warmth and charm and participatory elements you'd expect.

And we'll get through the business of the meeting as promptly as we can, which is usually about five or six minutes. And then Charlie and I will answer questions, your questions until noon, when we'll have a break for about a half an hour.

There's food outside all the time. And then at 12:30 we'll reconvene, and we'll go till 3:30 or thereabouts. And I hope my voice lasts. We've got various non-Coca-Cola products here designed to keep it going.

We'll have a zone system where we have 12 microphones placed around, and — I believe it's 12 — and we'll just go around in order. And if you'll go to the microphone nearest you, there will be someone there who will try to arrange the people — get to ask questions in the order in which they arrived. And we'll make sure that everybody gets a chance to ask their questions before people go on to second questions.

Particularly in the afternoon, we'll make a special effort to answer the questions from people that have come from outside North America. We really got quite an attendance today. All 50 states — at least in terms of tickets — all 50 states are represented.

We had — I had it here somewhere. Yeah, we had ticket requests, at least, and I met a number of people from South Africa, Australia, Brazil, England, France, Germany, Greece, Hong Kong, Ireland, Iceland, Israel, Saipan, New Zealand, Saudi Arabia, Singapore, Sweden, Switzerland.

So when people have come from that sort of distance, we want to make sure that they — obviously we want to make sure that they particularly get their questions answered.

Interestingly enough, we have an increased percentage from last year who come from Nebraska this year. And you have to be a little careful in interpreting that, because some people say they're from Nebraska and really aren't, because for status reasons they, you know, like that. (Laughter and applause)

So make them produce their driver's license if they tell you they came from Nebraska.

2. Formal business meeting begins

WARREN BUFFETT: I think that's most of the preliminaries, so I'm going to get into this. We'll get the meeting over with here promptly with your cooperation.

And I will go through this little script that's been prepared for me, and it says, the meeting will now come to order. I'm Warren Buffett, chairman of the board of directors of the company. I welcome you to this 1997 annual meeting of shareholders.

I will first introduce the Berkshire Hathaway directors that are present in addition to myself. I've introduced you to Charlie already.

And the other directors, I believe, are in the front row here. If they'd stand when I mention their names, you can withhold any applause until finished, and then it's optional. (Laughter)

Howard Buffett, Howie you want to stand up? Susan Buffett. Walter Scott. And Malcolm Chace III, "Kim" Chace. And that is our extensive directorate. (Applause)

Give them a lot of applause because they don't get much else for it. It's a rather low-paying board. (Applause)

Also with us today are partners in the firm of Deloitte and Touche, our auditors. They are available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings.

Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc B. Hamburg. Proxy cards have been returned through last Friday representing 1,012,050 Class A Berkshire shares and 645,940 Class B Berkshire shares, to be voted by the proxy holders as indicated on the cards. That number of shares represents a quorum, and we will therefore directly proceed with the meeting.

We will conduct the business of the meeting and then adjourn the formal meeting. After that we will entertain questions that you might have.

First order of business will be reading of the minutes of the last meeting of shareholders, and I recognize Mr. Walter Scott Jr. who will place the motion before the meeting.

WALTER SCOTT JR.: I move the reading of the minutes of the last meeting of shareholders will be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICES: (Inaudible)

WARREN BUFFETT: We got a second. The motion has been moved and seconded. Are there any comments or questions? We will vote on this motion by voice vote. Those in favor say “aye.”

VOICES: Aye.

WARREN BUFFETT: Opposed? Say, “I’m leaving.” (Laughter)

The motion is carried. Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated, a proxy statement that accompanied the notice of this meeting that was sent by first-class mail to all shareholders of record on March 7, 1997, being the record date of this meeting, there were 1,205,078 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting, and 815,015 shares of Class B Berkshire Hathaway common stock outstanding with each share entitled to 1/200th of a vote on motions considered at the meeting. Of that number, 1,012,050 Class A shares and 645,940 Class B shares are represented at this meeting by proxies returned through last Friday.

WARREN BUFFETT: Thank you. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholder that is present has not turned in a proxy and desires a ballot in order to vote in person, you may do so. If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you.

Will those persons desiring ballots please identify themselves so that we may distribute them?

3. Berkshire board elected

WARREN BUFFETT: OK, the one item of business for this meeting is to elect directors. I now recognize Mr. Walter Scott Jr. to place a motion before the meeting with respect to election of directors.

WALTER SCOTT JR.: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace III, Charles T. Munger, and Walter Scott Jr. be elected as directors.

WARREN BUFFETT: It sounds good to me. Is there a second? (Laughter)

It has been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace III, Charles T. Munger, and Walter Scott Jr. be elected as directors. Are there any other nominations? Is there any discussion?

My kind of group.

The nominations are ready to be acted upon. If there are any shareholders voting and present, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections. Think we had one or two to collect there.

Would the proxy holders please also submit to the inspector of elections a ballot on the election of directors, voting the proxies in accordance with the instructions they have received?

Miss Amick, when you are ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Friday cast not less than 1,015,697 and 2,300 votes for each nominee. That number far exceeds the majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as those cast in person at this meeting, if any, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace III, and Charles T. Munger, and Walter Scott Jr. have been elected as directors. After adjournment of the business meeting I will respond to questions that you may have that relate to the business of Berkshire but do not call for any action at this meeting.

Does anyone have any further business to come before this meeting before we adjourn? If not, I recognize Mr. Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT JR.: I move this meeting be adjourned.

WARREN BUFFETT: Second?

VOICES: (Inaudible)

WARREN BUFFETT: Motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say “aye.”

VOICES: Aye.

WARREN BUFFETT: Opposed, say “no.” The meeting is adjourned. (Laughter and applause)

You’re a very good group. You know, in that movie they said something about $350,000 an hour, and I see you’re conserving your money here by moving this thing right along. (Laughter)

4. Q&A session begins

WARREN BUFFETT: Now we’re going to answer questions. And if you’ll just go to the nearest microphone, and let’s see where we start here. I’m just orienting myself to a map here. And we have area 1 is right here.

I might describe this ahead of time. We have six areas on the main floor and we have six areas throughout the balcony. And they sort of work their way back one through six, and then seven starts over here, and then it works its way around to 12. And we look forward to having questions, the tougher the better. And if you always would just identify yourself and where you’re from, and that you’re a shareholder.

5. McDonald’s isn’t as “inevitable” as Coca-Cola and Gillette

AUDIENCE MEMBER: Yes, sir. My name is Tom Conrad (PH) and I’m from McLean, Virginia. And I’m a shareholder.

And I asked a question last year, Mr. Buffett, to you. I was struck with what you said, that it takes only three quality companies to be — to invest in to be set for a lifetime. And I asked you the question last year, “Should I wait until the market goes down, or should I get in now?”

And you advised to get in now, and the three companies that I chose were Coca-Cola, Gillette and Disney. And because of that advice I was able to afford the ticket to come back this year — (laughter) — to ask you a second question. (Buffett laughs)

And my question is this. I’m thinking of —

WARREN BUFFETT: You ought to quit while you’re ahead, but go ahead. (Laughter)

AUDIENCE MEMBER: I’m thinking of expanding to a fourth company. The fourth company that I’m thinking of is McDonald’s. And —

WARREN BUFFETT: I see.

AUDIENCE MEMBER: — I just wanted to ask you if you feel that McDonald's has the same ability to dominate the way Coca-Cola and Gillette has.

And secondly, do you feel that if the answer is yes, that I should wait until the price comes down a bit, or get in now? And that's my question.

WARREN BUFFETT: Would you it to the eighth of a point, or shall we round off? (Laughter)

In the annual report, we talked about Coca-Cola and Gillette in terms of their base business being what I call "The Inevitables." But that related, obviously, to the soft drink business in the case of Coca-Cola and the shaving products with Gillette. It doesn't extend to necessarily everything they do. But fortunately in both those companies those are very important products.

I would say that in the food business, you would never get the total certainty of dominance that you would get in products like Coca-Cola and Gillette. People move around in the food business, from where they eat, from — they may favor McDonald's but they will go to different places at different times. And somebody starts shaving with a Gillette Sensor Plus is very unlikely to go elsewhere, in my view.

So they do not — you just — you never would get in the food business, in my judgment, quite the inevitability that you would get in the soft drink business with a Coca-Cola.

You'll never get it again in the soft drink business. I mean, it took a hundred — I guess it'd be 1886, so it'd be about 111 years to get to the point where they are. And the infrastructure's incredible, and — so I wouldn't put it quite in the same class, in terms of inevitability.

That doesn't mean — it can be a better stock investment, depending on the price. But you're not going to get the price from me, and knowing Charlie I doubt if you'll get the price from him. But we'll give him a chance. (Laughs)

(Laughter)

He's breathing, folks. He's breathing. (Laughter and applause)

CHARLIE MUNGER: We've got this down to a routine. (Laughter)

No, I have nothing to add, Warren.

WARREN BUFFETT: OK. (Laughter)

I didn't have anything to say, either. I just took longer. (Laughter)

6. You can pay too much even if a business is "wonderful"

WARREN BUFFETT: How about area 2?

AUDIENCE MEMBER: Mr. Buffett, my name is Pete Banner (PH) and I'm from Boulder, Colorado, and I'm a shareholder.

Recently [Federal Reserve Chairman] Mr. [Alan] Greenspan made his comments about exuberance. And it wasn't long thereafter that you came out in the annual report and made your comments that you felt the market was fully valued or something of that nature.

Did you have, or have you had, any communication with Mr. Greenspan regarding the valuation of the stock market?

WARREN BUFFETT: No, the answer to that is no. The last time I — well, I can't remember precisely when the last time I saw Alan Greenspan was. It was a long time ago.

We had one conversation the day of the Salomon crisis, and he was formerly on the board of Cap Cities before he took his job with the Fed — Cap Cities/ABC — so I knew him then, but —

You know, it's very hard to understand what Alan says sometimes, so there's not much sense talking to him, I mean — (Laughter)

He's very careful about what he says.

But I should — I'm glad you brought up the subject of the annual report. Because what I was doing in the annual report is I had talked about Coke and Gillette as being "The Inevitables," and what wonderful businesses they were.

And I thought it appropriate, particularly — the report goes to a lot of people — that they would not take that as an unqualified buy recommendation about the companies, because they're absolutely wonderful companies run by outstanding managers.

But you can pay too much, at least in the short run, for businesses like that. So I thought it was only appropriate to point out that no matter how wonderful a business it is, that there always is a risk that you will pay a price where it will take a few years for the business to catch up with the stock. That the stock can get ahead of the business.

And I don't know where that point is with those companies or any other companies, but I did say that I thought that the risks were fairly high that that situation existed with most securities in the market, including companies such as "The Inevitables."

But it was designed to be sure that people did not take the remarks that I made about those companies, and just take that as an unqualified buy recommendation regardless of price.

We have no intention of selling those two stocks. We wouldn't sell them if they were selling at prices considerably higher than they are now.

But I didn't want — particularly — relatively unsophisticated people to see those names there and then think, "This guy is touting these as a wonderful buy." Generally speaking, I think if you're sure enough about a business being wonderful, it's more important to be certain about the business being a wonderful business than it is to be certain that the price is not 10 percent too high or 5 percent too high or something of the sort.

And that's a philosophy that I came slowly to. I originally was incredibly price conscious. We used to have prayer meetings before we would raise our bid an eighth, you know, around the office. (Laughter)

But that was a mistake. And in some cases, a huge mistake. I mean, we've missed things because of that.

And so what I said in the report was not a market prediction in any sense. We never try to predict the stock market.

We do try to price securities. We try to price businesses, is what we try to do. And we find it hard to find wonderful, good, average, substandard businesses that look to us like they're cheap now. But, you know, you don't always get a chance to buy things cheap.

Charlie?

CHARLIE MUNGER: Well, I certainly agree with that. (Laughter)

The one thing we can confidently guarantee is that real inflation-adjusted returns from investing in a standard collection of stocks will be lower in the long-term future than they've been in the last 15 years or so. This has been an unprecedented period, and there will be some regression toward the mean in average returns from investing in the stock market.

WARREN BUFFETT: American business has done extraordinarily well in the last decade-plus. And that's a huge plus for securities, because they just represent pieces of those businesses.

Interest rates over the last 15 years have fallen. That's a big plus for stocks. Anytime interest rates go down, the value of every financial asset goes up, in rational calculation.

Both of those factors have combined in recent years to produce conditions that enhance the true value of American business. But those are pretty widely recognized now, and after a while — Ben Graham always used to say you can get in more trouble in investment with a good premise than with a bad premise, because the bad premise will shout out to you immediately as being fallacious, whereas with a good premise it'll work for awhile.

You know, businesses are worth more money if interest rates fall and stocks rise. But then eventually the market action of the securities themselves creates its own rationale for a whole — for a large crop of buyers, and people forget about the reasons and the mathematical limitations that were implied in what they — in what got them excited in the first place. And after a while, rising prices themselves alone will keep people excited and cause more people to enter the game.

And therefore the good premise, after a while, is forgotten except for the fact that it produced these rising prices. And the prices themselves take over.

He wrote about that and the connection with the 1920s when Edgar Lawrence Smith in 1924 wrote a fine book on why stocks were better than bonds. And that was sort of the Bible of the bull market of the ’20s, and it made sense, if you paid attention to a couple of the caveats which were in Edgar Lawrence Smith’s little book, which related to price.

But people tend to forget about the importance of the price they pay as the experience of a bull market just sort of dulls the senses generally.

7. Berkshire discourages “street name” registrations of its stock

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Mr. Buffett, my name is Lola Wells (PH) and I come from Florida.

I’m a very minimum stockholder. And I’m curious why stockholders whose stock is held in street name aren’t eligible to make recommendations for your donations.

WARREN BUFFETT: The distinction really isn’t whether their stock is held in street — well, that’s one distinction. The Class B shareholders, as was pointed out in the prospectus originally for the B shares, do not participate in the program. The A shares that are held by the beneficial owner do participate.

We obtained a tax ruling — 1981 or thereabouts — that made sure that the — there would be no taxation as a constructive dividend of the amount that shareholders could designate. There always was that possibility that the IRS would take a position that by allowing shareholders to designate a contribution to a charity, that we were giving them something which first would be taxed as a dividend, and then they would later give away.

So we have a tax ruling, and that tax ruling applies to shares held by beneficial owners, or by record holders themselves. And we followed that ruling subsequently.

I might say it would be sort of a nightmare too, frankly, if we got into street name holders. We’re at the point now where we probably have 30 or 35,000 street name holders of the A, and with the B it's probably 60,000 or some number like that. And it would be quite a nightmare to do.

And anyone, you know, unless they have margin debt against their stock, they can put it in their own name and we encourage people to do it.

One reason we encourage people to do it is that they'll get their shareholder communications more promptly, too. We find that it's quite erratic — that the distribution of reports is quite erratic — when handled through brokerage houses to street name holders.

So we really do encourage you to have your stock registered in your own name. You'll get the communications promptly, and if you get the A shares you'll be able to participate in the contributions program.

And don't minimize your holdings, incidentally. Between the two of us we control the company, so I'm glad to have you here. (Laughter)

Charlie?

CHARLIE MUNGER: There's no ideological bias against the small shareholder. It's just not technically feasible to do it as a matter of administration.

WARREN BUFFETT: I should point out that the entire shareholder-designated contributions program, really, all of the work in relation to this meeting, I mean, and Ak-Sar-Ben has been terrific. They've helped out enormously.

But in terms of sending out 11,000-plus tickets to the meeting, the baseball tickets, the planning that goes into it and everything, it's all done by the people at Berkshire, basically. They pitch in to do all kinds of work.

So when you look at that 3,000-plus square foot office — we get help from an internal auditor who works — does not work — in the office.

But very few people just do all of their regular jobs, and then they do this on top of it. And they never thought they were getting into this. (Applause)

Thank you.

We could have a department of 50 people, you know, assigned to something like this. But, the same way — you know, we get thousands and thousands of requests for annual reports, and they all come in, and we've got just a few people, and they handle it with courtesy and cheerfulness and I really tip my hat to them.

8. Why Buffett hasn't written a book

WARREN BUFFETT: Now, let's go to Zone Four please.

AUDIENCE MEMBER: Good morning. I'm Marshall Patton (PH) from Bandera, Texas.

And first I'd like to thank you very much for not only giving us a good investment vehicle, but giving us a good education along the way. And thanks a lot for the two-volume set of the letters to stockholders over the years. It's required reading around our place.

And if you can contain your hostility, I'd like to thank Charlie Munger for — (Buffett laughs) — the copy of his speech to the University of Southern California Business School students back in 1994. It's also required reading.

And I want to ask you, when are you going to write your book?

WARREN BUFFETT: (Laughs) Well, first of all I'd like to comment on Charlie's talk here.

I think every investor in the world ought to read that talk before they invest. I think that's a classic. And we have copies available for — we mailed it out a year or so ago to the shareholders at that time. But anybody'd like a copy of that talk I'd be glad to supply it.

There doesn't seem to be any need for me to write a book. Everybody else is doing it. (Laughter)

We've got Janet Lowe here who just wrote the most recent one.

You know, at one time or another I said everything I know and a good bit more. So I've never felt compelled to do it. I really feel that the annual reports are sort of a book on the installment system.

Plus I think very few people write two books, and I have this kind of unwarranted optimism, I guess, that the best is always yet to come and there are a lot more interesting things that are going to happen, and I would hate to preclude commenting on those. So I think it's going to be a few years. But I may get around to it at some point.

But I think maybe it'd be a bad sign if it happened, because it might be that I really thought that what I was writing about was more important than what was going to happen next.

Charlie, are you going to write a book?

CHARLIE MUNGER: No, but your comment about why you are unable to write a book reminds me of the Middle Western fellow who left an unfinished manuscript. And he apologized for not finishing his book, which was entitled Famous Middle Western Sons Of Bitches. (Laughter)

And he said he was always meeting a new one — (laughter) — and therefore he could never finish the book. (Laughter and applause)

WARREN BUFFETT: As a courtesy, Charlie and I are leaving each other out of the book that we write. (Laughter)

Charlie was — Charlie grew up in Nebraska, and he's authentic. He has the credentials to prove it. We worked in the same grocery store at different times many years ago.

9. "Realistic" expectations

WARREN BUFFETT: Area 5, please.

AUDIENCE MEMBER: Mr. Buffett, my name is J.P. from Singapore. I flew 24 hours to get here.

Mr. Buffett, throughout your life you have repeatedly under promised and over delivered. For many recent years, for example, you've targeted Berkshire Hathaway's long-term book value growth at 15 percent. Yet you have come through at about 24 percent. That is a big gap of 9 percent between your modesty and the outcome. Perhaps the biggest dose of modesty in corporate history.

May I ask, why is there such a big gap between your modesty and the outcome? (Laughter)

WARREN BUFFETT: I don't think it was modesty. I think it was —

For one thing, we've had a terrific market that has reappraised all businesses in the last ten or 15 years. So when we really started worrying about future performance, the key factor was having larger amounts of capital. And there's no question that the larger the amount of capital you work with, the more difficult the job is.

Now, we were fortunate that that ascension in capital happened to coincide with things that just lifted all the boats substantially. And so we've had better luck than I would have guessed we would have had ten years ago, or five years ago.

But it's been aided by a huge tailwind. And absent that tailwind we would not have done as well. I think maybe we would have done relatively as well, but we would not have done as well in absolute terms.

And we won't have that tailwind in the future, I can assure you of that. But we will have a larger amount of capital, which is the anchor that works on it.

So, if Charlie and I could make a deal to increase the intrinsic value of Berkshire at 15 percent a year over the next ten years, we would sign up now. And I don't want you to even tempt us with lower numbers, because those numbers get astounding.

If we paid no dividend at all over a ten-year period, you can figure out where a 15 percent rate would take us. And we hope to get there, but we think that is absolutely the tops.

And I think it's very likely for a period when the market starts underperforming businesses, that the rate could be very substantially lower than that.

Charlie, do you want to expand on that?

CHARLIE MUNGER: Well, the questioner came from Singapore, which has perhaps the best economic record in the history of developing an economy. And therefore he referred to 15 percent per annum as modest. It's not modest, it's arrogant. (Laughter)

Only somebody from Singapore would call it modest. (Laughter)

WARREN BUFFETT: Yeah. Yeah. Be careful, Charlie, or they'll have a voice vote that we should move to Singapore, I mean —

This is the group that wants performance.

Large quantities of money are not going to compound at super rates — at super compound rates. Small sums probably aren't either, but large sums aren't.

And if anybody that manages large sums of money that promises or implies that they can achieve really outstanding returns, you know, I'd stay away from them.

The numbers just get too big. And you know, you've seen some of that with certain money management organizations in recent years. And you know, 15 percent on an intrinsic value which is substantially greater than our book value gets to be a very, very big number.

And we need huge ideas. We don't need thousands of ideas. I mean, we might need them, but we could never come up with them. So what we look for is the very large idea.

But we're not finding them now. And we'll keep looking, and every now and then we will find something.

But really, if you think we're going to have any chance of doing better than 15 percent, and believe me, that is no number that I'd want to sign my name to, but you really shouldn't — you're going to be disappointed in Berkshire. And we don't want to disappoint you, so that's the reason we try to be realistic about expectations.

10. Pre-Buffett Berkshire shareholders

WARREN BUFFETT: Zone 6?

AUDIENCE MEMBER: My name is Darrell Patrick (PH) from Dayton, Ohio.

How many shareholders do you have that have owned Berkshire longer than you and Charlie? And have you ever gotten together with them?

WARREN BUFFETT: How many shareholders have had it longer than we have? Well, we started buying in 1962. And it was seven and — I think the first ticket was at 7 5/8ths or thereabouts.

It was 2,000 shares. I've got the trading card on the wall, and I paid a dime commission. I can't believe I was paying a dime commission in those days. We pay a nickel now, on much higher-priced stocks. (Laughter)

It's a good thing I didn't have a fistfight with a broker about whether to pay it or not. I might have not had those 2,000 shares.

We have as a director, Kim Chace, and his family's holdings in Berkshire go back to, what? Kim, where are you down here? There we are. What year would you —?

MALCOLM CHACE: The '20s.

WARREN BUFFETT: The '20s, yeah. The Chace family has been in Berkshire since the '20s.

But I would say — we bought about 70 percent of the — Buffett Partnership, which was a partnership I ran in the '60s — bought about 70 percent of the company. So that means they were 300,000 shares roughly that were not owned by us.

Aside from the Chace family, I'm sure there are people that — I'm sure we've got, you know, 50 or 100 shareholders maybe from that earlier dates that are still around, and I'm glad they are.

Charlie?

CHARLIE MUNGER: Nothing to add.

11. Buffett's jet: "Indefensible" to "Indispensable"

WARREN BUFFETT: Area 7, up in the balcony over here.

AUDIENCE MEMBER: Maurus Spence from Omaha, Nebraska.

In light of recent stock market volatility, could you give us your definition of stock market risk, and how does your definition differ from the standard definition?

Finally, due to Charlie's recent counter-revelation about jets, are you going to rename "The Indefensible?"

WARREN BUFFETT: Charlie would like to make an announcement on that second point. (Laughs)

CHARLIE MUNGER: Prompted by Al Ueltschi, we are changing the name of the company plane from “The Indefensible” to “The Indispensable.” (Laughter and applause)

WARREN BUFFETT: Yeah, it was Chateaubriand, who, incidentally, was a writer and philosopher in addition to being the father of a piece of meat — Chateaubriand wrote one time, I believe I’m correct on my attribution here, that events make more traitors than ideas.

And if you think about that in terms of Charlie’s remark, that the purchase of FlightSafety caused Charlie to have this counter-revelation. It’s an experience that is duplicated many times in life where people flip over very quickly to a new view based on their new circumstances.

Now, what was that first question again? (Laughter)

CHARLIE MUNGER: I might add that I have a friend who’s a United Airlines pilot, and he has recently been promoted into the 747-400. Before he started carrying people like you around for hire, he had to train intensively for five weeks. One-hundred percent of his training was in a simulator. They’re that good. So —

WARREN BUFFETT: They better be that good. They cost us about 19 million.

I mean, but they’re fabulous. I mean, if you think about — I think it’s 85 percent of the problems that you can encounter in a plane, if you attempted to teach people by actually being in a plane, they wouldn’t be here anymore, so there’s —

You want to develop the instincts and responses that can react to 85 percent of the problems, the only place to learn them is in a simulator, and probably the other 15 percent the best place is.

12. “Volatility is a huge plus to the real investor”

WARREN BUFFETT: Now, let’s go back to your first question. Give it to me again.

AUDIENCE MEMBER: The first part was, would you define — give us your definition of stock market risk and how it differs from the standard definition.

WARREN BUFFETT: Yeah. We don’t think in terms of — well, we think first in terms of business risk, you know.

We — the key to [Benjamin] Graham’s approach to investing is not thinking of stocks as stocks or part of a stock market. Stocks are part of a business. People in this room own a piece of a business. If the business does well, they’re going to do all right as long as they don’t pay way too much to join into that business.

So we look at — we're thinking about business risk. Now, business risk can arise in various ways. It can arise from the capital structure when somebody sticks a ton of debt into some business, and so that if there's a hiccup in the business that the lenders foreclose.

It can come about just by the nature of the — certain businesses are just very risky. Back in — when there were more commercial aircraft manufacturers, Charlie and I would think of making a commercial airplane, a big airliner, sort of as a bet-your-company risk because you would shove hundreds and hundreds of millions of dollars out into the pot before you really had customers.

And then if you had a problem with the plane, you know, that company could go. There's certain businesses that inherently — because of long lead times, because of heavy capital investment — that basically have a lot of risk.

And commodity businesses have risk unless you're the low-cost producer, because the low-cost producer can put you out of business.

Our textile business was not the low-cost producer. And we had a fine management, and everybody worked hard. We had cooperative unions, all kinds of things. But we weren't the low-cost producer, so it was a risky business. The guy who could sell it cheaper than we could made it risky for us.

So there's a lot of ways businesses can be risky.

We tend to go into businesses that inherently are low-risk, and are capitalized in a way that that low risk of the business is transformed into a low risk to the enterprise.

The risk beyond that is that even though you buy — identify — such businesses, that you pay too much for them. That risk is usually a risk of time rather than loss of principal, unless you get into a really extravagant situation.

But then the risk becomes the risk of you yourself. I mean, whether you can retain your belief in the real fundamentals of the business and not get too concerned about the stock market.

The stock market is there to serve you, and not to instruct you. And that's a key to owning a good business, and getting rid of the risk that would otherwise exist in the market.

You mentioned volatility. It doesn't make any difference to us whether the volatility of the stock market, you know, is — averages a half a percent a day or a quarter percent a day or 5 percent a day. In fact, we'd make a lot more money if volatility was higher, because it would create more mistakes in the market.

So volatility is a huge plus to the real investor.

Ben Graham used the example of "Mr. Market," which is the — and we've used it. I've copied it in the report. I copy from all the good writers.

And Ben said, "You know, just imagine that when you buy a stock, that you — in effect, you've bought into a business where you have this obliging partner who comes around every day and offers you a price at which you'll either buy or sell. And the price is identical."

And no one ever gets that in a private business, where daily you get a buy-sell offer by a party. But in the stock market you get it. That's a huge advantage. And it's a bigger advantage if this partner of yours is a heavy-drinking manic depressive. (Laughter)

The crazier he is, the more money you're going to make.

So you, as an investor, you love volatility. Not if you're on margin, but if you're an investor you aren't on margin.

And if you're an investor, you love the idea of wild swings because it means more things are going to get mispriced.

Actually, volatility in recent years has dampened from what it used to be. It looks bigger because people think in terms of Dow points and so they see these big numbers about plus 50 or minus 50 or something. But volatility was much higher many years ago than it is now. And you had — the amplitude of the swings was really wild. And that gave you more opportunity.

Charlie?

CHARLIE MUNGER: Well, it got to be the occasion in corporate finance departments of universities where they developed the notion of risk-adjusted returns. And my best advice to all of you would be to totally ignore this development.

Risk had a very good colloquial meaning, meaning a substantial chance that something would go horribly wrong. And the finance professors sort of got volatility mixed up with a lot of foolish mathematics.

To me, it's less rational than what we do, and I don't think we're going to change. (Buffett laughs)

WARREN BUFFETT: Finance departments teach that volatility equals risk. Now, they want to measure risk, and they don't know any other way. They don't know how to do it, basically. And so they say that volatility measures risk.

And, you know, I've often used the example that the Washington Post stock when we first bought it had gone — in 1973 — had gone down almost 50 percent from a valuation of the whole company of close to, say, 180 or 175 million, down to maybe 80 million or 90 million.

And because it happened very fast, the beta of the stock had actually increased and a professor would have told you that the stock — company — was more risky if you bought it for 80 million than if you bought it for 170 million. Which is something that I've thought about ever since they told me that 25 years ago, and I still haven't figured it out. (Laughter)

13. University of Florida will teach Graham-style investing

WARREN BUFFETT: Incidentally, I should make an announcement on that, because I think that I've made a certain amount of fun of financial departments over the years.

A fellow named Mason Hawkins who runs Southeastern Asset Management just gave a million dollar gift to the University of Florida, and the state of Florida is matching that with 750,000.

So this million-seven-fifty is going to be used to have several courses in what essentially is the Graham approach to investing, I think, starting very soon. So that there will be at least — and there are more than this — but there will be a finance department in this case specifically devoted to teaching the Graham approach.

And I think they're even going to pick up on my suggestion that I stuck in the annual report about having a course on how to value a business and what your attitude toward the stock market should be.

So thanks to Mason, who's done very well managing money, I should add.

And there will be at least one university course that tackles what I think are the important questions in investing.

14. Compulsory reinvestment and "owner earnings"

WARREN BUFFETT: Zone 8, please.

AUDIENCE MEMBER: Gentlemen, my name is Richard Sercer from Tucson, Arizona.

WARREN BUFFETT: Let's give him a hand. This is the gentleman that led to the FlightSafety purchase. (Applause)

AUDIENCE MEMBER: My question relates to owner earnings. What guidance can you give us as to the calculation of item (c), which is maintenance capital spending and working capital requirements?

WARREN BUFFETT: Item (c)? Richard, I was going to ask you a question. How about another company? (Laughter)

Richard and his wife Alma have attended, what, maybe eight or so meetings, and what he did is covered in the annual report. But if it had not been for Richard we would not have merged with FlightSafety. And for that we owe him a lot of thanks.

Now, the item (c), I don't remember item (c).

CHARLIE MUNGER: He's talking about maintenance expenditures and working capital —

WARREN BUFFETT: Yeah, I know.

CHARLIE MUNGER: — and so forth. The compulsory reinvestment.

WARREN BUFFETT: Oh, oh, back on the — goes back some years on that description. Yeah.

In the case of the businesses that we're in, both wholly owned and major investee companies, we regard the reported earnings — with the exception of the — some major purchase accounting adjustment, which will usually be an amortization of intangibles item — we regard the reported earnings — actually the reported earnings plus — plus or minus, but usually plus — purchase accounting adjustments, to be a pretty good representation of the real earnings of the business.

Now you can make the argument that when Coca-Cola's spending a ton of money each year in marketing and advertising that they're expensing, that really a portion of that's creating an asset just as if they were building a factory, because it is creating more value for the company in the future, in addition to doing something for them in the present. And I wouldn't argue with that.

But of course, that was true in the past, too. And if you'd capitalized those expenditures in those earlier years, you'd be amortizing the cost of them at the present time.

I think with a relatively low inflation situation, with the kind of businesses we own, I think that reported earnings plus amortization of any — well, it's really amortization of intangibles. Other purchase accounting adjustments usually aren't that important. I would say that they give a good representation to us of owner earnings.

Can you think of any exceptions in our businesses particularly, Charlie?

CHARLIE MUNGER: No. We have — after some unpleasant early experience, we have tried to avoid places where there was a lot of compulsory reinvestment just in order to stand still.

But there are businesses out there that are still like that. It's just that we don't have any.

WARREN BUFFETT: Yeah. I would say that in the case of GEICO, for example, the earnings — the gain in intrinsic value — will be substantially greater than represented by the annual earnings.

Whether you want to call that extra amount owner earnings or not is another question. But as we build float from that business, as long as it's represented by the same kind of policyholders that we've had in the past, there is an added element to the gain in intrinsic value that goes well beyond the reported earnings for the year.

But whether you want to really think of that as earnings, or whether you just want to think of that as an increment to intrinsic value, you know, I sort of leave to you.

But I would say that there's no question that in our insurance business, where our float was $20 million or so when we went into it in 1967, and where it is now, that there have been earnings, in effect, through the buildup of the float that have been above and beyond the reported earnings that we've given to you.

I think our look-through earnings are — they're very rough. And we don't try to — we don't believe in carrying things out to four decimal places where, you know, we really don't know what the first digit is very well.

So, I don't want — I never want you to think of them as too precise, but I think they give a good rough indication of the actual earnings that are taking place, attributable to our situation every year.

And I think the pace at which they move gives you a good idea as to the progress, or the lack of progress, that we've made. The only big adjustment I would make in those is in the super-cat insurance business, we're going to have a really bad year occasionally. And you probably should take something off all of the good years, and you probably should not regard — when the bad year comes — you should not regard that as something to be projected into the future.

Charlie?

CHARLIE MUNGER: No more.

WARREN BUFFETT: No more.

15. Ratings after Walt Disney's purchase of ABC

WARREN BUFFETT: Zone 9, please.

AUDIENCE MEMBER: Mr. Buffett, I'm Rick Fulton from Omaha. Really.

Recently I was in Washington, D.C. on — with my wife on a business trip, and I wanted to tell Mrs. Graham, I know she's here, what a pleasure it is to get up in the morning to a good newspaper like the Washington Post.

Also, I have a question about CapCities and now Disney.

And is Mr. Murphy keeping busy now that ABC's owned by Disney? (Buffett laughs)

Also, every week you read in the paper the Nielsen ratings. And does it matter that ABC now, it seems that less people recently are watching? Does it matter to Disney's bottom line? Thank you.

WARREN BUFFETT: Well, the first question about Mr. Murphy is that if we could hire Mr. Murphy we would. I mean, there is no one in this world that is a better manager than Tom Murphy, or a better human being as far as that's concerned, so —

He — I think he's keeping pretty busy. He has been responsible for NYU Hospital. He wouldn't say that, but he's been the chairman of it for some years, and that's a $800 million a year or thereabouts organization. Charlie runs a hospital, so he knows how busy it can keep you.

And he — but I would say this, that I would love to find a business that I could entice Murph to come back and run. Because they don't get any better than he is.

And Charlie, you want to add anything on Murph, or?

CHARLIE MUNGER: Well, I'd like to because you're absolutely right. (Laughter)

WARREN BUFFETT: And what was the other part of the question?

AUDIENCE MEMBER: Sir, does recent — the decline in ABC's Nielsen ratings —

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: — have anything to do with the bottom line?

WARREN BUFFETT: Are we talking (inaudible) —

AUDIENCE MEMBER: — (inaudible) Forrest Gump last night? (Laughter)

WARREN BUFFETT: Yeah, it makes a difference, sure. Ratings translate in many cases into, not — depends on daypart, depends on a whole bunch of things. But overall, you make more money if your ratings are good in news, if they're good in early morning, if they're good in daytime, if they're good at late evening, whatever. I mean, ratings translate into money.

They may not translate immediately, particularly if they have some big hit show you may have sold it out too cheap. But over time the prices you receive for your product relate to ratings.

And over time, but over a longer period of time, the price that you pay for the product also relates to the ratings. But there's a difference in the time cycle. So that it makes a difference to any network's bottom line what their ratings level is.

Disney is conscious of that, and they are very able operators, and I predict you'll see in a couple of years. But you can't it immediately. The schedule fixes don't work on a, you know, week to week basis because people have habits, and there's a time lag involved in any change.

And you've seen — over the last 20 years — you've seen various networks on top or on the bottom from time to time. So it moves around. It moves around a fair amount.

Charlie?

CHARLIE MUNGER: Yeah, I think the TV network business is intrinsically a pretty tough business.

And Disney did way better on ESPN than they might have forecast, and they probably did a little worse on the network. These things happen.

WARREN BUFFETT: That was, incidentally, the situation when CapCities bought ABC. In 1985, we made the deal, I think, and it closed — I think it closed the first day or two of '86. I may be wrong on that.

But the network diminished — the ratings — diminished significantly, and particularly in daytime. We'd always thought daytime was almost a certainty to produce big earnings, and it had.

Primetime is what people pay the most attention to, but daytime slipped significantly after we bought it. It has no relationship to those movies — I mean, to a movie you saw earlier — when I started appearing on it. Don't want anybody to make that connection, but it did happen to be at the same time.

The kicker we got, again, was ESPN. ESPN was losing money when CapCities made the deal to buy ABC, and we never really regarded it as being that — having that big a potential.

And you know, it has been huge. It was enormously better for us than we ever anticipated.

Leonard Goldenson, who ran ABC, told us it was going to be that good. But, of course, we were too smart to pay any attention to him. And I think Disney has been pleasantly surprised by how well ESPN has done, too. It's a powerhouse.

16. Creation of Class B shares similar to a stock split

WARREN BUFFETT: Zone 10, please.

AUDIENCE MEMBER: My name is Bill Turan (PH). I'm from Des Moines, Iowa, and I'm a stockholder.

It would appear that there's going to be a capital gains tax cut. If it does materialize, would you consider a stock split? (Buffett laughs)

Secondly, is there an extra copy of your annual report available on the premises?

WARREN BUFFETT: My guess is we'll get you an annual report. In fact, if someone could take it up to zone 10, we'll be glad to get it to you.

I don't think — well, I'll put it this way. If they cut the capital gains tax to zero, we'll maybe — (Laughter)

I don't think I'd get Charlie's vote though, anyway. No, we will not be splitting Berkshire stock. (Applause)

Incidentally, we do not consider splitting the stock a pro-shareholder move. If we did, we'd do it.

We think that net, to take the entire experience, it's worked out well for shareholders, and we think we have a more investor-oriented — or investment-oriented — audience in this room today than we would have had if we'd split many times.

It is a way of enticing certain types of investors, and perhaps discouraging others. And so it's worked well.

But I will say this, too. We got pushed into, in effect, issuing the Class B shares last year. Wasn't our — wouldn't have been something we would have done, except for the possible formation of the unit trust. And I would say that's worked out very well from our standpoint. So we're happy that it happened, and we're happy that the Class B shareholders have joined us. And we now have something that's denominated, you know, at a much lower level.

And there have been no bad effects whatsoever from having the Class B out there. So anybody owns the A stock and wants to split, you can split 30-for-1 this afternoon. I mean, how many other companies give you that chance?

Charlie?

CHARLIE MUNGER: I think what he's trying to tell you is that you've had your stock split. (Laughter)

17. We don't know how to value Intel and Microsoft

WARREN BUFFETT: Zone 11, please.

AUDIENCE MEMBER: Yes, Mr. Buffett, I would like to thank you again for issuing the Class B shares.

WARREN BUFFETT: (Laughs) Well, I'm glad we did, and I hope you own them.

AUDIENCE MEMBER: I am a class B shareholder.

I need your comment on some analysis that we did. If someone uses your investment philosophy of building a highly concentrated portfolio of six to eight stocks, and adopts your buy-and-holding principle so that the max of compounding and no tax works for you, but however, with one major modification: invest in high-octane companies like Intel and Microsoft that are growing at 30 percent, instead of typical 15 percent growth company in your portfolio.

My question is, will this investment philosophy will translate into twice the shareholder return as you have historically provided to your shareholders?

WARREN BUFFETT: Yeah. Well, it will certainly work out to twice the return if Intel and Microsoft do twice as well as Coke and Gillette. I mean, it's a question of being able to identify businesses that you understand and feel very certain about.

And if you understand those businesses, and many people do, but Charlie and I don't, you have the opportunity to evaluate them. And if you decide they're fairly priced and they have marvelous prospects, you're going to do very well.

But there's a whole group of companies, a very large group of companies, that Charlie and I just don't know how to value. And that doesn't bother us. I mean, you know, we don't know what — we don't know how to figure out what cocoa beans are going to do, or the Russian ruble, or I mean, there's all kinds of financial instruments that we just don't feel we have the knowledge to evaluate.

And really, you know, it might be a little too much to expect that somebody would understand every business in the world.

And we find some that are much harder for us to understand. And when I say understand, my idea of understanding a business is that you've got a pretty good idea where it's going to be in ten years. And I just can't get that conviction with a lot of businesses, whereas I can get it with relatively few. But I only need a few. As you've pointed out, you only need a few, six or eight or something like that.

It would be better for you — it certainly would have been better for you — if we had the insights about what we regard as the somewhat more complicated businesses you describe, because there was and may still be a chance to make a whole lot more money if those growth rates that you describe are maintained.

But I don't think they're — I don't think you'll find better managers than Andy Grove at Intel and Bill Gates at Microsoft. And they certainly seem to have fantastic positions in the businesses they're in.

But I don't know enough about those businesses to be as sure that those positions are fantastic as I am about being sure that Gillette and Coca-Cola's businesses are fantastic.

You may understand those businesses better than you understand Coke and Gillette because of your background or just the way your mind is wired. But I don't, and therefore I have to stick with what I really think I can understand. And if there's more money to be made elsewhere, I think the people that make it are entitled to it.

Charlie?

CHARLIE MUNGER: Well, if you take a business like Intel, there are limitations under the laws of physics which eventually stop your putting more transistors on a single chip. And the 30 percent per annum, or something like that, you — I don't think — those limitations are still a good distance away, but they're not any infinite distance away.

That means that Intel has to leverage its current leadership into new activities, just as IBM leveraged the Hollerith machine into the computer. Predicting whether somebody's going to be able to do that in advance is just — it's too tough for us.

WARREN BUFFETT: Bob Noyce —

CHARLIE MUNGER: We could (inaudible) to you.

WARREN BUFFETT: Bob Noyce, one of the two founders of — two primary founders — of Intel, grew up in Grinnell, Iowa. I think he's the son of a minister in Grinnell, and went through Grinnell College and was chairman of the board of trustees of Grinnell when I went on the board of Grinnell back in the late '60s.

And when he left Fairchild to form Intel with Gordon Moore, Grinnell bought 10 percent of the private placement that funded — was the initial funding for Intel.

And Bob was a terrific guy. He was very easy to talk to, just as Bill Gates is. I mean, these fellows explained the businesses to me, and they're great teachers but I'm a lousy student. And they — I mean, they really do. They're very good at explaining their businesses.

Bob was a very down to earth Iowa boy who could tell you the risks and tell you the upside, and enormously likeable, a hundred percent honest, every way.

So we did buy 10 percent of the original issue. The genius that ran the investment committee and managed to sell those a few years later, I won't give you his name. (Laughter)

And there's no prize for anybody that calculates the value of those shares now.

Incidentally, one of the things Bob was very keen on originally, in fact he was probably the keenest on it, was he had some watch that Intel was making. And it was a fabulous watch, according to Bob.

It just had one problem. We sent a guy out from Grinnell who was going out to the West Coast to where Intel was. And Bob gave him one of these watches. And when he got back to Grinnell he wrote up a report about this little investment we had, and he said, "These watches are marvelous." He said, "Without touching anything, they managed to adapt to the time zones as they change as we went along." In other words, they were running very fast, as it turned out. (Laughter)

And they worked with that watch for about five or six years, and they fell on their face.

And as you know, you know, they had a total transformation in the mid-'80s when the product on which they relied also ran out of gas. So, it's not —

And Andy Grove has written a terrific book, incidentally, "Only the Paranoid Survive," which describes strategic inflection points. I recommend that every one of you read that book, because it is a terrific book.

But they had an Andy Grove there who made that transformation, along with some other people. But that doesn't happen every time. Companies get left behind.

We don't want to be in businesses where companies — where we feel companies can be left behind. And that means that, you know — and Intel could have, and almost did, go off the tracks. IBM owned a big piece of Intel, as you know, and they sold it in the mid-'80s.

So, you know, here are a bunch of people that should know a lot about that business but they couldn't see the future either.

I think it's very tough to make money that way, but I think some people can make a lot of money understanding those kinds of businesses. I mean, there are people with the insights.

Walter Scott, one of our directors, has done terrifically with a business that started, you know, just a gleam in the eye maybe ten or 12 years ago here in Omaha, and it turned into a huge business.

And you know, Walter explained that to me on the way down to football games, but bad student again, so — (Laughs)

Walter — if Walter could have connected, and you know, I'd cheer from the stands. But that doesn't bother me at all. I mean, what would bother me is if I think I understand a business and I don't. That would bother me.

Charlie?

CHARLIE MUNGER: Well, having flunked when we were young and strong at understanding some complex businesses, we're not looking to master what we earlier failed at — (laughs) — in our latter years. (Laughter)

WARREN BUFFETT: Zone 12? This may turn out like a revival meeting where we all confess our sins and come forward (inaudible). (Laughter)

18. Confident about Salomon but not rest of Wall St.

AUDIENCE MEMBER: Good morning, gentlemen. My name is Cary Blecker (PH) from Wellington, Florida.

I know in 1987 when you purchased — or invested — in the Salomon Brothers convertible preferred stock, you had the eight-year time frame to convert it into common or take the cash out. I know in '95 you took cash out, which was not a vote of confidence for Salomon Brothers. Any feelings on that in the future?

WARREN BUFFETT: Yeah. We — as the gentleman mentioned, we bought it in 1987, and starting in 1995 we have a — we have, every year for five years, we either have to take cash or convert to common, 20 percent of the original issue of 700 million.

We don't have to make those decisions ahead of time. So we, in 1995, we elected to take cash. In 1996 we elected to take stock.

And you know, we see no reason ever to swing at the ball while it's still in the pitcher's glove. We'd just as soon wait till it gets to the plate to make the decision. So the ball will get to the plate on October 31st of 1997, I believe, for the next 20 percent. And we'll decide whether to swing at that point. But we don't need to make that decision today.

I would say that, you know, the odds are overwhelming that we'll convert, but we'll wait until that time to make the final decision.

We have terrific confidence in the people that run Salomon. They helped us through some incredibly dark days in the past, and showed the stuff of which they were made. And so we feel very good about that.

We don't have the same degree of conviction about the profitability of the investment banking or brokerage business as a whole.

It’s not the sort of — you don’t develop that kind of conviction about that business versus a Coca-Cola or something. They’re different. They have different economic characteristics.

So we will see how the businesses — the industry — evolves. But we feel very good about the management, and the odds are extremely high that we will convert. But we will swing at the ball when it gets to the plate.

Charlie?

CHARLIE MUNGER: No more.

WARREN BUFFETT: OK.

19. Can’t exchange stocks without paying taxes

WARREN BUFFETT: Let’s see. We did 12. We’re back at 1 again.

AUDIENCE MEMBER: My name is Ted Vokali (PH) from Corpus Christi, Texas. And I would like to ask a question to you.

Companies are purchased from time to time, and the purchasing company will give shares instead of cash, and their shareholder will receive new shares.

Can an individual investor transfer non-Berkshire to Berkshire with or without going through a broker? And if not, how does Berkshire do this with another company? And if possible, I would like to also receive a copy of the annual report.

WARREN BUFFETT: OK, we’ll get you a copy of the annual report.

The only way I know of — and maybe Charlie knows some other way — the only way you can switch your shares in one company for — into shares of another company is to have a tax-free merger. And the Internal Revenue Code has specifications about that.

You can have a transaction, as we had with FlightSafety where a portion is — of the shareholders — can take cash, and a portion can take stock, and it’s still tax-free for the people who elect stock.

You can’t have too many people take cash and have that happen. There are a lot of technical rules about what’s tax-free.

But there’s no way that you can own General Motors and transfer it into General Electric stock without a tax and a broker. Well, you don’t have to have a broker. If your neighbor happens to own it you could make a deal privately. But the easiest way usually is through a broker.

But there's no way you can do it without tax, unless General Motors and General Electric decide to merge at some point.

So the opportunities to switch from one security to another without tax are really limited to merger.

And in terms of brokerage costs, it just happens to be that it's — that the most economical way of finding the person in the world that wants to both buy the stock you want to sell and sell you the stock you want to buy is through an intermediary — a broker. And the costs of that actually can be relatively low.

Charlie?

CHARLIE MUNGER: Well, I think there's one way still permitted by the tax laws. You can still form a partnership. If you own General Electric and I own General Motors and we each feel too concentrated, well, you could form a partnership and each put in your stock. And in essence you would each thereafter be invested half and half with some diversification. I will predict that Wall Street will eventually get around to promoting such partnerships.

WARREN BUFFETT: Yeah, well, they did through swap funds, you know, since 25 years ago. And then — that was where you put in your highly — your stock that had an enormous amount of unrealized appreciation in it, and a whole bunch of other people did, and then you owned a fund which itself had a lot of unrealized appreciation in it. And you had —

CHARLIE MUNGER: Plus a new layer of costs.

WARREN BUFFETT: Yeah, plus a new layer of costs, always.

And you owned a piece of this larger fund, and you owned a piece of everything else — everything that the other people wanted to get rid of, and they owned a piece of what you wanted to get rid of, and superimposed with some costs.

But that vehicle was sort of stopped in its tracks, I think, in the mid-'70s by an amendment to the Internal Revenue Code.

But as Charlie said, you could replicate the effect of a swap fund by doing it with a partnership. It'd be kind of awkward, but it can be done.

20. Strong businesses, but no "master plan"

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Gentlemen, I'm Marc Rabinov from Australia. I am a shareholder.

I had a question really related to our own businesses, and how they're going, and where you're looking to be in ten years' time.

Perhaps I could start with the insurance float. It's grown at 20 percent. Do you think that 20 percent growth rate will continue for the next ten years?

Do you think our stable businesses, which have been growing at, say, 5 or 7 percent will maintain that rate?

And do you think FlightSafety, which from the SEC filings has been growing at about 5 percent, do you think that'll continue at that rate?

WARREN BUFFETT: Well, we're glad to have you from Australia. I think we've got about 15 people here from Australia, so it — got a good representation.

I don't think the insurance float can grow at 20 percent a year. That's been helped by some acquisitions and things. I mean, it's done way better, obviously, than we ever thought it would 30, almost 30 years ago when we made the deal with Jack Ringwalt.

I would say, though, that I think GEICO is going to do even better than we expected when we bought it. And we thought it was going to do awfully well then.

In Tony Nicely, you know, we have an absolutely outstanding manager of that business. And he is focused on it. He knows it. I think he went to work there when he was 18. And he's been there 35 years or thereabouts. They don't come any better. And he is absolutely zeroed in on the things that he should be zeroed in on, and he's — the implementation gets better all the time.

I mentioned in the annual report that the unit growth of GEICO's voluntary auto business — and we talk about voluntary because you get assigned risk-type things that lose you money, but the real business is the voluntary auto business — grew at 10 percent last year, which was the best growth rate in over two decades.

First four months of this year, it's growing at about 16 percent. And 16 percent unit growth translates into about 20 percent a year premium growth.

So GEICO at present would give you some encouragement for at least that segment of the insurance float growing at a rate that's sort of comparable to the past.

Insurance is going to be a very big business for us. And the float will grow, in my view, at a good rate. But I wouldn't want to predict that good a rate.

Most of our other businesses, very good businesses. They don't have 20 percent a year growth possibilities in them. They throw off lots of cash, which we can use to buy other things, which may turn out to be a better strategy than even having a single high-growth business.

FlightSafety, about six weeks ago or thereabouts, announced a major hookup in a joint venture with Boeing, as you may have noticed. And they're a terrific partner, and it'll be a great partnership.

That's just for our — the training for our — for larger planes, primarily, I think, hundred-seat and up planes, although I think there may be a few Fokkers in there that are slightly smaller planes. But it's basically the big commercial planes.

And the combination of FlightSafety and Boeing worldwide in training over the coming decades, I think, will be a very powerful combination. So we've got some very good businesses.

And I don't see that movie that's presented before — I sit out here like you and watch it. But I like the ending of it.

And the people we have out there, they've run businesses extremely well in the past. They get better results out of those businesses, frankly, than other people would, or that other people in the industry generally do. So I think they have good futures.

But they will throw off lots of cash in aggregate. And the tough job — we like to tell people it's the tough job anyway — is that Charlie and I have to figure out where to put that cash to maintain higher — reasonable — growth rate.

AUDIENCE MEMBER: (Inaudible)

WARREN BUFFETT: Could you — I'm not sure that's — could you turn that on, please, so that —

MARK RAVENHILL: I'm sorry to pin you down, but —

WARREN BUFFETT: That's OK. You can pin me down.

AUDIENCE MEMBER: — would you guess that FlightSafety, then, is more likely to be in that 10 to 15 percent ballpark?

WARREN BUFFETT: Well, it's hard to tell on numbers. I mean, certainly there's going to be growth in pilot training around the world. But FlightSafety already has a significant portion of the corporate market, for example. So it would be hard to grow a lot faster in the corporate market, although I can hear Al grinding his teeth, you know, when I say that, because he plans to grow a lot faster than the market.

But the corporate market, we've got a significant percentage. Commercial market, there could be a lot of potential in. You know, it won't come tomorrow or the next day. But, you know, ideally we would like to see people when they buy a 777 or 747 or something, buy a lifetime pilot training contract at that time.

So I wouldn't want to stick a number on it, but I've got high hopes. And FlightSafety also announced recently a very major contract with the government through Raytheon. So it's a company that's got its sights set a lot higher than where it is now.

AUDIENCE MEMBER: And insurance, 15 percent? (Inaudible)

WARREN BUFFETT: Will you — you want tenths of a percent or will you — (Laughter)

We just don't know. I mean, we didn't know 25 — we didn't — 30 years ago we didn't know we would be in the insurance business.

I mean, Berkshire, we have no master plan. And Charlie and I did not sit down in 1960 — early '65 — and say, "We're going to do this and that," and all that.

We're going to do — we're going to try and do sensible things as we go along. The more money we have, the harder it is to find sensible things.

But that's the criteria. Insurance is certainly a major area of opportunity for us. It's been a major opportunity.

We have — in certain fields we have a terrific advantage for the three reasons I laid out in the annual report. But I mean, we have capital strength, and a willingness to take on risk, and a speed of action, and a certainty of payment, that in aggregate no one matches.

Now, how much demand there is for that depends on circumstances in the business and how much supply there is at lower prices that we think don't make sense is another question. But I think we'll do OK in insurance over time.

21. Most money managers have "gotten a lot for nothing"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, I'm Tim Medley from Jackson, Mississippi.

WARREN BUFFETT: We're glad to have you back, Jim — Tim.

How many years have you come?

AUDIENCE MEMBER: This is my 11th.

WARREN BUFFETT: Good.

AUDIENCE MEMBER: They've been 11 great years. Thank you very much.

At this meeting four or five years ago, you commented that money managers in the aggregate have not done better than various market indices. And you attributed this, in part, to the frictional cost inherent in an actively-managed portfolio.

I wonder if today you would update your thoughts on this. And do you think that this underperformance compared to index funds will continue?

And then a related question, if the two of you were giving advice to a classroom of equity mutual fund managers, are there two or three things in particular that you would want to suggest to them?

WARREN BUFFETT: Yeah. Well, I would say this. Money managers, in the last few years since I made that statement, have not disappointed me. (Laughter)

In aggregate, they have underperformed index funds. And it's the nature of the game. They simply cannot overperform, in aggregate. There are too many of them managing too big a portion of the pool.

And for the same reason that the crowd could not come out here to Ak-Sar-Ben in the past years and make money, in aggregate, because there was a bite being taken out of every dollar that was invested in the parimutuel machines, that people that invest their dollars elsewhere through money managers in aggregate cannot do as well as they could do by themselves creating their own index fund, or it would be easier to have — just to buy into an index fund.

It's — you know, they say in this world you can't get something for nothing. But the truth is money managers, in aggregate, have gotten something for nothing. I mean, they've gotten a lot for nothing. And — (applause)

And people — investors have paid — and the corollary is investors have paid something for nothing.

And that doesn't mean that people are evil. It doesn't mean that they're charlatans or anything. It's the nature, if you got a 6 or $7 trillion, or whatever it may be, equity market, and you have a very significant percentage of it managed by professionals, and they charge you significant fees to invest with them, and they have costs when they change around.

They cannot do as well as unmanaged money, in aggregate.

And it's the only field in the world that I, you know, that I can think of — Charlie'll think of some others — but where the amateur, as long as he recognizes he's an amateur, will do better than the professional does for the people whose money he's handling.

And therefore if I were in a — teaching this class or speaking to that class, I would probably tell them that for their own psychological well-being they should probably leave the room. (Laughter)

Charlie?

CHARLIE MUNGER: Well, I pretty well said what I had to say on this subject in that talk I gave at USC. And anybody that wants to read that, why, can read it.

I will say that one of the things I like about the annual meeting is I get to interface with a whole lot of people that have even lower annual investment management expenses than Berkshire Hathaway the company does. I mean, if you stop to think about it, we've got our costs almost to zero, and many of you have gotten it to zero.

WARREN BUFFETT: Yeah, we — Charlie and I would be glad to take any money management organization in the world that manages — oh, just been handed a note that says, "Unfortunately, we don't have extra annual reports on site. Those shareholders desiring one should call us or write." So. And we're also on the internet. You can run it off there, too.

So I apologize for not having them on the — here. But they're easy to get. Just dial 346-1400 and there's an annual report line, and you'll have one sent to you.

We would be willing to take any money management organization in the world managing 10 billion or more, and in the case of brokerage houses who have their brokers in aggregate handling 10 billion or more, and we would be willing to bet that their aggregate investment experience over the next five years or ten years for the group that they advise will be less — will be poorer — than that achieved by a no-load, very low-cost index fund.

And we'd put up a lot of money to make that wager with anybody that would care to step forward.

Gambling may be illegal, but now you can do it through something called derivatives, you see? (Laughter)

We could create an instrument that would allow that, even though it might be against the laws of the state of Nebraska.

Charlie, would you join me on that or —?

CHARLIE MUNGER: Well, I certainly agree with you. I always say that the — exactly one-fifth have to be in the bottom 20 percent, and — (Laughter)

There are certain fundamental forces at work here that —

But it is a very peculiar profession where you have to be in a state of psychological denial to shave in the morning if you do the work. I don't think that's true for a handful —

WARREN BUFFETT: Well, it isn't.

CHARLIE MUNGER: — of investment managers. I think we know investment managers who add value. But it's a comparatively rare and small percentage.

WARREN BUFFETT: Yeah. There — we have identified, in the past even — I mean, on a prospective basis, not retrospective — managers who have added value. And there's couple of them in this room.

CHARLIE MUNGER: Well, and there's Lou Simpson of GEICO.

WARREN BUFFETT: Well, he's the one I had in mind. (Laughter)

You can do it. You can't do it with unlimited amounts of money, and a good record tends to attract money. Even a mediocre record presented by a good salesperson tends to attract money.

But there are people working with smaller amounts of money that — (coughs) — where the probabilities are that they will do better than — excuse me. (Clears throat)

Where the probabilities are that they will — (clears throat) — do better than average. But they're very rare.

Incidentally, I apologize on this voice. I had to leave Gorat's early last night, and there were a number of you I was hoping to see. But I just — it was gone entirely last night, and then I —

I'd like to tell you I did it by Cherry Coke, but I've managed to nurse it back to where it's working again in reasonable shape.

22. USAir CEO Stephen Wolf has done "terrific" job

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Martha Copeland (PH) from San Francisco.

My question involves the headwinds which face USAir. Are you considering redeploying assets? Or how will your management plan to improve this company?

WARREN BUFFETT: Well, we're just an investor in US — they call it now US Airways — but we're just an investor. We've owned a preferred stock for almost eight years.

The company had some very rough going. Charlie and I would not have thought its chances for survival were very good, even some years back.

But it's done quite well lately. Stephen Wolf has done a terrific job of running it.

So as of the middle of April, all of our dividends are — were caught up, current. We've received, I don't know, 260 or '70 million in dividends in the last eight years.

But we have nothing to do with managing the company. Matter of fact, there are some people that might have noted that when Charlie and I left as directors, that was when the fortunes of the company turned abruptly upward. (Laughter)

But — and we feel very good about what Stephen Wolf has done. I mean, he — there's no tougher job than running an airline. That is not a job I would wish on anyone. And he's improved the operating performance dramatically, and the financial performance has improved. And better yet, the preferred dividends have been paid. So we thank him for that, but we have nothing to do with it.

By the terms of our preferred, in just a little over two years, we are due to be paid back our principal amount. It was really a loan in equity form, with a kick — possible kicker on the upside because of the conversion privilege on the preferred.

We would have sold the conversion privilege for nothing a few years ago, but it actually is not so far away now. The stock's in the low 30s, and our conversion is in the high 30s. So we actually have some chance of even having conversion value on that. It's been a very pleasant surprise.

You know, I made a mistake in getting into it, but Mr. Wolf is — seems to be capable of nullifying my mistake.

Charlie?

CHARLIE MUNGER: Pass. (Laughter)

WARREN BUFFETT: We'll give him this (inaudible). (Laughter)

23. Put all your money into Berkshire stock?

WARREN BUFFETT: Zone 5, please.

AUDIENCE MEMBER: I'm Eric Butler (PH) from Menlo Park, California. A couple of questions, one serious, one not quite.

Considering Berkshire Hathaway is well run at low cost, and is diversified, why should anyone do anything but put all their money into Berkshire Hathaway instead of maintaining a diversified portfolio?

And in some of these hagiographic kind of biographies, it's apparent that you have other investments yourself beyond Berkshire Hathaway.

The second question I had, is there any significance to the fact that the Omaha World-Herald does not include Berkshire Hathaway in its stock tables on any day? Is this a sign that they do not honor profits?

WARREN BUFFETT: (Laughs) No, they — actually, they have a separate little table called Midlands — I think it's entitled Midlands Investment. But they pick out about 50 stocks that are of particular interest to people in this area, and they lift those from the regular table and put it in this separate table, which is usually on a second page right following the main stock table. So they give us our just due on that, but you do have to — you should look in a different table for that.

Second question about putting all your money in, I've got 99 percent of my money in Berkshire. But it was bought at a different price. (Laughter)

And Charlie's was bought a little cheaper, too, I think. So you know, we like the idea of having it all in there, but we don't recommend that people do that because it's — you will get very low-cost management. What we hope — well we hope is that from this point forward, that that cost does not reflect its value.

But the price at which you enter is very important. You do get a great group of businesses. You get a lot of great operating managers. You get very reasonable costs. But that is fairly widely recognized now compared to the past, and people pay more for it than they used to.

I'm still very comfortable with it, and I think Charlie's comfortable with it, too. But everyone has to make up their own mind about price.

Charlie?

CHARLIE MUNGER: Yeah. Eventually, if the success continues and we have more of this hagiography, the stock will get to such a high price that it's no longer sensible at all to buy.

We hope we dampen that process as we go along. And of course, there's always the very substantial chance that we'll just fail to meet expectations due to the vicissitudes of life.

WARREN BUFFETT: Falling on our face is what we call it. (Laughter)

24. Won't buy a tobacco company, but could buy tobacco stocks

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: My name is Michael Hooper. I'm from Grand Island, Nebraska. I applaud Berkshire for starting the Class B shares.

My question deals with tobacco stocks, which have been beaten down lately. Does Berkshire own any tobacco stocks, and are some of these stocks attractive now that prices are down on some of them? And in particular, a company called UST. Thank you.

WARREN BUFFETT: Yeah. We have owned — we won't comment on what we own now — but we have owned tobacco stocks in the past. We've never owned a lot of them, although we may have made a mistake by not owning a lot of them. But we've owned tobacco stocks in the past, and I've had people write me about whether we should do it or not.

We own a newspaper in Buffalo. It carries tobacco advertising. We don't — well, actually, Charlie's a director of a sensational warehouse chain called Costco, which used to be called PriceCostco. You know, they sell cigarettes.

So we are part of the distribution chain in — with a hundred percent-owned subsidiary in the Buffalo News. And so we have felt that if we felt they were attractive as an investment, we would invest in tobacco stocks.

We made a decision some years ago that we didn't want to be in the manufacture of chewing tobacco. We were offered the chance to buy a company that has done sensationally well subsequently, and we sat in a hotel in Memphis in the lobby and talked about it, and finally decided we didn't want to do it.

Can I give you some —?

CHARLIE MUNGER: But it wasn't because we thought it wouldn't do well. We knew it was going to do well.

WARREN BUFFETT: We knew it was going to do well.

But now, why would we take the ads for those companies, or why would we own a supermarket, for example, that sells them, or a 7-Eleven, you know, or a convenience store that sells them or something of the sort, and not want to manufacture them? I really can't give you the answer to that precisely.

But I just know that one bothers me and the other doesn't bother me. And I'm sure other people would draw the line in a different way.

So the fact that we've not been significant holders of tobacco stocks has not been because they've been on a boycotted list with us. It just means that overall we were uncomfortable enough about their prospects over time that we did not feel like making a big commitment in them.

Charlie?

CHARLIE MUNGER: Yeah. I think each company, each individual, has to draw its own ethical and moral lines, and personally, I like the messy complexity of having to do that. It makes life interesting.

WARREN BUFFETT: I hadn't heard that before. (Laughter)

We'll make him in charge of this decision.

CHARLIE MUNGER: Yeah, no, no. But I don't think we can justify our call, particularly. We just — we have to draw the line somewhere between what we're willing to do and what we're not, and we draw it by our own lights.

WARREN BUFFETT: We owned a lot of bonds at one time of RJR Nabisco, for example, some years back. And should we own the bonds and not own the stocks?

Should we own, you know — should be willing to own the stock but not be willing to own the business? Those are tough calls.

Probably the biggest distributor of — the biggest seller — of cigarettes in the United States is probably Walmart, but — just because they're the biggest seller of everything. They're the biggest seller of Gillette products, and they're huge.

And you know, do I find that morally reprehensible? I don't. If I owned — we owned all of Walmart, we'd be selling cigarettes at Walmart. But other people might call it differently, and I wouldn't disagree with them.

25. Buffett on anti-abortion protesters

WARREN BUFFETT: Zone 7?

AUDIENCE MEMBER: Gentlemen, I'm John Tarsney (PH), a shareholder from Omaha, Nebraska.

People have already asked any sophisticated question that I might have, so I'm reduced to my simple ones.

I first became a shareholder through FlightSafety, and at that time I wasn't sure that I wanted to be bought out. However, I decided that any man who could agree with me on FlightSafety might be a good man to go along with.

CHARLIE MUNGER: (Laughs) Well, that's one way of doing it. (Laughter)

Maybe you'd fit in well at headquarters. (Laughter)

AUDIENCE MEMBER: I have a couple — well, I don't use Gillette products, either, as those of you who are close to me can see. (Laughter)

My questions, my simple ones then, are, a couple of years ago, or within the recent times, you had said you would not necessarily buy Berkshire Hathaway. And I'd like to know whether you still feel the same way.

Secondly, since I came to you through FlightSafety I'm wondering if there's any other positions I should be looking at in that same — (laughter) — same light.

And thirdly, there was a very distressing sign to me — sign that I saw when I drove in. And I don't know what the meaning of it is, or if you do. And it said something about abortion. And I just don't have a clue.

If you do — now, you can use yes or no answers to these and save your voice. (Buffett laughs)

Or suit yourself and elaborate.

WARREN BUFFETT: Yeah, we'll work backwards.

I think the signs probably relate to the contributions to Planned Parenthood. (Applause)

Thank you.

We follow a policy, as you know, at Berkshire of corporate contributions being designated by shareholders. We have some made by our operating companies to their local communities, and the local managers do what they think appropriate within their communities and with their own businesses.

So Tony Nicely at GEICO — I have no idea what GEICO contributes to, but they make those decisions at GEICO.

But in terms of the parent company, we let the shareholders designate the contributions. We have a number of shareholders who designate Planned Parenthood. We have other shareholders who designate organizations that are — would be opposed to the ideas of Planned Parenthood. We make no judgment about those. (Mild applause)

And in terms of — I designate the Buffett Foundation every year, and then the Buffett Foundation, in turn, gives money to other things, including Planned Parenthood.

And so, in the sense that those funds come indirectly from Berkshire, they come in direct proportion to ownership the same way as everybody else gets a chance to do with their shares.

And we've had people write us about it. You know, I — there's no way in the world we would — you know, in fact there's some that would say that we should be boycotted because I do this.

And we would not dream of questioning, you know, the people that we buy our almonds from, or walnuts from, or chocolate from, as to what their beliefs were, you know, before we bought that, or whether we would hire somebody that they'd have to agree with our beliefs, so —

It seems to me perfectly appropriate for people to express their views on it, and they probably don't like — clearly they don't like — what I do on that. But it's where my reasoning and, you know, my own judgment leads me.

But they're out there, the few people out there expressing their views on it, and they're entitled to do that. And I don't have any problem with that.

I think when they start saying, you know, "We don't want to hire you because you have a different view than we do," or "We don't want to buy your products," I think that's a little different position to take. I wouldn't do that. But again, it's their right to do that.

26. Berkshire stock is now "more appropriately valued"

WARREN BUFFETT: Going back to whether we would buy the stock, I would say this a year ago — well, it was about March 1st because that's when I wrote the annual report in 1996 — the stock was 36,000 and I said it was not undervalued at that point.

And since we were more or less forced to have an offering by the unit trust, which I'm very glad in retrospect we did, but it was not our idea, we felt that it was only appropriate in connection with that offering to point out that we had said it was not undervalued, and since Charlie and I like to buy undervalued securities, that we would not buy it ourselves at that price or recommend that others do.

And in the ensuing year, the intrinsic value of Berkshire changed quite dramatically. And the price didn't change. In other words, the stock, after years of overperforming the business somewhat, underperformed the business. Which, of course, it's bound to do.

And we're glad that they got back more in tandem. So we said this year that we regarded the stock as being much more appropriately valued than it was a year earlier, which is obvious.

And I would say that the caution I made about securities generally would apply. I would not except Berkshire from that caution, but I would rather own or purchase Berkshire myself than I would most other securities. I can tell you that.

Charlie? (Applause)

Charlie gives to Planned Parenthood, too, so he has to — (laughs). They didn't put his names on those signs, but I'll take care of that. (Laughter)

CHARLIE MUNGER: I'm perfectly willing to have that limelight passed, as well as the opportunity to say more on the subject.

WARREN BUFFETT: Did I miss one question up there? I think there were three of them, and I addressed two of them.

AUDIENCE MEMBER: About any other area I should be looking at.

WARREN BUFFETT: That's the reason I skipped it. (Laughter)

Yeah, we don't direct people to any specific investments.

27. World Book encyclopedia vs Microsoft's Encarta

WARREN BUFFETT: Zone 8, please.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. This is Nancy Jacobs (PH) from Omaha, a shareholder for about four years now.

Before I leave today, I'm planning to purchase the World Book on CD-ROM for my ten-year-old daughter. And I'd like a few words from either one of you, or both of you, about why I'm making the right choice.

And second, does purchasing World Book over a competitor give her a somewhat improved chance of becoming a brilliant billionaire investor?

WARREN BUFFETT: Practically guarantees it, but go ahead. (Laughter)

AUDIENCE MEMBER: OK. I'm buying, then.

WARREN BUFFETT: Charlie, you want to — you love to talk about World Book.

CHARLIE MUNGER: Well, I think World Book is clearly the class of the field. They have every word in the English language graded for reading comprehensibility, and the articles are cleverly written so the difficulty of comprehension rises slightly as you go through it.

And it's very user-friendly to young people. And since it's something you want to encourage, making it user-friendly is wonderful. I also find that with whatever intellect I have, it's more user-friendly to me. And so I think it's a hell of a product, either for the young people or the old.

And for a quick reference system, I don't think there is anything better.

Personally, I like the reading version, being an old-fashioned fellow. And I can hardly imagine a world where the wise people don't do a lot of reading.

Now, maybe we're going to have wise people in the future who spend all their time in front of screens in the course of getting that wisdom. But I doubt it. That's all. (Laughter)

I think you may have bought a wonderful product, but I would have the other one, too. (Laughter)

WARREN BUFFETT: The product you see there was the joint development, and was launched in January of this year in conjunction with IBM. IBM has been our partner in that product. I believe it's being bundled into all the IBM PCs now being sold. So they've worked very well with us. Frankly, there's a book, even, that deals with this.

Bill Gates did a very good job of developing a product that was bundled with millions and millions and millions of PCs. It's called Encarta. It's actually Funk and Wagnalls. He hates it when that comes out, but they changed the name to Encarta, which was smart of him. (Laughter)

And there are a few people in this room who were witness to a demonstration four or five years ago in Bermuda, where in connection with Encarta, they showed the moon and the earth.

And the moon bumped into the earth in this. And I just, I don't know why it sticks in my mind. I thought I would mention it today, that the — (Laughter)

But his is doing very well. So apparently there are a number of people that don't care about the fact the moon and the earth collide, but in the World Book the moon and the earth never bump into each other. (Laughter)

He's done extremely well with Encarta, incidentally. I mean, it was a masterpiece of moving into an area and pushing hard. And you know, I tip my hat to him, but now we're going to —

CHARLIE MUNGER: Yeah, we copied him.

WARREN BUFFETT: Yeah, we copied him. Right. (Laughter)

OK, Nancy, be sure to buy the print version, too, so Charlie will respect you. (Laughter)

28. Tax fairness, economic prosperity, and the "ovarian lottery"

WARREN BUFFETT: Zone 9.

AUDIENCE MEMBER: Good morning, gentlemen. My name is Patrick Byrne. I'm here today from Hanover, New Hampshire.

I've searched for a couple questions upon which I might get the two of you to disagree.

First, what level of taxation — and I direct these as much to Mr. Munger, therefore, as to you Mr. Buffett — first, what level of taxation on capital gains is most conducive to the long-term economic health of a society, and is that also the fair or just rate?

In other words, is the just rate of taxation on capital gains precisely that rate that creates the most economic stuff? Or is there some other goal a state might pursue?

And as a not-so-subtly related question, I work in a New Hampshire factory that makes industrial torches.

WARREN BUFFETT: As CEO, I might add, Patrick. (Laughter)

AUDIENCE MEMBER: Say again?

WARREN BUFFETT: As CEO of — that "working" made it sound like you were down there on the floor. I just wanted people to — (Laughter).

Patrick writes me letters from chairman to chairman, so I think we've got to get him back at it.

AUDIENCE MEMBER: Continuing. (Laughter)

Well, it's a small company. I do work as CEO, but it's not much of a hierarchy.

We make torches used in heavy manufacturing, and the fortunes of our factory echo those of industrial America.

Do you agree with the conventional wisdom that maintains that the age of classical industrial America has passed, and that we will — that America cannot be competitive in the long term with low-wage countries?

So the first question is on taxation of capital gains, and then the second is on the future for industrial America.

WARREN BUFFETT: I have a sensational answer on the tip of my tongue, but I think I'll let Charlie go first — (laughs) — while I refine it a bit.

CHARLIE MUNGER: Well, I think there's an easy answer to your capital gain issue. And one is what makes an economy work best in some abstract mathematical sense. And the other is the consideration that you allude to, which gets into issues of fairness.

Aristotle felt that systems work better when they were generally perceived as fair. The civilization worked better if people saw the differences in rewards as having been fairly — reasonably fair, anyway.

And I think that if you had a civilization where if you work 90 hours a week driving a taxicab with no money, no medical insurance and so forth, and somebody else does nothing but own Berkshire Hathaway shares and sit on the country club porch and peel off a few every year to pay the bills, that would be regarded as so unfair that even if it had some theoretical economic efficiency it would be counterproductive for our particular civilization to have that kind of a tax code.

So I'm all for having some taxation of capital gains. Once you reach that conclusion, you get into the question of what should — what is the fair rate?

I think the fair rate might well be a little lower than it is now, but not much lower.

WARREN BUFFETT: Sounds to me like he's a seller — of Berkshire. (Laughs)

Patrick is a former heavyweight boxer, and just got his Ph.D. fairly recently from Stanford with a 700-page dissertation, which has in it some commentary that actually bears on this.

And I thank Patrick, actually, for introducing me to kind of a system of construct — mental construct — to attack questions like this.

Patrick gave me the example one time — and I think this may go back to John Rawls at Harvard — but he said, just imagine that you were going to be born 24 hours from now.

And you'd been granted this extraordinary power. You were given the right to determine the rules — the economic rules — of the society that you were going to enter. And those rules were going to prevail for your lifetime, and your children's lifetime, and your grandchildren's lifetime.

Now, you've got this ability in this 24-hour period to make this decision as to the structure, but there — as in most of these genie-type questions there's one hooker.

You don't know whether you're going to be born black or white. You don't know whether you're going to be born male or female. You don't know whether you're going to be born bright or retarded. You don’t know whether you’re going to be born infirm or able-bodied. You don’t know whether you’re going to be born in the United States or Afghanistan.

In other words, you’re going to participate in 24 hours in what I call the ovarian lottery. (Laughter)

It’s the most important event in which you’ll ever participate. It’s going to determine way more than what school you go to, how hard you work, all kinds of things. You’re going to get one ball drawn out of a barrel that probably contains 5.7 billion balls now, and that’s you.

Now, what kind of a society are you going to construct with that in prospect?

Well, I suspect you would focus on two issues that Patrick mentioned in his question. You would try to figure out a system that is going to produce an abundant amount of goods, and where that abundance is going to increase at a rapid rate during your lifetime, and your children and your grandchildren, so they can live better than you do, in aggregate, and their grandchildren can live better.

So you’d want some system that turned out what people wanted and needed, and you’d want something that turned them out in increasing quantities for as far as the eye can see.

But you would also want a system that, while it did that, treated the people that did not win the ovarian lottery in a way that you would want to be treated if you were in their position. Because a lot of people don’t win the lottery.

I mean, Charlie — when we were born the odds were over 30-to-1 against being born in the United States, you know? Just winning that portion of the lottery, enormous plus. We wouldn’t be worth a damn in Afghanistan.

We’d be giving talks, nobody’d be listening. Terrible. (Laughter)

That’s the worst of all worlds.

So we won it that way. We won it partially in the era in which we were born by being born male, you know —

When I was growing up, you know, women had — they could be teachers or secretaries or nurses, and that was about it. And 50 percent of the talent in the country was excluded from, in very large part, virtually all occupations.

We won it by being white. You know, no tribute to us, it just happened that way.

And we won it in another way by being wired in a certain way, which we had nothing to do with, that happens to enable us to be good at valuing businesses.

And you know, is that the greatest talent in the world? No. It just happens to be something that pays off like crazy in this system. (Laughter)

Now, when you get through with that, you still want to have a system where the people that are born —like Bill Gates or Andy Grove or something — get to turn those talents to work in a way that really maximizes those talents. I mean, it would be a crime to have Bill or Andy or people like that, or Tom Murphy, working in some pedestrian occupation just because you had this great egalitarian instinct.

The trick, it seems to me, is to have some balance that causes the people who have the talents that can produce goods that people want in a market society, to turn them out in great quantity, and to keep wanting to do it all their lives, and at the same time takes the people that lost the lottery and makes sure that just because they, you know, on that one moment in time they got the wrong ticket, don't live a life that's dramatically worse than the people that were luckier.

And when I get all through that long speech, I probably come out with the idea that the capital gains tax as it exists today is probably about right, so —

I see very few people — and I've been around a lot of people with money and talent over time — they don't always go together — but I've been around both classes — (laughs) — and the — I see very few of them that are turned off from using their talents by a 28 percent capital gains tax. It just doesn't happen.

I mean, they do what they like to do. And part of the reason they're good at what they do is they like to do it. And I've just never seen it happen.

And I've seen a lot of people that pay taxes that are higher than 28 percent that are contributing more to society, by some judgment other than a pure market system.

(BREAK IN TAPE)

29. "American economy encourages adaptation"

WARREN BUFFETT: The other question about the low-cost industrial — you know, how does the industrial society evolve, I — you know, the world evolves in a way, in a market society, so people do what they're best at. And this country's done very well in recent years — something like, you know, software that — where a Microsoft has been leading or an Intel or something. I mean, we have done very well.

Ten years ago the American public was sort of down on itself, or 15 years ago, in terms of what the economy could do.

But here we are with our unemployment rate — in Nebraska it's under 3 percent.

And you know, you look at the countries of Europe that were supposedly going to beat us into the ground, or you look at Japan.

I think the American economy encourages adaptation. I mean, Singapore may be better, but in terms of major large economies, I think the American economy does awfully well in encouraging adaptation to what people want, and delivering it to them in ever-increasing amounts. And you know, I view that as all to the good.

So I don't regard any industry as sacred. I regard innovation and freeing up the able people to — able, in terms of production of goods in a market economy — to spend 12 hours a day all the time — I don't see Andy or Bill letting up at all, in terms of where Intel and Microsoft are now.

I don't see Roberto Goizueta at Coca-Cola, or Michael Eisner at Disney, or any of those people.

They don't work 40-hour weeks, they work 70 or 80-hour weeks. And I think that system works very well in this country, and I don't worry particularly about the specific products that are turned out.

Charlie?

30. Munger critical of Harvard philosopher John Rawls

CHARLIE MUNGER: I would not like the conclusion that both Warren and I have reached, that issues of fairness are properly to be considered in the tax laws, to cause anyone here to believe that I have a great respect for Harvard University's philosopher John Rawls.

He is perhaps the world's best-known living philosopher. And personally, I think he's had a pernicious influence on human thought.

He doesn't know enough science. He doesn't know enough economics. He doesn't know enough about how systems work to be really good at figuring out what's fair in systems. And he studied too much philosophy and too little of everything else. (Laughter)

If anybody thinks we love John Rawls, well, you can count me out. (Laughter)

WARREN BUFFETT: No — I wasn't endorsing his conclusions, I was endorsing his thought — his original construct.

Charlie, how about the industries part of the question that Patrick asked?

CHARLIE MUNGER: Well, if Patrick isn't the smartest person in the room, there can't be many in his class.

You are getting questions from a very able man, and he's deliberately made them very difficult. (Laughter)

And that whole issue is too complex for me to usefully discuss here. There are also certain limitations on ability that enter the equation. (Laughter)

31. Class A stock may be exchanged for Class B at any time

WARREN BUFFETT: So we'll go to zone 10. (Laughter)

AUDIENCE MEMBER: Good day, gentlemen. My name is Bill Rodenberg (PH) from Dayton, Ohio. I'm a shareholder, and my daughter Sarah, who is 13, is also a shareholder. She chose not to join me in the limelight. I think the hot dogs had a higher appeal to her.

WARREN BUFFETT: Not to mention —

AUDIENCE MEMBER: And I'd like to say that it's very reassuring to know that Uncle Warren and Uncle Charlie are taking care of her college fund. And it's easy to sleep at night.

I have two questions, one related to a question my wife asked me, which I was unable to fake a good answer to, and a second one related to my daughter's one share of Berkshire A.

My wife asked me, in the annual report you stated that if anyone out there has a good company like FlightSafety, please let you know and you'd be glad to look it over and give an answer within five minutes or less.

And her question is, how can he do that? Where does he get the information to make that decision? And how does he know that that information is valid?

My second question has to do with my daughter. She's 13. In five years she'll be off to college, perhaps UNL, perhaps not.

In any case, she's going to face a significant capital gains when she sells that one share of stock.

WARREN BUFFETT: I hope so. (Laughter)

AUDIENCE MEMBER: You mentioned earlier, and I believe this is correct, you said that you could trade one share of A for 30 shares of B this afternoon. And I thought, wait a minute, I thought there was a limited window on that. We happened to be out of the country at the time that exchange took effect, and we missed it.

WARREN BUFFETT: No, the exchange exists forever. You can —

AUDIENCE MEMBER: Forever?

WARREN BUFFETT: You can always exchange a share of A for 30 shares of B. You cannot do it in reverse. You cannot shift 30 shares of B into one share of A. But there was no window or timetable on that.

The A stock is forever exchangeable for 30 shares of B. I don't recommend that she does it, because it's always an option, and in the meantime she gets the shareholder-designated contribution, and there's always the chance that the A will sell slight — at a price slightly above 30 shares of B. It doesn't do it very often and it won't be very much if it does, but —

We didn't want to create an incentive for people to exchange A for B, but we — they will always have the right to do so.

32. Just takes 5 minutes to know if we're interested in a company

WARREN BUFFETT: The five minute test is a — you know — Charlie and I have — we're familiar with virtually every company of a size that would interest us in the country. I mean, if you've been around for 40 or more years looking at businesses, it's just like if you were looking at — you know, studying baseball players every day. You get to know all the players after a while. And that's the way it works.

Then we have a bunch of filters we've developed in our minds over time. We don't say they're perfect filters. We don't say that those filters don't occasionally leave things out that should get through. But they're very — they're efficient.

And they work just as well as if we spent months and hired experts and did all kinds of things. So we really can tell you in five minutes whether we're interesting in something, and —

We'd never owned shares in FlightSafety but we'd been familiar with the company for at least 20 years, wouldn't you say, Charlie?

CHARLIE MUNGER: Sure, I had a partner who bought a lot of it 20 years ago. Yeah.

WARREN BUFFETT: Yeah. But that's true of almost any business. And we know — we've got a fix on what we don't understand, and then we don't care to know any more about them, particularly, although we'll pick up a little as we go along, maybe.

And then the ones that are — we're capable of understanding, we've probably gotten about as far as we'll get already. So we do know in five minutes.

Now, when we do something with FlightSafety, before the purchase and even for somewhat — a little after the purchase — I'd never been — I'd never set foot on a piece — they have 40 or so training centers around the world — I'd never set foot on one of them.

I'd never been to their headquarters. We never looked at a lease. We never look at title of the properties. I mean, we don't do all of those things.

And I will say this: to date, that's never cost us a penny. What costs us money is when we misassess the fundamental economic characteristics of the business.

But that is something we would not learn by what people generally consider due diligence. We could have lawyers look over all kinds of things, but that isn't what makes a deal a good deal or a bad deal. And we don't kid ourselves by having lots of studies made and lots of reports made. They're going to support whatever they think the guy that pays them, you know, wants anyway. So they don't mean anything. They're nonsense.

But we do care about being right about the economic characteristics of the business, and that's one thing we think we've got certain filters that tell us in certain cases that we know enough to assess. And then we make some mistakes.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that, except that people underrate the importance of a few simple big ideas. And I think that to the extent Berkshire Hathaway is a didactic enterprise teaching the right systems of thought, I think that the chief lessons are that a few big ideas really work, as I think these filters of ours have worked pretty well. Because they're so simple.

WARREN BUFFETT: Yeah, I think most of the people in this room, if they just focused on what made a good business or didn't make a good business and thought about it a little while, they could develop a set of filters that would let them, in five minutes, figure out pretty well what made sense or didn't make sense.

I mean, there may be some reason after five minutes we don't get together on a deal of some sort, but —

Another thing you can usually tell — at least you can tell it in the extreme cases — you can tell whether you've got the kind of manager, very quickly, that you want to have. I mean, if you've got somebody that's been batting .400 all their life, and fortunately age doesn't change that picture, in terms of business performance, and they love what they do, it's going to work.

If the seller cares a lot about the money, you're probably not going to make a very good deal. If their real interest is going in the — is what they're going to do with the money, they may fall out of love or have less interest in their business subsequently.

We love working with people who are just plain nuts about their businesses. And it works very well. And you can usually spot that.

Now, having said that, we'll have a few people figuring out how to fake that attitude, you know, when they try and sell us some piece of junk here, but — (Laughter)

Charlie says we can get conned by some guy with a green eyeshade, you know, and a low-rent office and all that. But we won't get taken in by the guy with the suede shoes. (Laughter)

33. Buffett describes a "normal" day

WARREN BUFFETT: Zone 11.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, thank you for having me here today. My name is Dorsey Brown from Baltimore, Maryland.

I have two quick questions for you. Could you please comment on any observations that either of you may have concerning executive compensation and option issuance, a topic that seems to be getting a lot more media attention? And are we going to — getting a little bit of excesses in that area?

And my second question to you, Mr. Buffett, could you just give us some idea of what a normal day, how you would like to spend a reasonable, normal day and — working on the investment side of the equation, or analysis, or reading, or just to give us some flavor of that? Thank you.

WARREN BUFFETT: OK, I'll answer the second question first. Very easy.

I just — I read a lot, and I talk on the telephone a fair amount. We have no meetings. We have no committees. We have no slide presentations. You know, we have nothing, I mean it — (Laughter)

And so I read a lot. I read annual reports. I read business publications. I could do it in way less time, but I enjoy doing it so I make it last, I mean, you know, like some other activities in life. The - (laughter)

So it's — there's really — it's the most boring job to anybody watching it, but I'm in love with it, you know. And so I like doing that.

And I don't like talking about it a lot, I just like to kind of keep up with what's going on. Like I say, by this point in life I could filter out so much of that I would — I just don't need to do that much of it.

But I kind of enjoy just seeing what's going on vicariously through doing a lot of reading. And I spend some time on the phone, and I'm on the computer a lot playing bridge, and I get to do what I like all the time.

We'll let Charlie describe what he does, which is even more bizarre. (Laughter)

And then we'll talk about compensation and options.

CHARLIE MUNGER: Well, there's a little more foolishness in my life than Warren's, and — including being chairman of a large hospital. I'm not suggesting that hospitals are foolish, I'm just suggesting that it takes a certain quirk of mind to be willing to be the chairman of a hospital.

And so my life is even more — it's less rational than Warren's. Warren lives one of the most rational lives I've ever seen. And it's almost unbelievable, and — (Laughter)

WARREN BUFFETT: He's got me wondering why I'm here today. (Laughter)

34. Abuse of stock options as executive compensation

WARREN BUFFETT: Well, we'll talk about comp then, a little.

CHARLIE MUNGER: Yeah, comp, yeah.

WARREN BUFFETT: The — comps — there are three or four aspects to that.

On the subject of options, I would say that most options are constructed poorly, from the standpoint of the owner, but they're constructed very well from the standpoint of the person who receives them, which is not entirely unexplainable because the — it's a very strange form of negotiation when the beneficiary is the one that also really does all the design and hires the experts to come in and tell him what is good for the company when the expert knows that the guy who signs the check would be quite interested also in hearing what's good for him.

There's nothing wrong with options per se, at all. Frankly, in terms of Berkshire, it would have been perfectly appropriate if a properly designed option had been given to me or to Charlie.

I mean, we have responsibility for the whole enterprise, and we believe that any kind of incentive for performance should be related to the area in which you have responsibility.

We feel that if you want a typist to type 100 words a minute, that you ought to pay for typing 100 words a minute, not what the earnings per share were last year.

We feel if a salesman gets paid for how many of the product is sold, he should get paid for that and not for some production quotas met.

So we believe in tying incentive comp to performance for which you have responsibility. And there are certain areas of a business that don't lend themselves to that staff performance and so on.

But that would lead to the corollary, that the people that are responsible for the entire results of the business, it's perfectly appropriate to compensate them by options that in some way reflect the performance of that entire business.

The trouble is that stock prices reflect other things than the performance of the business.

For one thing, over a period of time, they reflect simply the reinvestment of earnings. You know, I have pointed out in the past that if you gave me an option on your savings account — to manage your savings account — and you reinvested all the interest, I would take away a significant payment at the end of ten years simply because you left the interest in.

With a company that pays no dividend like Berkshire, if you're going to leave all your capital in every year, for me to get a fixed-price option for ten years would mean that I was getting a royalty on money that you left with me. And I made the choice to have you leave it with me. So that does not strike me as equitable.

So I think any option should have a step-up in price that reflects the fact that money is reinvested by the shareholders annually. That if somebody wants to pay out a hundred percent of the earnings every year, then I'd say that you can have a fixed-price option. If you give me the money every year, and you do more with the money that's left with you than the original sum, that's fine.

But if money is left with someone for ten years, there's going to be some increase in value even if they spend every day golfing. And to give a piece of that away simply over — to have a royalty on the passage of time for them is a mistake.

I think options ought to be granted, basically, at the fair value of the business at the time they're granted. Sometimes that's the market price, sometimes it isn't the market price, but —

Certainly the management of a company would not give an option on their business to some third party at a market price they felt was way too low, so I find it a little disingenuous when managements say that they're — when they get a takeover bid, they say that the company's really worth twice that much, but they're perfectly willing to issue options to themselves at this price which they say is totally inadequate, when the owners get the option elsewhere.

But options, properly structured, for people with responsibility for the business, I think, makes — can make sense. And I think that if something happened to me and to Charlie, in terms of the manager of the business subsequently, if it was structured properly, I would not see anything wrong with an option arrangement.

We carry this philosophy down to our subsidiaries where they generally get incentive arrangements that relate to the operation of their business. But they don't have incentive arrangements that relate to Berkshire overall, because if Chuck Huggins does a wonderful job at

See's Candy, as he has done, and I fall on my face, in terms of allocating capital, Berkshire stock will go no place despite what Chuck does.

And to penalize him, or to tie his rewards to something over which he has no control, I think, is kind of silly. So we tie it instead to the operations of the candy business.

In terms of overall level of compensation, the real sin is having a mediocre manager. I mean, that is what costs owners very significant amounts of money over time.

And if a mediocre manager is paid a relatively small sum, it's still a great mistake. And if they're paid huge sums, it's a travesty. And that happens sometimes.

It's almost impossible to pay the outstanding manager a sum that's disproportion to the value of that outstanding manager, when you get a large enterprise.

Coca-Cola had a market value of $4 billion when Roberto Goizueta took over. It had stagnated during the previous decade under an earlier management, despite having the same product and those great Mean Joe Greene commercials you saw, that was — Mean Joe Greene was in the '70s. The "Teach the World to Sing" commercial was in the '70s. All these great commercials. But the company didn't do much.

Roberto — if we'd bought the entire Coca-Cola Company — I wish we had — in 1981 or '2, whenever he came in, for 4 billion and we now had a business worth 150 billion, Roberto would have earned more money with us than he's earned under the present arrangement.

I mean, having the right person in place is just enormously important.

How much they should take is another question. That's more a philosophical question.

Tom Murphy, best manager, you know, in the world, he just didn't feel like taking a lot of money out of it, you know. And you know, I tip my hat to him, but I don't think that necessarily makes it wrong for somebody else to take more money for doing the job. But I think it ought to be related to doing the job.

When I ran a partnership in the 1960s, I took a quarter of the profit over 6 percent a year. And I didn't get paid any salary, but I could make a lot of money doing that. And that thought occurred to me as I ran the place from day to day, and I think it probably helped a little. (Laughter)

So I don't think it's a terrible thing to have somebody get paid for making money for the shareholders.

But they ought to get paid for really making it, not simply because the shareholders reinvest money with them. They ought to make it based on the fair value of what they had when they took over, and they ought to make it really for just excellent performance.

Charlie?

CHARLIE MUNGER: Well, we have remarked in previous Berkshire Hathaway meetings that we regard present mandated corporate accounting, with respect to stock options as weak, corrupt, and contemptible. And it is.

WARREN BUFFETT: Otherwise, we're undecided. (Laughter)

CHARLIE MUNGER: If something is so wonderful as a standard technique of compensation, why does it have to be masked under weak, corrupt, and contemptible accounting? I think it is no credit to our civilization that we've drifted into this particular modality.

And you can get, if you overuse stock options, where the whole thing is sort of a chain letter. I mean, in Silicon Valley there's one company that practically paid everybody in options, and as long as the chain letter galloped, it worked as far as the income account because nothing went through expense.

And then once everybody is issuing stock options, everybody else feels that he has to do it. And the practice spreads.

So I am not totally wild about the extreme prevalence of the stock option modality in American corporate life. Personally, I would vastly prefer different modalities, which would probably involve stock instead of stock options.

I'm all for sharing with the kind of people who are doing the important work pretty well down in the organization in a place like Costco or Coca-Cola or any other such company. But I don't much like the present scheme that civilization has drifted into.

With respect to the subject of do we have some wretched excesses in American corporate compensation, my answer would be yes. I don't think the excess is necessarily the guy who got the most money. In many cases I agree with Warren, that the money has been deserved.

But such is the envy effect that the practice spreads to everybody else. And then the taxi driver and everybody starts thinking the system is irrational, unfair, crazy.

And I think that's what causes some people, as they rise in American corporations, to, at a certain point of power gaining and wealth gaining, they start exercising extreme restraint as a sort of moral duty. And that's what Warren was saying about Tom Murphy.

And I would argue that the Tom Murphy attitude is the right attitude. And it goes way, way back in the history of civilization. The word "liturgy" comes from a Greek word which is just the same. I mean, if you were an important citizen of Athens, it was a lot like being an important person in Jewish culture.

I mean, you had duties to give back and to act as a certain example. And the civilization had social pressures that enforced those duties. And I would argue that the Berkshire Hathaway compensation system, considering what the people at the top already have, it would be better if we saw a little more of it.

WARREN BUFFETT: A few —

CHARLIE MUNGER: I think Warren and I do all right. (Laughter and applause)

WARREN BUFFETT: A few years — I think an added problem is the sort of, in terms of the accounting, the sort of hypocrisy that it pushes people into, and then which becomes accepted and sort of a norm, particularly when leaders do it.

And you know, you had a situation a few years back when there's no question that any manager would say that stock options are a form of compensation. They would say that compensation is a form of expense, and they would say that expense belongs in the income account. But they didn't want to have stock options counted because they felt that it might restrict their use.

So when the federal — the FASB, Financial Accounting Standards Board — came up with a proposal to actually have reality reflected en masse, corporate chieftains descended on Washington to pressure legislators to have Congress start enacting accounting standards, which as I mentioned, one time in Indiana in the 1890s, there was a legislator that introduced a bill to have the value of pi changed to an even 3 because he thought that 3.14159 was too tough for the schoolchildren and it would ease computational problems.

Well, that sort of behavior by corporate chieftains when they are in there, you know, arguing that black is white, in order to feather their own nest and maybe create a little higher stock prices, I think that it means that they forfeit, to some degree, their right to be taken seriously when they claim they're operating for the good of the Republic, and march on Washington in other regards.

And I just think that when the organization recognizes its hypocrisy and so on, I think there's a degradation that can set in through an organization that — whose leaders are also leaders in hypocrisy.

Like I say, we have no strong feelings on this subject, but — (Laughter)

Charlie, do you have anything?

CHARLIE MUNGER: It’s rather interesting, though. There’s an earlier example. Commodore Vanderbilt took no salary from his railroads. After all, he controlled the railroads. They paid all the dividends that he needed, and he got the fun of running the whole railroad, and he thought it was beneath Commodore Vanderbilt to take a salary.

We’ve never quite reached the Vanderbilt standard, but — (Laughter)

WARREN BUFFETT: We don’t have any dividends, Charlie.

CHARLIE MUNGER: Yeah, yeah. (Laughs)

Well, maybe that’s the reason. (Laughter)

Afternoon Session - 1997 Meeting

1. When opportunity knocks …

WARREN BUFFETT: OK. If we're live now — what we might do is maybe have just — I think maybe we only need four microphones for the afternoon session. So we'll have two on each side, one toward the back, one toward the front. And we'll just go around in four microphones. Are we OK on that?

And we'll start just one second. Everybody has a chance to get to their seats.

Charlie has promised to stop tapping the Coke can during this — (laughter) — session.

CHARLIE MUNGER: I only did that when somebody else was talking. (Laughter)

WARREN BUFFETT: Number 2? OK.

I used to have a friend that was a stock salesman many years ago. And when you'd have lunch with him, he would just keep going like this: (knocking sound).

And finally, it would get to you. And you'd say, "What's that?" And he'd say, "That's opportunity." (Laughter)

He was pretty good.

2. How to buy a business

WARREN BUFFETT: OK, let's — Kelly tells me we should start with number 2, zone 2. So we're going to start with zone 2.

AUDIENCE MEMBER: Yes. I'm Fred Cooker (PH) from Boulder, Colorado.

And this is a question about intrinsic value. And it's a question for both of you because you have written that, perhaps, you would come up with different answers.

You write and speak a great deal about intrinsic value, and you indicate that you try to give shareholders the tools in the annual report so they can come to their own determination.

What I'd like you to do is expand upon that a little bit. First of all, what do you believe to be the important tools, either in the Berkshire annual report or other annual reports that you review, in determining intrinsic value?

Secondly, what rules or principles or standards do you use in applying those tools?

And lastly, how does that process, that is the use of the tools, the application of the standards, relate to what you have previously described as the filters you use in determining your valuation of a company?

WARREN BUFFETT: If we could see, you know, looking at any business, what its future cash inflows or outflows from the business to the owners — or from the owners — would be over the next, we'll call it, a hundred years, or until the business is extinct, and then could discount that back at the appropriate interest rate, which I'll get to in a second, that would give us a number for intrinsic value.

In other words, it would be like looking at a bond that had a whole bunch of coupons on it that was due in a hundred years. And if you could see what those coupons are, you can figure the value of that bond compared to government bonds, if you want to stick an appropriate risk rate in.

Or you can compare one government bond with 5 percent coupons to another government bond with 7 percent coupons. Each one of those bonds has a different value because they have different coupons printed on them.

Businesses have coupons that are going to develop in the future, too. The only problem is they aren't printed on the instrument. And it's up to the investor to try to estimate what those coupons are going to be over time.

As we have said, in high-tech businesses or something like that, we don't have the faintest idea what the coupons are going to be.

When we get into businesses where we think we can understand them reasonably well, we are trying to print the coupons out. We are trying to figure out what businesses are going to be worth in ten or 20 years.

When we bought See's Candy in 1972, we had to come to the judgment as to whether we could figure out the competitive forces that would operate, the strengths and weaknesses of the company, and how that would look over a ten or 20 or 30-year period.

And if you attempt to assess intrinsic value, it all relates to cash flows.

The only reason for putting cash into any kind of an investment now is because you expect to take cash out. Not by selling it to somebody else, because that's just a game of who beats who, but, in a sense, by what the asset, itself, produces.

That's true if you're buying a farm. It's true if you're buying an apartment house. It's true if you're buying a business.

And the filters you describe. There are a number of filters which say to us we don't know what that business is going to be worth in ten or 20 years. And we can't even make an educated guess.

Obviously, we don't think we know to three decimal places, or two decimal places, or anything like that, precisely what's going to be produced. But we have a high degree of confidence that we're in the ballpark with certain kinds of businesses.

The filters are designed to make sure we're in those kinds of businesses. We, basically, use long-term, risk-free government bond-type interest rates to think back in terms of what we should discount at.

And, you know, that's what the game of investment is all about. Investment is putting out money to get more money back later on from the asset. And not by selling it to somebody else, but by what the asset, itself, will produce.

If you're an investor, you're looking at what the asset — you're looking at what the asset is going to do — in our case, businesses.

If you're a speculator, you're primarily focusing on what the price of the object is going to do independent of the business. And that's not our game.

So we figure if we're right about the business, we're going to make a lot of money. And if we're wrong about the business, we don't have any hopes — we don't expect to make money.

And in looking at Berkshire, we try to tell you as much as possible as we can about our business, of the key factors. Those are the things that Charlie and I —

With the things we put in our report about those businesses are the things that we look at ourselves.

So if Charlie had nothing to do with Berkshire but he looked at our report, he would probably, in my view, he would come to pretty much the same idea of intrinsic value that he would come to from being around it, you know, for X number of years. The information should be there.

We give you the information that, if the positions were reversed, we would want to get from you.

And in companies like Coca-Cola or Gillette or Disney or those kind of businesses, you will see the information in the reports. You have to have some understanding of what they're doing. But you have that in your everyday activities. You'll get that kind of knowledge.

You won't get it, you know, in terms of some high-tech company. But you'll get it with those kind of companies. And, then, you sit down and you try to print out the future.

Charlie?

CHARLIE MUNGER: I would argue that one filter that's useful in investing is the simple idea of opportunity cost.

If you have one opportunity that you already have available in large quantity, and you like it better than 98 percent of the other things you see, well, you can just screen out the other 98 percent because you already know something better.

So the people who have a lot of opportunities tend to make better investments than people that don't have a lot of opportunities. And people who have very good opportunities, and using a concept of opportunity cost, they can make better decisions about what to buy.

With this attitude, you get a concentrated portfolio, which we don't mind. That practice of ours, which is so simple, is not widely copied. I do not know why. Now, it's copied among the Berkshire shareholders. I mean, all of you people have learned it.

But it's not the standard in investment management, even at great universities and other intellectual institutions.

Very interesting question. If we're right, why are so many eminent places so wrong? (Laughter)

WARREN BUFFETT: There are several possible answers to that question. (Laughter)

The attitude, though — I mean, if somebody shows us a business, you know, the first thing that goes through our head is would we rather own this business than more Coca-Cola? Would we rather own it than more Gillette?

It's crazy not to compare it to things that you're very certain of. There's very few businesses that we'll find that we're certain of the future about as companies such as that. And therefore, we will want companies where the certainty gets close to that. And, then, we'll want to figure that we're better off than just buying more of those.

If every management, before they bought a business in some unrelated deal that they might not have even heard of, you know, more than a short time before that's being promoted to them, if they said, "Is this better than buying in our own stock, you know? Is this better than even buying, you know, buying Coca-Cola stock or something," there'd be a lot fewer deals done.

But they don't — they tend not to measure — we try to measure against what we regard as close to perfection as we can get.

Charlie, anything?

CHARLIE MUNGER: Well, I will say this, that the concept of intrinsic value used to be a lot easier, because there were all kinds of stocks that were selling for 50 percent or less of the amount at which you could've easily liquidated the whole corporation if you owned the whole corporation.

Indeed, in the history of Berkshire Hathaway, we've bought things at 20 percent of then-liquidating value.

And in the old days, the Ben Graham followers could run their Geiger counters over corporate America. And they could spill out a few things. And you could easily see, if you were at all familiar with the market prices of whole corporations, that you were buying at a huge discount.

Well, no matter how bad the management, if you're buying at 50 percent of asset value or 30 percent or so on down, you have a lot going for you.

And as the world has wised up and as stocks have behaved so well for people, good stocks, generally, have gone to higher and higher prices. That game gets much harder.

Now, to find something at a discount from intrinsic value, those simple systems, ordinarily, don't work. You've got to get into Warren's kind of thinking. And that is a lot harder.

I think you can predict the future in a few places best if you understand a few basic ideas that come from a good general education. And that's what I was talking about in that talk I gave at the USC Business School.

In other words, Coca-Cola's a simple company if it's stripped down and analyzed in terms of some elemental forces.

WARREN BUFFETT: When Charlie —

CHARLIE MUNGER: It's not hard to understand Costco, either, you know —

There are certain fundamental models out there that do not take — you don't have the kind of ability that quantum mechanics requires. You just have to know a few simple things and really know them.

WARREN BUFFETT: When Charlie talks about "liquidating value," he's not talking about closing up the enterprise. But he's talking about what somebody else would pay for that stream of cash, too, I mean —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: You could've looked at a collection of television stations owned by Cap Cities, for example, in the early to mid — well, 1974. It would've been worth, we'll say, four times what the company was selling for. Not because you'd close the stations, but just their stream of income was worth that to somebody else. It's just that the marketplace was very distressed — depressed.

Although, like I say, on a negotiated basis, you could have gone and sold the properties for four times what the company was selling for. And you got wonderful management.

I mean, those things happen in markets. They will happen again. But part of investing and calculating intrinsic values is if you get the wrong answer when you get through — in other words, if it says don't buy, you can't buy just because somebody else thinks it's going to up or because your friends have made a lot of easy money lately or anything of the sort.

You just — you have to be able to walk away from anything that doesn't work. And very few things work these days. You also have to walk away from anything you don't understand which, in my case, is a big handicap.

CHARLIE MUNGER: But you would agree, wouldn't you, Warren, that it's much harder now?

WARREN BUFFETT: Yeah. But I would also agree that almost anytime over the last 40 years that we've been up on a podium, we would've said it was much harder in the past, (laughs) too.

But it is harder now. It's way harder.

Part of it being harder now, too, is the amount of the capital we run. I mean, if we were running $100,000, our prospects for returns would be — and we really needed the money — our prospects for return would be considerably better than they are running Berkshire. It's very simple. Our universe of possible ideas would expand by a huge factor.

We are looking at things today that, by their nature, a lot of people are looking at. And there were times in the past when we were looking at things that very few people were looking at.

But there were other times in the past when we were looking at things where the whole world was just looking at them kind of crazy. And that's a decided help.

3. Stocks look high, but not as high as they look

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: My name is Bakul Patel (PH). I'm from upstate New York. I've got a few questions. And I need your permission to ask each question separately and wait for the answer.

WARREN BUFFETT: Well, we'll take a couple, but —

I got through college, you know, only answering three or four questions. So I don't want to go through that again. (Laughter)

AUDIENCE MEMBER: They are unrelated questions.

WARREN BUFFETT: OK. OK. We'll give you a couple, then we'll let other people have a chance. How about two, OK?

AUDIENCE MEMBER: Fine. Mr. Market is valuing Dow Jones at about 7,000 and S&P at about 800.

By your valuation model, at the current interest rate and current inflation rate and current growth rate, what is a fair valuation of both these companies?

WARREN BUFFETT: Well, that's a good question but a tough question. But I would say that if you believed American — the American business, in aggregate, could earn the kind of returns on equity that they have been earning in the last — or has in the last couple of years — and then you postulate no change in interest rates, you can justify 7,000 on the Dow and 800 on the S&P.

Now, you know, there's a couple ifs I threw in there. And if interest rates go higher, the valuation goes down automatically.

And more importantly, if the returns on equity of American industry — which are historic highs, and which sort of classical economics would tell you would be hard to maintain — if those returns go down, on average, that also would pull it down.

But if you're willing to accept the current level of returns on equity as being typical of the future case for American business and you're willing to assume present interest rates are lower, then, you can justify a valuation on the Dow and S&P.

And it's interesting because I got all that commentary after I wrote that line in the report which was, as I said earlier, designed for a little something else. I'll give you a little trivia quiz.

What two years in this century has the Dow had the greatest overall gain? The two years in the 1900s are 1933, which most of you don't think of as a banner year, and 1954. And in both of those years, the Dow was up over 50 percent, counting dividends.

In March of 1955, because of that, the fact that the Dow had gone up — bear in the mind that the high on the Dow was 381 in 1929 and it took 25 years before that was surpassed. And in 1954, the Dow went from, say, 280 up to 404, or something like that, just a little over 50 percent.

So what did they decide to do? They decided to have congressional hearings about it. And they did.

In March of 1955, they had hearings in the Senate Banking and Currency Committee, Chairman Fulbright. And my boss, Ben Graham, was called down to testify. And it's fascinating reading. Bernard Baruch was there, all kinds of people. I've got the hearings at home.

And Ben's opening comments about the market at that time were that the market looks high, it is high, but it's not as high as it looks. Well — (Laughter)

That's about the present situation. I mean, it looks very high, just by comparing 7,000, certainly, to the 404 at the end of 1954 when was Ben was testifying.

But there are — there have been huge changing in earnings and return on equity on American business in general. And, then, you had this big move in interest rates.

Now, those are underlying fundamentals that have had — powered a huge bull market. After a while, as I mentioned earlier, people get captivated simply by the notion of rising prices without going back to the underlying rationale. And that's when you get very dangerous conditions in terms of possible bubbles.

And it would — you know — I have no idea where markets will go. But if you had the kind of conditions that could cause real excesses, just like you had excesses in 1973 and '4, going back to when you could buy things at 20 cents on the dollar, you had excesses in the other direction.

You know, the country didn't disappear or anything. It's just people behave in extreme ways in markets. And over time, that's very good for people that keep their heads.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

WARREN BUFFETT: OK. You get one more. (LAUGH)

4. When Berkshire is cheap, other things are usually cheaper

AUDIENCE MEMBER: If Mr. Market goes in the depressed phase that Berkshire Hathaway has got an investment portion of its book value about 28,000 per Class A share, that would put that Berkshire Hathaway share much lower than what it is now. Would Berkshire Hathaway consider buying back its own share? Or has it done so in the past? Or is it out of the question?

WARREN BUFFETT: If the market went in the tank, Berkshire stock would go in the tank, too. And so there shouldn't be anybody in this room that owns the stock that would not find it palatable, if not become positively enthusiastic, about the stock going down 50 percent.

It would not bother Charlie. It wouldn't bother me, because we would have very intelligent things, then, to do with whatever capital we came into. And we would be generating capital as we went along.

We wouldn't have sold our Coke. We wouldn't have sold our Gillette. We wouldn't have sold our businesses. So most of our capital would've ridden that down. But at least, we would have intelligent things to do with the money.

One of the intelligent things, possibly, could be to buy in our own stock. But that would imply that our own stock was cheaper relative to value than anything else we could find among possible opportunities. And the chances are we could find things that were more attractive.

Back in 1973 or '4, when we were buying Washington Post at a fraction of what it was worth, Berkshire stock may have been cheap then. But it wasn't as cheap as the Washington Post.

In 1987 or — well, in 1988 and '89, you know, Berkshire stock may or may not have been cheap. But it wasn't as cheap as Coca-Cola.

And it's unlikely that among the thousands of the possible investments that Berkshire will be the most attractive at any time. But if it were, you know, obviously, we would buy in our own stock.

But I think if the Dow went down 50 percent, we would have plenty of interesting things to do. And we would not be unhappy.

Charlie?

CHARLIE MUNGER: Yeah. We don't have any rule against it. Opportunity cost is the game around here.

5. International earnings in the United States

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: I'm David Day from Coppell, Texas. And I'm a Berkshire shareholder.

Mr. Buffett, what is your opinion of investing in foreign company stocks?

WARREN BUFFETT: Well, we have a number, well, at least several major businesses, three or four at least, five, six, I mean, as I count along, that derive very significant percentages of their earnings from international operations.

Coca-Cola earns 80 percent or more from international operations. Gillette would earn two-thirds or more from international operations.

So if you look to where earnings are coming from, we get a lot from international companies. They don't have to be domiciled outside the United States.

It's a slight advantage to us to have them domiciled in this country. For example, their dividends are treated better. We get better treatment on the dividends if they are domestically based rather than based someplace else, just because of the way the U.S. tax laws work.

But if Coca-Cola were domiciled in Amsterdam, or Gillette were domiciled in London, they had the same basic businesses, we would be attracted to them to virtually the same degree we are as having them domiciled in Atlanta and Boston.

We look at businesses outside this country that are domiciled outside this country. Many don't meet our size requirements. But that's true here, too. We have to look at very big companies. But we have nothing against buying into companies that are domiciled — or even buying the entire business of a company — that's domiciled outside the United States.

We feel slightly less familiar with the tax laws and the corporate cultures, perhaps. But that would not be a huge factor in a great many countries. And, you know, we will keep looking. We need to look everywhere with the kind of money that we have available for investment.

Charlie?

CHARLIE MUNGER: Again, we've had a wonderful way of playing the rapid development of economies outside the United States. And so far, we haven't seen anything that attracted us as being better.

And if you can sell Coca-Cola, you know, do you really want to get into steel in Malaysia or something? (Laughter)

WARREN BUFFETT: We sold a substantial number of Kirby units outside of the United States last year. And that business has grown very significantly in recent years. And I think it promises to grow.

We're always looking for opportunities. Some things travel very well. And some things don't.

I mean, Gillette travels. Disney travels. McDonalds travels. Coke travels.

You know, See's Candy doesn't travel as well. It might if you spent 50 years working on it. But it's not an easy thing to travel. Actually, candy bars, themselves, don't travel very well.

If you look at the top-selling candy bars in France or in England and Japan, you don't find the similarity that you find in terms of the bestselling soft drinks or movies or fast food hamburgers or razor blades, and —

CHARLIE MUNGER: Except Snickers. For some reason, Snickers. (Laughter)

WARREN BUFFETT: Well.

CHARLIE MUNGER: It travels very well. Don't ask me why. (Laughter)

WARREN BUFFETT: Yeah. Well, Charlie's had a lot of experience as he goes around the world. (Laughter) You don't want to eat where we eat. You may want to invest where we invest, but — (Laughter)

6. Businesses with "natural limits" welcomed at Berkshire

WARREN BUFFETT: OK. Section 1.

AUDIENCE MEMBER: I'm Richard Tomkins (PH) from Gallatin, Tennessee. And I have just two quick questions.

Could both of y'all discuss the Kansas Bankers business and its competitors? How big of a moat Kansas Bankers has in the industry and if they're going to expand, you know, outside of the 22 or 20 states that they're currently in. And that's A.

And, then, secondly, just clue us in a little bit more on the five-year discount notes that you did that were tied to the Salomon stock. And was that a way to unload it? Or just kind of give us a little more than what we saw in the annual.

WARREN BUFFETT: Sometimes in the insurance business, you have a choice between being a good business or a big business. And fortunately, Don Towle, who runs Kansas Banker Surety, has chosen for a good business.

It's a specialized operation that sells, as its name implies, to bankers, and primarily policies that have fidelity coverage.

That is just not a big volume business in the whole United States. They do it exceptionally well. Don knows every, you know, he knows every account. He knows every claim. You know, he runs a fabulous operation. But it's not an operation that can double or triple in size doing what it does and doing well. There just aren't — there's not the opportunity there.

On the other hand, I think it's tough to compete against Don because he brings an element of knowledge and personal attention to the account and factors of that sort that a really large company would have trouble duplicating.

Charlie, you want to add anything on Kansas Bankers?

CHARLIE MUNGER: Yeah. There's a huge class of businesses in America which are very strong and will throw out large amounts of cash in relation to their size but which can't rationally be expanded very much. And if you try and expand certain kinds of businesses, you're throwing money down the rat hole.

The beauty of the Berkshire Hathaway system is that such businesses are very welcome here because the cash comes into headquarters and is allocated there.

If there's anything sensible to do at the subsidiary level, we always want it done. But there are businesses where — lots of businesses — where there isn't much of a way of redeploying the cash.

WARREN BUFFETT: Part the reason they have a moat around them is that they're of a size and have specialized skills that other organizations just can't get into it. I'll give you another example, and that's somewhat the same field.

There's a company called Western Surety. It's changed ownership a couple of times. Charlie and I went up to see them 15 years ago about buying it at Sioux Falls.

They write notary bonds. And they write a whole bunch of things that have $50 premiums or $25 premiums. They have — it was a company doing not that many millions of premiums, but they had 30,000 agents. But each agent, you know, may have done $500 worth of business within a year or a thousand dollars.

Well, Chubb can't go after that business the same way. We certainly can't at National Indemnity. They have a distribution system that works wonders. But you can't pump two or three times the volume through that distribution system. And if you could pump it through, there would've been more competition.

So there are businesses that have certain natural limits that, you know, you want to be careful that you don't talk yourself into thinking a business that has limits and find out that it really has way more potential.

I mean, it would've been a shame if Mr. [Asa Griggs] Candler decided that Coca-Cola only appealed to people in Atlanta or something of the sort. So you have to be a little careful on that.

But we — a fellow like Don will be very good at understanding, you know, where his competitive advantages can take him and where they don't take him. He's done a terrific job over the years doing it.

7. Debt deals vs. buying stock

WARREN BUFFETT: There was a second question, was there?

AUDIENCE MEMBER: Just the $500 million I think that y'all did, of the discount.

CHARLIE MUNGER: Oh, the Salomon notes.

WARREN BUFFETT: Oh, the Salomon notes. Yeah. Well, that is simply an issue of Berkshire — by Berkshire — of 500 million, as you mention, of a very low-coupon note — low-interest rate note, too — that is convertible — or exchangeable — into Salomon stock anytime during the next five years.

And it's a way of taking the capital out of that block of stock at a low-interest cost to use elsewhere, while retaining a limited portion of the upside in the Salomon stock.

And we just — we made that decision, whenever it was, six months ago or so, based on the thought that we might have some good opportunities at some point to use that money, and raising the money at a little over a one percent current cost, or a three percent cost to maturity — and we think the actual cost is likely to be close to the one percent — made sense for us.

We have never owned — I mean, we have the convertible preferreds of Champion, of US Airways, and of Salomon. And those are three industries — I don't think we've ever owned an airline stock, common stock. I don't think we've ever owned a paper company common stock. And we've only had a very limited amount of investment in the investment banking businesses.

Those are industries that we don't feel that we've got the same kind of long-term economic advantage that we have in something like a Coke or a Gillette. So those are not natural places for us to be common shareholders. And the issuance of that exchangeable debt reflected that view.

Charlie?

CHARLIE MUNGER: I agree. (Laughter)

8. Lower tax rate probably won't trigger Berkshire stock sales

WARREN BUFFETT: OK. Zone 2.

CHRISTINE SHRAM: My name Kristen Schramm (PH). I am from Springfield, Illinois.

I am a proud shareholder of Berkshire Hathaway. In light of the upcoming capital gains tax reduction, do you envision any increased selling pressure, such as buying opportunities for Berkshire stock?

WARREN BUFFETT: That's a good question, Kristen. We're proud to have you, too. (Applause)

A very high percentage of Berkshire shares is owned by people with a very low tax basis. So that if I had to guess, I would say that probably 80 percent, at least, of the shares are owned by people whose cost is less than a hundred dollars a share on the A stock.

And that, undoubtedly, contributes to some people's reluctance to sell, particularly if they're older, and —

But I think it would probably — it might make less difference than you think. I think most people, if there were a lower capital gains rate, I don't think it would be a huge change in the propensity to sell the stock.

I would hope, even if there was a zero capital gains tax, that there really wouldn't be any rush for the exits. It wouldn't affect my attitude, particularly. But I think it's perfectly reasonable to assume that as the tax rate goes down, there will be some greater tendency to sell by people with a low tax basis on their shares.

Charlie?

CHARLIE MUNGER: Well, I think the laws of microeconomics and the laws of psychology are such that if you said, "The tax rate will, for one month, go down to zero," you would have some very dramatic effects in the markets. It's not going to happen, of course.

WARREN BUFFETT: No. But if you said the tax rate was going to zero for one month, and then going to a hundred percent subsequently, I think you'd get a certain amount of activity. (Laughter)

CHARLIE MUNGER: But then you'd really —

So you could tinker with the tax laws in a way that would cause dramatic market effects. I don't anticipate any such things happening.

We had something similar back when they — what was it, '86 — where the tax rate was 20 percent on long-term capital gains. And it was the last year you could liquidate a corporation and not pay gains taxes on appreciated assets that were disposed of in the liquidation. And we got a great flood of liquidations in that year.

So it's possible to do things to the tax laws that have big market effects. But it gets very unlikely that any such thing is going to happen this year.

WARREN BUFFETT: Yeah. I agree with that.

9. We know our super-cat insurance risks, but many others don't

WARREN BUFFETT: Zone 2?

VOICE: (Inaudible)

VOICE: What number is this? Is this three or four? What is it?

WARREN BUFFETT: Is there a zone 2?

VOICE: Is this it?

WARREN BUFFETT: The microphone working?

Zone 3? Well, we'll go to zone 3, then.

AUDIENCE MEMBER: I am Charles Parcells (PH) from Grosse Pointe, Michigan. Very glad to be here. I'm a recent stockholder of Berkshire. I'm sorry to say that. (Laughter)

But it does not diminish my admiration for past performance or my confidence in future performance.

I heard recently a remark by, I think, a very successful investor, whom I think worked with the Bass family in Texas for a while.

And one of his comments, if I understand it correctly, said something like this. "Hurricane Andrew destroyed the super-cat industry." And that's about all he said. And I know we're into it. I'm interested in its importance to Berkshire and your comments on it, Mr. Buffett and Mr. Munger.

WARREN BUFFETT: Yeah. I guess I would say I don't fully understand why he would — or even partially understand — why he would say that.

I mean, we are in business in the super-cat business — and I should explain, super-cat business is very much like it sounds. I mean, we write insurance for other insurance companies, other reinsurance companies, to protect them, to pay them at a time when something really big comes along, a super catastrophe. And Hurricane Andrew was certainly a super catastrophe.

But that's the reason people do business with us, so —

We pay off infrequently, but we pay off big. And we paid off about 120 million at Hurricane Andrew. But if Hurricane Andrew happened today — well, at least in one of the policies (inaudible) we have — we would certainly be paying off at least, what, 6, 700 million, something like that.

And if it happens five years from now, we'll pay off a lot more than that because we will, undoubtedly, be writing more business at that time.

So it's just part of the game. And there will be super-cats of various kinds. There will be, you know, huge quakes. There will be more hurricanes than huge quakes. And when that time comes, we will write a big check.

But that doesn't — you know, prices may be firmer after such an event. They may not be. They didn't firm as much as you might expect after Andrew happened. Andrew was a huge surprise to people.

As a digression, you know, people in the insurance business thought that — they all had these models — and some of them were prepared by reinsurance brokers and some of them by various research institutes — as how much they would lose under certain kinds of circumstances.

And they couldn't have been further off with an Andrew, or with the Northridge earthquake.

Fortunately, we don't rely on those. We — I don't know what exactly we do rely on, but we don't rely on those. (Laughter)

And the — Hurricane Andrew was, you know, that was just — that's part of business with Berkshire.

And we will have another one. And we'll have another one after that. So every three, or five, or seven years, or who knows what, we will lose significant money in the super-cat business. And we expect that over 20 or 25 years, we will make more money than we lose.

We bring some real advantages to that business, as I wrote about in the report. And it makes sense for us to be in it. It only makes sense for us to be in it when the premium prices are right. But when they are appropriate, we will — we're more than willing to step up and take on a fair amount of risk.

As I wrote in the report, on the California Earthquake Authority, you know, we could, tomorrow, face a demand for roughly a billion dollars. And we are prepared to write a check that day to take care of that. And we will write it, if it happens. And there aren't many people in the world that an insured can count on to do that.

The interesting thing is that the worst exposure, still, for super-cats, are not borne by us. But they're borne implicitly by some very big direct writing companies that have lots of risk on Long Island or along the New Madrid Fault or other places.

And they have got, well, millions of policies, and maybe hundreds of thousands of exposed policies. And they don't think of themselves as being in the super-cat business. Well, they really do, but they don't think, you know, day by day about it. And they are very exposed.

Our exposures are limited to a given dollar amount. That dollar amount may be large. But at least we know what it is. And we take risks — that we're willing to take risks when we think we're appropriately paid.

There's a mentality to bring to the super-cat business that's somewhat akin to what you bring to the investment business. So we think we're well equipped for it.

Charlie?

CHARLIE MUNGER: Yeah. A billion dollars would be, what, 2 1/2 percent, or less, of the liquid assets and securities around Berkshire. And so that's irritating, but it — (laughter) — it's not going to destroy the enterprise.

Whereas, if you have an unwitting super-cat exposure that you don't even recognize you have, it could destroy your company. Twentieth Century, a very well-run direct writer of insurance, they all but went broke with the Northridge Earthquake.

WARREN BUFFETT: And they didn't think it was possible, either.

CHARLIE MUNGER: And they had no idea they had a super-cat exposure in what they thought was a simple, little direct writing insurance operation.

No, I don't think we've got the main super-cat risks at all at Berkshire.

WARREN BUFFETT: GEICO lost something like 150 million in Andrew. And their initial estimate of the loss was, like, $35 million. And that's after they thought they'd heard about most of it. You can really get fooled in this business.

In fact, 20th Century, which lost a billion dollars at Northridge just at the end of 1996, I think, added $40 million, as I remember, to the reserves for the Northridge Quake, which I think was in January of '94.

Now, you think on an earthquake, you know, you'd kind of know when it was over. But — (laughter) — you can really — you can get fooled.

And down at Andrew, I mean, the costs of construction go up dramatically in an area that's been wiped out. And then there were all kinds of things in the codes. I mean, I think they started requiring architects' drawings on everything, you know, over $5,000 in the way of repairs, some number like that — don't hold me to the number. And, of course, the architects had a field day.

And then it turned out that everybody had a homeowner's policy in the Oakland fire, for example. They all had a $300,000 book collection in their library. And, you know, who knows after the place has burned down? (Laughter)

It's not — you get a lot of surprises in that field. And the surprises in insurance are never symmetrical. They're all bad. (Laughs)

10. "You need a large margin of safety"

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Yes. My name is (inaudible). I'm from New Mexico. And I'm a shareholder. I have two questions.

First, in your '91 letter, you wrote about investors eventually repeat their mistakes. So what do you do to keep you from making the same mistake twice?

And the second question is, in your '92 letter, you wrote that you tend to deal with a problem of future earning in two ways. The first way is the business you understand. And the second is the margin of safety. And you say they are equally important. But if you — (loud noise) — but if you cannot find the happy combination of faster growth at a low key, which one do you think is more important, faster growth or low key? That's my two questions.

WARREN BUFFETT: I think we were told by — (loud noise) — we were told by some higher authority which one was more important there for a second. (Laughter)

Well, they're bound together. Obviously, if you understood a business perfectly — the future of a business — you would need very little in the way of a margin of safety.

So the more volatile the business is — or possibility is — but assuming you still want invest in it, the larger the margin of safety.

I think in that first edition of [Benjamin] Graham — I doubt if I'm right — was it (inaudible) and said, you know, maybe it was worth somewhere between 30 or 110, or some number. He said, "Well, that sounds — how much good does that do you to know that it's worth between 30 and 110?" Well, it does you some good if it's selling below 30 or above 110."

That's — you need a large margin of safety.

Well, if you're driving a truck across a bridge that holds — it says it holds 10,000 pounds — and you've got a 9,800 pound vehicle, you know, if the bridge is about six inches above the crevice that it covers, you may feel OK.

But if it's, you know, over the Grand Canyon, you may feel you want a little larger margin of safety, in terms of only driving a 4,000 pound truck, or something, across. So it depends on the nature of the underlying risk.

We don't get the margin of safety now that we got in a 1973-4 period, for example.

The biggest thing to do is understand the business. If you understand the business, and get into the kind of the businesses where surprises — by their nature — surprises are few. And we think we're largely in that type of business.

11. Learn from the mistakes of others

WARREN BUFFETT: The earlier part about — you know, I've said about learning from your mistakes, the best thing to do is learn from other guys' mistakes, I mean, you know —

It's like, you know, [U.S. General George] Patton used to say, you know, "It's an honor to die for your country. Make sure the other guy gets the honor," you know and — (Laughter)

So our approach is really to try and learn vicariously. But there's a lot of mistakes that I've repeated, I can tell you that.

The biggest one, probably — or the biggest category over time — is being reluctant to pay up a little for a business I knew was really outstanding, or to continue to buy it at higher prices when I knew it was outstanding.

So the cost of that has been many, many billions. And I'll probably keep making that mistake.

There are — the mistakes are made when there are businesses you can understand and they're attractive and you don't do something about it.

I don't worry at all about the mistakes that come about because when I met Bill Gates, I didn't buy Microsoft or something. That's not my game. But the mistakes are made when you — most of our mistakes have been mistakes of omission rather than commission.

Charlie?

CHARLIE MUNGER: Yeah. I think most people get very few, what I call, no-brainer opportunities, where it's just so damned obvious that this is going to work. And since they are very few and they may be separated by periods of years, I think people have to learn to have the courage and the intelligence to step up in a major way when those rare opportunities come by.

WARREN BUFFETT: Yeah. You got to be willing to take a really big bite. And it's crazy if you don't. And it's crazy if you dabble around at the edges, so you're not prepared to take a big bite when the time comes.

12. Treasury bonds are yardstick to compare investments

WARREN BUFFETT: We, apparently, have lost mike 4. So we're just going to use three mikes from now on. And if you'll just make your way to those mikes, we'll see how we do with them.

How about zone 1?

AUDIENCE MEMBER: Mr. Buffett, my name is Pete Brown (PH) from Columbus, Ohio, a Class B shareholder.

I had a couple questions if I could. The first is, I don't have a very good idea in my mind how our typical insurance operations work. I mean, in particular, how money leaves the insurance pool and enters the investment pool, and how our operations are different than the typical, run-of-the-mill insurance operation, you know, around the country.

Why are we able to generate so much more float than, you know, the XYZ Company, you know, somewhere else?

And a second question is, it kind of goes back to an article you wrote for Fortune Magazine back in the late '70s about the effect of inflation on equity values and that sort of thing. And in it, you asserted that stocks were — in businesses — were really like bonds. They just had their own par. And the par being the average 12 percent return on equity that companies have averaged.

You know, a company does better than that has assets that are worth way more than a hundred cents on a dollar. A company does less, you know, will be less, correspondingly.

My question is, when you're projecting cash flows of a company as a prospective investment, why would you use the interest rate, you know, of risk-free Treasury bills? Why wouldn't you use the sort of opportunity cost to discount that maybe Charlie was referring to, maybe 12 percent return on equity of average corporations? Maybe, you know, your 15 percent goal may be Coca-Cola's return on equity as a comparison.

I mean, doing that would dramatically change the value of the company that you're, you know, evaluating, as I'm sure you know. Why would you use the risk-free rate is my question.

WARREN BUFFETT: The risk-free rate is used merely to equate one item to another. In other words, we're looking for whatever's the most attractive. But in terms of present valuing anything, we're going to use a number.

And, obviously, we can always buy the government bonds. So that becomes the yardstick rate. It doesn't mean we want to buy government bonds. It doesn't mean we want to buy government bonds if the best thing we can find is only — has a present value that works out at a half percent a year better than the government bond.

But it's the appropriate yardstick, in our view, to simply use to compare across all kinds of investment opportunities, oil wells, farms, whatever it may be.

Now, it gets into degree of certainty, too. But it's the yardstick rate. It's not because we want to buy government bonds. But it does serve to make that a constant throughout the valuation process.

13. Insurance and investing are equal, but distinct, businesses

WARREN BUFFETT: In our insurance business, we really have a group of insurance businesses. And they have different characteristics.

The consistent characteristic, actually, is that they're all very, very good businesses. Some of them are a lot larger and have opportunities to get larger. And some of them are not so large and have limited opportunities, in terms of growth. But every insurance operation we have is a distinct asset to Berkshire.

We've got smaller — a worker's comp operation. We've got a credit operation — credit card — operation. We've got a Homestate operation. We have all these different businesses, Kansas Bankers Surety, whatever.

They're all good businesses. Some of them don't develop a lot of float relative to premium volume.

The nature of Kansas Bankers Surety is that it won't develop a lot of float. It just happens to be the kind of business they write.

The nature of comp is that it develops more float, because comp claims pay more slowly.

We — you really should think of each one, though, as having different characteristics.

GEICO is entirely different than the super-cap business. They're both good businesses.

In terms of how we invest the money when it comes in, we invest it when it comes in. I mean, we'll get a large super-cap premium today. It's invested.

Now, if we have a claim tomorrow, then, we disinvest and in a substantial way.

If you take something like GEICO, the cash flow is always going to be positive, probably, on that, you know.

We won't have another Hurricane Andrew, because we've backed out of the homeowner's business to quite an extent.

So month by month, the money comes in at a GEICO. And the faster it grows, the more the money that comes in.

We have so much capital that we can, basically, put that money into whatever makes the most sense for Berkshire. So we have none of either the mental or psychological constraints, or regulatory constraints, that many insurance companies operate under.

Many of them think they sort of should have this portion in this and this portion in that and so on.

Investments usually play second fiddle to the insurance business at most companies that are in the insurance business. We look at them as being of equal importance.

And we run them as two distinct businesses. We do whatever makes the most sense on the investment side, whatever makes the most sense on the insurance side. We never do anything on the investment side that will impinge on our business on the insurance side.

But you really should look at each one of our businesses separately. GEICO has entirely different characteristics than the super-cat business. They both call themselves insurance. They both develop float.

But in economic terms and in terms of competitive strengths and that sort of thing, they're two very different businesses. And our smaller businesses are different businesses. Some of those may grow reasonably well. We'll keep working on it.

Charlie?

14. Munger on choosing your spouse

CHARLIE MUNGER: Yeah. That — if you look at a corporate stock, it's obvious you can buy any maturity of government bond you want. So one opportunity cost of buying the stock is to compare it with a bond.

But you may find that half the stocks in America, you're so fearful about or know so little about or think so poorly of, that you'd rather have the government bond. So on an opportunity cost basis, they're taken out of the filter.

Now, you start finding corporations where you like the stocks way better than government bonds. You got to compare them one against the other. And when you find one that you regard as the best opportunity, that you can understand as the best opportunity, now you've got one to buy.

It's a very simple idea. It uses nothing but the most elementary ideas from economics or game theory. It's child's play as a mental process. Now, it's hard to make the business appraisals. But the mental process is a cinch.

WARREN BUFFETT: If Charlie and I were forced — told we had a choice of buying stock A, B, C or D and all 2,500 or 3,000, or whatever it may be, listed on the New York Stock Exchange, or buying a ten-year government bond and we had to hold the stock for ten years or the bond for ten years, probably in at least 80 percent of the cases, we'd take the ten-year Government, you know.

In many cases, because we didn't understand the business well enough elsewhere. Or secondly, we may understand it and still prefer the 10 percent Government.

So — but we would measure everything that way.

And I don't know, did you come up with 80 percent or where, Charlie?

Desert island, ten years. Get to fondle a stock certificate or fondle a government bond. Which one are you going to choose? (Laughter)

CHARLIE MUNGER: I think life is a whole series of opportunity costs. You know, you got to marry the best person who is convenient to find who will have you. (Laughter)

Investment is much the same sort of a process. (Buffett laughs)

WARREN BUFFETT: I knew we'd get in trouble after lunch. (Laughter)

15. Why don't more companies copy Berkshire?

WARREN BUFFETT: Zone 2. (Laughs)

AUDIENCE MEMBER: Hello. Martin Wiegand, Bethesda, Maryland, stockholder. For myself, my family and other small business owners, I want to thank you for the annual reports. They help a lot in helping us make business decisions and life decisions.

My question is, many people come here — (Applause)

Many people come here to listen to you and to copy and understand your investment philosophy. But why don't more people, in your opinion, try to copy your investment vehicle, a corporation that pays no dividends?

WARREN BUFFETT: Well, I don't really think if the right — I think there are other things that are probably better to copy about Berkshire, but they don't get copied either.

It was always interesting to me how few people — everybody read [Benjamin] Graham's — and they didn't really disagree with him. They just didn't like following him because it didn't promise enough, in a sense. I mean, people really wanted something very quickly.

In terms of not paying dividends, we don't pay dividends because we think we can turn every dollar we retain into more than a dollar of market value. I mean, the only reason for us to keep your money is if it becomes worth more by us keeping it than it would be worth if we gave it to you.

And if we can create more than a dollar of market value for every dollar we keep, you're better off, whether you want to take that dollar out by selling a little piece of your stock, or whether you continue to leave it in. That's the test.

If we come to the conclusion that we can't do that, and we could come to that conclusion sometime, then we should distribute it to you.

The interesting thing is, we're in certain businesses, for example, See's Candy being one — we don't have a way to intelligently use all of the money that See's generates within the See's Candy Company.

So if See's were a standalone company, it would pay very large dividends, not because it, you know, just had some dividend paying policy. It would be simply because we wouldn't have a way of using, in this case, $30 million a year, intelligently in expanding that business.

The Buffalo News is the same way. We don't have a way of using money within that specific business, intelligently, to use the money it generates.

We hope that in the overall Berkshire Hathaway scheme of things that we can intelligently use the money that the companies, in aggregate, generate for us.

And we think, so far, we have. And we think the prospects are reasonably good that we can continue to do that.

But dividend policy should really be determined by that criteria, also bearing in mind the possibilities of repurchase of stock, too.

But they should be determined by whether a dollar left in the business is worth more to the shareholder than a dollar paid out.

Someplace like Coca-Cola, you know, if Coca-Cola paid no dividends and simply repurchased shares and developed the bottling system and done the things that they have, the shareholders probably would've been even better off. They've been sensationally well off as it is. But they probably would've been even better off than they have been with the dividend policy they have had.

And that's true for Gillette and Disney and the companies of that sort that have got these terrific opportunities to use capital within the business, or to repurchase shares of a company that simply can't be replaced.

If — that usually is the best use of capital. It's probably better than dividends. And, you know, we have written some about that, Martin. But people usually keep doing what they've been doing. They're hard to change.

Charlie?

CHARLIE MUNGER: Well, it's interesting that you take that simple standard, you should retain money if you can make it worth more than it is by retaining it. That is not the standard thing that's taught in the corporate finance departments of our major universities.

Why do we have this simple idea and they have another one? Time after time, we find that so.

I've tried to understand why they think the way they do. And I have great difficulty with it. I've just concluded that they're wrong, and — (Laughter)

But that isn't enough. There has to be reason why so many smart people are that wrong. And — (laughter) — that's a story for another day. But there are things gravely wrong with American education that I hope that Berkshire Hathaway is slowly helping to fix.

WARREN BUFFETT: Can you imagine if the — pick any one of you here. And let's say the two of us were in a business together. You know, it was earning $100,000 a year. How would we decide whether to leave the 100,000 each year? And it'd be exactly what we've talked about here. If we thought the 100,000 would translate into a present value of more than 100,000 by some action, we'd leave it in. And if it didn't, we'd take it out. And it doesn't seem to register, generally.

And incidentally, in our own case, we'll probably go too long before we come to the conclusion that we're not really using it that effectively, because there'll be a certain — denial — we'll go through. And we'll say, "Well, that was just temporary last year."

But that will — that is our approach. And we'll do our best to apply it.

16. Corporate profits can't stay so high

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, my name John Shane (PH). I'm from Nashville, Tennessee.

You touched on the subject of return on equity in response to a different question. I wonder whether you might be willing to elaborate along the following line.

Right now, the Standard & Poor's 500, in aggregate, have a return on equity of about 22 percent. The average over the decades for corporate America has been more like 12 or 13 percent.

How did we get to this point of extraordinary profitability? And how likely do you think we are, over the next ten or 15 years, to revert back to the mean of the low teens?

WARREN BUFFETT: Well, I would say is, I never thought it would happen. So I start out with the fact that if you'd listened to me, you'd have been dead wrong, in terms of what the return on equity in 1996 or 1995, 1997 would be.

It does not seem to me that 22 percent returns on equity are sustainable in a world where the long-term interest rate is 7 percent, and where the capability of saving large amounts in the economy, you know, are quite dramatic.

You would just think that there would be some sort of leveling effect between 7 and the 22 you named, that as savings got directed within the economy and as the competitive forces operate that we've been taught will operate over time, would come into play.

But, you know, I've been wrong on that subject. And that's why I say these levels are not unjustified if those kinds of returns can be made.

Because let's just say that you had a 22 percent perpetual bond. And you had the ability — and let's say that a quarter of that — a third of that coupon — would be paid out. So you got a bond with a 22 percent coupon and, say, 7 percent is paid out, being the dividend payout on the S&P, we'll say. And the other 15 percent is reinvested in more 22 percent bonds with similar characteristics.

Now, what's that instrument worth on a present-value basis in a 7 percent world? It's worth a lot of money.

In fact, it's worth so much money that it becomes a mathematical fallacy at some point, because when the compound rate becomes higher than the discount rate, you get into infinite numbers, which are — or you get into infinity.

And that's a number — that's the concept we like to think about around Berkshire — (laughs) — we haven't figured out how to attain it.

There's a book called "The Petersburg Paradox" — there's an article called "The Petersburg Paradox and the Growth Stock Fallacy." I think that's the name of it, by a fellow named, I think, David Durand, written about 25 years ago. And it gets into this bit where the growth rate is higher than the discount rate. And it shouldn't work for an extended period of time. But it's sure fun while it's going on.

Charlie?

CHARLIE MUNGER: Yeah. I think a couple of things contributed to this phenomenon that we so carefully mispredicted.

Number one, it became very fashionable for corporations to buy in shares. And I think that we helped, in a very small way, bring on that enlightenment. And I think that was a plus, in terms of rational corporate decision making.

The other thing that happened is that the anti-trust administration got way more lenient in allowing people to buy competitors.

And I think those two factors helped raise returns on capital in the United States.

But that can't — you wouldn't think that can go on forever. And what 15 percent per annum compounded will do is grow way faster than the economy can grow, way faster than aggregate profits can grow, over a long pull. So, sooner or later, something has to happen. I don't think we've reached a new order of things where the laws of mathematics are somehow repealed.

WARREN BUFFETT: If real output in this country grows at, say, 3 percent a year — or real GDP grows at 3 percent a year — and the capitalized value of industry in the country grows at 10 percent a year, at some point you get into mathematical absurdities, I mean, at the low inflation rates.

You know, you can't have it — if we have an economy that's seven or eight trillion now in GDP and seven or eight trillion in equity valuation, that may or may not make sense. But if you have one that's 15 billion in GDP and 75 billion in equity valuation — 75 trillion in equity valuation — you know, you get to things that don't — can't make any sense.

So if you get these differential rates of growth among items that have some relationship, however tenuous, or at least non-specific in the short run, it doesn't work after a while. And, you know, nobody wants to think about that. They don't want to think about their own death. But I mean, it doesn't go away just because you don't want to think about it.

And we haven't gotten to any point like that. But you can project out numbers. And they just won't make any sense after a while.

CHARLIE MUNGER: Yeah. Corporate profits can't be 200 percent of GNP.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Indeed, they can't be 50 percent of GNP. So these high rates of compounding just go automatically into absurdity.

WARREN BUFFETT: Yeah. They really can't be 20 percent of GDP or some number like that. So if — and if you start saying you can't have a multiple of more, you get differential rates. And they just simply — you leave the tracks after a while.

CHARLIE MUNGER: And all you people should be aware of this because all the people who are professional sellers of investment advice and brokerage service, et cetera, et cetera, have an immense vested interest in believing that things that can't be true are true. (Laughter)

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And not only that, they've been selected in a Darwinian process to have formidable sales skills and large energy. (Laughter)

And this is dangerous to the rest of us. (Laughter)

WARREN BUFFETT: Yeah. Well, you've been selected to be the recipients of their advice. (Laughs)

CHARLIE MUNGER: Right.

Furthermore, they figure out who we are and come in about 6 o'clock in the evening. (Buffett laughs)

17. "It's not share of market. It's share of mind that counts"

WARREN BUFFETT: Zone 1 again.

AUDIENCE MEMBER: Mike Assail (PH) from New York City.

Could you explain a little more about what you call the "mind of the consumer" and the "nature of the product" and explain how you actually apply these concepts to find the companies with the growing demand and the best investment potential? And thank you for being two of the greatest professors I've ever had.

WARREN BUFFETT: Thanks. (Applause)

You know, what you really — when you get into consumer products, you're really interested in finding out — or thinking about — what is in the mind of how many people throughout the world about a product now, and what is likely to be in their mind five or ten or 20 years from now?

Now, virtually every person on the globe — maybe, well, let's get it down to 75 percent of the people on the globe — have some notion in their mind about Coca-Cola. They have — the word

"Coca-Cola" means something to them. You know, RC Cola doesn't mean anything to virtually anyone in the world, you know, it does to the guy who owns RC, you know, and the bottler.

But everybody has something in their mind about Coca-Cola. And overwhelmingly, it's favorable. It's associated with pleasant experiences.

Now, part of that is by design. I mean, it is where you are happy. It is at Disneyland, at Disney World. And it's at ballparks. And it's every place that you're likely to have a smile on your face, including the Berkshire Hathaway meeting I might add. (Laughter)

And that position in the mind is pretty firmly established. And it's established in close to 200 countries around the world with people.

A year from now, it will be established in more minds. And it will have a slightly, slightly, slightly different overall position. In ten years from now, the position can move just a little bit more.

It's share of mind. It's not share of market. It's share of mind that counts.

Disney, same way. Disney means something to billions of people. And if you're a parent of a couple young children and you got 50 videos in front of you that you can buy, you're not going to sit down and preview an hour and a half of each video before deciding what one to stick in front of your kids. You know, you have got something in your mind about Disney. And you don't have it about the ABC Video Company. Or you don't even have it about other — you don't have it about 20th Century. You know, you don't have it about Paramount.

So that name, to billions of people, including lots of people outside this country, it has a meaning. And that meaning overwhelmingly is favorable. It's reinforced by the other activities of the company.

And just think of what somebody would pay if they could actually buy that share of mind, you know, of billions of people around the world. You can't do it. You can't do it by a billion dollar advertising budget or a $3 billion advertising budget or hiring 20,000 super salesmen.

So you've got that. Now, the question is what does that stand for five or ten or 20 years from now? You know they'll be more people. You know they'll be more people that have heard of Disney. And you know that there will always be parents that are interested in having something for their kids to do. And you know that kids will love the same sort of things.

And, you know, that — (Munger accidentally knocks over his microphone) — what's? (Laughter)

He emphasizes the key points when we get to those. (Laughter)

But that is what you're trying to think about with a consumption product. That's what Charlie and I were thinking about when we bought See's Candy. I mean, here we were. It's 1972. You know, we know a fair amount about candy. I know more than when I sat down this morning. (Laughs)

I mean, I had about 20 pieces already. (Laughter)

But, you know, what — whose, you know — does their face light up on Valentine's Day, you know, when you hand them a box of candy and say, you know, it's some nondescript thing and say, "Here, honey, I took the low bid," you know, or something of the sort, and — (Laughter)

No. I mean, you want something — you know, you've got tens of millions of people — or at least many millions of people — that remember that the first time they handed that box of candy, it wasn't that much thereafter that they got kids for the first time or something.

So it's — the memories are good. The association's good.

Total process. It isn't just the candy. It's the person who takes care of you at Christmastime when they've been on their feet for eight hours, and people have been yelling at them because they've been in line with 50 people in line, and that person still smiles at them.

The delivery process. It's the shop in which they get all kinds of things, the treat we give them. It's all part of the marketing personality.

But that position in the mind is what counts with a consumer product. And that means you have a good product — a very good product — it means you may need tons of infrastructure, because you've got to have that — I had a case of Cherry Coke awaiting me at the top of the Great Wall when I got there in China. Now that — you've got to have something there so that the product is there when people want it.

And that happened — in World War II, General Eisenhower, you know, said to Mr. Woodruff that he wanted a Coca-Cola within arm's length of every American serviceman in the world. And they built a lot of bottling plants to take care of that.

That sort of positioning can be incredible. It seems to work especially well for American products. I mean, people want certain types of American products worldwide, you know, our music, our moves, our soft drinks, our fast food.

You can't imagine, at least I can't, a French firm or a German firm or a Japanese firm having that — selling 47 or 48 percent of the world's soft drinks. I mean, it just doesn't happen that way. It's part of something you could broadly call an American culture. And the world hungers for it.

And Kodak, for example, probably does not have quite the same — and George Fisher's doing a great job with the company. This goes back before that.

But Kodak probably does not have the same place in people's mind worldwide quite as it had 20 years ago. I mean, people didn't think of Fuji in those days, we'll say, as being in quite the same place.

And, then, Fuji took the Olympics, as I remember, in Los Angeles. And they just — they put them — they pushed their way to more of a parity with a Kodak. And you don't want to ever let them do that.

And that's why you can see a Coca-Cola or a Disney and companies like that doing things that you think, well, this doesn't make a hell of a lot of sense. You know, if they didn't spend this $10 million, wouldn't they still sell as much Coca-Cola?

But, you know, that — I quoted from that 1896 report of Coca-Cola and the promotion they were doing back then to spread the word. You never know which dollar's doing it. But you do know that everybody in the world, virtually, has heard of your product. Overwhelmingly, they've got a favorable impression on them and the next generation's going to get it.

So that's what you're doing with consumer products.

With See's Candy, you know, we are no better — we want — no better than the last person who's been served their candy or the last product they've been served.

But as long as we do the job on that, people can't catch us. You know, we can charge a little more for it because people are not interested in taking the low bid. And they're not interested in saving a penny a bottle on colas. Remember we've talked about in these meetings, private labels, in the past.

And private label has stalled out in the soft drink business. They want the real thing. And 900 and some odd million eight-ounce servings will be served today of Coca-Cola product around the world. Nine-hundred million, you know. And it'll go up next year, the year after. And I don't know how you displace companies like that.

I mean, if you gave me a hundred billion dollars — and I encourage if any of you are thinking about that to step forward — (laughter) — if you gave — and you told me to displace the Coca-Cola Company as the leader in the world in soft drinks, you know, I wouldn't have the faintest idea of how to do it. And those are the kind of businesses we like.

Charlie?

CHARLIE MUNGER: Yeah. I think the See's Candy example has an interesting teaching lesson for all of us.

Warren said we were — it's the first time we really stepped up for brand quality. And it was a very hard jump for us. We'd been used to buying dollar bills for fifty cents.

And the interesting thing was that if they had demanded an extra $100,000 for the See's Candy company, we wouldn't have bought it. And that was after Warren had been trained under the greatest professor of his era, and had worked 90 hours a week.

WARREN BUFFETT: And eaten a lot of chocolates, too. (Laughs)

CHARLIE MUNGER: Yeah. Absorbing everything in the world. I mean, we just didn't have minds well enough trained to make an easy decision right. And by accident, they didn't ask the extra $100,000 for it. And we did buy it. And as it succeeded, we kept learning.

I think that shows that the name of the game is continuing to learn. And even if you're very well-trained and have some natural aptitude, you still need to keep learning.

And that brings along the delicate problem people sometimes talk about: two aging executives. (Laughter)

I don't know what the hell that means as an adjective because I don't know anybody that is going in the other direction. (Laughter and applause)

But you people who hold shares are betting, for a while at least, until younger successors come along, you're betting to some extent on what we'll now tactfully continue to call "aging executives" continuing to learn.

WARREN BUFFETT: Yeah. Well, if we hadn't have bought See's, with some subsequent developments after that because that made us aware of other things, we wouldn't have bought Coca-Cola in 1988. I mean, you can give See's a significant part of the credit for the, I guess, $11 billion-plus profit we've got in Coca-Cola at the present time.

And you say, "Well, how could you be so dumb as not to be able to recognize a Coca-Cola?" Well, I don't know, but —

CHARLIE MUNGER: You were only drinking about 20 cans a day.

WARREN BUFFETT: Yeah. Right. It wasn't that I hadn't been exposed to it, or — (Laughter)

It's amazing. But it just made us start thinking more. I mean, we saw how decisions we made in relation to See's played out in a marketplace and that sort of thing.

And we saw what worked and didn't work. And it made us appreciate a lot what did work and shy away from things that didn't work. But it led — it definitely led to a Coca-Cola. And we've had the good luck to buy some businesses themselves in their entirety that taught us a lot.

You know, we bought — and it's worked in the other direction. I mean, we were in the windmill business, one time. I was. Charlie stayed out of the windmill business. But I was in the windmill business and pumps and — third-level department — or second-level — department stores.

And I just found out how tough it was and how it didn't — you could apply all kinds of energy to them. And it didn't do any good. It made a great deal of sense to figure out what pond to jump in. And what pond you jumped in was probably more important than how well you could swim.

Charlie?

CHARLIE MUNGER: I don't think it's necessary that people be as ignorant as we were, as long as we were. (Laughter)

I think American education could be better, but not in the hands of any of the people who are now teaching. (Laughter)

WARREN BUFFETT: Is there any group we've forgotten to offend? I mean — (Laughter)

18. Life advice: "You will do well in what you enjoy"

WARREN BUFFETT: OK. Zone 2.

AUDIENCE MEMBER: Yes. Good afternoon, Mr. Chairman and Mr. Vice Chairman. My name is Ha Tsin Tsu (PH) and originally from China. Now, I'm living Kansas. And it's my honor to speak to you both.

My question is, if someone like to form a company doing what you did 30 or 40 years ago, what is your suggestion to them? And would you share some of your wisdom with us? Thank you.

WARREN BUFFETT: First thing we'd suggest is they send us a royalty. (Laughter)

Charlie, you take over on that. You've thought more about starting over again than I have. (Laughter)

CHARLIE MUNGER: I want to frankly say that that's a question I ordinarily duck.

I always believe in getting the fundamental mental tools in place. And I always believe in running reality, as it comes in, preferably vicariously through the newspaper, et cetera, instead of through personal painful experience, through the filter of these sound ideas.

And I not only think that that works in life to create success, I think it makes life more fun. So I argue for sound thinking. But the exact specific techniques of turning yourself into another Warren Buffett, I leave to you. (Laughter)

WARREN BUFFETT: Well, the one thing I would advise is I would be — A, I think there's a ton of opportunity out there. And I would do something I enjoyed. I wouldn't do something because I thought it was going to get me to a life I was going to enjoy later on, because if I made a lot of money I was going to be a lot happier, or anything like that.

I've never done that. And I think that you will do well in what you enjoy. And I think it's crazy in life to endure a whole lot that — I don't mean — Charlie and I worked in a grocery story. We didn't really jump up and down over it all the time.

But in terms of making a commitment to really being a business that you're only in it for the money, I think that's crazy.

And if we were in this only for the money, you know, we'd have quit a long time ago, obviously.

It just — you ought to have fun while you're doing it. It should not be jam tomorrow and not jam today. It just doesn't make any sense to me. And I think you'll get better results that way, too.

19. Buffett rejects criticism of Disney over same-sex benefits

WARREN BUFFETT: Zone 2? Or did we just do zone 2? I think we did. Yeah. It'd be zone 3.

AUDIENCE MEMBER: Dave Youberg (PH) from Sac City, Iowa.

And I must —

I haven't heard you on the moral and ethical considerations of stocks like ABC and Disney. They are now getting more and more criticism from mainstream religious groups in this country, main — their reliance on sex and violence and their cronyism — homosexuality — and —

VOICE: Did they hear it? I couldn't hear it.

(Scattered applause)

WARREN BUFFETT: I didn't — we didn't cut anybody off there.

CHARLIE MUNGER: (Inaudible)

WARREN BUFFETT: What?

The — what I would — I would say, you know, I'm delighted to have my grandchildren exposed to the full range of Disney product. (Applause)

You know, I'd love to take them to Disneyland or Disney World or take them to Disney movies or Disney videos. You know, I think the Disney Company is being run in an absolutely first-rate way. And I have no problem whatsoever with gays being employed or receiving benefits or anything of the sort. (Applause)

20. We don't care who is buying or selling securities

WARREN BUFFETT: Zone one?

AUDIENCE MEMBER: Good afternoon, Mr. Buffett. Good afternoon, Mr. Munger. My name is Bashir Narema (PH) from Arlington, Texas.

I see in the USA Today article about the shortage of labor in the state. And I was wondering when you analyze a company, do you take that into consideration by choosing companies who are not dependent so much on labor?

The second question is, I heard you in the beginning of the meeting that so much capital coming from foreign country, you mentioned so many different country, who buy — who bought the Berkshire Hathaway. And I'm sure they buy all companies in the Dow.

Do you feel like the analyst who analyze the Dow had that into consideration that the Dow now is becoming as the Walmart of the security business in the world, where all the national different country, they bypass their market and they come in and buy in the United States.

And as a result that the idea of [Federal Reserve Chairman] Mr. [Alan] Greenspan, as far as exuberant, it's moot because if you remember how the Japanese were when they start to buy the real estate in America, they force us to pay high premium for the price. And I think that's what's going to happen in the market. And we, as Americans, who've been accustomed to low P/Es, now we're going to miss on and the price is going to continue going up.

And the third question is —

WARREN BUFFETT: Maybe we better stop at two. (Laughs)

AUDIENCE MEMBER: Alright. Thank you.

WARREN BUFFETT: OK. Thanks.

We pay very little attention — we don't pay any attention — to capital flows. In other words, we don't really care who's buying or selling any securities. Somebody is buying or selling each one.

So, obviously, there's, you know, you could focus on the buyers. You could focus on the sellers. But — you can say now that there's 20 billion a month or so going into equity funds and all.

But it doesn't make any difference to us. All we're interested is what the business is worth. And what people are paying attention to, in terms of capital flows or whatever — or market signals or whether the Fed's going to move, that all changes.

Do you remember ten years ago, it was, you know, it was M2 that everybody — every — whatever day of the week it was, you know, what's M2 this week?

I always thought of having a mystery, you know, about whatever happened to M2? (Laughter)

There's always something that people are talking about. There's so much time to fill with chatter, you know, and pages to fill, that they write about all these things that, to us, don't make much difference, because we don't care if the market closes for the next five years.

We care how much Coca-Cola has sold five years from now, and what percentage of the world market they have, and what they're charging for it, and how many shares are outstanding, and that sort of thing.

But we just — we don't care who's buying or selling it in the least, except we like it when the company's buying it.

The same way with Gillette. We care about whether people are trading up in the shaving experience.

So capital flows and all of those macro factors that people like to write about a lot just have nothing to do with what we do. We're buying businesses.

And I really think it is not a bad mindset, whenever you buy a stock to say, "Would I be happy buying this stock if the market closed for five years?" Because then you're buying a business, if you say yes to that. If you don't say yes to that, you may not be focusing on the proper thing.

By its nature, the U.S. is running a substantial trade deficit, merchandise trade deficit.

If you buy more from the rest of the world than you're selling them, which is what happens when you're running a trade deficit, you have to balance the books. I mean, they get something in exchange. And what happens is they get some sort of capital asset in exchange.

They may get a government bond. They may get a piece of the U.S. business or something. But the key thing in economics, whenever somebody makes some assertion to you about economics, you always want to say, "And then what?" In fact, it's not a bad idea to say that about everything in life. But you always have to say, "And then what?"

So when you read that the merchandise trade deficit is nine billion, what else does that mean? Well, it means that somehow we have to have created nine billion of capital assets, claims on our production in the future, with somebody else in the world. So they have to invest. They don't have any choice.

When somebody says, "Won't it be terrible if the Japanese sell all their government bonds?" They can't sell all their government bonds without getting something else in exchange, you know, they get some other American asset in exchange because there's no other way to do it. They could sell it to the French. But then the French have the same problem.

So trace through where the transactions go anytime someone starts talking about one specific action in economics.

21. "We like a business with low labor costs"

WARREN BUFFETT: Question about labor. Generally speaking, obviously, we like a business with low labor costs. But we like a business with low costs of every kind, I mean, because the rest is profit.

So it would be true that on balance we would not be high on labor-intensive companies. But there's some very good businesses that are labor intensive.

(BREAK IN TAPE)

WARREN BUFFETT: But if you say, "Would I rather have a labor intensive business or a non-labor intensive business and everything else is equal," the answer is the less labor intensive business. Charlie, you want to comment on either one?

CHARLIE MUNGER: No. I don't think I've got anything more. (Laughter)

22. Subsidiaries make own decisions on accepting American Express

WARREN BUFFETT: Area two?

AUDIENCE MEMBER: First, I'd like to thank you both for being so generous with your time and with your ideas for us today. (Applause)

WARREN BUFFETT: Thank you.

We get paid by the hour, so — (Laughs)

AUDIENCE MEMBER: Well, I'll try and talk quickly then.

WARREN BUFFETT: Oh no. (Laughs)

AUDIENCE MEMBER: My name is Bob Costa (PH) from Evansville, Indiana. I've been a shareholder for four years.

This is my first visit to Omaha. And I went to the mega mart. And I actually bought something there. And I tried to pay for it with American Express card.

WARREN BUFFETT: Uh huh.

AUDIENCE MEMBER: And they told me, just like the ad, you can't use it here. I hope you'd both comment on that or at least one of you.

But my real question is that I just stumbled across the idea of intellectual capital and how that might be useful in valuing a business. And I was hoping that one or both of you could clarify that for me and whether that's useful to us as investors or just another academic theory that we'd be better off ignoring.

WARREN BUFFETT: Yeah. Harvey Golub, who runs American Express and has done a terrific job of running it, has written me about the Furniture Mart as well as about See's.

And we, basically, let our managers run their own businesses. So, the people at each entity — Borsheim's takes American Express. Others of our businesses do, too. We let every manager make his decisions.

As soon as I start telling the managers that they ought to, say, take American Express or not take Visa or whatever it may be, you know, at that point, they've lost some of the responsibility for their operations and, perhaps, to an extent even, you know, some of the pride that comes from running them.

Most of our managers do not need to work for a living. They run their businesses for the same reason Charlie and I run Berkshire. They love doing it. They jump out of bed in the morning because it's exciting to do.

And the one thing that would keep the two of us, or drive the two of us away from Berkshire, is if we were getting second-guessed all the time or somebody else was telling us when to swing or not to swing.

We would have no interest in running it. We'd go run — we'd do something else then. And maybe our other managers aren't as extreme as we are in that respect. But we feel they've built successful businesses. They know how to do it.

We do allocate the excess capital they generate. But aside from that, we really let them make their own decisions. So we have no companywide policy on virtually anything that I can think of, except send money to Omaha. (Laughter)

But — and, you know, we're delighted to have American Express give the Furniture Mart the reasons why the Furniture Mart will be better off using American Express. And my guess is they have some very good reasons.

But they're going to have to sell them on that, and just like any vendor of anything has to sell each operation. We wouldn't tell the people at See's who to buy the nuts from, or who to buy the container from, or anything of the sort, how to design the stores, or whatever it may be. And that's just the Berkshire philosophy on that.

Charlie, you want to comment?

23. Berkshire's intellectual capital is its managers

CHARLIE MUNGER: Yeah. Let me shift to intellectual capital.

Berkshire has a lot of intellectual capital in these very able executives in the various businesses. And we hope we've got some intellectual capital in the few hundred square feet at headquarters. (Laughter)

But we are not in the business of designing oil refineries with armies of engineers, or developing software with armies doing complicated accounting work all over the world. We just haven't drifted into that kind of a business.

And intellectual capital has gotten to be a new buzzword, because we've now developed huge businesses, like Microsoft, which really didn't exist on that scale not so very long ago.

And so people have suddenly realized, my God, there's really a lot of money in the aggregation effects and momentum effects when you get a bunch of really bright people working in the same direction. And that's what's made the concept so fashionable.

By and large, we've avoided the field. Again, it's hard for us to understand.

WARREN BUFFETT: Yeah. We look for brains and energy and integrity in people that we work with. And if you get that combination and you're in a decent business, you know, you can own the world.

And, you know, whether you call it intellectual capital or anything — you know, you can stick the names on it. And that's who we try to associate with. I mean, it's a lot easier than doing it yourself.

And when we get, in our own businesses — you saw that group there at the end of the movie — I mean, that's a huge asset to Berkshire.

They talk about getting into accounting for it. That's nonsense in my view. I mean, you don't need to do that. But you should pay for it. And you should pay for it as shareholders. You should pay for it as managers.

When we get people, you know, whether it's Tom Murphy, or Al Zeien at Gillette, or Roberto Goizueta, or Michael Eisner, I mean, those people have added billions of dollars of value.

And, it's just — you know, that's who we want to be associated with. And we don't want to be associated with the mediocre managers because the difference is just — is huge.

But we don't go through an elaborate exercise. We just recognize the people that have got those — we think we — we try to recognize the people who have got those qualities. And, then, we — and then if they're in a good business and they've got those qualities, we want to take a big bite.

CHARLIE MUNGER: But take intellectual capital. People think patents. They think copyrights. Patents and copyrights have gotten to be way more valuable, as a percentage of the investment assets of the world.

And so people are very much more interested in intellectual capital.

Think of the great drug companies and how small they were 20 years ago and how everything they have is, basically, intellectual capital. It's the few products that have — that really work that have the patents. But by and large, we're not in drug companies.

WARREN BUFFETT: No. But that's — there are different forms — as Charlie said, there's businesses you sort of think of that way as their whole being being intellectual capital.

But I would argue that when Roberto Goizueta, 15 years ago, saw how to make the future of Coke — same product — dramatic — and basically the same system, although it required some changes — but saw how to make that dramatically more valuable by doing a lot of little things over a long period of time and doing them consistently and not getting his eye off the ball.

Michael Eisner did the same thing. Disney hadn't gone anyplace, you know, in the 15 years or so after Walt died. Now, you know, we all knew who Mickey Mouse was and everything. But Michael really saw what the future should be. And he still does, you know.

And you say it's easy when it's all over. But how many people were doing something about it at the time? The place was languishing, basically, 15 years ago. They had the assets.

And, to me, that's — you know, it's different than what Bill Gates does or Andy Grove does. But it's our form of intellectual capital. And it's what we can understand better.

24. "Mistake" to not buy pharmaceutical stocks

WARREN BUFFETT: Zone, what do we have? Three.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, my name's Will Jacks. (PH) I'm from Chicago, and I'm a happy shareholder.

I, first, want to thank both of you for the unusual privilege you give us for your time and your expertise. This is very unusual. And I think it's to be commended. (Applause)

And my question has to do with one of the major American industries that, unless I missed something in the reading, that is the pharmaceutical industry, the companies that make medicines.

I wonder under what circumstances you might consider those industries for investment by Berkshire Hathaway?

WARREN BUFFETT: Well, those industries — the pharmaceutical industry's, obviously, been a terrific industry to invest in.

We have trouble, or at least I have trouble, distinguishing among the companies, in terms of seeing which ones, ten years from now, might be the best ones to be in.

I mean, it's easy for me to figure out that Coca-Cola's the soft drink company to be in, or Gillette is the shaving company to be in, or Disney's the entertainment company to be in, than it is for me to figure out which one in the pharmaceutical.

But that — I'm not saying you can't do it. I'm just saying that that's difficult for me.

We have — we started buying one of them a couple of years ago. And we should've continued, but we didn't because it went up an eighth, and — (Laughter)

Your chairman was a little reluctant to follow it, a terrible mistake.

But I would say the biggest — and we could've bought the whole industry and done very well at various times, particularly when the threat of — what people thought was the threat of the Clinton health program cast a big cloud over the pharmaceutical industry.

That was the time you could've just bought the whole industry and done very well. We didn't do it. It was a mistake.

Charlie?

CHARLIE MUNGER: Well, it's hard to think of any industry that's done more good for consumers, generally. When you think of the way children used to die and now, they very seldom die. And it's been a fabulous business. And it's been one of the glories of American civilization.

But it's — we've admired it. But we haven't been part of it.

WARREN BUFFETT: We've missed a lot of things. And I'm dead serious about that. And we've missed things that should not have been beyond our capacity to grasp. A lot of things that should be beyond our capacity to grasp, but there's some that haven't been. And we've just plain missed them.

25. Munger: Good general education helps investors

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Hello. I'm another Chicagoan, (inaudible), and a share owner.

This question is directed, first, to Mr. Munger, and then to Mr. Buffett.

Mr. Munger, I am intrigued by your marshalling of the Commodore [Cornelius Vanderbilt] and Aristotle to support your points. Very few of today's money managers would, or could, do that.

Could you elaborate on what role a study of history of civilization plays in developing a sound investment philosophy? Thanks.

CHARLIE MUNGER: Well, I don't want to praise Aristotle too much. You know, he was the one who thought that women had a different number of teeth from men — (laughter) — and never looked in his wife's mouth. (Laughter)

WARREN BUFFETT: Maybe his wife did. (Laughter)

CHARLIE MUNGER: I'm all in favor of a good general education. And I think it helps investment performance. And it helps business performance. And it helps one be a better citizen.

And some of the things people say are quite memorable. And therefore, they're helpful to the mind by the very ease of which they're remembered.

And I think you'd be surprised how many bright investment professionals could talk a lot about Aristotle, or even people I can't stand — (laughter) — like [German philosopher Georg Wilhelm Friedrich] Hegel.

WARREN BUFFETT: You want to quote a little more from anybody to reinforce your —? (Laughs)

CHARLIE MUNGER: One of my favorite quotations in the whole world is from Einstein. He says everything should be made as simple as possible, but no more simple. And I think that describes the reality that we all face.

WARREN BUFFETT: Charlie's favorite, though, is Ben Franklin. That's probably true, isn't it, Charlie?

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: We get more from Ben than anybody else. "Keep thy shop and it will keep thee," that sort of thing. I mean, we're just — we're loaded with that stuff. (Laughter)

CHARLIE MUNGER: "Three removes are as good [bad] as a fire."

"It's hard for an empty sack to stand upright." (Laughter)

That's the bible around Berkshire.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: I once heard Warren say, "The reason I'm so financially conservative is I don't want to find out how badly I might behave if I were stretched." (Laughter)

WARREN BUFFETT: I think we better cut him off here. (Laughter)

26. "Why risk losing what you need and have for what you don't need and don't have?"

WARREN BUFFETT: Zone 2.

You better cut the thumping there.

CHARLIE MUNGER: Yeah. (Laughter)

AUDIENCE MEMBER: My name is Stanley Watkins and — from Manhattan, Kansas. And I'm a shareholder. And I have two questions.

And the first one, I know the answer. So you can just say yes or no. (Laughs)

Would you consider investing in indexes such as OEX? Pure speculation, you're going to say yes.

And number two, would you encourage investors to, if they were trying to get a lot of their investment, to use LEAPS on investments such as Coca-Cola instead of buying the stock?

WARREN BUFFETT: Use what on? I missed that —

CHARLIE MUNGER: LEAPS.

WARREN BUFFETT: Leak?

CHARLIE MUNGER: LEAPS, L-E-A-P-S.

WARREN BUFFETT: Oh, I see. We're still on options.

CHARLIE MUNGER: (Inaudible)

WARREN BUFFETT: Oh yeah.

WARREN BUFFETT: Both the questions relate to futures of one sort, calls, or whatever they may be, and —

I think that investors should stick to buying ownership in businesses. It's not that you can't come up with a theoretical argument for buying, say, a —

I mean, if you think Coca-Cola's attractive, you can say, well, I'd rather buy a five-year option on Coke than buy the stock directly because it introduces leverage without the risk of going broke.

But I think that that's a dangerous path to start down, because it —

If it works well, it's so — it's dynamite to start playing with things that can expire and become worthless, or can be bought with very low margin, as the OEX options you were talking about.

Borrowed money usually — or frequently — leads to trouble. And it's not necessary.

I mean, if you had some compelling reason — if you're going — if you had to double your money by the end of the year or be shot, you know, then, I would head for the futures market because, you know, you need to do it. I mean, you have to introduce borrowed money.

But you really ought to figure out how you can be happy with the present amount of money you've got and, then, figure that everything else is, you know, all to the good as you go along, and —

I don't think people — once they start focusing on short-term price behavior, which is the nature of buying calls, or LEAPS, or speculating in index futures, once you start concentrating on that, I think you're very likely to take your eye off the main ball, which is just valuing businesses. I don't recommend it.

Charlie?

CHARLIE MUNGER: Well, this is a group of affluent investors. I don't think many of them did it in LEAPS. (Laughter)

WARREN BUFFETT: Yeah. It's certainly true. If we'd operate Berkshire with considerable borrowed money over the years, you know, it would've done very much better than it has.

But nobody knew what that amount of borrowed money would have — the appropriate level would have been.

And it wouldn't have made any difference to us. I mean, we have just as much fun doing what we've done than if we'd owned it on leverage and had it been twice as much. I mean, it just — it's just — it's not the way we approach it.

If you have X and you think you're going to be way happier when you've got 2X, it's probably not true.

You really ought to enjoy where you are at a point. And if you can make, you know, if you can make 12 or 15 percent a year, and you desire to save, and you like piling it up, you know, it'll all come in time.

And why, you know, why risk losing what you need, you know, and have, for what you don't need and don't have? It's never made a lot of sense to us.

CHARLIE MUNGER: Warren wrote a letter when they were developing the security options businesses. And he urged the civilization not to allow the new exchanges. And you can see how much attention they paid to him. (Buffett laughs)

WARREN BUFFETT: The usual amount.

CHARLIE MUNGER: Yeah, right.

27. Haven't looked at hazardous waste business, but have seen toxic waste in markets

WARREN BUFFETT: Area 3?

AUDIENCE MEMBER: Hi, my name's Greg Collart (PH), a shareholder from Calgary, Canada, the home of Bre-X Minerals. (Laughter)

My question for you is, the companies in the hazardous waste disposal industry have underperformed the market for about a decade now. Do you see any value in that area?

WARREN BUFFETT: We've never looked at that business. I'm familiar with the names of the companies. But that's been a business that I've never looked at.

And maybe Charlie knows more about it than I do. He almost has to. (Laughs)

CHARLIE MUNGER: No. We have never really looked at the hazardous waste business.

We've observed a lot of toxic waste in the securities market. (Laughter)

Maybe we'd get our fill that way. (Laughter)

28. Lesson of State Farm's improbable success story

WARREN BUFFETT: Area one.

AUDIENCE MEMBER: My name is Hugh Stephenson. I'm a shareholder from Atlanta, Georgia. My question involves GEICO.

If I remember correctly from last year, GEICO had about 2 percent of the insurance market and had approximately $4 billion in float.

My question is, as their market share expands, will the float, in your expectation, expand in a somewhat linear fashion?

And related to that, what is your guess might be the top end? Could they ultimately become as dominant as a Gillette or a Coke and their businesses?

Or is the nature of it such that, you know, they might stop at ten percent of the market or 15 percent when they start to hit a significant hurdle?

And second, to follow up on this other gentlemen's question, if you don't adjust for risk by using higher discount rates, how do you adjust for risk? Or do you?

WARREN BUFFETT: Well, the second question: we adjust by simply trying to buy it at a big discount from that present value calculated using the risk-free interest rate.

So if interest rates are 7 percent and we discount it back to flows — which Charlie says I never do anyway and he's correct — but in theory, if we discount them back at 7 percent then we would look at a substantial discount from that present value number in order to warrant buying.

The question about GEICO: the float will grow, more or less proportionately, to premium volume. There's a moderate amount of our float, a very small amount of the float, that's accounted for by some discontinued lines from the past. And, of course, that won't grow the same way.

But if we double the size of GEICO on premium volume, we'll come close to doubling the size of the float.

You know, the history of auto insurance is quite interesting. It's something that isn't studied at business schools and should be studied, because the great insurance companies of the early 1900s were, you know — whether it's Aetna, Hartford, Travelers — they had these agency forces nationwide, and wrote what was then more property business.

They wrote a lot of fire business in those days. And, of course, the automobile only came in, you know, in the early 1900s. And so their orientation was to property business.

But they had this huge agency force throughout the United States. There were property insurance agents representing these big companies in every — throughout the country. And they had lots of capital.

And now, if you look at the business in 1997, something well over 20 percent — probably close to 25 percent — of the personal, auto, and homeowners business in insurance is written by a company called State Farm.

And State Farm was started, I believe, in the '20s, by a fellow in Bloomington, Illinois with no capital to speak of, no agency force initially, and started as a mutual company, no incentive, I mean, no stock options, no capital invested where he could become a billionaire if he built the business up or anything.

So here this company starts without any of the capitalist incentives that are we are taught are essential to a business growing, and in a huge industry, becomes the dominant player — has more than twice the market share of Allstate, the second player — becomes the dominant company against these extremely entrenched competitors with great distribution systems and loads of capital.

Now I say that's — and incidentally, State Farm, on the Fortune 500 list of companies, has the third largest net worth of any company in the United States. Number three from Bloomington, Illinois with a guy with no money in it.

Now, how does that happen? Well, I would say that's a subject worth studying, you know, in business schools, because it —

You know, Darwin used to say that any time he got any evidence that flew in the face of his previous convictions, he had to write it down in the first 30 minutes or the mind was such that it would reject contrary evidence to cherished beliefs.

And certainly, there's some cherished beliefs around business schools that might, at least, find some interesting aspects in studying how a company could become the third largest company in net worth in the country with no apparent advantage going in.

There’s another company down in Texas called USAA, United States —

It’s for the United Services Auto Association. And it’s been enormously successful, has billions of net worth, loads of satisfied policy holders, the highest renewal ratio among policy holders in the country. Nobody studies that, to my knowledge, either.

The people who started GEICO came from that company. In 1936, Leo Goodwin and his wife, who had worked for USAA, went over and started this little GEICO company with practically no capital. And, now, it’s — we have about 2.7 percent of the market. And we’re — we’ll write probably 3 1/2 billion of voluntary auto this year.

Catching a State Farm is going to be very difficult. So I wouldn’t want to predict we’d do that. I will predict that we will gain very materially in market share over the next ten years. And we’ll gain materially this year. But we will — we have got a very good mousetrap.

I said in the report that 40 percent of you would save money insuring with — I didn’t say a hundred percent or 80 percent or 60 percent, because there are areas and professions where somebody else is going to have a lower price than we are.

But across the country, we are going — and for all classes of citizens — we are going to have a low price — the low price — more often than anyone else.

And we’ve got that because we’ve got low costs. And our costs are going to get lower. And we’ve got a virtuous circle going, in terms of it feeding on itself.

So GEICO will grow a lot. But I — State Farm is plenty tough. So I’m not going to predict catching State Farm. I’m not even going to predict catching Allstate. But we’ll catch somebody.

And Charlie, you want to say anything more?

CHARLIE MUNGER: Well, I love your example of State Farm. I mean, the idea of picking some extreme example and asking my favorite question, which is what in hell is going on here — (laughter) — that is the way to wisdom in this world.

And it is too bad. A lot of the mutual companies are now trying to demutualize, helped by a bunch of consultants and so forth.

And they are not looking at State Farm. They’re looking at some other model, and —

Everybody can’t be a State Farm. That place got some fundamental values into its operating mechanics, the way it selected personnel, the way it selected agents, the way it discarded agents. It was huge discipline, wouldn’t you agree, in that operation?

WARREN BUFFETT: Yeah. Somebody would — you would say somebody had to do something very right. But the question — I don't know anybody studying what they did that was right.

You know, they don't want to because it doesn't fit the pattern. And you know, when something like a State Farm happens in this world, you should try to understand it.

When something like a GEICO happens in this world, you should try to understand it.

In 1948, I think it was two-thirds or three-quarters — I think it's two-thirds — of GEICO was for sale because the fellow that had originally backed these two people from USAA died. And so they had the stock for sale in 1948.

You couldn't sell it. That's how Ben Graham ended up buying it for Graham-Newman, because they hocked it all over for six months. They went to all the big insurance companies. And the insurance companies, who could see this company on a very, very tiny scale offering a product for way less money and making lots of money doing it, they simply couldn't shake themselves loose from the mists of the past to step up and buy it.

They could've bought it for a million-two-hundred-thousand dollars, as I remember, and owned the whole company. And instead, they've watched their own distribution system get their heads beaten in, you know, over the years. And all the time, you know, with these ideas from the past.

So you have to be very careful to look hard at what's really happening. You know, as Yogi Berra https://en.wikipedia.org/wiki/Yogi_Berra said, "You can observe a lot just by looking." (Laughter)

29. Love it when a wonderful business buys back its stock

WARREB BUFFETT: OK. Zone one?

EVERETT PUREE: I'm Everett Puree (PH) from Atlanta, Georgia. And I wanted to ask you if you could comment on the matter of intrinsic value as it applies to some of "The Inevitables," given that the overpayment risk now is high and the share repurchases that are going on there.

WARREN BUFFETT: Yeah. Well, we won't stick a price on them. We just — we tell you that they are absolutely wonderful businesses run by sensational people, and that they are selling at prices that are higher than they sold at most of the time. And then — but that — you know —

They may be — they may well be worth it and worth a lot more, even in terms of present terms. Or it may turn out they're a couple years ahead of themselves. We don't know the answer to that. We know we're very happy owning them.

Gillette does not repurchase its shares, or hasn't in any significant quantity for many years. Coke consistently repurchases its shares.

We generally like the policy of companies that have really wonderful businesses repurchasing their shares.

There aren't that many super businesses in the world. And the idea of owning more and more of a company like that over a period of time has an appeal to us, and almost an appeal regardless of price.

The problem is that most companies that repurchase their shares, you know, are so-so — are frequently — so-so businesses. And they're being done for motivations other than intensifying the interests of the shareholders in a wonderful business.

But we really know you have a wonderful business. And we think most of the ones we own are anywhere from extremely good to wonderful. We think it usually makes a lot of sense.

It's hard to do things intelligent with money in this world. And Coke has been very intelligent about using their capital to, particularly, to fortify and improve their bottler network around the world. I mean, they've done a terrific job that way. That was a neglected area for a long time. And that comes first.

But there's only so far you can go with that — and to enhance the ownership of the shareholders in a company like Coca-Cola — when we bought our first Coca-Cola in '88, we bought about 6.2 percent of the company. And at that time, they may have been 600 million servings — not any more than that — a day. So we had an interest in 36 or 37 million servings.

Now we have 8 percent of 900 million-plus. So we have an interest in 75 million or so servings a day. Seventy-five million people are drinking Berkshire Hathaway's share of Coca-Cola products today, in an eight-ounce serving. And you know, the profit's gone up a little per serving.

So that gets pretty attractive. And we'd just as soon they keep doing that.

30. Coca-Cola history lesson: "One of the dumbest contracts" ever

WARREN BUFFETT: The bottling thing's actually kind of interesting. And a fellow from Omaha — or at least lived in Omaha for a long time — Don Keough, had a lot to do with this. And Roberto had plenty to do with it, too, obviously.

But Candler — Asa Candler — back in the late 1880s, in a series of transactions — I think some of it's a little fuzzy, exactly, as to the timing of them — but he essentially bought the whole Coca-Cola Company for $2,000. And that may be the smartest purchase in the history of the world.

And, then, in 1899, I believe it was, a couple of fellows from Chattanooga came down. And in those days, soft drinks were sold over the counter to people in drug stores, primarily. But there was a little bottling going on. There already was somebody bottling in Mississippi, as I remember.

But a couple fellows came down. And they said, “You know, bottling’s got a future. And you’re busy on the fountain side of the business. So why don’t you let us develop the bottling system?”

And I guess Mr. Candler didn’t think much of bottling. So he gave them a contract, in perpetuity, for almost all of the United States, for a dollar he sold it to them, and gave them the right to buy Coca-Cola syrup at a fixed price forever.

So Asa, who had scored with his $2,000 — (laughs) — in a rather big way, managed to write what — you know, it’s easy for us to look back — but certainly looks like one of the dumbest contracts in history. (Laughs)

And, of course, as the years went by, and particularly around World War II when the price of syrup was — the primary ingredient, in terms of cost, in syrup was sugar. And sugar went wild during and after World War I in price. And so here was a guy that, in effect, had contracted to sell sugar at a fixed price forever.

And he’d also given these people perpetual rights and so on. In those days, they sold the subrights to bottler contracts. And those were usually the distance that a horse could go in a day and come back. That was sort of the circle that you gave people.

And the Coca-Cola Company was faced, over the years, with a problem of having the bottling system, which soon became the dominant system for distribution of Coke, being subject to a contract where there was no price flexibility and where the contracts ran in perpetuity.

And, of course, every bottler on his death bed would call his children, his grandchildren around. And he propped himself up and croak out in his last breath, you know, “Don’t let them screw with the bottling contract.” You know, and then he’d croak. (Laughter)

So the Coca-Cola Company faced this for decades. And they really couldn’t do much about that bottling system for a long time.

And Roberto and Don Keough and some other people spent 20 or 25 years getting that rationalized. There were lawsuits back in the ’20s and some things. But it was a huge project. But it made an enormous difference over time in the value of the company.

And that’s what I mean when I talk about intellectual capital, because you know you aren’t going to get results on that in a day, or a week, or a month, or a year, if you set out to get that all rationalized. But they decided that to get the job done, they had to do this.

And that took capital. And they used capital to get that job done. But they used capital beyond that to repurchase shares in a big way. And it's been very smart. And I hope they keep — you know, I — they are repurchasing shares, probably, as we talk. And that's fine with me.

Charlie?

CHARLIE MUNGER: Well, I do think Coca-Cola Company is one of the most interesting cases in the history of business. And it ought to be way more studied than it is. And there's just lesson after lesson after lesson in the history of the Coca-Cola Company. But it's too long a story for today. (Buffett laughs)

31. Wesco is part of Berkshire due to "historical accident"

WARREN BUFFETT: Section two?

AUDIENCE MEMBER: I'm Jolene Crowley (PH) from San Diego. And I want to say I feel very lucky to be here today. When I tried to buy my first Baby Berkshire share last year, my stockbroker, who's a value investing devotee, tried to talk me out of it, telling me that it was overvalued. So I feel lucky to be here.

I've recently also discovered Wesco stock. And I'd like you to explain to me the ownership and management relationships between Berkshire Hathaway and Wesco, and how you use them together.

And since I may not understand the answer to that question, could you just tell me, is it possible that buying Wesco today at about $20 a share is like buying Berkshire Hathaway was 20 years ago?

CHARLIE MUNGER: Well, if you could buy Wesco today at $20 a share, you should buy all you can.

WARREN BUFFETT: (Laughs) No, no —

AUDIENCE MEMBER: Beg your pardon. Two —

WARREN BUFFETT: Two-hundred dollars a share.

AUDIENCE MEMBER: Two-hundred.

WARREN BUFFETT: Yeah. Charlie is — (laughter) — chairman of Wesco. And why don't you talk about it first, Charlie?

CHARLIE MUNGER: Wesco's 80 percent owned by Berkshire. And in terms of operating businesses now, it's got two. And it has an immense percentage of its net worth in marketable securities in its insurance subsidiary.

It's a very quiet company. And as the chairman of Wesco, I have always delighted in saying that we have way less human value in the executive staff than Berkshire Hathaway does.

It's a — it's a — what is it Daniel Webster said about Dartmouth? He says, "A small school but there are those who love her."

Well, Wesco's a small place. And it's there in Berkshire as sort of an historical accident. But the main current of Berkshire is right here in the Berkshire shares.

WARREN BUFFETT: Yeah. I don't know which one I would rather buy at present prices. I mean, I think it's — you could flip a coin.

It does not have dramatically better growth potential just because it happens to sell at $200 a share instead of 38,000 a share than Berkshire. I mean, I think the prospects, probably, are relatively close between the two.

And they're run by the same people, pretty much, in effect. Charlie may spend a little more time on Wesco than I do, but — they are — they've got the same prospects.

But one problem that Wesco would have is that if people — and this is not a huge problem — but if people want to do a share exchange deal, they're going to want to do it, probably, with Berkshire rather than Wesco.

At Wesco, we have small acquisitions in fields we knew — Wesco's a logical place to put them unless they happen to be in areas that Berkshire's already in. And for the really large things, you know, Berkshire can do them and Wesco can't.

But there's nothing — I don't think there's anything significantly superior or inferior about investment in Wesco compared to Berkshire.

CHARLIE MUNGER: Well, the long-run record of Berkshire is better.

WARREN BUFFETT: Yeah.

The one thing — It is a mistake to think that just because it's cheaper per share on a dollar price that it's got way more potential, I think, because that just isn't the case.

A very large percentage of Wesco's value is represented by its interest in Freddie Mac. And a very large percentage of Berkshire's interest is represented — Berkshire's value — is represented by an interest in Coke, for example.

So there's different emphasis between the two places. I think Wesco owns some Coke. And Berkshire owns some Freddie, but in different proportions. That's an historical accident.

We'd love to see them both do well, obviously. There's another family that's in Wesco that we like a great deal. And we would hope that Wesco would perform as well or better than Berkshire. It's performed fine over the years. But it hasn't performed quite as well as Berkshire.

32. How Buffett surpassed Benjamin Graham

WARREN BUFFETT: Area 3?

AUDIENCE MEMBER: Yes. Hi. It's Jeff Hawthorne (PH), Toronto, Canada.

Mr. Buffett and Mr. Munger, you're both a positive influence on all of us and our generations to come. There were a few significant individuals that had helped to guide your way in the beginning.

Could you please share the current percentage of impact and evolution on your investment philosophy and approach between Graham-Dodd's — Graham and Dodd's versus Philip Fisher, and comment on each please.

WARREN BUFFETT: Charlie, you want to —? If you've got it worked out there. Calibrate —

CHARLIE MUNGER: Weren't you —

WARREN BUFFETT: Do you want that to tenths of a percent or hundredths of a percent? (Laughs)

CHARLIE MUNGER: You were closer to Ben Graham.

WARREN BUFFETT: Yeah. Well, Ben — yeah — things would've happened — good things would've happened with following either party irrespective the other.

Graham, obviously, had way more influence on me than Phil. I worked for Ben. I went to school under him.

And his — what I call the three basic ideas that underlie successful investing — which is to look at stocks as businesses, and to have the proper attitude toward the market, and to operate with a margin of safety — they all come straight from Graham. I didn't think of any of those.

And Phil Fisher opened my eyes more to the idea of trying to find the wonderful business.

Charlie did more of that than Phil did, actually, so you'd have to put Charlie —

But Phil was espousing that entirely. And I read his books in the late ’50s, early ’60s. So, you know, I — Phil’s still alive as you know. And, you know, I owe Phil a lot. But I — it doesn’t compare to what I owe Graham.

And that, in no way, reflects poorly on Phil. Ben was one of a kind.

Charlie?

CHARLIE MUNGER: Ben Graham was a truly formidable mind. And he also had a clarity in writing.

And we’ve talked over and over again about the power of a few simple ideas thoroughly assimilated. And that happened with Graham’s ideas, which came to me indirectly through Warren, but also some directly from Graham.

The interesting thing for me is to watch Buffett the former protégé — and by the way, Buffett was the best student Graham had in 30 years of teaching at Columbia. And — but what happened — and since I knew both men — was that Buffett became way better than Graham.

That is a natural outcome. It’s what Newton said. He said, “If I’ve seen a little farther than other men, it’s by standing on the shoulder of giants.”

And so Warren may have stood on Ben’s shoulders, but he ended up seeing farther. And no doubt, somebody will come along in due course and do a lot better than we have.

WARREN BUFFETT: I enjoyed making money more than Ben. I mean, candidly.

With Ben, it just — it really was incidental, at least by the time I knew him. It may have been different when he was younger. But it just didn’t — the process didn’t — of the whole game did not interest him more than a dozen other things may have interested him.

With me, I just find it interesting. And therefore, you know, I’ve spent way more — a way higher percentage of my time thinking about investing and thinking about businesses. I’ve probably thought way more about businesses than Ben ever did. He had other things that interested him.

So I’ve pursued the game a little — quite a bit — differently than he did. And therefore, measuring the record is really — the two records — it’s not a proper measurement. I mean, he was doing victory laps while I still thought I was out there running against, you know, the whole field.

CHARLIE MUNGER: But Graham had some blind spots, partly of sort an ethical professorial nature. He was looking for things to teach that would work for every man, that any intelligent layman could learn and do well.

Well, if that's the limitation of what you're looking for, they'll be a lot of reality you won't go into, because it's too hard to figure out and too hard to explain.

Buffett, if there was money in it, had no such restriction. (Laughter)

WARREN BUFFETT: Yeah. Ben sort of thought it was cheating if we went out and talked to the management, because he just felt that the person who read his book, you know, living in Pocatello, Idaho, could not go out and meet the management. So he didn't — and we didn't do it. I mean, when I worked for Graham-Newman, I don't think I ever visited a management in the 21 months I was there. He just —

But, you know, he wasn't sure whether it would be useful, anyway.

But if it would be useful, you know, that meant that his book was not all that was needed, that you had to add something to it.

I found it fun to go out and talk about their businesses with people, or to check with competitors, or suppliers, or customers, and all that.

But — Ben didn't think there was anything wrong with that. He just felt that if you had to do that, then his book was not the complete answer. And he didn't really want to do anything that the reader of his book couldn't do if he was on a desert island, you know, basically, with just one line to a broker.

CHARLIE MUNGER: But if you stop to think about it, Graham was trying to play the game of "Pin the Donkey," wearing very dark glasses. And Warren, of course, would use the biggest search light he could find. (Laughter)

WARREN BUFFETT: And we still can't find any donkeys these days. (Laughter)

33. Gillette customers more loyal than McDonald's customers

WARREN BUFFETT: OK. Area 1.

AUDIENCE MEMBER: I'm Joe Nobbe (PH) from Seattle, a shareholder.

Mr. Buffett and Mr. Munger, I wonder if you could comment a little bit further on McDonald's, carrying forward your comments of this morning, but more oriented toward how McDonald's would stack up against "The Inevitables" in international-type business. What your vision would be on their growth potential in places like Germany, China, so on and so forth.

WARREN BUFFETT: Yeah. I guess I just would have to stick with my comment that you won't get the inevitability in food that you will get in a single consumer product, you know, such as blades.

I mean, if I'm using a Gillette Sensor blade today, the chances are I'll try the next generation that comes out. It'll be the Sensor Excel right now. But I will try the next one that comes out, obviously. But I will not fool around at all in between.

And a very high percentage of people that shave, including women in shaving, they're happy with the product.

You know, it's not expensive. It's 20-odd dollars a year, you know, if you're a typical user. And if you're getting a great result, you're not going to fool around.

Whereas a great many of the decisions on fast food, as to where you eat, is simply based on which one you see. I mean, convenience is a huge factor.

So if you are going by a McDonald's, or a Burger King, or a Wendy's, and you happen to be hungry at that point, if you're traveling on the road and you see one of those signs up, you're probably going to stop at — you may very well — stop at the one you see.

So there's — there is not the — there's a loyalty factor, but it's just not going to be the same in food.

People want to vary their — I don't. I mean, I'm happy to eat there every day. But most people want to vary where they eat as they go through the week, or the month, or the year.

And they don't really have any great desire to vary their soft drink the same way. It's not the same thing.

So it's no knock on McDonald's at all. It's just the nature of the kind of industry they're in.

Charlie?

CHARLIE MUNGER: I can't think of anybody else who, before McDonald's, ever did what McDonald's did to create a chain of restaurants on such a scale, that worked.

WARREN BUFFETT: Oh, Howard Johnson's tried.

CHARLIE MUNGER: Yeah. There were a lot of failures. Some of you are old enough around Omaha to remember Reed's.

WARREN BUFFETT: Harkert's.

CHARLIE MUNGER: Or Harkert's — Harkett's Hamburgers.

WARREN BUFFETT: Harkert's.

CHARLIE MUNGER: Harkert's Holsum Hamburgers.

WARREN BUFFETT: Right.

CHARLIE MUNGER: Yeah. And they came and they went, those chains, and — but the —

It is a much tougher business that McDonalds is in.

WARREN BUFFETT: It's price sensitive, too, I mean, obviously.

CHARLIE MUNGER: Part of that's comparative. You can spend a lot more money on hamburgers in the course of a year than razor blades. I mean, you can't save that much by changing razor blades.

WARREN BUFFETT: Yeah. The average person will buy 27 — in the United States — 27 Sensor Excels a year. You know, that's one every, roughly, 13 days.

And I don't know what the retail price is because they give them free to us as directors, but the — (laughter) — you know —

If they're a dollar, it's 27 bucks, I mean, and —

It makes a lot of difference. That's what's happening, of course, around the world is people that are using cheap double-edged blades, or whatever is, they keep moving up the comfort scale — the comfort ladder. And Gillette is a direct beneficiary of —

If it's a difference between having great shaves and very so-so shaves, and lots of nicks and scratches and everything, is ten bucks a year or 12 bucks a year. I mean, that is not going cause many people to change their habits, and —

Incidentally, the Sensor for women has just been a huge success. I think they've had more razors go out on that in the same period than when the original Sensor was — came out for men.

So that's been an enlargement of the market. I would not have guessed that would work that well. Before that, all the women just used the disposables, or their husband's — boyfriend's — razor. But thank God they've gotten over that. (Laughter)

34. "Invisible hand does not work perfectly"

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: Gentlemen, my name is Ted Downey. I live in Mankato, Minnesota.

Mr. Munger, your reference to Einstein, I happen to have an article called "Strange Is Our Situation Here On Earth," which is somewhat related to my question.

This morning, you brought up the shortcomings of accountability. And I would like you to address the aspects of the environmental impact in our accounting system and how this might relate to a social screen for investment in other areas.

CHARLIE MUNGER: Well, again, that is broad enough and tough enough so that I think I should pass. (Applause)

WARREN BUFFETT: Yeah.

The — I would say the "unseen hand" — or [Adam Smith's] "invisible hand" — you know, does not work perfectly for all aspects of an economy, so —

But in terms of accounting for it — in terms of an individual balance sheet or income account, you know, that would be way beyond me. But there are things that the "invisible hand" won't do, and therefore, that unfettered market-driven economic action will not lead to the best result for society in my view.

I think the market works awfully well in an awfully — in a tremendous number of ways. It produces what people want in increasing quantities. And it — you know, it's enormously beneficial to have a market-driven society. But a pure market-driven society will do things that will have anti-social consequences.

CHARLIE MUNGER: You certainly need environmental rules.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: The pioneers died like flies because the drinking water was too near the sewage. And one of the glories of the world we live in now is that the sewage systems are so good.

And, you know, you don't think about it much, but it's dramatically changed our prospects and the general quality of how we live.

And there are a lot of other places where you need environmental rules.

All that said, some of the environmental stuff has gone way too far. But it's too complicated to try and offer precise lines.

35. Aim to increase both operating earnings and investments

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: My name is Gul Asnani (PH). I'm from Allentown, Pennsylvania.

I have a question concerning page four of the annual report where you talk about the investments per shares, et cetera.

WARREN BUFFETT: Right.

AUDIENCE MEMBER: And my question is, how much claim do the operating businesses have on these marketable securities?

WARREN BUFFETT: Yeah. Well, that table's a very important table in my view. And we measure our progress, to some extent, by the figures in both columns of that table, one of which shows the investments per share. And the other shows the operating earnings from everything other than investments.

The operating businesses have first claim on anything that relates to their business. I mean, if See's is going to buy a new plant, which it probably is now — or buy an additional building, I shouldn't say a new plant — you know, that comes first. The business has grown. It'll produce some economies and all that. We do that. You know, we try and do it as intelligently as possible. But that comes first. The —

That doesn't use but a small fraction of the capital. All of those needs don't use but a small fraction of the capital that Berkshire will generate. The investments reside largely in insurance companies because that's where largely the liquid funds are.

They have to have capital strength, obviously, because they have huge promises outstanding.

But where they reside does not determine who manages them. Lou Simpson manages GEICO's portfolio specifically. But in effect, Charlie and I manage everything else.

So where they precisely reside really makes no difference. I mean, they're sitting someplace. They're not for the operating management to use in projects that are far afield from what they're doing.

But if they need money in any operating business, you know, we'll have a check there that day. FlightSafety, for example, will be a fairly capital-intensive business.

I mean, if our project with Boeing goes as we hope it goes, you know, there will be substantial money in there because there — you know, we will have many more simulators around the world, and we'll be paying our proportional cost of it.

But they don't need to keep money around to prepare for that day, which they would if they were a standalone operation. We can — money's fungible.

We can deploy it all the time. And whenever anybody needs it, we'll come up with it. But we don't leave it around awaiting the day when some specific operation needs it.

Charlie?

CHARLIE MUNGER: The odds are very good that the marketable securities will keep going up, even as the businesses expand. That's the way the game has worked in the past. And we hope it'll keep going that way.

WARREN BUFFETT: What we are doing is trying to increase the numbers in both columns. We don't have any favoritism for this over that or anything of the sort. But we're looking, all the time, for things that will do — will help both columns. And we'd be disappointed if five or 10 years from now that they both haven't increased significantly.

But which column will increase at the greater rate, we don't know.

36. "We wouldn't be surprised" if stock returns are lower

WARREN BUFFETT: Area 1?

AUDIENCE MEMBER: Good day, my name is John Semanovich (PH) from Ottawa, Canada, which, incidentally, has nothing to do with Bre-X whatsoever. (Laughter)

My question more goes back to the discussion of intellectual capital, in particular, perhaps, your intellectual reserves.

And so, speaking of "Security Analysis," the first edition in 1934, Ben Graham talked about the development of the "New Era Theory" and its consequences on the security business.

In today's terms, we see a lot of the same words and phrases being repeated by analysts on Wall Street. And with the historical returns on common stocks, dating back to the 1800s, coming in at about 7 percent, pair that together with the concept of regression to the mean in statistics, do you not think that we're in a very dangerous period?

WARREN BUFFETT: Well, the answer — we never know, I mean, we — in terms of what markets will do, we —

I don't think that the Coca-Cola Company's in a dangerous position, you know — in a dangerous era — or Gillette is in a dangerous era, or McDonald's, or Wells Fargo, or whatever, but — or See's Candy, or the businesses we own in their entire, Kirby, whatever it may be.

Whether valuations are too high gets back to the question that we said — we talked about earlier. If businesses, in aggregate, they keep earning very high returns on equity and interest rates stay where they are, we are not in an overvalued period.

If it turns out that these returns are not sustainable, or interest rates go higher, we will look back and say this was a high point, at least for a while.

But we have no notion on that. And we really don't think about it, basically, because we don't know. You know, our job is to focus on things that we can know and that make a difference.

And if something can't make a difference or we can't know it, you know, we write that one off. So we're looking for the —

CHARLIE MUNGER: But Warren, you would expect average returns from stock market index-type investing to regress somewhat down —

WARREN BUFFETT: Oh, I don't think the —

CHARLIE MUNGER: — where they've have they been the last few years?

WARREN BUFFETT: I don't think you'll get the investment result from owning the S&P over the next 10 years that you've gotten over the past 10 years.

I would — if someone wanted to put some real money on that, they would find a taker with me. That's very unlikely to happen.

CHARLIE MUNGER: That's not predicting a crash.

WARREN BUFFETT: No.

CHARLIE MUNGER: It's just saying that the guaranteed result from the next 10 years is almost certain to be less than —

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: — that of the last.

WARREN BUFFETT: It wouldn't surprise — I mean, this is no way predictive. But I mean, it wouldn't surprise us in the least if stocks averaged 4 percent a year, you know, for the next 10 years.

That doesn't mean they will. We don't know the number. But that would not be a surprising outcome. And it wouldn't bother us particularly, either.

Charlie?

CHALIE MUNGER: No.

37. "We don't want to talk down something in order to buy it"

WARREN BUFFETT: Two.

LARRY WHITMAN: Hello. My name is Larry Whitman (PH) from Minot, North Dakota.

You have both talked today about the shrinking universe of stocks you could purchase, less margin of safety than ever, and a higher opportunity cost.

And you've also talked about looking to, potentially, purchase your great companies that you already have at reasonable prices.

And so I wonder if by talking so positively about some of your stocks — in particular Disney, such as in the '95 annual report when you talked about actually telling everyone that you were buying more shares on the open market and, again, at the '97 meeting — at their meeting — when you talked about maybe not selling the shares — those were both opportunities, maybe, when Disney may have dropped, because of such things as increased debt, or even people's concern about the Ovitz compensation package.

And I just wondered if that may hurt your ability to buy these great companies at reasonable prices by talking so positively about them when, in fact, maybe you could buy them at lower prices when people get irrational.

WARREN BUFFETT: Yeah. You're saying that — which I probably agree with — that if we would say the world is going to hell at Coke or Disney or Gillette — (laughs) — we might be better off, in terms of being able to buy more stock.

But, you know, I got asked the question at Disney and I answered it. And that's my general approach, that —

I think it's usually a bad mistake to sell your interest in wonderful businesses. I don't think people find them that often. And I think they get hung up, if they've sold them at X that they want to buy them back at 90 percent of X, or 85 percent of X, so they'll never go back in at 105 percent of X.

I think, on balance, if you are in a business that you understand and you think it's a really outstanding business, that the presumption should be that you just hold it and don't worry.

And if it goes down 25 percent in price or 30 percent in price, if you have more money available, buy more. And if you don't, you know, so what? Just look at the business and judge how it's doing.

But there’s no question. I mean, we try not to talk very much about the businesses, except maybe to use them as an illustration in a teaching mode or something of the sort. We’re not touting anything.

And I did try to stick those precautions in when I do talk about them as being wonderful businesses, so people don’t take it as an unqualified buy recommendation or something of the sort.

But we won’t try and put any spin on any — when we’re talking about businesses generally.

We may not talk about them at all. You know, if we’re buying something, we might be — particularly if no one knows that we’ve been in that stock at all — we might be somewhat quiet about the fact. But we don’t want to talk down something in order to buy it.

Charlie?

CHARLIE MUNGER: Well, I always — Jerry Newman, as I understand it, didn’t like Ben Graham giving all these courses explaining what Newman and Graham were doing, and —

But Graham’s attitude was that he was a professor first. And if he made just slightly less money by being very accurate in what he taught, why so be it.

And I think it’s fair to say that Warren has assimilated a bit of that ethos. And I think it’s all to the good. And if it costs us a tiny, little bit of money from time to time, there are probably compensating benefits. And if there aren’t, it’s probably the right way to behave anyway.

WARREN BUFFETT: Charlie, if you were in a less charitable mood, I might point out I didn’t behave that way till I got rich. (Laughter and applause)

Actually, I used to teach a course at what was then the University of Omaha. And we’d use all these current examples. And things were cheap then — (laughs) — that nobody paid any attention.

38. We don’t want to “hear stories” or buy from “jerks”

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: Hello, Mr. Munger and Mr. Buffett. My name is Liza Rema (PH) from Burbank, California.

I wanted to find out — earlier, you mentioned you looked at — you used filters to look at a company. So could you elaborate on what those filters are?

WARREN BUFFETT: Charlie, you want to —?

CHARLIE MUNGER: Well, we've tried to do a good deal of that, and —

Opportunity cost is a huge filter in life. If you've got two suitors who are really eager to have you, and one is way the hell better than the other, you do not have to spend much time with the other. And that's the way we filter stock buying opportunities.

Our ideas are so simple, people keep asking us for mysteries, when all we have is the most elementary idea.

WARREN BUFFETT: Yeah. The first filter we probably put it through is whether we think — and we know instantly — whether it's a business we're going to understand, and whether it's a business that — if it passes through that, it's whether a company can have a sustainable edge, you know.

And that gets rid of a very significant percentage of the things people have —

They always want to tell you some story or anything. And I'm sure they regard me and Charlie as very arbitrary, in terms of, you know, in the middle of the first sentence saying, "Well, you know, we appreciate the call, but we're not interested."

I mean, you know, they just think if they explain something — and I get letters on this all the time.

But we really can tell, in the middle of the first sentence, usually, whether those two factors exist. And if we can't understand it, obviously, it's not going to have — we can't make a decision as to whether it has a sustainable edge.

And if we can't understand it, we, very often, can come to the conclusion that it's not the kind of the business where it will have a sustainable edge.

So 98 percent of the conversations we can end, you know, in the middle of somebody's first sentence, which, of course, goes over very big with the caller, but — (Laughter)

And then, sometimes if you're talking about an entire business, we can tell by who we're dealing with whether a deal's ever going to work out or not.

I mean, it — if there's an auction going on, we don't want to — we have no interest in talking about it. And it just isn't going, you know, it isn't going to work.

If someone is interested in, essentially, doing that with their business, you know, they're going to sit down and want to renegotiate everything with us all over again after the deal is done. And we're going to have to buy the business two or three times before we get through.

You just see all these things coming.

And on the other hand, we've had, you know, terrific experience, basically, with the people we have associated with.

So it works. It's efficient. You know, we don't want to listen to stories all day. And we don't read brokerage reports of anything of the sort. It's just — there's other things to do with your time.

Charlie?

CHARLIE MUNGER: Yeah. Another filter that Warren was eluding to is this concept of the "quality person." And, of course, most people define "quality person" as somebody very much like themselves. (Laughter) But —

WARREN BUFFETT: Identical, actually, is the word you're searching for. (Laughter)

CHARLIE MUNGER: But there's so many wonderful people out there. And there's so many awful people out there. And there's signs frequently, like flags, particularly over the awful people. And generally speaking, those people are to be avoided.

It just — the amount of misery you bring into your life by trusting some awful person and the amount of felicity that you can bring in by making the right business associations — look around this room.

And there's some wonderful people who have created some wonderful businesses. And their customers can trust them. The employees can trust them. The problems can trust them to be fairly faced and reasonably solved. And those are the kind of people you want. And people who take their promises seriously.

I had some experience, recently, with a company. And they have their brand on a particular product. And somebody invented a better product in the same field. And they're taking their brand off their product. (Laughs) If it isn't the best, they don't want their brand on it.

People who think like that frequently do very well in business. And the flags are flying.

WARREN BUFFETT: It's like they got a sign on their chest that just says, "Jerk. Jerk. Jerk." (Laughter)

And then you think you're going to buy the business and they aren't going to be a jerk, you know, anymore. I mean, it's — (Laughter)

39. Why Dr Pepper has a future

WARREN BUFFETT: OK. Area 1.

AUDIENCE MEMBER: Hi. David Winters, Mountain Lakes, New Jersey, shareholder.

I'm just wondering if there's an organizational model where you deal with a plethora of information so you can physically and intellectually organize it so you have your maximum output and retain focus.

And secondly, if I may, in the domestic soft drink business, is it winner take all? I mean, is there room for three competitors? And, honestly, does Dr Pepper have a future?

WARREN BUFFETT: Yeah. I would say Dr Pepper has a future. I'll answer the second one.

But sure, there's room for more than one. I think Coke's market share will go up pretty much year after year. But not — you know, we're talking tenths of a percent in that business. But tenths of a percent are important.

The U.S. market is what? It must be 10 billion cases. So, you know, one percent's a hundred million cases.

There will be — Dr Pepper appeals to a lot of people.

It's interesting how regional tastes can be. I mean, Dr Pepper will have a share in Texas that's, you know, far higher than it will be in Minnesota or something. But there are people who are going to prefer it.

And an interesting thing, though, is that the high percentage of people that prefer cola, for example.

Although the cola percentage has gone down a little bit, the fastest growing big beverage at Coke is Sprite. Sprite has had huge gains in sales. It does well over a billion cases a year. And it sells very well in a whole bunch of countries.

So they'll — you can make money with a soft drink company that doesn't dominate the business. You'll do a lot better with one that does dominate. But it's not a winner take all. It's not like two newspapers in a town of 100,000 or 200,000.

There are certain businesses that are winner take all, clearly, but soft drinks, not one of them.

40. "Advantage of accumulation of useful information"

WARREN BUFFETT: What was the first question? Oh, the part about organizing —

AUDIENCE MEMBER: Oh, I'm just wondering, for those of us on the other side of the table, we get barraged with information. And I'm wondering how do you both — do you just read annuals, 10-Ks, and talk to people, and ignore everything else? And how do you keep track of everything, intellectually —?

WARREN BUFFETT: Well, we don't keep track of everything. But the beauty of — to some extent — of evaluating businesses — large businesses — is that it is all cumulative. I mean, if you started doing it 40 or so years ago, you really have got a working knowledge of an awful lot of businesses.

But there aren't that many, to start with, that are, you know —

And you can get a fix. You know, how many — what are there? Seventy-five, maybe, or so important industries. And you'll get to understand how they operate.

And you don't have to start over again every day. And you don't have to consult a computer for it or anything like that, it —

So it has the advantage of accumulation of useful information over time. And, you know, you just add the incremental bit at some point.

You know, why did we decide to buy Coca-Cola in 1988? Well, it may have been, you know, just a couple small incremental bits of information. But that came into a mass that had been accumulated over decades.

And it's a very — it's a great business that way. It's why we like businesses that don't change too much, because the past is useful to us.

Charlie?

CHARLIE MUNGER: I can't add a thing to that.

41. We'd "push" to buy cheap stocks, but not enough to lose sleep

WARREN BUFFETT: OK. Over there in 2.

AUDIENCE MEMBER: I'm Barbara Morrow (PH) from Wisconsin and New York.

If you both live as long as I believe you will, it could happen that they'll be a year when you write two big checks for super-cat claims when the market is throwing away things at really silly prices.

Could you share your thinking about how much debt you would consider taking on to buy great businesses that's cheap in that kind of a situation?

WARREN BUFFETT: Well, if we had both a big hurricane in the northeast or in Florida, and we had a big quake in California in the same year, and we had a financial market — the financial markets tanked, perhaps because of those events, but perhaps for other reasons, we would be thinking about ways — it might not be borrowing money directly — but we would be thinking to ways to buy securities if they got cheap enough.

I mean, any time securities get cheap — Charlie, you're thumping again here — (laughter) — any time securities get cheap, you know, we don't like to go to the office and not write a ticket. I mean, that, so —

We certainly would have the ability to borrow some money. We would never borrow a ton of money, relative to capital. We're just not set out that way.

We don't want to disappoint anybody in this world. We don't even want to worry about disappointing anybody in this world. So, we're not going to do that.

But we have a lot of extra firepower overall.

And I would say under almost any conditions that cause securities to get very cheap, we would find a way to buy some of them.

Charlie?

CHARLIE MUNGER: The beauty of our situation is that it has enormous flexibility built into it.

If something were large enough and cheap enough, we could stop writing super-cats. We're measuring opportunities one against the other, and we understand the way the numbers interplay.

And so we have a lot of different options.

And that's a huge advantage. There's so many places in business life where you have practically no options at all. You're just in a channel that you have to — waltz down the channel and you don't have any options to do anything else.

We have enormous options. We may not exercise them. But we have enormous flexibility.

WARREN BUFFETT: Yeah. We know they're there, and —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — and there's no reason to push on anything now. At least, we don't have any reason to push ourselves.

But if it ever became advantageous to push somewhat, we would push, although never to a degree that, in any way, causes us to lose a minute of sleep about fulfilling every obligation we had.

Morning Session - 1998 Meeting

1. Welcome

WARREN BUFFETT: Morning. Morning. I'm Warren Buffett, chairman of Berkshire, and — this is my partner. This hyperactive fellow over here is Charlie Munger. (Laughter)

And we'll do this as we've done in the past, following the Saddam Hussein school of management, we're going to go through the business meeting in a hurry, and then we're going to do questions.

And we'll do those until 3:30, with a break at noon, when we'll take off for 30 minutes or so while you can grab lunch. And those of you — there's — we're operating in an overflow room as well — so those of you who are in the overflow room now can join the main floor after the noon break, because we'll have plenty of room then.

We'll go until 3:30. We'll try to get to all the questions we can. We've got 11 zones, ten of them in this room, and we'll just make our way around them. I've got a little map here, which I'll get oriented on here in a second. And let's see.

And I think we'll get through the business meeting now. Incidentally, I don't see that movie before it's shown, but that was one of our directors singing at that final session there. (Applause)

We keep costs down at Berkshire. (Laughter)

2. Board of directors introduced

WARREN BUFFETT: OK, the meeting will now come to order. I'm Warren Buffett, chairman of the board of directors of the company and I welcome you to this 1998 annual meeting of shareholders.

I will first introduce the Berkshire Hathaway directors that are present in addition to myself.

So we have — and I can't see very well with the lights here, but if you'll stand as I name you.

Susan T. Buffett, the vocalist. (Applause)

Howard G. Buffett, the non-vocalist. (Applause)

Malcolm G. Chace. (Applause)

Charlie, you've met. And Ron Olson. (Applause)

And Walter Scott Junior. (Applause)

Also with us today are partners in the firm of Deloitte and Touche, our auditors. They are available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings.

Miss Becki Amick has been appointed inspect of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy owners for this meeting are Walter Scott Junior and Marc D. Hamburg. Proxy cards have been returned through last Friday, representing 1,039,276 Class A Berkshire shares, and 1,080,509 Class B Berkshire shares to be voted by the proxy holders as indicated on the cards.

The number of shares represents a quorum and we will therefore directly proceed with the meeting.

We will conduct the business of the meeting and then adjourn the formal meeting. After that, we will entertain questions that you might have.

3. Minutes and shares outstanding

WARREN BUFFETT: First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott Jr., who will place a motion before the meeting.

WALTER SCOTT JR.: I move the minutes — the reading — reading of the minutes of the last stockholders meeting be dispensed with.

WARREN BUFFETT: Do I hear a second? (Voices)

A lot of seconds. The motion has been moved and seconded. Are there any comments or questions? We will vote on this motion by voice vote. All those in favor say aye.

VOICES: Aye.

WARREN BUFFETT: Opposed? Motion's carried.

Does the secretary — (laughter) — have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first-class mail to all shareholders of record on March 6, 1998, the record date for this meeting, there were 1,199,680 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at this meeting.

And 1,245,081 shares of Class B Berkshire Hathaway common stock outstanding, with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 1,039,276 Class A shares and 1,080,509 Class B shares are represented at this meeting by proxies returned through last Friday.

WARREN BUFFETT: Thank you, Forrest.

If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so. Also, if any shareholder that is present has not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you. Those persons desiring ballots, please identify themselves so that we may distribute them.

4. Election of directors

WARREN BUFFETT: The one item of business at this meeting is to elect directors. I now recognize Mr. Walter Scott Junior to place a motion before the meeting with respect to election of directors.

WALTER SCOTT JUNIOR: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Junior, be elected as directors.

WARREN BUFFETT: Is there a second? It’s been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Junior be elected as directors.

Are there any other nominations? Is there any discussion? Nominations are ready to be acted upon.

If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections a ballot on the election of directors, voting the proxies in accordance with the instructions they have received.

Miss Amick, when you are ready you may give your report.

BECKI AMICK: My report is ready. The ballots of the proxy holder, in response to proxies that were received through last Friday, cast not less than 1,039,298 votes for each nominee. That number far exceeds the majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as those cast in person at this meeting, if any, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Junior have been elected as directors.

After adjournment of the business meeting, I will respond to questions that you may have that relate to the businesses of Berkshire that do not call for any action at this meeting.

Does anyone have any further business to come before this meeting before we adjourn?

5. Adjournment of formal business meeting

WARREN BUFFETT: If not, I recognize Mr. Walter Scott Junior to place a motion before the meeting.

WALTER SCOTT JUNIOR: I move this meeting be adjourned.

WARREN BUFFETT: Second? (Laughter)

Motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say aye?

VOICES: Aye.

WARREN BUFFETT: All opposed say I'm leaving. This meeting is adjourned. (Laughter and applause)

Charlie and I may not get paid much, but we work fast on an hourly basis. (Laughter)

6. Q&A session begins

WARREN BUFFETT: Now, we're going to do this by zones, and I think you can see who is manning each — yeah, I see we've got a number out there already.

And please ask just one question.

The only thing that I can think of that we won't discuss is what we're buying or selling or may be buying or selling, but we'll be glad to talk about anything that's on your mind. So let's go right to zone 1 and start in.

7. Price/earnings explanation

AUDIENCE MEMBER: Thanks for the beautiful — beautiful weekend in Omaha. I'm Mike Asale (PH) from New York City, with a question for Warren and Charlie about what makes a company's price-earnings ratio move up relative to other companies in its industry.

How can we, as investors, find companies, and even industries, that will grow their relative price-earnings ratios as well as their earnings?

And thank you for the wonderful weekend and for sharing your brilliance with the shareholders.

WARREN BUFFETT: Oh, thank you.

AUDIENCE MEMBER: Thank you. (Applause)

WARREN BUFFETT: You know, it's very simple, the price-earnings ratio — relative price-earnings ratios — move up because people expect either the industry or the company's prospects to be better relative to all other securities than they have been — than their proceeding view. And that can turn out to be justified or otherwise.

Absolute price-earnings ratios move up in respect to the earning power — or the prospective earning power of — that is viewed by the investing public of future returns on equity, and also in response to changes in interest rates.

And in the recent — well really, ever since 1982, but accentuated in recent years, you've had decreasing interest rates pushing up stocks, in aggregate.

And you've had an increase in corporate profits. Return on equity of American businesses improved dramatically recently. And that also — and people are starting to believe it, so that has pushed up absolute price-earnings ratios.

And then within that universe of all stocks, when people get more enthusiastic about a specific business or a specific industry, they will push up the relative P/E ratio for that stock or industry.

Charlie, you got anything?

8. No "degree of difficulty" bonus

CHARLIE MUNGER: Yes, I think he also asked, how do you forecast these improvements in price-earnings ratios.

WARREN BUFFETT: That's your — that's your part of the question. (Laughter)

CHARLIE MUNGER: Around here I would say that if our predictions have been a little better than other people's, it's because we tried to make fewer of them. (Laughter and applause)

WARREN BUFFETT: We also try not to do anything difficult, which ties in with that.

We really do feel that you get paid just as well — you know, this is not like Olympic diving. In Olympic diving, you know, they have a degree of difficulty factor. And if you can do some very difficult dive, the payoff is greater if you do it well than if you do some very simple dive.

That's not true in investments. You get paid just as well for the most simple dive, as long as you execute it all right. And there's no reason to try those three-and-a-halfs when you get paid just as well for just diving off the side of the pool and going in cleanly. (Laughter)

So we look for one-foot bars to step over rather than seven-foot or eight-foot bars to try and set some Olympic record by jumping over. And it's very nice, because you get paid just as well for the one-foot bars.

9. Efficient market hypothesis "contaminates" business schools

WARREN BUFFETT: OK, zone 2.

AUDIENCE MEMBER: Good morning. My name is Joe Lacey (PH). I'm from Austin, Texas.

In this era when the financial departments of the institutions of higher learning are referring to you as an anomaly, and they preach the efficient markets hypothesis, saying that you can't outperform the market, where does one go to find a mentor like you found in Ben Graham? Someone you can ask questions to regarding value investing.

WARREN BUFFETT: My understanding is that the University of Florida has instituted a couple of courses that, actually, Mason Hawkins gave them a significant amount of money to finance. And I believe they're teaching something other than efficient markets there.

There's a very good course at Columbia I know that gets a lot of visiting teachers to come in. I go there and teach occasionally, but a number of practitioners do.

So there — I think the efficient market theory is less holy writ now than it was 15 or 20 years ago in universities, but it's — there's a lot of it taught, but I think you can find more diversity in what is being offered now than ten or 20 years ago. And I'd recommend, you know, looking into those two schools.

You know, it's really quite useful. If you had a merchant shipping business, if all of your competitors believe the world is flat, you know, that is a huge edge, because they will not take on any cargo to go to places that are beyond where they think they will fall off. And so we should be encouraging the teaching of efficient market theories in universities. (Laughter)

It amazes me. But, you know, I think one time that — was it Keynes that said that most economists are most economical about ideas? That they make the ones they learned in graduate school last a lifetime. (Laughter)

And what happens is that you spend years getting your Ph.D. in finance and you learn theories with a lot of mathematics in them that the average layman can't do.

And you become sort of a high priest. And you get an enormous amount of yourself and ego, and even professional security, invested in those ideas. And it gets very hard to back off after a given point. And I think that to some extent has contaminated the teaching of investing in the universities.

Charlie?

CHARLIE MUNGER: Well, I would argue that the contamination was massive. (Laughter)

But it's waning.

WARREN BUFFETT: Yeah, it is waning.

CHARLIE MUNGER: It's waning. The good ideas eventually triumph.

WARREN BUFFETT: Yeah. The word "anomaly" I've always found interesting on that, because, you know, after a while — I mean Columbus was an anomaly, I suppose, for a while. But what it means is something that the academicians could not explain, and rather than re-examine their theories, they simply discarded any evidence of that sort as anomalous.

And I think when you find information that contradicts previously cherished beliefs, that you've got a special obligation to look at it and look at it quickly.

I think Charlie told me that one of the things Darwin did was that whenever he found anything that contradicted some previous belief, he knew that he had to write it down almost immediately because he felt that the human mind was conditioned, so conditioned to reject contradictory evidence, that unless he got it down in black and white very quickly his mind would simply push it out of existence.

Charlie knows more about Darwin than I do. Maybe he can explain that.

CHARLIE MUNGER: Well, I don't know about Darwin, but I did find it amusing. One of these extreme efficient market theorists explained Warren for many, many years as an anomaly of luck. And he got the six sigmas, six standard deviations of luck. And then people started laughing at him because six sigmas of luck is a lot. So he changed his theory. Now Warren has six or seven sigmas of skill. (Laughter)

WARREN BUFFETT: No.

CHARLIE MUNGER: So you see —

WARREN BUFFETT: I'd rather have the six sigmas of luck, actually. (Laughter)

CHARLIE MUNGER: The one thing he couldn't bear to leave was his six sigmas. (Laughter)

10. "Time is the enemy of the poor business"

WARREN BUFFETT: Let's try zone 3.

AUDIENCE MEMBER: My name is Warren Hayes (PH). I'm from Chicago, Illinois.

I understand from various publications, like Outstanding Investor Digest, that many of the best value investors are buying high-quality, multi-national Japanese companies that are trading below net-net working capital value.

Do you agree that these values exist in Japan? And would you consider a purchase of some of them?

WARREN BUFFETT: Well, Henry Emerson, who publishes the Outstanding Investor's Digest is here, so I will give a tout on it.

I read the Outstanding Investor's Digest, OID, and it's a very good publication. And I have read some of the commentary about Japanese securities.

We've looked at securities in all major markets, and we certainly looked at them in Japan, particularly in recent years when the Nikkei has so underperformed the S&P here.

We're quite a bit less enthused about those stocks as being any kind of obvious bargains than the people that you read about in OID.

The returns on equity in most areas of Japanese business, returns on equity are very low. And it's extremely difficult to get rich by owning — by being the owner of a business that earns a low return on equity. You know, we always look at what a business does in terms of what it earns on capital.

We want to be in good businesses. Where you really want to be is in businesses that are going to be good businesses and better businesses ten years from now. And we want to buy them at a reasonable price.

But many years ago we gave up what I've labeled the "cigar butt" approach to investing, which is where you try and find a really kind of pathetic company, but it sells so cheap that you think there's one good free puff left in it.

And — (laughter) — we used to pick up a lot of soggy cigar butts, you know. I mean, I had a portfolio full of them.

And there were free puffs in them. I mean, I made money out of that. But A, it doesn't work with big money anyway, and B, we don't find many cigar butts around that we would be attracted to.

But those are the companies that had low returns on equity. And if you have a business that's earning 5 or 6 percent on equity and you hold it for a long time, you are not going to do well in investing. Even if you buy it cheap to start with.

Time is the enemy of the poor business, and it's the friend of the great business. I mean if you have a business that's earning 20 or 25 percent on equity, and it does that for a long time, time is your friend.

But time is your enemy if you have your money in a low-return business. And you may be lucky enough to pick the exact moment when it gets taken over by someone else.

But we like to think when we buy a stock we're going to own it for a very long time, and therefore we have to stay away from businesses that have low returns on equity.

Charlie?

CHARLIE MUNGER: Yeah, it's not that much fun to buy a business where you really hope this sucker liquidates before it goes broke. (Laughter)

WARREN BUFFETT: We've been in a few of those, too.

CHARLIE MUNGER: Right. (Laughter)

WARREN BUFFETT: Yeah, Charlie and I, we — or at least I have, I've owned stock in an anthracite company. There are probably people in this room that don't know what anthracite is. Three railway companies. Windmill manufacturers. What other gems have we had, Charlie?

CHARLIE MUNGER: Textiles. (Laughter)

WARREN BUFFETT: Yeah, textiles. Don't even think. (Laughter)

Yeah, Berkshire was a mistake, believe it or not. I mean we went into Berkshire because it was cheap statistically just as a general investment back in the early '60s, and it was a company that in the previous ten years had earned less than nothing. I mean it had a significant net loss over the previous ten years.

It was selling well below working capital, so it was a cigar butt. And it was — I mean we could have done the things we've done subsequently from a neutral base rather than a negative base, and actually it would have worked out better, but it's been a lot of fun.

11. Munger wants "a good idea we can understand"

WARREN BUFFETT: Number four.

AUDIENCE MEMBER: Hello. My name is Martin Weigand from Bethesda, Maryland. Again, I want to thank you for your letters and principles. They're a great help for small business people running their business.

My question is, last year you said you had filters in your mind to help you quickly analyze businesses.

How do your filters take into account the very fast changes of technology and the way that businesses communicate with their customers, take orders, things like that?

WARREN BUFFETT: Well, we do have filters, and sometimes those filters are very irritating to people who check in with us about businesses, because we really can say in ten seconds or so "no" to 90 percent-plus of all the things that come in, simply because we have these filters. We have some filters in regard to people, too.

But the question of technology is very simple. That doesn't make it through our filter. I mean, so if something comes in where there's a technological component that's of significance, or where we think the future technology could hurt the business as it presently exists, we look at, you know, we look at that as something to worry about. We will — it won't make it through the filter.

We want things that we can understand, which filters out a lot of things. (Laughter)

And we want them to be good businesses, and we want the people to be people we're very comfortable with. That means ability and integrity.

And we can do that very fast. We've heard a lot of stories in our lives, and it's amazing how they — you can become quite efficient in, probably, getting 95 percent of the ideas through in a very short period of time that should get through.

Charlie?

CHARLIE MUNGER: Yeah, we have to have an idea that is A, a good idea, and B, a good idea that we can understand. It's just that simple. And so those filters are filters against consequences from our own lack of talent. (Laughter)

WARREN BUFFETT: Filters haven't changed much over the years, either. (Laughter)

12. "A lot of different talents" within Berkshire

WARREN BUFFETT: OK, area five.

AUDIENCE MEMBER: Hi. I'm Allan Maxwell. I live in the wonderful tropical island of O-maha. (Laughter)

WARREN BUFFETT: That's right up there with Aksarben. That's Nebraska spelled backwards. (Laughter)

AUDIENCE MEMBER: Everybody in this room's got to be wondering the same question. Who, in your opinion, both of you, is the next Warren Buffett?

WARREN BUFFETT: Charlie? Who's the next Charlie Munger? Well, let's try that first. That's a more difficult question. (Laughter)

CHARLIE MUNGER: There's not much demand. (Laughter)

I don't think there's only one way to succeed in life, and our successors, in due time, may be different in many ways. And they may do better.

WARREN BUFFETT: Incidentally, we have a number of people in the company, some of whom are in this room today, and the ones you saw on that screen, who are leagues ahead of Charlie and me in various kinds of abilities.

I mean a lot of different talents. We've got a fellow in this room today who's the best bridge player, probably, in the world. And Charlie and I could work night and day, and if he spent ten minutes a week working on it, he'd play better bridge than we would.

And there are all kinds of intellectual endeavors that, for some reason or another, one person's a little bit better wired for than someone else.

And we have people running our businesses that if Charlie and I were put in charge of those businesses, we couldn't do remotely as well as they do.

So there's a lot of different talents. The two that we're responsible for is, we have to be able to keep able people, who are already rich, motivated to keep working at things where they don't need to do it for financial reasons. I mean it's that simple.

And that's a problem any of you could think about, and you'd probably be quite good at it if you gave it a little thought, because you'd figure out what would cause you to work if you were already rich and didn't need the job. Why would you jump out of bed and be excited about going to work that day? And then we try to apply that to the people who work with us.

Secondly, we have to allocate capital. And these days we have to allocate a lot more capital than we had to allocate a decade ago.

That job is very tough at present. Sometimes it's very easy. And it will be easy at times in the future and it'll be difficult at times in the future. But there are other people that can allocate capital, and we have them in the company.

Charlie, you have any —?

CHARLIE MUNGER: No.

13. One of the few reasons to sell a stock

WARREN BUFFETT: OK. Number 6.

AUDIENCE MEMBER: Good morning. My name is Jad Khoury (PH). I'm from Gaithersburg, Maryland. I just want to thank you for sharing your wisdom.

And my question is, what criteria do you use to sell stock? I kind of understand how you buy it, but I'm not sure how you sell.

WARREN BUFFETT: Yeah. Well, the best thing to do is buy a stock that you don't ever want to sell. I mean — and that's what we're trying to do.

And that's true when we buy an entire business. I mean, we bought all of GEICO or we bought all of See's Candy or The Buffalo News. We're not buying those to resell.

I mean, what we're trying to do is buy a business that we will be happy with if we own it the rest of our lives, and we expect to with those.

It's the same principle applies to marketable securities. You get extra options with marketable securities. You can add to holdings. Obviously easier — we can never own more than a hundred percent of a business, but if we own 2 percent of a business and we like it at a given price, we can add and have 4 or 5 percent. So that's an advantage.

Sometimes, if we need money to move to another sector, like we did last year, we will trim some holdings, but that doesn't mean we're negative on those businesses at all. I mean, we think they're wonderful businesses or we wouldn't own them.

And we would sell A, if we needed money for other things.

The GEICO stock that I bought in 1951, I sold in 1952. And it went on to be worth a hundred or more times — before the 1976 problems — 100 or more times what I'd paid. But I didn't have the money to do something else. So you sell if you need money for something else.

You may sell if you believe the valuations between different kinds of markets are somewhat out of whack. And, you know, we have done a little trimming last year in that manner. But that could well be a mistake. I mean the real thing to do with a great business is just hang on for dear life.

Charlie?

CHARLIE MUNGER: Yes, but the sales that do happen, the ideal way is when you found something you like immensely better. Isn't that obvious that's the ideal way to sell?

WARREN BUFFETT: And incidentally, the ideal purchase is to find — is to have something that you already liked be selling at a price where you feel like buying more of it. I mean, we probably should have done more of that in the past in some situations.

But that's the beauty of marketable securities. You really do — if you're in a wonderful business, you do get a chance, periodically, maybe to double up in it, or something of the sort.

If the market — if the stock market were to sell a lot cheaper than it is now, we would probably be buying more of the businesses that we already own. They would certainly be the first ones that we would think about. They're the businesses we like the best.

Charlie?

CHARLIE MUNGER: Nothing more.

14. Make up your own mind

WARREN BUFFETT: OK. Zone 7.

AUDIENCE MEMBER: Good morning, Mr. Buffett, Mr. Munger. My name is Ron Wright (PH) from Iowa City, Iowa.

New companies have always been an interest to me. Is it reasonable to assume an Omaha-based company with only $5 billion in the bank might succeed in telecommunications?

WARREN BUFFETT: Well, I think that a new company with 5 billion in the bank is probably better off than most new companies. (Laughter)

Be like Jennifer Gates, as a newborn. (Laughter)

I think you're probably referring to a company that was created out of one of our local operations that's run by Walter Scott, one of our directors, from the Kiewit Company, Level 3.

I can tell you, it's got very able management. And I'll take your word for it that it's also got 5 billion in the bank, but you'll have to make your own judgment on the stock.

I know Charlie won't comment on that one. (Laughs)

15. Buffett jokes about Nebraska football's Tom Osborne

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: Yes, good morning. This is Mo Stintz (PH) from Omaha, Nebraska.

In the past you've often said that the insurance operation is the most important business in Berkshire's portfolio. Is that true? And what are numbers two and three?

I'd also like to ask, is it true that Charlie chose the colors for the cover of this year's annual report?

WARREN BUFFETT: Did Charlie chose them? (Laughs)

He had nothing to do with them. I chose them. (Laughter)

They were a tribute to the Nebraska football team and Tom Osborne, who you saw. (Applause)

Tom, incidentally, has a very low-key style, and Bobby Bowden, a few years ago, was in Lincoln. And he said that on their first date that Nancy had to slap Tom three times. And somebody said, "Was he that fresh?" And she said, "No, I was just checking to be sure he was alive." (Laughter)

Tom had a fairly conservative offense for a time in the past, although it hasn't been so conservative the last few years, but somebody said at that time the most reckless thing he did was to eat some cottage cheese the day after the expiration on the carton by then. (Laughter)

But I — no, I chose the colors. Now what was the question? (Laughter)

What was the question, Charlie? Do you remember?

A memorable question, but give it to us again. (Laughter)

16. Proud not to have a strategic plan

WARREN BUFFETT: Are we back there in zone 8? Oh, the number — yeah, sure.

The question was about the insurance business, which we have said will be, by far, the most important business at Berkshire. We said that many, many years ago, and it's proven to be the case.

It obviously got a big leg up when we purchased all of GEICO. Insurance, as far as the eye can see, will be, by far, the most significant business at Berkshire.

And the question about two and three: in terms of earnings, FlightSafety is the second largest source of earnings. But we don't really think of them that way. I mean we do know our main business is insurance, but we really have a lot of fun out of all of our businesses. And I had a great time out at Borsheims yesterday, or at a Dairy Queen.

So it will be accident, to some extent, over the next ten years, what ends up being the second or third or fourth largest. That'll be determined by opportunity.

We bid on certain businesses — or negotiated on them — that could have been very large businesses if they become part of Berkshire. And that'll happen again in the future.

So we have no predetermined course of action whatsoever at Berkshire. We have no strategic planning department. We don't have any strategic plan.

We react to what we think are opportunities. And if it's a business we can understand, and particularly if it's big, you know, we would love to make it number two.

Charlie?

CHARLIE MUNGER: I also want to say proudly that we have no mission statement.

WARREN BUFFETT: No. (Laughter and applause)

It's hard to think of anything that we do have, as a matter of fact. (Laughter)

Yeah, we have never had — I mean I'm sure you all know this. We've never had a consultant. And we try to keep things pretty simple.

We still have 12 people at headquarters. We have about 40,000 people that now work for Berkshire. And we hope to grow a lot, but we don't hope to grow at headquarters. (Laughter)

17. In "good shape" to handle Y2K problem

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: Yes, my name is Patty Buffett and I'm from Albuquerque, New Mexico.

WARREN BUFFETT: I like your name. (Laughter)

AUDIENCE MEMBER: Thanks.

In your opinion, what effect will the year 2000 compliant issue have on the U.S. stock market and the global economy?

WARREN BUFFETT: Well, I get different reports on 2000, but the main report I hear — I think, you know, we — you wouldn't want to rely on me on this, but you could rely on our managers. And I think we're in good shape.

It's costing us some money but not huge amounts of money to be prepared for 2000.

With companies in which I'm a director, you know, I hear some reasonably good-sized numbers. Those numbers are in their annual reports and described as to the cost of compliance.

But what I'm told by people that know a lot more than I do, is that they think probably that the weakest link may be in governmental units. They seem to think that in terms of where they stand versus the commercial sector, in terms of reaching where they need to be by 2000, that there's some areas of both national and state and local governments, and foreign government, where they're really behind the curve.

Now, that is not an independent judgment of mine. But somebody said, "You want to be very careful about making a phone call at five seconds before midnight at the millennium because you may get charged for 100 years," you know. (Laughter)

So it'll be interesting.

I don't think it's going to affect Berkshire in any material way, and I certainly have a feeling that the world will get past it very easily. But it is turning — it is expensive for some companies, and it's going to be very expensive for governments.

Charlie?

CHARLIE MUNGER: Yeah, I find it interesting that it is such a problem. You know, it was predictable that the year 2000 would come.

WARREN BUFFETT: Yeah. (Laughter and applause)

Yeah. Yeah, we decided that back in 1985, actually. (Laughter)

We didn't welcome it, understand. That's not Berkshire's style, though. (Laughs)

It is fascinating, isn't it, when you think about it, that a whole bunch of people with 160 IQs that could build up such a problem, but here we are. And — (laughter) — that's why we stick with simple things. (Laughter)

18. Laws needed to check campaign spending "arms race"

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: My name is Kristin Cham (PH). I'm from Springfield, Illinois. And I'm a proud shareholder of Berkshire Hathaway. (Applause)

WARREN BUFFETT: We're glad to you have you here.

AUDIENCE MEMBER: I've heard a little about your thoughts on trying to control campaign spending. Could you tell us more about your thoughts and efforts on this topic? Thank you.

WARREN BUFFETT: Charlie, did you get all of that?

CHARLIE MUNGER: I think it was campaign spending.

WARREN BUFFETT: Oh, campaign spending. Yeah, I have joined something that Jerry Kohlberg — this is personal. This has nothing to do with Berkshire — that Jerry Kohlberg spearheaded.

And it's taken a position — and probably 30 or so mostly business people — taken a position against soft money, and also taken a position on very fast disclosure of campaign finance money, because I personally think that the arms race, in terms of campaign spending by businesses, you know, has just begun. It doubled in the last election.

But political influence — and I don't mean that by buying a vote, but I mean just in terms of having a (inaudible) in Washington or in other state capitols.

Political influence has been an underpriced product in the past. I mean, the government is enormously important in this country to most companies. It was amazing how cheap — cheaply — it could be — attention could be purchased.

But the price is going up, and there will be an escalation. And I don't think it's easy — if you're the manager of a business and you own 1/10th of 1 percent of it and you're in a business that's heavily affected by government, I don't think it's very easy to tell your board of directors that you're going to take a hands-off approach.

So I think legislation is needed in that arena, and there are over a hundred campaign finance reform bills that have been introduced. Everybody wants to have their name on a bill. They just don't want to have it passed. (Laughter)

And, you know, John McCain's been working hard on it. And it's something I think we have to come to grips with because it's going to be a battle of the wallets for influence.

And, like I say, if I were running some other company, and my competitors were spending money to get the attention of would-be legislators, or actual legislators, it'd be very difficult to take some high and mighty position that I wasn't going to do it myself, and my board and my shareholders might ask me why I was taking that position.

We are lucky, basically, to be in a business that's relatively unaffected by legislation, although we will — we're going to pay a lot of tax this year. I said two years ago that it would only take 2,000 entities in the whole United States — businesses, individuals, any kind of entity — to pay the same amount of taxes as Berkshire, and that would take care of the entire budget.

You'd need no Social Security taxes. You'd need no nothing.

I think we're going to be able to say that again this year. I think that if you multiply our tax by 2,000 you will more than account for the entire federal budget, including Social Security and everything else.

So you might say, "Why aren't you in Washington lobbying for a capital gains rate at corporations that's the same as individuals?" or something, but we basically haven't played that game. We feel very fortunate.

I'll say this. I would rather, in this country, be a huge taxpayer myself than be somebody who needed the other end of it, the government dispensing.

I mean, if anybody here is paying taxes and they want to — (applause)

If you'd like to shift positions with somebody in a veteran's hospital or, you know, that has a couple of children by age 19 and is getting a check from the government, you know, I don't want to shift positions. I'm happy to be paying the taxes.

19. "The secret of life is weak competition"

WARREN BUFFETT: Zone 11, please. I think 11 is probably the remote — yeah. So we're going to hear this from the overflow room. Are we there?

AUDIENCE MEMBER: Yes. Good morning, Mr. Buffett, Mr. Munger. My name is Patrick Rown (PH) from Charlotte, North Carolina.

And I've watched returns on equity for the banking sector in the U.S. go up a good bit over the last few years. And returns on tangible equity for some of the major banks that have led to consolidation have gone up a good bit more. Leads me to wonder whether these returns are sustainable over the near-term or the longer-term, five, 10 years out.

WARREN BUFFETT: Well, that's the $64 question, because the returns on equity — and particularly tangible equity, as the gentleman mentioned — and particularly tangible equity in the banking sector, even — those returns have hit numbers that are unprecedented. And then the question is, if they're unprecedented, are they unsustainable?

Charlie and I would probably think the — we would certainly prefer — we would not base our actions on the premise that they are sustainable. Twenty percent-plus returns on tangible equity — or on book equity — and much higher returns on tangible equity. In the banking field, you have a number of enterprises that on tangible equity are getting up close to the 30 percent range.

Now, can a system where the GDP in real terms is growing, maybe, 3 percent — where in nominal terms this grows 4 to 5 percent — can businesses consistently earn 20 percent on equity?

They certainly can if they retain most of their earnings, because you would have corporate profits rising as a percentage of GDP, to the point that would get ludicrous.

So under those conditions, you'd either have to have huge payouts — either by repurchases of shares or by dividends or by takeovers, actually — that would keep the level of capital reasonably consistent among industry, because you couldn't sustain — let's just say every company retained all of its earnings and they earned 20 percent on equity — you could not have corporate profits growing at 20 percent as a part of the economy year after year.

This has been a better world than we foresaw, in terms of returns, so we've been wrong before. And we're not making a prediction now, but we would not want to buy things on the basis that these returns would be sustained.

We told you last year, if these returns are sustained and interest rates stayed at these levels or fell lower, that stock prices, in aggregate, are justified. And we still believe that.

But those are two big ifs. And a particularly big if, in my view, is the one about returns on equity and on tangible assets. It goes against — it certainly goes against classic economic theory to believe that they can be sustained.

Charlie, how do you feel about it?

CHARLIE MUNGER: Well, I think a lot of the increase in return on equity has been caused by the increasing popularly of Jack Welch's idea that if you can't be a leader in a line of business, get out of it.

And if you have fewer people in the business, why, returns on equity can go up.

Then it's got more and more popular to buy in shares, even at very high prices per share. And if you keep the equity low enough by buying shares back, why, you could make return on equity whatever you want.

It would be that, to some extent, a slow revolution in corporate attitudes.

But Warren is right. You can't have massive accumulations of earnings that are retained and keep earning these rates of return on them.

WARREN BUFFETT: An interesting question is to think about, if you had 500 Jack Welches and they were running the Fortune — they're cloned — and they were running all of the Fortune 500 companies, would returns on equity for American business be higher or lower than they are presently?

I mean if you have 500 sensational competitors, they can all be rational, but that doesn't — and they will be. And they'll be smart and they'll keep trying to do all the right things. But there's a self-neutralizing effect, just like having 500 expert chess players or 500 expert bridge players. You still have a lot of losers if they get together and play in a tournament.

So it's not at all clear that if all American management were dramatically better, leaving out the competition against foreign enterprises, that returns on equity would be a lot better. They might very well drive things down.

That's what, to some extent, can easily happen in securities markets. It's way better to be in securities markets if you have a hundred IQ and everybody else operating has an 80, than if you have 140 and all the rest of them also have 140.

So the secret of life is weak competition, you know. (Laughter)

Somebody said, "How do you beat Bobby Fischer?" You play him in any game except chess, well — (Laughter)

That's how you beat Jack Welch. You play him in any game except business, although he's a very good golfer, I want to — (laughs) — point out.

He shot a 69 a few months ago when I saw him at a very tough course. Jack manages to play 70 or 80 rounds of golf a year, and come in sub-par occasionally, while still doing what he does at

GE. He's a great manager. But 500 Jack Welches, I'm not at all sure would make stocks more valuable in this country.

20. Book recommendations

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: I'm Ben Knoll and I'm from Minneapolis. And first, I just wanted to thank you for providing your past annual letters to the shareholders, and Mr. Munger for providing your speech to the graduate students at USC a couple years ago.

Drawn a lot of insights from that, not only in investing but also in my day job as a business manager.

And I'm wondering if you could help me with my summer reading list and provide some additional suggestions for reading in the fields of investing and management, other than the standards of Graham and Fisher and so forth.

WARREN BUFFETT: Charlie?

CHARLIE MUNGER: Yeah. I have recently read a new book twice, which I very seldom do. And that book is "Guns, Germs and Steel" by Jared Diamond. And it's a marvelous book. And the way the guy's mind works would be useful in business. He's got a mind that is always asking why. Why, why, why. And he's very good at coming up with answers.

I would say it's the best work of its kind I have ever read.

WARREN BUFFETT: I read a little easier book — (laughter) — recently.

I'm not even sure of the title. I don't pay much attention to titles when I get into the book, but it's something to the effect of "The Quotable Einstein." I mean it's a lot of his commentary over the years, and it's great reading.

"The Fermat Theorem" was the book that — that isn't an exact title either — but it's the story of the discovery of the answer. That's a very interesting book. One of our shareholders from Sweden gave me a copy of that when I was in New York and I've enjoyed it.

21. Higher rates would hurt Freddie and Fannie

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Marc Rabinov. I'm a shareholder from Melbourne, Austria.

Gentlemen, we have large holdings in Freddie Mac and Fannie Mae, and as you both know, they were quite — well, they were hurt quite a lot when interest rates went up in the past.

I'm wondering if you think there'll be hurt again when interest rates go up in the future?

WARREN BUFFETT: Well, the question about Freddie Mac and Fannie Mae on interest rates, they are not as interest rate sensitive as people formerly thought they were.

But it would be the pattern, and I have a feeling that if interest rates got extremely low, so that there was a huge turnover in the portfolio, and then rates went up dramatically, that even though they have various ways of protecting themselves against interest rate scenarios, that that might get very tough. I think there would be some kind of squeeze there.

They may have good answers as to why that wouldn't happen, incidentally, because they certainly worry about every kind of interest rate scenario. That's their job.

But I think, in a sense, very low interest rates are more of a long-term threat, because if you get a portfolio chock full of, say, 4 percent mortgages or something of the sort, and then you had a huge move upward, that would be quite painful for some period of time, no matter what you've done in the way of hedging.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

WARREN BUFFETT: Yeah. That's what happened to the savings and loans, in effect, you see, 25 years ago or whenever it was.

And Freddie and Fannie have other functions, and they've got a lot of advantages, but they have a savings and loan-type operation. They just do it on a very big scale and they get their money from — in a very different manner than from millions of depositors. But the basic economics have some similarly.

22. No worries about tough times: "It's a lot of fun"

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Jane Bell (PH), Des Moines. Since I became a Berkshire Hathaway shareholder I've been coming to these meetings. This is my second. (Laughter)

WARREN BUFFETT: I've been coming to these meetings ever since I've been a shareholder. (Laughter)

AUDIENCE MEMBER: Mr. Buffett, I'm a partner and owner in a consulting business, and we tell our clients and potential clients that we design solutions for what keeps them awake at night.

Mr. Buffett, from your perspective as an investor, what keeps you awake at night?

WARREN BUFFETT: Well, that's a good question. And that's one I always ask the managements of our subsidiaries, as well as any new investment. I want to know what their nightmare is.

Andy Grove, in his book "Only the Paranoid Survive," talks about the silver bullet for a competitor. So in terms of, if you only had one silver bullet, which competitor would you fire it at?

And it's not a bad question. And your question's a little broader. If you only had one worry that you could get rid of, what would it be?

I would say that, and I think I speak for Charlie — (inaudible) — but we really don't worry. You know, we will do the best we can, and when we have capital allocated, sometimes it's very easy to do. Sometimes it's almost impossible to do.

But we're not going to worry about it, because, you know, the world changes. And if we had something we were worried about in the business, we would correct it.

I'm not worried about any — I'm not really worried about — you know, we can lose a billion dollars on a California earthquake. But I'm not worried about it, although I have a sister who's in the audience that lives in California. I told her to call me quickly if the dogs start running in circles or anything like that. (Laughter)

But there's — you know, if you're worried about something, the thing to do is get it corrected and get back to sleep. And I can't think of anything I'm worried about at Berkshire. That doesn't mean that I have any good ideas as to what we should be doing with a whole lot of money that we have around.

But, you know, I can't do anything about that except keep looking for things that I might understand and do something with the money. And if they aren't there, they aren't there. And we'll see what happens tomorrow and next week and next month and next year.

Charlie, what are you worried about?

CHARLIE MUNGER: Well, in the 30-some years I've been watching you, I would say what it takes to make you not sleep at night is an illness in the family.

Short of that, Warren likes the game. I like the game. And even in the periods that look tough to other people, it's a lot of fun.

WARREN BUFFETT: It's a lot of fun.

CHARLIE MUNGER: It's a lot of fun. (Laughter)

WARREN BUFFETT: In fact it probably is the most — (applause) — it's sort of, it is the most — I mean we define tough times differently than other people would, but our idea of tough times is like now, and our idea — we don't feel it's tough times when the market's going down a lot or anything of the sort. So we are having a good time then.

I mean we don't want to sound like undertakers during a plague or anything, but — (Laughter)

But there really — you know, it makes no difference to us whether the price of Berkshire is going up or down. We're trying to figure out ways to make the company worth more money years down the road, and if we figure that out, the stock will take care of itself, so —

And usually when the stock is going down, it means other things are going down. And it's a better chance for us to deploy capital, and that's our business.

So you will not see us worrying. Maybe we should. You know, "What, me worry?" (Laughs)

23. "What is important and what is knowable?"

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: My name is Paul Yoon (PH) from L.A., California.

Mr. Warren Buffett, Mr. Charles Munger, I am one of the persons who highly admire you both. I have two questions.

Question one: your view on the world financial business environment in the next decade.

Question two — (laughter) — U.S. position for economic competition in the next decade. Thank you.

WARREN BUFFETT: Well, you've asked two big questions, but you're going to get very small answers, I'm afraid. (Laughter)

And that's no disrespect. But we — we just — we don't have that. We don't think about those things very much.

We just are looking for decent businesses. And incidentally, our views in the past wouldn't have been any good on those subjects.

We try to think about two things. We try to think about things that are important and things that are knowable.

Now, there are things that are important that are not knowable. In our view, those two questions that you raised fall in that. There are things that are knowable but not important. We don't want to clutter our minds up with those.

So we say, "What is important and what is knowable?" And what among the things that fall within those two categories can we translate into some kind of an action that is useful for Berkshire.

And we really — there are all kinds of important subjects that Charlie and I, we don't know anything about, and therefore we don't think about them.

So we have — our view about what the world will look like over the next ten years in business or competitive situations, we're just no good.

We do think we know something about what Coca-Cola's going to look like in ten years, or what Gillette's going to look like in ten years, or what Disney's going to look like in ten years, or what some of our operating subsidiaries are going to look like in ten years.

We care a lot about that. We think a lot about that. We want to be right about that. If we're right about that, the other things get to be — you know, they're less important. And if we started focusing on those, we would miss a lot of big things.

I've used this example before, but Coca-Cola went public in, I think, it was 1919. And the first year one share cost $40. The first year it went down a little over 50 percent. At the end of the year, it was down to $19. There were some problems with bottler contracts. There's problems with sugar. Various kinds of problems.

If you'd had perfect foresight, you would have seen the world's greatest depression staring you in the face, when the social order even got questioned. You would have seen World War II. You would have seen atomic bombs and hydrogen bombs. You would have seen all kinds of things.

And you could always find a reason to postpone why you should buy that share of Coca-Cola. But the important thing wasn't to see that. The important thing was to see they were going to be selling a billion eight-ounce servings of beverages a day this year. Or some large number.

And that the person who could make people happy a billion times a day around the globe ought to make a few bucks off doing it.

And so that $40, which went down to $19, I think with dividends reinvested, has to be well over $5 million now. And if you developed a view on these other subjects that in any way forestalled you acting on this more important, specific narrow view about the future of the company, you would have missed a great ride. So that's the kind of thing we focus on.

Charlie?

CHARLIE MUNGER: Yeah, we're predicting the currents that will come, just how some things will swim in the currents, whatever they are.

24. Praise for Value Line's "perfect snapshot"

WARREN BUFFETT: Zone 5, please.

AUDIENCE MEMBER: Good morning, Marc Gerstein from Value Line.

Mr. Buffett, considering the large amounts of demands on your time, how do you go about reviewing the entire spectrum of choices in the equity markets?

WARREN BUFFETT: Give me that last part again? I got the demands on my time and —

MARK ERSTEIN: How do you and Mr. Munger manage to review the whole spectrum of choices in the equity markets?

WARREN BUFFETT: A fat pitch coming up. (Laughter)

But I don't mind it at all, because the truth is that we get — I don't even know what we pay for Value Line. Charlie and I both get it in our respective offices, but we get incredible value out of it because it give us the quickest way to see a huge number of the key factors that tell us whether we're basically interested in the company.

And it also gives us a great way — good way — of sort of periodically keeping up-to-date. Value Line has 1,700 or so stocks they cover, and they do it every 13 weeks. So it's a good way to make sure that you haven't overlooked something if you just quickly review that.

But the snapshot it presents is an enormously efficient way for us to garner information about various businesses.

We don't care about the ratings. I mean that doesn't make any difference to us. We're not looking for opinions. We're looking for facts.

But I have yet to see a better way, including fooling around on the internet or anything, that gives me the information as quickly. I can absorb the information on — about a company — most of the key information you can get — and probably doesn't take more than 30 seconds in glancing through Value Line, and I don't have any other system that's as good. Charlie?

CHARLIE MUNGER: Well, I think the Value Line charts are a human triumph. It's hard for me to imagine a job being done any better than is done in those charts. An immense amount of information is put in very usable form. And if I were running a business school we would be teaching from Value Line charts.

WARREN BUFFETT: And when Charlie says the charts, he does not mean just the chart of the price behavior. He means all that information that really is listed under the charts that —

CHARLIE MUNGER: Oh yeah.

WARREN BUFFETT: The detailed financial information. You can run your eye across that.

The chart of the price action doesn't mean a thing to us, although it may catch our eye, just in terms of businesses that have done very well over time.

But we — price action has nothing to do with any decision we make. Price itself is all-important, but whether a stock has gone up or down, or what the volume is, or any of that sort of thing, that is — as far as we're concerned, you know, those are chicken tracks, and we pay no attention to them.

But that information that's right below the chart, in those 10 lines or so — 15 lines — if you have some understanding of business, that's a — it's a perfect snapshot to tell you very quickly what kind of a business you're looking at.

25. Insurance mergers haven't hurt GEICO

WARREN BUFFETT: Zone 6, please.

AUDIENCE MEMBER: David Winters from Mountain Lakes, New Jersey.

With the consolidation in the insurance industry, how do you think that will affect Berkshire's insurance businesses and the long-term development of the float?

And if I may, not to encourage your dogma to run over your karma, but how do you think your policy of partnership and fair dealing has enhanced or detracted from your investment returns? Thank you.

WARREN BUFFETT: Now, with the consolidation taking place in insurance, it's been taking place for some time. There have been some big mergers over the years.

It should — there are developments in insurance. We mentioned the super-cat bonds, which are not bonds at all. But that has an effect.

But I would say that there's no merger that has taken place that I regard as being detrimental, either to our GEICO business or to our reinsurance business.

That has not been a factor, and I think if there were some more mergers it would not be a factor. I see no way that any entities being put together would change the competitive situation in respect to GEICO.

GEICO operating just as it does, independently, is as competitive as can be, and it would not benefit by being part of any other organization.

And our reinsurance business is much more opportunistic. And it's not consolidation there, it's just lack of fear, generally, by competitors who can price — particularly cat business — at a rate that could be totally inadequate, as I use in an illustration in the report. But nevertheless, it could appear to be profitable for a long time.

And there's probably more of that going on now, and there'll probably be a lot more going on in that arena.

We have some sensational insurance businesses, though. I have to tell you that — I don't think you really have to worry too much about how we do in insurance in the future.

We have a number of GEICO people here today. I hope you got a chance to meet them. GEICO — and you saw Lorimer Davidson. I really was hoping he could be here, but Davy is 95 years old. I went to visit him a few months ago, and it just isn't easy for him to get around.

But he built a sensational company and it stumbled once. Jack Byrne got it back on track and Tony Nicely's got it going down the track at about a hundred miles an hour and it's getting faster all the time. So we've got a great business there.

Charlie?

CHARLIE MUNGER: Nothing to add.

26. "Wonderful companies" should buy back stock

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Yes. Bill Ackman from New York.

Is there a price at which it's inappropriate for a company to use its capital to buy back its stock?

WARREN BUFFETT: Give me that again?

AUDIENCE MEMBER: Example. Coca-Cola at 40 P/E. Is that a smart place for Coke to deploy capital?

WARREN BUFFETT: Well, it sounds like a very high price when you name it in terms of a P/E to buy back the stock at that sort of number. But I would say this: Coca-Cola's been around a hundred and — what, 12 years now, and there are very few times in that 112 years, if any, when it would not have been smart for Coca-Cola to be repurchasing its shares.

Coca-Cola is, in my view, among businesses that I can understand, it's the best large business in the world. I mean it is a fantastic business.

And we love it when Coke repurchases shares and our interest goes up. We owned 6.3 percent of Coca-Cola in 1988 when we bought in. We actually increased that a little bit a few years later. But if they had not repurchased shares, we probably would own about 6.7 percent or 6.8 percent of Coke now. As it is, we own a little over 8 percent, through repurchases.

There are going to be about a billion eight-ounce servings of Coke sold around the world — Coca-Cola products — sold around the world today. Eight percent of that is 80 million and 6.8 percent is 68 million. So there are 12 million extra servings for the account of Berkshire Hathaway being sold around the world. And they're making a little over a penny a serving, so, you know, that gets me kind of excited. (Laughter)

I think it — all I can tell you is, I approve of Coke repurchasing shares. I'd a lot rather have them repurchasing shares at 15 times earnings, but when I look at other ways to use capital, I still think it's a very good use of capital.

And maybe the day will come when they can buy it at 20 times earnings, and if they can I hope they go out and borrow a lot of money to ton of it at those prices, and —

I think we will be better off 20 years from now if Coke follows a consistent repurchase approach.

I do not think that is true for many companies. I mean I think that repurchases have become en vogue and done for a lot of silly reasons. And so I don't think everybody's repurchase of shares is well reasoned at all. You know, we see companies that issue options by the ton and then they repurchase shares much higher, you know —

I started reading about investments when I was six, and I think the first thing that I read was, you know, buy low, sell high. But these companies, through their options, you know, they sell low and then they buy high. And they've got a different formula than I was taught.

So there are a number that we don't approve of. When we own stock in a wonderful business, we like the idea of repurchases, even at prices that may give you nose bleeds. It generally turns out to be a pretty good policy.

Charlie?

CHARLIE MUNGER: Well, I think the answer is that in any company the stock could get to a price so high it would be foolish for the corporation to repurchase its shares.

WARREN BUFFETT: Sure.

CHARLIE MUNGER: And you can even get into gross abuse. Before the crash, the Insull utilities were madly buying their own shares as a way of promoting the stock higher. It was like a giant Ponzi scheme at the end.

So there's all kinds of excess that possible, but the really great companies that buy at high price- earnings, that can be wise.

WARREN BUFFETT: Our interest in GEICO went from 33 percent to 50 percent without us laying out a dime, because GEICO was repurchasing its shares. And we've benefitted substantially.

But we benefitted a lot more, obviously, when prices were lower. I mean we would — our interest in The Washington Post company has gone from nine and a fraction percent, to 17 and a fraction percent over the years without us buying a single share. But The Post or Coke or any number of companies don't get the bargain in repurchasing now that they used to. We still think it's probably the best use of many in many cases.

27. Berkshire insurance float has a negative cost

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: My name is Hutch Vernon. I'm from Baltimore, Maryland.

My question has to do with float. You said in the annual, and you've said in the past, that float has had a greater value to Berkshire than an equal amount of equity.

I wondered if you could clarify that statement. Is that because the float has been generated at such a low cost relative to an imputed cost for equity, or is there something else behind that statement?

WARREN BUFFETT: No, it's because the float, which is now, we'll say, 7 billion, comes to us at a negative cost. We would not make that statement if our float was costing us a couple percent a year, even though float would then be desirable. Highly desirable.

But our float is even better than that, or it has been, and so it comes to us with a cost of less than zero. It comes to us with a profit attached.

So if we were to replace — if we were to get out of the insurance business and give up the 7 billion of float and replace it with 7 billion of equity, we would have less going for us next year than under the present situation, even though our net worth would appear to be 7 billion higher.

And I have said, if we were to make the decision — if we were offered the opportunity to go out of the insurance business, and that 7 billion liability would — as part of that decision — would evaporate from our balance sheet, so that our equity would go up 7 billion, with no tax implications, we would turn down that proposition.

So obviously we think that 7 billion, which is shown as a liability, when it's part of a — viewed as part of an insurance business, is not a liability at all in terms of real economic value. And of course, the key is not what the float is today, and not what the cost is today.

The key is what is the float going to be 10 or 15 years from now, and what is the cost going to be 10 or 15 years ago. And, you know, we will work very hard at both increasing the amount of float and keeping the costs down somewhere close to our present level.

That makes it a very attractive business when that can be done. GEICO's a big part of doing that, but we've got other things, other insurance operations, that'll be important in that, too. And we may have others besides that in the future.

Charlie?

CHARLIE MUNGER: Yeah. If the float keeps growing, that is a wonderful thing indeed.

We really have a marvelous insurance business. In addition to having this remarkable earning power, it's way less likely to get really clobbered than most insurance businesses. So I think it's safer on the downside and has a better upside.

WARREN BUFFETT: And it may sound strange, but we don't regard losing a billion dollars in a California quake as getting really clobbered. I mean that is —

CHARLIE MUNGER: No, no.

WARREN BUFFETT: — I mean that's part of the game.

There are many companies that have greater exposure than that that really aren't getting paid for it. And you don't see it specifically, but any company that has a ton of homeowners' business in Florida or Long Island or along the coast of Texas, may have exposures many times our billion, and really not even be getting paid appropriately or specifically for taking that risk.

28. Not worried Japan might "dump" U.S. bonds

WARREN BUFFETT: Zone 9.

AUDIENCE MEMBER: Hi, my name is Mary Semler (PH) from Seattle, Washington.

Japan is a major holder of U.S. Treasurys. Given the troubled Japanese economy, do you foresee Japan cashing in their U.S. investments to bail themselves out? Why or why not?

WARREN BUFFETT: Probably didn't get all that. I was busy chewing.

CHARLIE MUNGER: I didn't get that, either.

WARREN BUFFETT: I was busy chewing here and —

AUDIENCE MEMBER: Japan is a major holder of U.S. Treasurys. Given the troubled Japanese economy, do you foresee Japan cashing in their U.S. investments to bail themselves out? Why or why not?

WARREN BUFFETT: The problems with the Japanese economy and does that mean that — are you thinking particularly about them dumping Treasurys or something of the sort?

CHARLIE MUNGER: That's exactly what she's —

WARREN BUFFETT: Yeah. (Laughter)

Well, you know, it's very interesting. All the questions about what so-called foreigners do with investments.

Let's just assume the Japanese, or any other country, decides to sell some U.S. government holdings that they have. If they sell them to U.S. corporations or citizens or anything, what do they receive in exchange? They receive U.S. dollars. What do they do with the U.S. dollars? You know, I mean they can't get out of the system.

If they sell them to the French, you know, the French give them something in return. Now the French own the government securities.

But really as long as we, the United States, run a deficit — a big deficit — a trade deficit — we are accepting goods and giving something in exchange to foreigners. I mean when they send us whatever it may be — and on balance they send us more of that then we send over there — we give them something in exchange.

We give them — we may give them an IOU. We may give them a government bond. But we may give them an investment they make in the United States.

But they have to be net investors in this country as long as we're net consumers of their goods. It's a tautology.

So I don't even know quite how a foreign government dumps its government bonds without getting some other type of asset in exchange that may have an effect on a different market.

The one question you always want to ask in economics is — and not a bad idea elsewhere, too — but is, "And then what?" Because there's always a second side to a transaction.

And just ask yourself, if you are a Japanese bank and you sell a billion dollars' worth of government bonds — U.S. government bonds — what do you receive in exchange, and what do you do with it? And if you follow that through, I don't think you'll be worried about foreign governments selling U.S. bonds. It is not a threat.

Charlie?

CHARLIE MUNGER: If I owned Japan, I would want a large holding of U.S. Treasurys. You're on an island nation without much in the way of natural resources. I think their policy is quite intelligent for Japan, and I'd be very surprised if they dumped all their Treasurys.

WARREN BUFFETT: If they're a net exporter to us, though, what choice do they have? When you think about it.

If they send over more goods to us than we send to them — which has been the case — they have to get something in exchange. Now for a while they were taking movie studios in exchange, you know — (Laughter)

They were taking New York real estate in exchange.

I mean they've got a choice of assets, but they don't have a choice as to whether — if they send us more than they get from us — whether they get some investment asset in return.

I mean it's amazing to me how little discussion there is about the fact that there's two sides to an equation. But it makes for better headlines, I guess, when read the other way.

29. Mild endorsement for some Social Security money in stocks

WARREN BUFFETT: Zone 10.

AUDIENCE MEMBER: This is John Vaughan (PH) from Detroit, Michigan.

Nebraska's Senator Kerrey has proposed private investment accounts for up to two percentage points of the current payroll tax. His words were, and I quote, "People want more than just a transfer payment. They want wealth."

Do you approve this proposal? And if you do, would you recommend passive investing, i.e. index, or if you recommend active investing, would you and Charlie want to give it a shot? (Laughter)

WARREN BUFFETT: Well, I talked with Bob Kerrey about that, and Bob does like the idea of giving everybody some piece of the American economy and an interest in it. As you know, he's proposed, really, sort of small grants to the 3 1/2 million or so children born every year, and then some buildup of that account. Senator Moynihan has come up with something recently in conjunction with Kerry.

I personally would not like to see any major amount of Social Security — and Moynihan was talking about 2 percent. And actually, I suggested the idea that maybe 2 percent out of the 12 and a fraction percent, at the option of the beneficiary — Social Security participant — could be devoted to some other system, but then they would only get 5/6ths of the basic Social Security benefit.

I don't think you could drop it below that, because you wouldn't want people turning 65 — or maybe a more advanced age in the future, 70 — and not having the safety net of Social Security. So I wouldn't want to drop it below about 5/6ths of the present benefits.

I don't — I think it's a perfectly reasonable topic to discuss whether you want to take that 2 percent, then, and let people build up an account, perhaps tax-free, perhaps an IRA-type account, so they would have both wealth and the safety net. But I wouldn't want to drop the safety net very far.

And I think that I would not want to turn an army of salespeople loose on the American public with a mandatory 2 percent going in some direction. I don't think that would be particularly healthy.

Charlie?

CHARLIE MUNGER: I am much less enthusiastic than you are. (Laughter)

In other words, your negative, or conservative, attitude is way more affirmative than mine.

I think the idea of getting the government into promoting the value of equities — in Japan we have a taste of that now. The Japanese government has been using the postal savings system to buy equities massively year after year after year. I don't think we need to get the government into the equity market. (Applause)

30. Business schools "incoherent" on cost of capital

WARREN BUFFETT: We go to zone 11, please.

AUDIENCE MEMBER: I'm Dale Max from University Park, Illinois. And I've got a question for each of you. A short question for Charlie, and maybe a little longer for Warren.

My question for Charlie is, in a business school sense, what is the cost of capital for Berkshire Hathaway?

And my question for Warren is that I've been on the internet and I look at Yahoo and they give you recommendations for companies. And when I search for Berkshire Hathaway, it shows that nobody is recommending Berkshire Hathaway — (laughter) — despite the fact that there are maybe a thousand people that are wearing signs here, "I love Berkshire Hathaway." And of course I've got mine on, too.

But what seems to be the problem in lack of recommendations?

WARREN BUFFETT: Well, we're not recommending Yahoo, incidentally, either. (Laughter and applause)

But I'll let Charlie have that first question about the cost of capital, which has puzzled people for thousands of years. And then —

CHARLIE MUNGER: The way that is taught in most business schools now, I find incoherent. So I'm the one that asks that question and gets the incoherent answers. I don't have a good answer to a question I consider kind of a stupid question.

WARREN BUFFETT: That isn't —

CHARLIE MUNGER: What is the cost of capital at Berkshire Hathaway when we keep drowning in this torrent of cash which we have to reinvest?

WARREN BUFFETT: Yeah. There's really only two questions that get to that, but you don't need a mathematical answer.

The first question is, is when you have capital, is it better to keep it or return it to shareholders? It's better to return it to shareholders when you cannot create more than a dollar of value with that capital. That's test number one.

And if you pass that threshold, that you think you can achieve more than a dollar of value for every dollar retained, then you simply look around for the thing that you feel the surest about, and that promises the greatest return weighted for that certainty.

So our cost of capital is, in effect, is measured by the ability to create more than a dollar of value for every dollar retained. If we're keeping dollar bills that are worth more in your hands than in our hands, then we've exceeded the cost of capital, as far as I'm concerned.

And once we think we can do that, then the question is, is how do we do it to the best of our ability? And frankly, all the stuff I see in business schools — and I've not found any way to improve on that formula.

Now the trouble that you may have is that many managements would be reluctant to distribute money to shareholders even if they would rationalize that they would do better than they actually do. But that's — that may be a danger on it, but that won't be solved by them hiring a bunch of people to come up with some cost of capital that also justifies them keeping the money, because that's what they'll do otherwise.

31. We prefer individual shareholders

WARREN BUFFETT: The question about recommending the stock, we very seldom had stock recommendations over the years. As I think back to 1965, I can't think of a lot of brokerage reports that have recommended Berkshire.

I'm not looking for any, you know, reports at all. We are not looking to have Berkshire sell at the highest possible price, and we're not looking to try and attract people to Berkshire who are buying stocks because somebody else recommends them to them.

We prefer people who figure out for themselves why they themselves want to buy Berkshire, because they're much more likely to stick around if they enter the restaurant because they decide it's the restaurant they want to eat at, than if somebody has touted them on it. And that's our approach.

So we do nothing to encourage. But I think even if we did, we probably wouldn't generate a lot of recommendations. It's not a great stock to get rich on, if you're a broker.

CHARLIE MUNGER: Yeah, I think the reason — (Laughter and applause)

I think one of the main reasons why it's so little recommended in the institutional market is that it's perceived as hard to buy in quantity. (Laughter)

WARREN BUFFETT: We prefer — we've got some good institutions as holders, including one that's run by a very good friend of ours, but frankly it's more fun for us to have a bunch of individual shareholders.

I mean you see it — it translates — if there's money made, it translates into changes in people's lives and not some change in somebody's performance figure for one quarter.

And we think that individuals are much more likely to join us with the idea of staying with us for as long as we stay around. And, you know, that's the way we look at the business.

Very few institutions look at investments that way, and, frankly, we think they're often less rational holders than we get with individuals.

32. "The earthquake doesn't know the premium you receive"

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: Good morning. Good morning, gentlemen. I'm Hugh Stevenson (PH), a shareholder from Atlanta.

My question involves the company's super-cat reinsurance business. You've addressed some of this, but I would like for you to expound on it, please.

You've indicated that you think this is the most important business of the company. And my question is, what do you think the long-term impact of catastrophe bonds and catastrophe derivatives will be on the float and the growth in float of the company?

And I understand that the mispricing of risk in these instruments doesn't really affect the way you price your business, but I'm wondering how you think it can affect the volume of the business.

And I remember several years ago, Mr. Buffett, you talked about, you can never be smarter than your dumbest competitor.

WARREN BUFFETT: Right.

AUDIENCE MEMBER: And these are some potentially dumb competitors.

WARREN BUFFETT: You've got it. (Laughter)

I just want to put an asterisk on one thing. We say insurance will be our most important business. We've not said the super-cat business will be our most important.

Super-cat has been a significant part of our business, and may well over the years remain a significant part, but it is far less significant than GEICO. And I'll mention a word or two about that.

But the super-cat business, you can price wrong, as I illustrated in my report. You can be pricing it at half what it should be priced at.

I used an illustration in the report of how you could misprice a policy that you should be getting, say, a million and a half for, namely a $50 million policy on writing — on something that had one chance in 36 of happening, so you should get almost a million and a half for it.

I said if you price it at a million a year, you know, you would think you were making money after ten years 70-odd percent of the time. The interesting thing about that is if you price it for a dollar a year you would have thought you made money 70-odd percent of the time, because when you are selling insurance against very infrequent events, you can totally misprice them but not know about it for a long time.

Super-cat bonds open up that field wide open. I mean you've always had the problem of dumb competitors, but you have a much more chance of having dumb competitors when you have a whole bunch of people who, in the case of hedge funds who have bought some of these, where the manager gets 20 percent of the profits in a year when there are profits and there is no hurricane, and when there happens to be a hurricane or an earthquake he doesn't take the loss. His limited partners do.

So it's very likely to be a competitive factor that brings our volume down a lot. It won't change our prices.

You know, the thing to remember is the earthquake does not know the premium that you receive. (Laughter)

I mean the earthquake happens regardless.

So it doesn't say — you know, you don't have somebody out there on the San Andreas Fault that says, "Well, he only charged a 1 percent premium so we're only going to do this once every 100 years." (Laughter)

Doesn't work that way.

So we will probably do a whole lot less volume in the next few years in the super-cat business. We have these two policies that run for a couple more years. But in terms of new business, we will do a whole lot less.

GEICO is by far the most important part of our insurance business, though. GEICO in the 12 months ended April 30th had a 16.9 percent increase in policies in force. Year-end, I told you it was 16.0. A year ago, I told you it was 10. Year before that, I think it was six and a fraction.

So its growth is accelerating and it should be in a whole lot more homes around the country than it is now, you know, by a big factor. And it will be, in my view. So that will be the big part of our insurance business.

But we may be in the insurance business in some other ways too as time goes along. It's a business that if you exercise discipline you should find some ways to make money, but it won't always be the same way.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

33. What Buffett wants in an annual report

WARREN BUFFETT: OK. Zone 2.

AUDIENCE MEMBER: Hello. I'm Steve Davis (PH) from San Francisco.

I'd like your advice on how to understand annual reports. What you look for, what's important, what's not important, and what you've learned over the years from reading thousands of reports? Thank you.

WARREN BUFFETT: Well, we've read a lot of reports, I will tell you that.

And we — well, we start by looking at the reports of companies that we think we can understand. So we hope to find — we hope to be reading reports — and I do read hundreds of them every year — we hope to be reading reports of businesses that are understandable to us.

And then we see from that report whether the management is telling us about the things that we would want to know about if we owned a hundred percent of the company.

And when we find a management that does tell us about those things, and that is candid in the same way that a manager of a subsidiary would be candid with us, and talks in language that we can understand, it definitely improves our feeling about investing in such a business.

And the reverse turns us off, to some extent. So if we read a bunch of public relations gobbledygook, you know, and we see lots of pictures and no facts, it has some effect on our attitude toward a business.

We want to understand the business better when we get through with the annual report than when we picked it up. And that is not difficult for a management to do if they want to do it.

If they don't want to do it, you know, we think that is a factor in whether we want to be their partners over a ten-year period or so.

But we've learned a lot from annual reports. For example, I would say that the Coca-Cola annual report over the last good many years is an enormously informative document. I mean, I can't think of any way if I'd have a conversation with Roberto Goizueta, or now Doug Ivester, and they were telling me about the business, they would not be telling me more than I get from reading that annual report.

We bought that stock based on an annual report. We did not buy it based on any conversation of any kind with the top management of Coca-Cola before we bought our interest. We simply bought it based on reading the annual report, plus our knowledge of how the business worked.

Charlie?

CHARLIE MUNGER: Yeah. I do think the — if you've got a standardized bunch of popular jargon that looks like it came out of the same consulting firm, I do think it's a big turnoff. That's not to say that some of the consulting mantras aren't right. But I think there's a lot — that for a sort of candid, simple, coherent prose — a lot to be said for it.

WARREN BUFFETT: Almost every business has problems, and we'd just as soon the manager would tell us about them.

We would like that in the businesses we run. In fact, one of the things, we give very little advice to our managers, but one thing we always do say is to tell us the bad news immediately. And I don't see why that isn't good advice for the manager of a public company.

Over time, you know, I'm positive it's the best policy. But a lot of companies, for example, have investor relations people, and they are dying just to pump out what they think is good news all the time.

And they have this attitude that, you know, you've got a bunch of animals out there to be fed. And that they're going to feed them what they want to eat all the time. And over time the animals learn.

So we've tried to stay away from businesses like that.

CHARLIE MUNGER: What you seldom see in an annual report is a sentence like this: "This is a very serious problem and we haven't quite figured out yet how to handle it." (Laughter)

But believe me, that is an accurate statement much of the time.

VOICE: — just a moment.

(Buffett leaves the table after someone tells him something in his ear.)

34. Munger goes it alone on Coke vs Pepsi

CHARLIE MUNGER: All right. Zone 3. (Laughter)

AUDIENCE MEMBER: I'm Leta Gurtz (PH) and I live in the area. And I would like to know what your prediction is for Coca-Cola's long-term growth versus Pepsi-Cola's recent efforts to increase the competitiveness with Coke?

CHARLIE MUNGER: Yeah. (Laughter)

Long-term, I would expect Coke to continue to gain versus Pepsi. (Laughter and applause)

(Buffett returns and sits down)

WARREN BUFFETT: What has he been doing while I was gone? What'd you say, Charlie? (Laughter)

I knew I was taking a chance. (Laughter)

What was the question?

CHARLIE MUNGER: I said that long-term I expected Coke to continue to gain versus Pepsi.

WARREN BUFFETT: Oh. Well. It's those kind of insights as to why we keep him on the job year after year. (Laughter)

In a moment of particular confidence, he one time told me the same thing about RC. (Laughter)

Now, that was probably zone 3 you were answering, so we'll go to 4.

What have you got there? You got peanut brittle?

CHARLIE MUNGER: Um-huh. (Laughter)

35. Ignoring asset gains at Coca-Cola

WARREN BUFFETT: Zone 4, please.

AUDIENCE MEMBER: Nat Chase (PH), Houston, Texas.

My first question's on the quality of earnings and your evaluation of quality of earnings in the U.S. right now.

And the second is, what multiples should be put on asset gains such as sale of bottling assets or reversal of merger reserves? Thanks.

WARREN BUFFETT: Yeah, well, taking the second question, for example, with Coca-Cola, the bottling transactions are incidental to a long-term strategy which, in my view, has been enormously successful to date, and which has more successes ahead of it.

But in the process of rearranging and consolidating the bottling system, and expanding to relatively undeveloped markets, there have been, and there will be, a lot of bottling transactions. And some produce large gains. Some produce small gains. I ignore those in my evaluation of Coke.

The two important elements in Coke are unit case sales and shares outstanding. And if the shares outstanding go down and the unit case sales advance at a good clip, you are going to make money over time in Coca-Cola.

There have been transactions where people have purchased rights to various drinks. Coca-Cola's purchased some of those around the world. And when you see what is paid for a million or 100 million unit cases of a business, and then you think to yourself that maybe Coke will add a billion and a half cases a year, that's a real gain in value. It's a dramatic gain in value.

And that is what counts, in terms of the Coca-Cola Company. If you think the Coca-Cola Company's going to sell some multiples of its present volume 15 or 20 years from now, and you think there'll be a lot fewer shares outstanding, you've gone about as far as you need to go. But I would pay no attention to asset gains. I would just take those out of the picture.

36. Stock options and inflated earnings

WARREN BUFFETT: Now, as to quality of earnings, Charlie and I feel that, in several respects, but in one important respect, that the quality of earnings has gone down. Not because the policy has changed, but because it's just become more significant. And that's in the case of stock options.

We have — there are certain companies that we've evaluated for possible purchase where, in our calculation of earnings, the earnings are maybe 10 percent less per year per share than reported. And that isn't necessarily the end of the world, but it is a difference in valuation that is significant and is not reported under standard accounting.

So we think the quality of earnings as reported by a company with significant stock option grants every year, we think is dramatically poorer than for one where that doesn't exist. And there are a lot of companies that fall in that category.

Coca-Cola's earnings are very easy to figure out. Just figure out what they're, you know, what they're earning per case from operations, and you'll see over the years the earnings per case go up. And the cases go up and the shares go down. And it doesn't get much more complicated than that.

Charlie?

CHARLIE MUNGER: You've said it wonderfully. (Laughter)

I just wish we had more like that.

WARREN BUFFETT: Yeah.

GEICO, the key — I mean the same way. It's policies in force and underwriting experience per policy. And that is exactly the way, as noted in the annual report, we pay people there. We pay them, from the bottom to the very top, based on what happens with those two variables.

And we don't talk about earnings per share at GEICO, and we don't talk about investment income. We don't get off the track, because there are two things that are going to determine what kind of business that GEICO is over a long period of time. And policies at GEICO are unit cases at Coca-Cola.

37. Benjamin Graham and how Buffett would teach investing

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. My name's James Claus (PH) from New York City. And I just wanted to ask you a question.

Both you and Mr. Munger have repeatedly said that you don't believe that business valuation is being taught correctly at our universities, and as a Ph.D. student at Columbia Business School, that troubles me, understandably, because in a couple of years I'll be joining the ranks of those teaching business valuation.

My question isn't what sources, such as Graham or Fisher or Mr. Munger's talks, you would point people that are teaching business valuation to, but do you have any counsel about the techniques of teaching business valuation?

WARREN BUFFETT: Well, I was lucky. I had a sensational teacher in Ben Graham, and we had a course there, there's at least one fellow out in the audience here that attended with me. And Ben made it terribly interesting, because what we did was we walked into that class and we valued companies.

And he had various little games he would play with us. Sometimes he would have us evaluate company A and company B with a whole bunch of figures, and then we would find out that A and B were the same company at different points in its history, for example.

And then there were a lot of little games he played to get us to think about what were the key variables and how could we go off the track.

I remember one time Ben met with Charlie and me and about nine or so other people down in San Diego in 1968 or so, when he gave all of us a little true/false test, and we all thought we were pretty smart — we all flunked. But that was his way of teaching us that a smart man playing his own game and working at fooling you could do a pretty good job at it.

But I would, you know, if I were teaching a course on investments, there would be simply one valuation study after another with the students, trying to identify the key variables in that particular business, and evaluating how predictable they were first, because that is the first step.

If something is not very predictable, forget it. You know, you don't have to be right about every company. You have to make a few good decisions in your lifetime.

But then when you find — the important thing is to know when you find one where you really do know the key variables — which ones are important — and you do think you've got a fix on them.

Where we've been — where we've done well, Charlie and I made a dozen or so very big decisions relative to net worth, but not as big as they should have been. And we've known we were right on those going in. I mean they just weren't that complicated. And we knew we were focusing on the right variables and they were dominant.

And we knew that even though we couldn't take it out to five decimal places or anything like that, we knew that in a general way we were right about them. And that's what we look for. The fat pitch. And that's what I would be teaching — trying to teach students to do. And I would not try to teach them to think they could do the impossible.

Charlie?

CHARLIE MUNGER: Yes. If you're planning to teach business valuation, and what you hope to do is teach the way people teach real estate appraising. So you can take any company, and your students, after studying your course, will be able to give you an appraisal of that company, which will indicate, really, its future prospects compared to its market price, I think you're attempting the impossible.

WARREN BUFFETT: Yeah, probably on the final exam I would take an internet company, and I would say the final exam, the question is, "How much is this worth?" And anybody that gave me an answer I would flunk. (Laughter)

CHARLIE MUNGER: Right. Right.

WARREN BUFFETT: Make grading papers easy, too. (Laughter)

38. Munger: Wesco is a "historical accident"

WARREN BUFFETT: OK, zone 6.

AUDIENCE MEMBER: Good morning. Laurence Balter (PH), Carlsbad, California. Question for the two of you.

There was an article, I think about last year in The New York Times, that regarded Wesco as a Berkshire Class C share-type company, and I'd like to know your comments on that.

And the second question is, if I were to write you a check for the operating businesses that Berkshire owns, how much would it have to be?

WARREN BUFFETT: Big. (Laughter)

Charlie is the resident expert on Wesco, so I'm going to let him address that side. He gets very eloquent on this.

CHARLIE MUNGER: Yeah. We always say that, per unit of book value, Wesco is worth way less than Berkshire, and indeed the market is saying the same thing. It is not a clone of Berkshire. It's a historical accident. (Audience mumbling)

WARREN BUFFETT: We want it to do well, obviously, for Wesco. We own 80 percent of it and we've got strong feelings about the people who are partners there, particular the Peters family, who, in effect, invited us in 20-odd years ago and trusted us to manage a big part of their money, in effect, by letting us buy control. So we've got strong fiduciary feelings about it.

It suffers in comparison with Berkshire because for one thing, anybody that wants a tax-free merger is going to want to come to Berkshire. You know, that's just the way it is, unfortunately.

And we are looking for big ideas, primarily, and the big ideas are going to fit into Berkshire.

We would love to get ideas that fit into Wesco, and we had a very good one a couple years ago, thanks to Roy Dinsdale pointing me in the right direction. And we added Kansas Bankers Surety to Wesco, and it's a gem. And it's run by Don Towle, who's done a terrific job.

But that's the exception, unfortunately. Because if a FlightSafety comes along, it's not going to fit Wesco.

So we will do our best for Wesco, but the nature of things is that most of the opportunities that make a lot of sense are going to come to Berkshire.

Charlie, do you have anything?

CHARLIE MUNGER: Nothing more.

39. Buy Berkshire or the stocks it buys?

WARREN BUFFETT: OK. Zone 7.

AUDIENCE MEMBER: My name is Bob Swanson (PH) from Phoenix.

And I'm wondering, what are the advantages of investing in Berkshire Hathaway as opposed to investing in the stocks that Berkshire owns?

WARREN BUFFETT: Well, a lot of people do one or the other and some people do both. But you have to really make up your own mind on that.

We're not going to go to great lengths to tell you about everything that Berkshire is doing as we go along, and there could be some changes, and there will be things that can happen in Berkshire that I think you would have trouble duplicating elsewhere.

But on the other hand, you know, if you'd put all your money in Coca-Cola some years back, you might have done better than if you'd put it in Berkshire.

So we really make no recommendations as to what people do with their money. We do not seek to become investment advisors through, in effect, our portfolio actions at Berkshire.

Charlie?

CHARLIE MUNGER: Amazingly, we hate it when people following us — follow us around buying what we buy. (Laughter)

WARREN BUFFETT: Nothing personal.

CHARLIE MUNGER: No. (Laughter)

40. Shareholders get info they need to value Berkshire

CHARLIE MUNGER: By the way, the questioner before this last one asked what is the market value under the hammer of all Berkshire's operating subsidiaries, and the answer is you have to figure that out yourself. (Laughter)

WARREN BUFFETT: Mr. Nice Guy. (Laughter) Zone —

But we give you the information, incidentally, where your judgment on it should be about as good as ours. There's nothing mysterious about valuing The Buffalo News, or See's Candy, or FlightSafety, or Dairy Queen. So you really have the same information we have in that.

I mean if there's material information that we aren't giving you about any important Berkshire subsidiary, we'd like to give it to you, because we think you are entitled to have the information. It enables you to value the various pieces.

Because of the aggregate size of Berkshire now, in terms of market capitalization and some of the positions we own, the smaller subsidiaries really cannot have that much effect. We love them just as much. I enjoy all of the businesses we're in and I enjoy the people that run them.

So, we don't make a — there's not — we don't differentiate in our attitude within the company, but in terms of the actual impact on the valuation of Berkshire, there are a number that really just don't make that much difference in terms of figuring out whether Berkshire's worth X or X minus a thousand or plus a thousand, because a thousand now is over a billion dollars, in terms of valuation. A billion is still a lot of money.

41. Three factors driving the bull market

WARREN BUFFETT: Area 8, please.

AUDIENCE MEMBER: Hello, Mr. Buffett, Mr. Munger. My name is Robert McCormick, I'm from Holdrege, Nebraska.

And I would like to know how much you attribute the gains enjoyed by the stock market these past years to the baby boomer generation investing for their retirement?

WARREN BUFFETT: Yeah, I would say that, personally, I would not think that has much to do with it.

I think the two big factors are in — well, there's three big factors. One is the improved return on equity, which was a fundamental factor that pushed stock prices up.

Two is a decline in interest rates that pushed stock prices up.

And then finally, stock prices advancing, themselves, brings in buying. It doesn't go on forever, but it creates its own momentum, to some extent, if you have these underlying factors that started to push it along.

So I would say two of the three factors are fundamental and the third is a market-type factor that bull markets do feed on themselves, and I think that you've seen some evidence of that.

But I don't think that any specific — you know, the 401(k) factor or whatever it may be, was it by itself.

But I do think money is pouring into mutual funds, for example, because people have had a very favorable experience with those funds. And that does bring investors along. People want to be on the train.

Charlie?

And I think, incidentally, many of them have very unrealistic expectations.

CHARLIE MUNGER: Yeah. The general investment experience in the last, what, 18 years in common stocks has been awesomely high, I think by any past standards now, isn't that right, Warren?

WARREN BUFFETT: Right. Well you've had — since 1982 you've had roughly tenfold in the Dow, and probably similar in the S&P. With a huge amount of money and with more participants all the time.

And there are people coming into the market every day because they feel that they've missed the boat or they're coming in heavier than they came in before, simply because they've had a pleasant experience.

Past experience doesn't — does not mean much, in terms of what you should expect from your investments. You will do well in your investments because you own or bought things at the right price and the businesses behaved well from that point forward.

CHARLIE MUNGER: Well, you won't have 18 more years of 17 percent or 18 percent per annum. That I think we can virtually guarantee.

42. Buffett and Munger about equal at "goofing off"

WARREN BUFFETT: Area 9.

AUDIENCE MEMBER: Hello. I'm Tubby Stayman from Palm Beach, Florida.

I know you enjoy bridge very much. I know you play my late husband's convention.

Tell me, how often are you able to devote to this wonderful game? How many times a week do you play other than the internet?

WARREN BUFFETT: I didn't get all of that, Charlie? Did you?

CHARLIE MUNGER: How much bridge are you playing?

WARREN BUFFETT: Uh-oh.

AUDIENCE MEMBER: Yes. (Laughter)

WARREN BUFFETT: Well, this week — we should put this in the annual report, because it may be a material factor. (Laughter)

I'm probably — at least ten hours a week. Maybe a little more. I don't get any better by doing it, either, so it's rather discouraging, but it is a lot of fun. And it has to have come out of reading time.

I don't think it's hurt Berkshire yet, but that may be because we're in a slow period generally.

If the market goes down a lot, I promise to cut back on my bridge. (Laughter)

Charlie?

CHARLIE MUNGER: Yeah. Well, I probably play three or four hours a week. But I don't play on the internet.

WARREN BUFFETT: He plays a lot of golf, though. Confess Charlie.

CHARLIE MUNGER: Oh yes. (LAUGH)

WARREN BUFFETT: Yeah, we both spend about the same amount of time goofing off. I mean if you —(laughter) — want to know.

43. Defending Walt Disney-Capital Cities accounting

WARREN BUFFETT: OK. Area 10.

AUDIENCE MEMBER: Yes, my name is Cary Blecker (PH), also from West Palm Beach, Florida.

With all due respect to Mr. Eisner if he's in the audience, there's been some criticism levied recently at the Disney Company, mainly from an accounting professor at one of the state universities in New York, in reference to Disney's purchase of Capital Cities and the way they accounted for that purchase.

Basically, what this professor is saying is that Disney somehow created a slush fund and is charging the expenses to the merger to this slush fund rather than earnings.

If you're familiar with this criticism, I'm wondering what you think of it? And if you're not, are you familiar with the way Disney accounted for the purchase of Capital Cities?

WARREN BUFFETT: Yeah, I am familiar.

AUDIENCE MEMBER: Thank you.

WARREN BUFFETT: And actually, Abe Briloff, who wrote that, is a fellow who, in general, I admire.

Abe wrote me a letter not more than about three or four weeks ago and asked me to talk at a university where he teaches. And I wrote him back and I told him I wouldn't be able to do it because it's not in proximity to where I'll be.

And I told him — and he asked me about the Disney thing. And I told him I disagreed with him on —

I admire what Abe does in the attempt to have accounting reflect economic reality, but he and I don't see it exactly the same on some points, although we would agree on other points.

I think — I don't think Disney is a very complicated enterprise to evaluate. I mean there are — when Cap Cities bought ABC, there were purchase accounting adjustments, and they tend to wash through, to some extent.

I mean if you have programs that you're stuck on, you may write those down from what the previous carrying cost was. Maybe the previous management should have written them down, too, at that point. But I don't think that — I think with Disney, what you see now is what you get.

Charlie?

CHARLIE MUNGER: Yeah. I've got no great quarrel with the accounting at Disney. I think —

WARREN BUFFETT: Abe Briloff is a wonderful guy.

CHARLIE MUNGER: Yeah. He's got a good sense of humor and he generally fights the right demons, but I don't think you can criticize Disney's accounting.

WARREN BUFFETT: We certainly disagree with Abe, who, like I say, I agree with Charlie, he is a good guy.

But he — we disagree with him on amortization of intangibles entirely. So we would say that if Disney is charging, whatever it may be, probably 400 million a year for amortization of intangibles, which is not tax deductible, we would include that as a component of earnings.

So there might be some plusses and minuses that you'd make in adjustments, but I would say, by the time you add back amortization of intangibles that we would probably think the economic earnings of Disney might well be more than the reported earnings in the next few years.

44. Buffett wants accounting change

WARREN BUFFETT: I think that the intangible amortization question — which the FASB is looking at now — I think it should be changed. I mean I think it absolutely distorts economic reality, and I think that it influences whether people go to purchase, or accounting, or pooling, and they do all kinds of acrobatics to try and get pooling accounting.

And, you know, it shouldn't make that kind of difference in reported numbers, based on whether a transaction, which has exactly the same economics, is done through a purchase or pooling. But I have seen managements, some I know quite well, arrange to do things on a pooling basis that they think — where if they were private they would do it on a purchase basis.

And I think that's nuts. And I think if accounting is pushing people to doing things that are nuts, that it's time for accounting to look at itself.

I would say that — (applause) — net, the economic earnings of Disney, in our view, are somewhat higher than reported earnings.

45. I'll never know enough to buy tech stocks

WARREN BUFFETT: Zone 11, please.

AUDIENCE MEMBER: Good morning, Mr. Munger and Mr. Buffett. My name is Prakash Puram (PH) from Minneapolis.

There seem to be great values in the technology sector that meet most of your criteria and philosophy in investing, with the exception of the simplicity criterion. Names like IBM, Microsoft, HP, Intel.

Would you ever consider investing in companies in this sector in the future?

WARREN BUFFETT: Well, the answer is no, and it's probably pretty unfortunate, because I've been an admirer of Andy Grove and Bill Gates and, you know, I wish I had translated that admiration into backing it up with money.

But the truth is, I don't know where Microsoft or Intel — I don't know what that world will look like in 10 years.

And I don't want to play in a game where I think the other guys have got an advantage over me, and —

I could spend all my time thinking about technology for the next year and I wouldn't be the hundredth or the thousandth or the 10,000th smartest guy in the country in looking at those businesses.

So that is a seven or eight foot bar that I can't clear. There are people that can clear it, but I can't clear it. And no matter how I train, I can't clear it.

So, the fact that there will be a lot of money made by somebody doesn't bother me, really. And I mean there may be a lot of money made by somebody in cocoa beans, but I don't know anything about them.

And there are a whole lot of areas I don't know anything about. So, you know, more power to them.

And I think it would be a very valid criticism if Charlie and I — if it were possible that Charlie and I, by spending a year working on it, could become well enough informed so that our judgment would be better than other people's, but that wouldn't happen. And it would be a waste of time.

It's much better for us to swing at the easy pitches.

Charlie?

CHARLIE MUNGER: Whatever you think you know about technology, I think I know less. (Laughter)

WARREN BUFFETT: That's probably about true, incidentally. Charlie has a little more of — he understands some things in the physical world a lot better than I do.

46. We've "missed the boat" on share buybacks

WARREN BUFFETT: But anyway. We'll go to zone 1.

AUDIENCE MEMBER: Good morning. I'm Murray Cass from Markham, Ontario.

First off, against my dentist's advice, I'd like to thank you for the free Coke and ice cream last night. (Laughter)

Earlier this morning, Mr. Buffett, you mentioned that you liked when wonderful companies like Coke purchased their shares back.

Similarly, I own shares in a wonderful company, that's Berkshire. Should I be hoping that you buy your own shares back?

WARREN BUFFETT: Well, it's interesting, we should have — perhaps we should have bought some shares back, but usually at the time we could have bought something else that also did very well for us.

I mean maybe when we were buying Coke we could have been buying our own shares back. To some extent there hasn't been that much trading in it.

But I think it's a valid criticism to say that we have missed the boat at various times in not repurchasing shares.

We'll see what we do in the future on it. If it looks like the best thing to do with money, it's what we should be doing.

And in the past, I've probably been not optimistic enough in respect to Berkshire compared to other things we were doing with money.

Now, the money we spent buying the GEICOs and all of that has turned out to be a good use of money, too.

But we've never wanted to leverage up. That's just not our game. So we've never wanted to borrow a lot of money to repurchase shares. We might advise other people to do it, but we would — it's not our style ourselves.

We've got all our money in the company. We've got all of our friends' and our relatives' money virtually.

So we have never felt that we wanted to leverage up this company like it was just one of a portfolio of a hundred stocks.

But it's a valid criticism to say that we have not repurchased shares when we should have. And it's also a valid criticism to say that we've issued some shares we shouldn't have issued.

Charlie?

CHARLIE MUNGER: Oh, I would agree with both comments.

47. "Smile train"

WARREN BUFFETT: Area two.

AUDIENCE MEMBER: Fellow investors of Berkshire and Hathaway, Warren Buffett and Charlie Munger. I am from originally China. Now I have a company in Michigan.

I want to ask questions based on facts. I want to sell Coke, GEICO, and a little book called The Wizard of Omaha: The Investment Philosophy of Warren Buffett, in China. Through all the villages, the cities, little towns, I want to make that a reality. Cheers.

WARREN BUFFETT: Cheers. (Applause)

CHARLIE MUNGER: Cheers.

WARREN BUFFETT: Zone three. (Laughter)

AUDIENCE MEMBER: I have not asked the question.

WARREN BUFFETT: Oh, just warming up. OK. (Laughter)

AUDIENCE MEMBER: I will.

WARREN BUFFETT: They always tell me to get off the stage while you're in good shape, but I'll say it. (Laughter)

AUDIENCE MEMBER: I could (inaudible), but you missed your chance. (Laughter)

I'm a owner of Berkshire and I spent 6 percent of my net worth to be engaged to Berkshire.

WARREN BUFFETT: Wise decision. (Laughter)

AUDIENCE MEMBER: I did better than guess who? Bill Gates. I notice Bill Gates and you were traveling on a slow boat in China. I want to go home, on a fast train.

You want to cut me off?

VOICE: Do you have a question or —?

AUDIENCE MEMBER: If you want to cut off, fine. Up to the investors. (Applause)

I'll quit if you want to do that.

VOICE: Do you have a question? A question?

AUDIENCE MEMBER: I come long ways.

VOICE: OK. Ask your question.

AUDIENCE MEMBER: OK. I know I'm a problem for you. (Laughter)

VOICE: Not a problem. Just ask the question.

AUDIENCE MEMBER: But I'm here for a reason. Because I made some money, I'm go on a train. A smile train. Yesterday, or the day before, at the baseball I asked Mr. Warren Buffett, "Have you heard of the smile train?" He said, "No." I'm back here to respond. This is a smile train.

WARREN BUFFETT: OK, we thank you. But I think that's your question.

48. Why Buffett bought silver

WARREN BUFFETT: We'd better go to zone 4, I think. (Applause)

AUDIENCE MEMBER: Good morning, or afternoon, actually. My name's Matt Schwab. I'm from New York. Pound Ridge, New York.

I actually had a question about the silver purchase last year. When you announced it, you said that you believed that supply and demand fundamentals would only be established at a higher price — re-established at a higher price.

I was just wondering if you could go into more detail about what some of those fundamentals are. I mean, we've read a lot about, like, battery technology and some other things.

WARREN BUFFETT: Yeah, we have no inside information about great new uses for silver or anything of the sort. But the situation — and you can get these figures and they're not precise, but I think they're in general — they're generally accurate.

You can see from looking at the numbers that aggregate demand, primarily from photography, from industrial uses, and from ornamental jewelry-type uses, is close. Call it 800 million-plus ounces a year.

And there are 500 million or so ounces being produced of silver, annually, although there will be more coming on in the next couple of years. There's more coming on right now.

However, most of that silver is produced as a byproduct in the mining of gold or copper and lead zinc, so that since it's a byproduct, it's not responsive to — not very responsive to price changes, because obviously, if you've got a copper mine and you get a little silver out of it, you're much more interested in the price of copper than silver.

So you have 500 million ounces or so of mine production, and you have 150 million ounces or so of reclaimed silver, a large part of which relates to the uses in photography.

So there's been a gap in recent years of perhaps 150 million ounces — but none of these figures are precise — which has been filled by an inventory of bullion above ground, which may have been a billion-two, or more, ounces a few years back, but which has been depleted.

And no one knows the exact figures on this, but there's no question that the bullion inventory has been depleted significantly.

Which means that the present price for silver does not produce an equilibrium between supply, as measured by newly-mined silver plus reclaimed silver, and usage.

And that — eventually something will happen to change that picture. Now, it could be reduced usage, it could be increased supply, or it could be a change in price.

And that imbalance is sufficiently large, even though there is some new production coming on, and there's the threat of digital imaging that will reduce silver usage, perhaps, in the future in photography.

But we think that that gap is wide enough so that it will continue to deplete inventories — bullion inventories — to the point where a new price is needed to establish equilibrium.

And because of the byproduct nature, which makes the supply inelastic, and because of the nature of demand, which is relatively inelastic, that — we don't think that that price change would necessarily be minor.

It's interesting, because silver has been artificially influenced for a long time. You saw that movie about — you know, it was William Jennings Bryan, who was editor of The Omaha World-Herald and a congressman from Nebraska — and his brother was governor of Nebraska — who was the big silver man.

And they used to talk 16-to-1. The 16-to-1 ratio, I think, goes back to Isaac Newton, when he was master of the mint. Charlie will know all about that, because he's our Newtonian expert here. But that ratio had kind of a mystical significance for a while. Didn't really mean anything.

And in 1934, the government passed an act called The Silver Purchase Act of, surprisingly, 1934, which set an artificially high price for silver at that time, when production and usage was much less.

And the government, U.S. government, ended up accumulating two billion ounces of silver. Now, this was at a time when demand was a couple hundred million ounces a year, so you're talking ten years' supply.

So there was an artificially high price for a while. By the early 1960s, that became an artificially low price of $1.29, and at that time I could see the inventories of the U.S. government being depleted, somewhat akin to what inventories are being depleted now.

And despite the fact that Lyndon Johnson and the administration said they would not demonetize silver, they did demonetize it, and silver went up substantially. That was the last purpose we had of silver, but I've kept track of the figures ever since.

The Hunt brothers caused a great amount of silver to be converted into bullion form, including a lot of silver coins. So they, again, increased the supply in a very big way by their action in pushing the price way up to the point where people started melting it down.

So you had this — dislocations in silver over a 60-plus year period, which has caused the price to be affected by these huge inventory accumulations and reductions.

And we think right now that — or we thought last summer when we started buying it — that the price we bought it, that that was not an equilibrium price, and that sooner or later — and we didn't think it was imminent, because we don't wait till things are imminent.

You know, we were going to buy a lot of silver. We didn't want to buy so much as to really disrupt the market, however. We had no intention of replaying any Hunt scenario. So we wanted to be sure we didn't buy that much silver. But we liked it.

Charlie?

CHARLIE MUNGER: Well, I think this whole episode will have about as much impact on Berkshire Hathaway's future as Warren's bridge playing. (Laughter)

You've got a line of activity where once every 30 or 40 years you can do something employing 2 percent of assets. This is not a big deal for —

WARREN BUFFETT: No.

CHARLIE MUNGER: — Berkshire. The fact that it keeps Warren amused and — (Laughter)

WARREN BUFFETT: Yeah, I do like —

CHARLIE MUNGER: — and not doing counterproductive things — (Laughter)

WARREN BUFFETT: It makes me feel good about — it makes me feel better about all those pictures that people take over the weekend. (Laughs)

They all use a little bit of silver. (Laughter)

CHARLIE MUNGER: At least it shows something that teaches an interesting lesson. Think of the discipline it takes to think about something for three or four decades, waiting for a chance to employ — (laughter) — 2 percent of your assets.

I'm afraid that's the way we are. (Laughter)

It means there'll be some dull stretches.

WARREN BUFFETT: Right. Yeah, it's less than a billion dollars in silver. It's $15 billion in Coke. You know, it's a —

CHARLIE MUNGER: It's a non-event.

WARREN BUFFETT: It's 5 billion in American Express. I mean it is close to a non-event, but if you see it there — you know?

CHARLIE MUNGER: At least it shows the human personality at work. (Laughter)

Very peculiar personality, I might add. (Laughter)

WARREN BUFFETT: Reinforced by a partner.

CHARLIE MUNGER: Yes. (Laughter)

49. I only talk to students

WARREN BUFFETT: OK, let's go to area five.

AUDIENCE MEMBER: My family is a Class B shareholder. Thank you for issuing those shares.

I have one observation and one question. Your Class B share is creating a new phenomenon in this country. These "baby shares" are not only attracting my baby boomer generation, but also X generation and (inaudible) generation, your grandchildren.

My question is, this next generation would like to hear from you your investment discipline, your lifestyle, and your philosophy of contributing the wealth back to the society in a language they can understand and communicate back to their friends when they get back to school on Tuesday. Thank you.

WARREN BUFFETT: Thank you. (Applause)

Well, I appreciate that, and I would say the only speeches I give — I get a lot of requests, perhaps because I don't do them. But I get a lot of requests, including from a lot of our managers, in terms of trade conventions, all kinds of things.

I don't do — the only groups I talk to are students. And I try to talk to college and university students, although I talk to high school students, too. Whenever it fits, in terms of travel schedules.

And I just think that if you're going to spend your time with groups talking, that rather than entertain people, that it probably is better to talk to the group you talked about.

Charlie and I are never reluctant to talk, so we do it. Charlie has given a couple of talks. One I sent you a few years ago from USC, but there's been another one recently that I think everybody would profit by reading.

So, it was reprinted in the Outstanding Investor Digest, but if you write Charlie, I'm sure he'll send you a copy.

50. If forced to choose, we'd keep the operating businesses

WARREN BUFFETT: Area six, please.

AUDIENCE MEMBER: Hi, my name is David Oosterbaan. I'm from Kalamazoo, Michigan.

This is a hypothetical question about Berkshire. It's going to take a little imagination, I think.

The scenario is as follows, that the U.S. Justice Department makes a ruling that Berkshire must split into two parts immediately. You and Mr. Munger must decide which part to keep.

You can either choose your marketable securities, Coke, Gillette, Disney, et cetera, or you can choose your insurance and private businesses. Which one do you choose and why?

WARREN BUFFETT: Well, that's an easy question for me. I would choose the operating businesses anytime, because it's more fun.

And I have a good time out of the investments too, but I like being involved with real people, in terms of the businesses where they're a cohesive unit that can grow over time, and —

You know, I wished we owned all of Disney or Coca-Cola or Gillette, but we aren't going to. So if I had to give up one or the other, I'd give up the marketable securities.

But it's not going to happen, so we're going to be happen in both arenas, and I look forward to being in both arenas for the rest of my life.

Charlie?

CHARLIE MUNGER: Well, I'll be in a hell of a fix if I am not in the same arena. (Laughter)

WARREN BUFFETT: We'd both be in a hell of a fix.

CHARLIE MUNGER: Yeah, yeah.

51. We'd be fine even if our top 25 execs all dropped dead

WARREN BUFFETT: Area 7.

AUDIENCE MEMBER: Yes, hello to Mr. Munger and Mr. Buffett. My name is Jerry Gonzalez (PH) from Plantation.

My question is, what are your recommendations of Berkshire Hathaway if Charlie Munger were in charge, or your third man in charge — your third man, which I think you said, is the CEO of GEICO, what are your recommendations?

WARREN BUFFETT: I missed that.

JERRY GONZALES: If Charlie Munger were to stay in charge fully, 100 percent, or your third man, the CEO of GEICO.

CHARLIE MUNGER: Well, in due course this corporation will have a change in management. I'm afraid we have no way of fixing that. (Laughter)

But we do not — apart from making sure we've got good options and having some system in place, we are not obsessing about a future management yet.

WARREN BUFFETT: No. The directors —

CHARLIE MUNGER: Warren plans to live almost indefinitely.

WARREN BUFFETT: Absolutely. (Laughter)

Although I must say, at my last birthday somebody asked me how old I was. And I said, "Well, why don't you just count the candles on the cake?" And he said he was driven back by the heat, so — (Laughter)

But we're not going to leave willingly.

And we do — the directors know who — they have a letter that says who we think should be the ones to succeed us at both the operating aspect and the investment allocation aspect. And those letters can change over time as we keep hanging around.

But I don't worry about the fact that 99 percent-plus of my estate will be in Berkshire Hathaway stock or that a foundation will eventually receive that stock. So it doesn't bother me in the least. I can't think of a place I'd rather have it.

And that includes my appraisal of the managers that we have who can step in and do what Charlie and I do. And who knows, one of them may even understand technology. (Laughter)

CHARLIE MUNGER: I think this place would have very respectable prospects if the top 25 managers all dropped dead at once.

WARREN BUFFETT: Well, that's not an experiment we intended to pursue. (Laughter)

CHARLIE MUNGER: No, but I see no reason to think it wouldn't continue to do quite well.

WARREN BUFFETT: Right.

CHARLIE MUNGER: It's been lovingly put together to have a certain margin of safety.

WARREN BUFFETT: Right. We actually — if we have a choice, it's number three through 23, though — 25 — that we're interested in. (Laughter)

52. "Honesty will only do so much for you"

WARREN BUFFETT: OK. Area 8, please.

AUDIENCE MEMBER: This is Raul from Walnut Creek, California.

Thanks Mr. Buffett, thanks Mr. Munger, thanks for your great company. I wish I had known about it 10 years ago. You are not only the greatest but the most honest. I want to commit 99 percent of what I have to Berkshire Hathaway, and I will.

The question I want to ask is, how do you calculate the intrinsic value of the company? And based on intrinsic value, to me, Berkshire Hathaway looks a great bargain at these prices, especially based on look-through earnings. Is that true?

And one last question I want to ask, just for fun. What do you think about telecom IPOs like Qwest, (inaudible)? They seem to pop up 50 percent at opening. Does it make any sense to invest in these? Thank you very much.

WARREN BUFFETT: Charlie, you want to tackle that?

CHARLIE MUNGER: I didn't follow that all.

Intrinsic value, we give you the facts and you make your own conclusions.

I like the fact that you think we're honest, but, you know, if you people keep bidding up the price of our stock, honesty will only do so much for you in the future. (Laughter)

WARREN BUFFETT: Yeah, we've never been tested. I mean we're very lucky. We've never had anything that we needed, really, that we haven't had.

And, you know, who knows what the situation would be if your family was starving or something? So our intention is to continue the position where we'll never be tested, too, I might add.

53. Intrinsic value: "Easy to say and impossible to figure"

WARREN BUFFETT: The intrinsic value question. I mean, by definition, intrinsic value is the present value of the stream of cash that's going to be generated by any financial asset between now and doomsday.

And that's easy to say and impossible to figure, but it's the kind of thing that we're looking at when we look at a Coca-Cola, where we think it's much easier to evaluate the stream of cash that comes in the future than it is in a company such as Intel, marvelous as it may be. It's easier for us. Andy Grove may be better at figuring out Intel than Coke.

And in Berkshire, it is complicated by the fact that we have no business that naturally employs all of the capital that flows to us, so it is dependent, to some extent, on the opportunities available and the ingenuity used when that cash pours in, as it does.

Some businesses have a natural use for the cash. Actually, Intel has a good natural use for the cash over time as they've expanded in their business. And many businesses do.

But we do not have a natural use. We have some businesses that use significant amounts of cash. FlightSafety will buy a lot of — build a lot of simulators this year and they cost real money.

But in relation to the resources available, we have to come up with new uses, new ways to use cash. And that makes for a more difficult valuation job than if you've got — well, the classic case used to be a water or electric utility where the cash could be deployed and the return was more or less guaranteed within a narrow range, and it was very easy to make calculations then as to the expectable returns in the future.

But that's not the case at Berkshire. We've got very good businesses, both directly and partially owned. And those businesses are going to do well for a long, long time.

But we do have new cash coming in all the time, and sometimes we have good ideas for that cash and sometimes we don't. And that does make your job more difficult, in terms of computing intrinsic value.

We'll have — yeah, we're going to break after the next question. At that time — we break whenever Charlie and I run out of candy up here, actually. (Laughter)

We're going to let everybody — you can get something to eat, if you want to stick around, and we will be here till 3:30 when we reconvene at 12:30.

And those of you who have been with us this morning and had enough, we thank you for being here this weekend. We've had a terrific time with you, so I'm very appreciative of that.

54. "Multiple models is the game" for Munger

WARREN BUFFETT: Let's have a question from zone 9 and then we'll go to lunch.

AUDIENCE MEMBER: Good morning. My name's Frank Gurvich (PH). I'm a shareholder from London, Ontario in Canada.

My question is for Mr. Munger, and it concerns his models. And the question specifically is related to market valuation. I know I'm not going to get a prediction. That's not your bag.

What I'm curious about, is there any specific touchstone models that you reflect upon in trying to gain perspective at these markets where the historic valuations are quite high? And why do you draw on those models?

And my second question is for Mr. Buffett and it relates to taxation. If you were able to trade your portion of your portfolio, at least, in a tax-exempt fashion, like 401(k) plans, or in Canada, the RSP plans, would you possibly trade more actively?

WARREN BUFFETT: Charlie, you want to answer yours first?

CHARLIE MUNGER: Yeah. Well, the Munger system for dealing with reality is to have multiple models in the head, and then run reality against multiple models.

I think it's a perfect disaster to look at reality through just one model or two. It's —

There's an old proverb that says, "To the man with only a hammer, every problem looks pretty much like a nail." (Laughter)

And that is not our system. So I can't sit here and run through all the models in my head, even though there aren't that many. But multiple models is the game.

55. Buffett: Taxes don't bother me

WARREN BUFFETT: The question about taxation. It would not — if we were running Berkshire absent a capital gains tax, I don't think it would make much difference in what we do. I don't think it would make — certainly it wouldn't make a difference in causing us to trade actively.

We own the businesses we want to own. We don't own them because taxes have restrained us from selling them.

And as I mentioned earlier, I'm fairly sure we'll pay at least a billion dollars in income tax this year. We might not, but it looks that way to me, that we'll pay a billion dollars.

And I could do things that at least deferred, and perhaps — and I certainly could do things by doing nothing — that avoided paying that billion in tax, or a good bit of the billion, call it 800 million of the billion. But that is not a big factor with me. It's never been a big deal with me.

I paid my first income tax when I was 13, so I guess I got brainwashed at the time. And it doesn't bother me a lot to be paying taxes. I think, net, personally, I'm under-taxed in relation to what the society has delivered to me, and, you know, I don't send along any voluntary payments to I.R.S., I want you to understand. (Laughter)

But I really do. I mean, there's nobody I want to trade places with because their tax situation is better than mine. So it would not increase the activity.

56. Looking for owners who love their business more than money

WARREN BUFFETT: I've been asked to take one more question from zone 10. I'm not sure why, but maybe because they see that I still have candy up here. (Laughter)

So zone 10, please, and then we'll break.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, my name is Sanjiv Mirchandani, shareholder from Boston.

First of all, thank you to both of you for everything. I have two questions.

For you, Mr. Buffett, you obviously have filters that you apply on selecting people as you do on stocks. Can you tell us a little bit about what those filters are?

WARREN BUFFETT: Filters on people?

AUDIENCE MEMBER: Yes, in selecting — you have an ability to motivate people who have a lot of money to keep working. What do you look for to figure out who those people are?

WARREN BUFFETT: Well, that's a key, key question, because when we buy businesses we don't have managers to put in them. I mean we are not buying them that way. We don't have a lot of MBAs around the office that we're —

CHARLIE MUNGER: Thank God.

WARREN BUFFETT: Yeah. (Laughter)

And, you know, I have not promised that they're going to have all kinds of opportunities or anything.

So as a practical matter, we need management with the businesses that we buy. And three times out of four, thereabouts, the manager is the owner and is receiving tens of millions, maybe hundreds of millions of dollars. So they don't have to work.

And we have to decide in that time when we meet them whether they love the business or love money. And we're not making a moral judgment. Charlie may, but I'm not making a moral judgment about whether it's better to love the business or love money, but it's very important for me to know which of the two is the primary motivator with them.

And we have had extremely good luck in identifying people who love their business. And so all we have to do is avoid anything that, on our part, that diminishes that love of the business or makes other conditions so intolerable that they overcome that love of the business.

And we have a number of people working for us, they have no financial need to work at all. And they probably outwork, you know, 95 percent or more of the people in the world, and they do it because they just love smacking the ball. And we almost — we virtually had no mistakes in that respect.

And we have identified a number of people, Charlie and I have, in terms of proposals to us, where we've felt that they did really — they liked the money better than the business. They were kind of tired of the business. You know?

And they might promise us that they would continue on and they would do it in good faith, but something would happen six months later or a year later and they'd say to themselves, "Why am I doing this, you know, for Berkshire Hathaway when I could be doing," whatever else they want to do?

I can't tell you exactly how we — what filter it is that we put them through mentally, but I can tell you that if you've been around a while, you can — I think you can have a pretty high batting average in coming to those conclusions. As you can about other aspects of human behavior.

I'm not saying you can take a hundred people and take a look at them and analyze their personalities or anything of the sort. But I think when you see the extreme cases, the ones that are going to cause you nothing but trouble, or the ones that are going to bring you nothing but joy, I think you can identify those pretty well.

Charlie?

CHARLIE MUNGER: Well, yeah, I think it's pretty simple. You've got integrity, intelligence, and experience, and dedication. And that's what human enterprises need to run well, and we've been very lucky in getting this marvelous group of associates to work with all these years.

It would be hard to do better, I think, than we've done on that respect.

Look around this place. I mean, and really, you young people look around this place. And look at how much gratification can come into these lives which have been mostly spent in deferring gratification. It's a very funny group of people, you shareholders. (Laughter)

Afternoon Session - 1998 Meeting

1. When is it time to buy a house?

WARREN BUFFETT: Let's settle down please and we'll —

We're going to go to — we skipped one last time so we're going to go first to zone 4.

AUDIENCE MEMBER: Hello. My name's Nelson Arata (PH), I'm from Southern California.

And I have a question. It's not really related to intrinsic value or any of that stock stuff, but more on — (laughter) — houses.

I'm still quite young, I don't have a house yet and I'm thinking about buying a house someday soon. And in order to do that I'm going to have to put a down payment, which means I might have to sell my shares.

And I was wondering if you can provide some insight on when is the best time to buy a house and how much down payment — (laughter) — you should be putting down, in relation to interest rates and also in relation to available cash and the stock market.

WARREN BUFFETT: Well, Charlie's going to give you an answer to that in a second. I'll just relay one story, which was when I got married we did have about $10,000 starting off, and I told Susie, I said, "Now, you know, there's two choices, it's up to you. We can either buy a house, which will use up all my capital and clean me out, and it'll be like a carpenter who's had his tools taken away for him. (Laughs)

"Or you can let me work on this and someday, who knows, maybe I'll even buy a little bit larger house than would otherwise be the case."

So she was very understanding on that point. And we waited until 1956. We got married in 1952.

And I decided to buy a house when it was about — when the down payment was about 10 percent or so of my net worth, because I really felt I wanted to use the capital for other purposes. But that was a way different environment in terms of what was available to buy.

In effect, if you have the house you want to buy, you know, I definitely believe in just going out and probably getting the job done. But in effect, you're probably making something in the area of a 7 or 8 percent investment, implicitly, when you do it. So you know, you'll have to figure out your own equation from that.

Charlie probably has better advice on that. He's a big homeowner — (laughter) — in both senses of the word.

CHARLIE MUNGER: I think the time to buy a house is when you need one. (Laughter)

WARREN BUFFETT: And when do you need one?

CHARLIE MUNGER: Well, I have very old-fashioned ideas on that, too. The single people, I don't care if they ever get a house. (Laughter)

WARREN BUFFETT: When do you need one if you're married, Charlie? I'll follow up for the — (Laughter)

You need one when your wife wants one.

CHARLIE MUNGER: Yeah, yes. (Laughter) I think you've got that exactly right. (Laughter)

VOICE: Mr. Buffett?

WARREN BUFFETT: Yeah.

VOICE: May I make an announcement?

WARREN BUFFETT: Sure.

VOICE: Gregory Crawford needs to go to the security office, please, for emergency message. Gregory Crawford to the security office for emergency message. Thank you.

WARREN BUFFETT: OK, hope it isn't a margin call. (Laughter)

2. Executive compensation: Buffett slams big money for mediocrity

WARREN BUFFETT: OK, we'll go to zone 1, please.

AUDIENCE MEMBER: I'm Ralph Bedford (PH) from Phoenix, Arizona.

The question I'm going to ask does not pertain to Berkshire Hathaway, but I would appreciate it if you gentlemen, if you can, explain the justification and rationalization for the exorbitant salaries, bonuses, perks, directors' fees, and other benefits that most public corporations are paying. (Applause)

WARREN BUFFETT: I would say this. In my own view, the most exorbitant are not necessarily the biggest numbers. What really bothers me is when companies pay a lot of money for mediocrity, and that happens all too often.

But we have no quarrel in our subsidiaries, for example, for paying a lot of money for outstanding performance. I mean, we get it back 10 or 20 or 50-for-1.

And similarly in public companies, we think that there have been managers — in our managers — who have taken companies to many, many, many billions of market value more than would've happened with virtually anyone else.

And they sometimes take a lot of money for that. Sometimes, as in the case of Tom Murphy at Cap Cities, you know, it just didn't make a difference to him.

I mean, he performed in a way that would justify — would have justified huge sums, but it wasn't — he would tell you that he had all the money he needed and he just didn't care to take what the market might bear.

But I am bothered by irrational pay systems. And I'm particularly bothered when average managers take really large sums.

I'm bothered when they design, or have designed for them, systems that are very costly to the company — maybe partly to make themselves look good because they want huge options themselves, so they feel if they give options widely throughout the company — so they design a system that is illogical company-wide because they want one that's illogical for them personally.

But large sums, per se, don't bother me. I'm not saying, you know, whether any individual should — might want to take them or not. But I do not mind paying a lot of money for performance.

It's done in athletics, it's done in entertainment, but in business the people who are the .200 hitters and the people who would not attract a crowd as an entertainer have worked it out so that — I mean, the system has evolved in such a way that — many of them take huge sums. And I think that's obscene, but I can tell you, there isn't much you can do about.

The system feeds on itself. And companies do look at other companies' proxy statements, every CEO does. And they say, "Well, if Joe Smith is worth X I have to be worth more." And they tell the directors that, "Certainly you wouldn't be hiring anybody that was below average, so how can you pay me below average?" And the consultants come in and ratchet up the rewards.

And it's not anything that's going to go away. It's like we were talking about campaign finance reform earlier. The people who have their hands on the switch are the beneficiaries of the system. And it's very hard to change the system when the guy whose hand is on the switch is benefitting enormously, and perhaps disproportionately, from that system.

Charlie?

CHARLIE MUNGER: Well yeah, I'd like to report that the original Vanderbilt behaved even better than the people at Berkshire Hathaway. He didn't take any salary at all. He thought it was beneath him as a significant shareholder to take a salary. That ideal, I'm afraid, died with him. (Laughter)

WARREN BUFFETT: Yeah, Charlie and I — our directors are paid $900 a year, but I tell them on an hourly basis they're making a fortune because we don't work them that hard. (Laughter)

But Charlie and I did not think through, when we established that $900 a year, is that they set our salaries, too, so — (Laughter)

We have not followed the standard procedure, which is to load it on the directors, and the directors shall load it on you.

CHARLIE MUNGER: I do think it will have pernicious effects for the country in its entirety as this thing keeps escalating, because I think you're getting a widespread perception that at the very top, corporate salaries in America are too high. And that is not a good thing for a civilization, when the leaders are regarded as not dealing fairly with the institutions that they head.

WARREN BUFFETT: Yeah. If — (Applause)

CHARLIE MUNGER: And as for the corporation consultants who advise on salaries, all I can say is that prostitution would be a step up for them. (Laughter)

WARREN BUFFETT: Put him down as undecided. (Laughter)

3. Class B stock "worked out as well as possible"

WARREN BUFFETT: Zone two, please.

AUDIENCE MEMBER: I'm Dan Blum (PH), from Seattle, Washington via Cambridge, Massachusetts.

I want to ask whether the issuance of Class B stock has achieved the objective which you announced for it, when it was created.

WARREN BUFFETT: Well, I would say this, that considering the alternatives we faced, which was the imminence of unit trusts that would've been promoted with heavy front-end commissions, with substantial annual fees, with bad tax consequences, and with, probably, a misrepresentation of the historical record in such a way that people who really didn't know much about securities would've been enticed in — with that as an alternative I think the B stock was the best thing we could've done, and I feel good about how it's worked out.

I think that, you know, we didn't set out to issue it. We don't like talking anybody into buying our stock. But I don't think in any way that the group we have here is diminished in the least by having a mix of B and A shareholders, as opposed to A only.

The B has worked out as well as possible. I hope that, you know, we haven't enticed anybody in with unreasonable expectations. That's the biggest thing that Charlie and I worry about. And it's hard not to have that happen with the historical record. I know it would've happened in a big way with the unit trust.

So, you know, it's like making the mistake originally of starting with Berkshire, I think. We enjoy things as they come along and we've gotten a good group with the B shareholders, and we're happy with the present situation.

Charlie?

CHARLIE MUNGER: Yeah, we wanted to step hard on what we regarded as a disreputable financial scheme, and that we did. And — (Laughter)

WARREN BUFFETT: And I think the way we sold the B was such as to not — as to attract the kind of people who really did look at it on a long-term basis. We did everything we could to discourage people who thought they were going to make a lot of money in a hurry.

So I think we attracted a whole new group of shareholders who are quite similar in perspective to the shareholder group that we already had, and that was our hope.

4. Berkshire's investing minimum

WARREN BUFFETT: Zone 3, please?

AUDIENCE MEMBER: My name is Alan Rank from Pittsburgh.

I first want to thank Susan Jacques for returning the cocktail yesterday, and I hope she was rewarded with good sales at Borsheims.

Question is regarding the fact that you don't report details of anything under $750 million, and with the change of the values of small-cap in relation to large-cap, would that be something that Berkshire or individuals might try to look as opportunity with the small-cap premium shrinking, as it has?

WARREN BUFFETT: We don't worry about whether a stock is small-cap or large-cap except to the extent that by now we've gotten to a point where anything below a certain level just is not of interest to us because it can't be material to our results, so —

We never think of opportunities as existing because something is small-cap, or sectors, or all that, you know, what generally gets merchandised.

So our cutoff point is set more or less at the point where we think it's material. That's not as defined by the SEC, we could have a higher limit.

But we think when you get down below 2 percent of assets or thereabouts that the reporting of positions would not affect anybody's calculation of intrinsic value or give them insights about the way we run the business, but it would be more for the people who were looking for things to piggyback on.

And so we will move the cutoff point up as we go along. Because of our size, we will never be in companies that have capitalizations that, you know, of a half a billion or a billion dollars, because we just can't put enough money in it. Occasionally we'll be in one just by accident.

But we're looking at things that we can put $500 million in ourselves, at least. At 500 million, a 5 percent position has a $10 billion market cap.

That limitation has hurt, will hurt, is hurting, our performance to some degree. You would — if Berkshire were exactly 1/100th of its present size in all respects, owning the operating businesses it did but all 1/100th the size, our prospects would be better than they are with the kind of money we have presently.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

5. "Sandy Weill is a very, very good manager"

WARREN BUFFETT: OK. Zone four, please.

AUDIENCE MEMBER: OK. My name is Tom Conrad (PH), I'm from McLean, Virginia.

I just wanted to first thank you, Mr. Buffett and Mr. Munger, for each year answering our questions. I found myself at 5 a.m. standing outside the door here, and I don't do that for anyone. (Laughter)

And it's a real pleasure to hear your answers. I have two questions.

One is, with Travelers, the company Travelers, and their merger with Citibank, do you have confidence in the management of Sandy Weill?

My second question is, you said it in a few meetings ago that diversification is a protection against ignorance. And it only takes three great companies to be set for an investment lifetime. And I invested in those three companies: Coca-Cola, Gillette, and Disney.

And I went ahead and invested in a fourth company without asking you. I invested in Pfizer. And I just wonder what you think about the pharmaceutical industry, if you feel there's some great companies in that industry. Thank you very much.

WARREN BUFFETT: Yeah. Well, A) we think Sandy Weill is a very, very good manager. Sandy is — I mean, the record is clear. It is not easy to manage in Wall Street, and Sandy has done an excellent job there as well as in other allied, or somewhat allied, fields. So his record is proven.

And he has been (inaudible) ever since buying Commercial Credit from Control Data. He's built a terrific company.

And he built a terrific company in businesses that themselves aren't necessarily so terrific, so it's required real management skill.

6. Pharmaceutical stocks: "We stupidly blew that one"

WARREN BUFFETT: Pharmaceuticals, we missed. We would not have known how to pick out any single business, but we — single company — within the industry, but we certainly should've recognized — did recognize, didn't do anything about it — that the industry as a whole represented a group that would achieve good returns on equity, and where some sort of a group purchase might've made sense.

We did buy one a while back, but we didn't — it was peanuts. And it would of been — it was within our circle of competence to identify the industry as likely to enjoy very high profits over time. It would not have been within our circle of competence to try and pick a single company.

Charlie?

CHARLIE MUNGER: Yeah, we stupidly blew that one. (Laughter)

WARREN BUFFETT: We'll blow more, too. (Laughter)

7. Decentralization "just short of total abdication"

WARREN BUFFETT: Zone five.

AUDIENCE MEMBER: Yes, sir. Good afternoon. My name is Matt Lovejoy from Lexington, Kentucky. And gladly, I'm not a consultant. (Laughter)

I have a question, sir, Mr. Buffett, about your operating management style. In my opinion, the mainstream media minimizes the significance of your nonpublic operating investments.

When you consider capital allocation in these companies, do you have the managers submit annual business plans? And if so, do you formally meet with those managers to see how well you can track progress against those plans?

WARREN BUFFETT: Yeah, that's a good question. And the answer is that we may meet with some of them annually, we may meet with others semiannually, but we have no formal system whatsoever, and we will never have a formal system. We don't demand any meetings of any of our managers. We have no operating plan submitted to headquarters.

Some of the companies use operating plans themselves, some of them don't. They are all run by people who have terrific records, and they have different batting styles. And we're not about to tinker with somebody that's batting with .375 just because somebody else holds the bat a little differently or uses a different weight bat, or something of the sort.

So we believe in letting them do, currently and in the future, what has been successful for them in the past.

And different people have very different styles. I've got my own style, you know?

But we have managers that like to talk things over, we have other managers that like to go their own way. And we have managers that have a by-the-book approach which works well, we have other managers who wouldn't dream of that. We have managers that — most managers probably have monthly statements of financials. We have other managers that don't.

And that really isn't a problem. What we want to have is good managers, and there's more than one way to get to, at least, business heaven, and we have a number that have found different ways to get there.

So we have never imposed — we have certain requirements because we're a public company, and SEC requirements, and International Revenue Service coordination.

But we've never imposed anything from the top on any of the operating managements.

We have MBAs running companies, we have people who never saw a business school. And talent is the scarce commodity, and when you find talent and they've got their own way of doing things, we let it — we're delighted to have them do it. More than letting them do it — we want them to do it their way. We don't want to change them.

Charlie?

CHARLIE MUNGER: Yeah, the truth of the matter is that we have decentralized power in the operating businesses to a point just short of total abdication. (Laughter)

And we don't think our system is right for everybody. It has suited us and the kind of people that have joined us. But we don't have criticism for other people, like Emerson Electric or something, who have operating plans, and compare performance quarterly against plan and all that sort of thing. It's just not our style.

WARREN BUFFETT: Yeah, we centralize money and — (laughs) — everything else we decentralize, pretty much, but —

I don't know whether you've met him here, but for example, Al Ueltschi is here. He started FlightSafety in 1951 and he's — I don't know what he'll spend on simulators this year, but it could easily be a hundred million dollars or thereabouts.

And he — if I spent hours with him, I couldn't add 1/100th of 1 percent to his knowledge of how to allocate that money. It would be ridiculous. It'd be a waste of his time and it would be an act of arrogance on my part. And I have no worries about how Al allocates the money. And that's an unusually capital intensive business compared to most of our businesses.

There's some that I get into the details more because I just worked with the person that's running things a long time and we kind of enjoy it.

Ajit and I talk virtually every night about the reinsurance business. You know, I am not improving the quality of his decisions at all, but it's an interesting game and I like hearing about it, and he doesn't mind talking about it, so we talk them over. But that's just a matter of personal chemistry.

And as we add managers, we will adapt to them. We adapt our accounting systems, to a degree, to them. Now, we do have certain requirements that result from the SEC and IRS. But we don't — our managers know their businesses and they know how to run them.

And if they don't — this hasn't been the case — but if they didn't, we would, you know, we'd do something about the manager, we wouldn't try and build a bunch of systems.

8. Avoid the "Frozen Corporation"

WARREN BUFFETT: Zone 6, please.

AUDIENCE MEMBER: Good afternoon, gentlemen. My name is George Donner from Fort Wayne, Indiana.

My question has to do with estimating the intrinsic value of a company, in particular the capital intensive companies like you were mentioning. I'm thinking of things like McDonald's and Walgreens, but there are lots of others where you have a very healthy and growing operating cash flow, but it's marginally or completely offset by heavy expenditures on putting up new stores or restaurants, or building a new plant.

And so my question is, what do you do for your estimate of future free cash flow? And with Treasurys around — long Treasurys around 6 percent — at what rate do you discount those cash flows?

WARREN BUFFETT: Well, we discount at the long rate just to have a standard of measurement across all businesses. But we would take the company that is spending the money as it comes in, and they don't get credit for gross cash flow, they get credit for whatever net cash is left every year.

But of course, if they're spending the money wisely, even though you have to discount it for more years, the growth in cash development should offset that or they weren't investing it wisely.

The best business is one that gives you more and more money every year without putting up anything to get it, or very little. And we've got some businesses like that.

The second-best business is a business that also gives you more and more money. It takes more money, but the rate at which you invest — reinvest — the money to get that growth is a very satisfactory rate.

The worst business of all is the one that grows a lot, and where you're forced — forced, in effect — forced to grow to stay in the game at all, and where you're reinvesting the capital at a very low rate of return. And sometimes people are in those businesses without knowing about it.

But in terms of discounting, in terms of calculating intrinsic value, you look at the cash that is expected to be generated and you discount back at — in our case, we use the long-term Treasury rate. That doesn't mean that you pay the amount that that present value calculation leads to, but it means that you use that as a common yardstick, that Treasury rate.

And that means that if somebody is reinvesting all their cash flow the next five years, they'd better have some very big figures coming in down the road. Because at some day, a financial asset has to give you back cash to justify you laying out cash for it now.

Investing is the art, essentially, of laying out cash now to get a whole lot more cash later on, and something at some point better deliver cash.

Ben Graham in his class, we used to talk about what he called the Frozen Corporation. And the Frozen Corporation was a company whose charter prohibited it from ever paying anything to its owners, or ever being liquidated, or ever being sold and —

CHARLIE MUNGER: Sort of like a Hollywood producer. (Laughter)

WARREN BUFFETT: Yeah. And the question was, what was such an enterprise worth? Well, that's sort of a theoretical question, but it forces you to think about the realities of what business is all about. And business is all about putting out money today to get back more money later on.

Charlie?

CHARLIE MUNGER: I do think there is an interesting problem that you raise, because I think there is a class of businesses where the eventual cash back part of the equation tends to be an illusion. I think there are businesses where you just keep pouring it in and pouring it in, and then all of a sudden it doesn't work, and no cash comes back.

And what makes our life interesting is trying to avoid those and get in the alternative kind that drowns you in cash. (Laughter)

WARREN BUFFETT: The one figure we regard as utter nonsense is the so-called EBITDA. I mean, the idea of looking at a figure before the cash requirements and merely staying in the same place — and there usually are — any business with significant fixed assets almost always has with it a concomitant requirement that major cash be reinvested in order simply to stay in the same place competitively and in terms of unit sales — to look at some figure that is before — that is stated before those cash requirements, is absolute folly and it's been misused by lots of people to sell lots of merchandise in recent years.

CHARLIE MUNGER: It's not to the credit of the investment banking fraternity that it has learned to speak in terms of EBITDA. I mean, the idea of using a measure that you know is nonsense, and then piling additional reasoning on that false assumption, it's not creditable intellectual performance. And then once everybody is talking in terms of nonsense, why, it gets to be standard. (Laughter)

9. Checklist for selecting stocks

WARREN BUFFETT: Zone 7, please.

AUDIENCE MEMBER: Hi. My name is Brennan Vecchio (PH) and I'm in the Academy of Finance at Northwest High School in Omaha.

Could you explain the criteria you look at when selecting your stocks?

WARREN BUFFETT: Well, we look at — I'm glad you came. I hope there's a large group. I got a note, I think from your teacher, on that. (Applause)

We look at it — the criteria for selecting a stock is really the criteria for looking at a business. We are looking for a business we can understand. That means they sell a product that we think we understand, or we understand the nature of the competition, what could go wrong with it over time.

And then when we find that business we try to figure out whether the economics of it means the earning power over the next five, or 10, or 15 years is likely to be good and getting better or poor and getting worse. But we try to evaluate that future stream.

And then we try to decide whether we're getting in with some people that we feel comfortable being in with.

And then we try to decide what's an appropriate price for what we've seen up to that point.

And as I said last year, what we do is simple but not necessarily easy.

The checklist that is going through our mind is not very complicated. Knowing what you don't know is important, and sometimes that's not easy. And knowing the future is definitely — it's impossible in many cases, in our view, and it's difficult in others. And sometimes it's relatively easy, and we're looking for the ones that are relatively easy.

And then when you get all through you have to find it at a price that's interesting to you, and that's very difficult for us now. Although there have been periods in the past where it's been a total cinch.

And that's what goes through our mind. If you were thinking of buying a service station, or a dry cleaning establish, or a convenience store in Omaha to invest your life savings in and run as a business, you'd think about the same sort of things.

You'd think about the competitive position and what it would look like five or 10 years from now, and how you were going to run it, and who was going to run it for you, and how much you had to pay.

And that's exactly what we think of when we look at a stock, because the stock is nothing other than a piece of a business.

Charlie?

10. Easy decision case study: National Cash Register

CHARLIE MUNGER: Yeah. If finance were — when finance is properly taught, it should be taught from cases where the investment decision is easy.

And the one I always cite is the early history of National Cash Register Company, and that was created by a fanatic who bought all the patents, and had the best salesforce, and the best production plants. He was a very intelligent man and passionately dedicated to the cash register business.

And of course, the cash register business was a godsend to retailing when cash registers were invented. So that was the pharmaceuticals of a former age.

If you read an early annual report prepared by Patterson, who was CEO of National Cash Register, an idiot could see that this was a talented fanatic. Very favorably located, and that, therefore, the investment decision was easy.

If I were teaching finance, I would collect a hundred cases like that. And that's the way I would teach the students.

WARREN BUFFETT: We have that annual report. What was that, 1904 or something, Charlie?

But it's really a classic report because Patterson not only tells you why his cash register is worth about 20 times what he's selling for to people, but he also — (laughs) — tells you that you're an idiot if you want to go in competition with him. It's a classic.

CHARLIE MUNGER: It is just a (inaudible). But no intelligent person can read this report and not realize — (laughs) — that this guy can't lose.

11. "Norman Rockwell frame of mind"

WARREN BUFFETT: Area 8, please.

AUDIENCE MEMBER: Good afternoon. My name is Robert Rowland (PH) from London, England.

I've been in Omaha all weekend with my wife on the first leg of my honeymoon, and I've noticed you're quite a buyer of nostalgic assets. Can I ask whether nostalgia is one of your filters? (Buffett laughs)

Are there any assets like that left in the U.S. to buy? And if not, can I suggest you come to the U.K. where all we do is sell them? (Laughter)

WARREN BUFFETT: Well, I don't want to interrupt your honeymoon. (Laughter)

But if you'd send me a list of those companies over there that are long on nostalgia, that might be to our liking. Because Charlie and I tend to operate from sort of a Norman Rockwell frame of mind. And it is true that the kind of companies we like sort of do have a homey, Norman Rockwell, Saturday Evening Post-type character to them there.

They have character. And they're the kind of companies, I think, frequently, that people, when they join them, expect to spend the rest of their lives there rather than look at it as something to stick on their resume.

And there are businesses like that. If you look at the businesses that we've bought in the last three or four years, there is real character to the businesses and to the people that build them.

And that's why the people that build them stay on and feel very strongly about running them correctly, even though they have no financial consequence to themselves whatsoever, so —

If you've got a list of those in England and you still have any strength left after your honeymoon, drop me a line. (Laughter)

12. A and B shares are nearly equivalent investment choices

WARREN BUFFETT: Zone 9, please.

AUDIENCE MEMBER: Good afternoon. Joshua Andrews (PH) from Omaha Northwest High School, Academy of Finance.

WARREN BUFFETT: Good.

AUDIENCE MEMBER: And on behalf of the Academy of Finance, we want to thank you for the tickets. There's 33 of us in attendance today.

WARREN BUFFETT: Terrific. (Applause)

AUDIENCE MEMBER: We had the opportunity to play a national game, the Investment Challenge. And on the list of the stocks there were BRK A and BRK B. Can you explain what the difference of the two stocks are?

WARREN BUFFETT: Yeah, the difference between the Berkshire A and B is simply that an A can be converted to a B at any time in the ratio of one A into 30 Bs. The B cannot be converted into the A, so it's a one-way street on conversion.

The economic value of the B is exactly 1/30th that of the A. So anytime the A ever gets any money of any kind from dividends, or liquidation, or a merger, or something of the sort, for every $30 that you get on the A you're going to get $1 on the B.

The two differences are that there is less voting power, proportionately, in the B. And the B does not participate in a designated-contributions program that Berkshire runs, simply because that would be very, very hard to administer. And when we issued the B we pointed out those two differences.

The B should never sell for more than 1/30th of the price of the A. When it sells just a tiny bit above that then arbitrage settles in as people buy the A and convert it to B, and sell the B. Occasionally the B may be at a slight discount to the A because it's not convertible the other way.

But I think as a practical matter you can treat the A and B as very equivalent investment choices. There's not enough difference to make it significant.

Charlie?

CHARLIE MUNGER: Nothing further.

13. How teenagers can prepare for the future

WARREN BUFFETT: OK. Area 10, please.

AUDIENCE MEMBER: My name is Sheena Cho (PH) from the Academy of Finance.

What recommendations would you give us as teenagers to prepare for our future and become as successful as you? (Laughter)

WARREN BUFFETT: Well, if you're interested in business, I definitely think you ought to learn all the accounting you can by the time you're in your early 20s. Accounting is the language of business.

Now, that doesn't mean it's a perfect language, so you have to know the limitations of that language, as well as all aspects of it. So I would advise you to learn accounting. And I would advise you to be — in terms of part-time employment or anything else, work at a number of businesses.

There's nothing like seeing how business operates to build your judgment in the future about businesses. You know, when you understand what kind of things are very competitive, and what kind of things are less competitive, and why that works that way, all of that adds to your knowledge.

So I would do a lot of reading. If you're interested in investments, I would — A, I would take the accounting courses.

I'd do a lot of reading about investments and I would get as much business experience. I would talk business with people that are in business to find out what they think makes their operation tick, or where they have problems and why. I just think you just kind of sop it up every place that you can.

And if it turns you on, you'll do well in it. I mean, I think that, you know, certain activities grab different people. But if business is of interest to you, my guess is you'll do well.

And if you understand business you understand investments. Investments are simply business decisions in terms of capital allocation. I wish you well on it.

Charlie?

CHARLIE MUNGER: Yeah, there's also the little matter of underspending your income year after year after year.

WARREN BUFFETT: Which we have mastered. (Laughter)

CHARLIE MUNGER: Yes. That really works if you keep at it.

WARREN BUFFETT: Yeah, I mean, Charlie and I both — Charlie started having children at a rapid rate, so — and he was lawyer when there was not big money in then.

But, I was — any money you save before you get out and start having a family is probably — any dollar — is probably worth $10 later on simply because you can save it.

The time to save is young, and you'll never have a better time to save than really, free formation of a family. Because the expenditures come along then whether you like them or not. So I —

You know, work for yourself first and put the money aside. I was lucky that way, I didn't have to pay for my own college. Probably wouldn't have gone to college if I'd had to pay for it.

But I, you know, I was able to save everything I made in my teens and those dollars got magnified quite a bit.

Whereas the money I — when I started first selling securities, I mean, the money I made then was taken up by family needs to quite an extent. So start saving early. A lot of it's habit anyway, so it's a great habit to have.

14. "We are not reluctant to invest abroad"

WARREN BUFFETT: OK, zone 1, please.

TONI: I'm Toni Ausnit (PH) from New York City, following up on the questioner from London.

In light of the current dearth of investment opportunities, do you see yourselves investing in non-U.S. companies which are well-managed, understandable, and growing?

WARREN BUFFETT: Well, if we find such companies as you describe at a price that's half attractive we're perfectly willing to buy them. So the answer to that is yes.

But we would be looking, to an extent, worldwide irrespective of market conditions in the United States. Now, market valuations in this country tend to be fairly well-matched in most of the major countries. So we don't — there's been a bull market all over the world in a huge way in the bigger markets.

And so unfortunately — I mean, it would of been nice for us if the U.S. market had tripled and other markets had stayed the same, and then we would be very likely to be finding things abroad. We're not finding them abroad, but we're certainly looking for the kind of thing you're talking about.

We are not reluctant to invest abroad.

And our two — well, all three of our largest holdings — American Express, Gillette, and Coke — and we're talking about $25 billion of market value there that we have — all three of those have major businesses abroad. And in the case of Coke and Gillette, it's a majority of their earnings from abroad.

So we're interested and there's better growth opportunities in many areas abroad than here. But we're not finding bargains as we look around the world.

Charlie?

CHARLIE MUNGER: Nothing more.

15. Philanthropy share sales won't hurt stock price

WARREN BUFFETT: OK. Area two.

AUDIENCE MEMBER: My name is Henry Allen (PH), Mamaroneck, New York.

Question I have is a little delicate, relates to my family and heirs rather than myself, because I'm a couple of decades older than you gentlemen.

You've been very candid about the succession and the estate planning, but how will the recipients of huge grants — charitable grants — get the liquidity they need without — to use the money without unduly driving the stock down?

WARREN BUFFETT: Well, I don't think that supply and demand, in terms of specific — you know, let's just say that 3 percent of Berkshire were to be added to the supply, anyway. I don't think that makes much difference.

What really makes the difference is the prospects of the business.

If my charitable foundation were operative today, it would have to sell — it would have to give away 5 percent of the value of the foundation every year. And if Berkshire paid no dividend, that means it would have to sell 5 percent of the holdings per year.

I don't think that the price of Berkshire would be materially different if there were a seller of — that would be, in this case, 2 percent of Berkshire's capitalization — I don't think it would be materially different.

If it is, it probably should be different. I mean, there should be a reasonable amount of trading that can take place annually without affecting the price of the stock materially or the price of the stock is being propped for sort of unnatural reasons.

So I wouldn't really worry about that. We had one shareholder die about a year, year and a half ago, that had 3/4 of 1 percent of the company, for example. It was sold in, I don't know, six weeks or thereabouts, and they raised, at that time, $250 million or thereabouts from the sale.

I am not worried about that. I'm worried about — I mean, I don't worry — but the key factor is what are the prospects of the businesses? If the businesses are worth money — there are all kinds of companies on the New York Stock Exchange who are perfectly decent businesses where 30 or 40 percent of the stock turns over a year.

And Berkshire's price should not be way different if 10 percent trades a year as opposed to the present 3 percent.

Charlie?

CHARLIE MUNGER: I agree with that. I don't think there'd be any problem at all at the present time if the Buffett Foundation were selling 5 percent of its holdings every year.

WARREN BUFFETT: Could be 500 shares a week or something like that. But if there isn't demand for 500 shares a week of A on a company with our capitalization, then the price probably is artificially wrong at that time.

CHARLIE MUNGER: But I just had lunch with Susie and it doesn't look to me like she's in any imminent danger of mortality. (Laughter)

WARREN BUFFETT: No. Yeah, it will — it will come into play when the survivor of the two of us dies and when the estate gets cleaned up and everything else.

So I think — I certainly hope and I think it's quite a ways away.

CHARLIE MUNGER: You people have more important things to worry about. (Laughter and applause)

16. Buffett's favorite book on his philosophy

WARREN BUFFETT: Zone 3, please.

AUDIENCE MEMBER: My name is Jim Howard (PH). I'm from Syracuse, Indiana.

My question is, does the book "Buffettology" by Mary Buffett present fairly, in all material respects, the calculations you use in evaluating a business for purchase, or did the lady just write a book?

WARREN BUFFETT: Well, it was written by two authors. But I would say that — no, I would say that in a general way, it gets at the investment philosophy.

But I wouldn't say that — it's not the book I would've written, precisely, but I have no quarrel with it, either.

I actually think by reading Berkshire's reports, you should be able to get more — I would think you'd get more of our philosophy than in any other manner.

I think Larry Cunningham, the fellow who held the symposium at the Cardozo School at Yeshiva, did the best job, actually, of sort of reconstructing the various things that have been written at Berkshire into sort of the best-organized presentation of our philosophy. So and he —

CHARLIE MUNGER: And he's selling it right here. It's a very practical —

WARREN BUFFETT: Yeah, he had it at Borsheims — in the mall outside Borsheims yesterday.

And Larry did a very good job. You know, I had nothing to do with it, but I think that that — I really think he's done a first-class job of sort of organizing by topic, I mean, all these things that I've sort of written annually and Charlie's written over time. So that would be — that would probably be my — if I were picking one thing to read, that would probably be the one.

17. Disney sale in the '60s was a "huge mistake"

WARREN BUFFETT: OK, zone 4, please.

AUDIENCE MEMBER: My name is Leigh (inaudible). I'm from Los Angeles, California.

And I want to begin by thanking you for having Bob Hamman. It was a stroke of genius. I could shop at Borsheims and my husband was entertained while I did so. (Laughter)

WARREN BUFFETT: Well, Bob is not only the best bridge player around but he is an entertaining guy, too. We —

AUDIENCE MEMBER: He's great.

WARREN BUFFETT: Yeah, he is great. I agree with you.

AUDIENCE MEMBER: My question. You owned Disney once before and sold it. You also owned advertising companies in the ’70s, I believe —

WARREN BUFFETT: Right.

AUDIENCE MEMBER: — and you sold them. Could we have some insight into your thinking as to why you sold them?

WARREN BUFFETT: I’m not sure I want to give you any insight into that thinking. (Laughs)

Well, we’ll start off with the fact that when I was 11, I bought some Cities Service preferred at 38 and it went to 200, but I sold at 40, so — (laughter) — grabbing my $2 a share of profit.

So I — everything we’ve ever sold has gone up subsequently, but some of them have gone up more painfully, subsequently, than others.

And certainly the Disney sale in the ’60s was a huge mistake. I should have been buying, forget about holding, and —

That’s happened many times. I mean, we think that anything we sell should go up subsequently, because we own good businesses and we may sell them because we need money for something else, but we still think they’re good businesses, and we think good businesses are going to be worth more over time.

So everything I sold in the past, virtually that I can think of, has gone on to sell at a lot more — for a lot more money. And I would expect that would continue to be the case.

That’s not a source of distress. But I must say that selling the Disney was a mistake, and actually the ad agencies had done very well since we sold them, too. Now, maybe some of that money went into Coca-Cola or something else, so I don’t worry about that.

I would worry, frankly, if I sold a bunch of things right at the top, because that would indicate that, in effect, I was practicing the bigger fool-type approach to investing, and I don’t think that can be practiced successfully over time.

I think the most successful investors, if they sell at all, will be selling things that end up going a lot higher, because it means that they’ve been buying into good businesses as they’ve gone along.

Charlie?

CHARLIE MUNGER: Well, I’m glad that the questioner brought this touch of humility, because it is really useful to be reminded of your errors. (Laughter)

And I think we're pretty good at that. I mean, we kind of mentally rub our own noses in our own mistakes. And that is a very good mental habit.

Warren can tell you the exact number of cents per shares that he sold at and compare it with the current price. It actually hurts him. (Laughter)

WARREN BUFFETT: It actually doesn't hurt. (Laughs)

The truth is, you know, because, you know, you just keep on doing things.

But it is instructive to look at — to do postmortems on everything and say — as long as you don't get carried away with it.

But every acquisition decision, that kind of thing, you know, there should be postmortems. Now, most companies don't like to do postmortems on their capital expenditures.

I've been a director of a lot of companies over the years and they've usually not spent a lot of time on the postmortems. They spend a lot of time on telling you how wonderful the acquisitions are going to be, or the capital expenditures, but they don't like to look so hard, necessarily, at the results.

CHARLIE MUNGER: Think of how refreshing a board of directors meeting would be if they sat down, "And now we'll spend three hours examining all our stupid blunders and how much we've blown."

WARREN BUFFETT: And then after that the compensation committee will meet. Now — (laughter) — that's not going to happen. (Laughter)

CHARLIE MUNGER: Right.

18. Phil Carret is one of Buffett's heroes

WARREN BUFFETT: OK. Area 5, please.

AUDIENCE MEMBER: My name is Keller, Harpel Keller, from Portland, Oregon.

Two questions, one of a personal nature. Obviously there are many, many people here today. And I wonder if one of the true patriarchs of the investment business is here today, Phil Carret —

WARREN BUFFETT: Well, I'll answer —

AUDIENCE MEMBER: Many of his friends and admirers would wish him well.

WARREN BUFFETT: Phil, up till a week ago was going to be here today. Phil is 101, wrote a book on investments in 1924, and I've known Phil for about 46 or '7 years.

And Phil has made all the meetings for a number of years, would be here today, and he broke a hip about five or six days ago. But he sent a message that he will definitely be here next year. (Laughter) And he will be, too. (Applause)

WARREN BUFFETT: Phil is a hero of mine. Go ahead.

19. End of Cold War isn't an investing factor

AUDIENCE MEMBER: Second question. Has to do with Ben Graham. And he changed his valuation standards as the decades progressed.

When he couldn't buy stocks below a net-net, he changed his standards because the environment changed.

Now, the world today seems to be a much different place than in 1989 when the U.S.S.R. collapsed. Even they are stumbling toward the free enterprise system. The Russian mafia is a perverse illustration of that.

Now there is only one superpower in the world, the U.S.A., and we must be extremely grateful for the men who put us on the track to the free enterprise system.

Now, the free enterprise system is out of the bottle, it's not going to get back in. It seems to be expanding and accelerating around the world. With the resulting expansion of world trade, may that lead to a reevaluation of historical measures for measuring investments?

WARREN BUFFETT: Well, my answer to that would be that I doubt it, but I, you know, I also don't know.

But I don't think that the end of the Cold War is something that I would factor into my evaluation of businesses. There are all kinds of events that happened, and their impact, in terms of being quantified, very difficult to figure over time, very difficult to isolate any single variable in a complex economic equation.

So in terms of how the world was going to work ten years from now, or the returns are going to be on equity in business, you know, I don't know what will be all the variables that impact on that.

And obviously, right now people are very bullish about the fact that those returns — or something like those returns — will continue.

But I don't — I would not rely in making such a projection on the fact that the Cold War has ended or really any political or economic development around the world.

I don't know how to predict future earnings of American business. And when I look at all of the great historic events of the past, nothing there gives me much in the way of a clue as to which ones would signal major changes in profitability of American business.

Charlie?

CHARLIE MUNGER: Well, I think you raise one very interesting question. If the rest of the world becomes very much more prosperous, as it will if it adopts the free enterprise system, which investments are likely to do best?

I would argue that the Cokes and Gillettes and so on are likely to be helped by a great increase in prosperity in what is now the Third World. And I'm not so sure that's true of a lot of other businesses.

WARREN BUFFETT: Yeah, we like the international businesses we have. And as I say, our three top holdings all have a major international aspect to them, and really, in aggregate, a dominant international aspect to them.

And there's no question in my mind that a Coke will grow faster outside of the United States than in the United States, and the same is true of Gillette, maybe the same is true of American Express. So that's built into what we — our evaluation of those businesses.

But I felt that way before 1989, too. I mean, it's very hard to evaluate how the ball is going to bounce, generally, around the world. But it is a plus to have products such as Gillette has or Coke has, that have demonstrated the fact that they travel extraordinarily well around the world, the people crave those products, and that they're going to — no one's going to find a way to do it better than those two companies in their respective fields. And they sell an inexpensive product, so all of that's going for us.

But in terms of how stocks generally sell or the profitability of American business generally is in the future, it doesn't help me much.

Charlie, any more on that?

CHARLIE MUNGER: No more.

WARREN BUFFETT: OK.

20. Subsidiary managers are never second-guessed

WARREN BUFFETT: Area 6.

AUDIENCE MEMBER: Hi. My name is Bartley Cohen (PH). I just want to thank you for a great weekend.

And my question is, after you bought Dairy Queen I heard they put Coca-Cola into all the stores, but yesterday when I went to the Nebraska Furniture Mart they said they don't take American Express. And my question is — (crowd noise) — my question is, do you encourage the subsidiaries and the companies that you have stock to use each other's products, or do you leave it up to the management of the subsidiary?

WARREN BUFFETT: Well, that's a good question. And it does tell you something about the Berkshire method of operation.

We tell each subsidiary to run their business in the way that they think is best for their operation. Borsheims takes American Express, See's takes American Express, the Furniture Mart doesn't, for example. But that'll be true in other areas, too.

If Harvey Golub at American Express — who has absolutely done a sensational job for us — if he wants to talk with — or have his representatives talk — with anybody at any of our operations, you know, we're all for that happening.

But we will never tell a subsidiary manager which vendor to patronize or anything of that sort.

Once we start making decisions for our managers in that respect then we become responsible for the operation, and they are no longer responsible for the operation.

They are responsible for their operations, and that means they get to call the decisions. And they should do what is best for their subsidiary, and it's up to any other company that wants to do business with them to prove why that is best for them. That's the Berkshire approach to things.

And I think on balance, our managers like it that way. So they're not getting second-guessed and somebody can't go over their head. I get letters all the time from people who are trying to jump over the heads of our managers, and they want us to say this advertising agency should be used or that, and that sort of thing.

It doesn't work at Berkshire. They deal with the managers of the businesses and they're not going to get around them.

Charlie? (Applause)

CHARLIE MUNGER: I love your answer. It gives Warren lots of time to read annual reports at headquarters. (Laughter)

21. Buffett smells trouble for tobacco companies in settlement

WARREN BUFFETT: Area 7.

AUDIENCE MEMBER: Hello, my name is Steve Errico (PH). I'm from New York.

What do you think is likely to happen with respect to the tobacco settlement, and what do you think should happen?

And secondly, McDonald's and Dairy Queen are similar businesses. Was there a relationship between your acquisition of Dairy Queen and the disposal of McDonald's? Thank you.

WARREN BUFFETT: Yeah, there's no connection in the second case. They have certain similarities, but there's certainly a lot of differences, too.

You know, a Burger King and McDonald's would be much more similar, or a Wendy and McDonald's. But Dairy Queen is much more of a niche and away from that.

The tobacco settlement's interesting, just in terms of watching the dynamics of it. Because one of the things in labor negotiations that's always a problem is that when you — as a manager you have a labor negotiation, at the end of the negotiation you as management are committed, and basically the union isn't, because the union is going to have a vote on it.

And that's just the way it is. I mean, you can't get away from that. But it is not fun to be in a negotiating position where you're bound and the other side is not bound.

And although that wasn't totally contractually necessarily the situation of tobacco area, it smelled like trouble to me for the tobacco companies — whether you feel they should've had that trouble or not — but it smelled like trouble to me when they were bound and you had another side that was not bound in any way, and where there were lots of political considerations, and where there was a lot of time was going to expire.

I mean, that did not smell to me like a deal that would stick.

And I don't know any of the tobacco executives that were involved in that. I don't know how much they agonized over getting in a position where they were bound and the other party wasn't. But I can tell you from labor negotiations that that's not a pleasant place to be, and it's not a great strategic place to be.

Charlie, what do you think of it?

CHARLIE MUNGER: I don't feel I've got any great expertise in this situation.

WARREN BUFFETT: Well, neither did I, but I'm — (Laughter)

22. Buffett on inheritance: "Enough to do anything, not enough to do nothing"

WARREN BUFFETT: OK, zone 8, please.

JAIME MCMAHON: Hello, I'm Jaime McMahon (PH) from Birmingham, Alabama.

And I was hoping that, Mr. Buffett and Mr. Munger, y'all would expand a little bit on your ideas of an inheritance, and the positive and negative influences that that can have on your heirs, and what you might be able to do as a businessperson, and an investor, and as a parent to sort of mitigate those negative influences.

WARREN BUFFETT: Yeah, well, I quoted — I think Kay Graham was quoting her father at the time but — some years back as saying, "If you're quite rich, probably the idea of leaving your children enough so they can do anything, but not enough so they can do nothing, is not a bad formula."

I think, if you're talking about people that aren't quite rich, I've seen — you know, socially, I wouldn't have a system that involved inheritances. But recognizing the situation that exists, I think probably at lower levels, that leaving to the children in this society is perfectly OK.

But I believe enough in a meritocracy that if I were devising the system with a consumption tax and everything, I would probably make inheritance a form of consumption that would be very heavily taxed, because I don't believe that because you happen to be the — come out of the right womb, essentially, that you are entitled to live an entirely different life than somebody who wasn't quite as lucky, in terms of womb selection. (Laughter)

But in my own case, you know, I follow the "enough so they can do anything, but not enough so they can do nothing." I think that society showered all these —

I was very lucky, I was wired the right way at the right time in history to do very well in this kind of a market economy. Whereas Bill Gates has told me if I was born some thousands of years ago, I'd been some animal's lunch. (Laughter)

You know, I don't run very fast. (Laughter)

And there are different assets that are useful at different times.

And I'll add, I'm not wired to play championship bridge, or championship chess, or not wired to be a basketball star or anything. It just so happens I'm in an area where it pays off like crazy to be good at capital allocation.

And that doesn't make me a more worthwhile human being than anybody else or anything. It just means I was lucky.

And should that luck, in effect, enable many generations of people that are good at womb selection to do nothing in this world? You know, I would have some reservations about that.

So that's my own feeling on inheritance. But Charlie has a bigger family and he can give you a better answer.

23. Munger on inheritance: Few people are "ruined by money"

CHARLIE MUNGER: Well, I feel, in a capitalist system, that there should be an inheritance tax, and that once that's been imposed and paid, what each person wants to do in his own testamentary arrangements is up to that person.

I see very few people that I regard as ruined by money. Many of the people that I see ruined who have money would have been ruined without money. (Laughter)

And I think the percentage of the people that are going to be living the life of the French aristocracy before the revolution is always going to be very small.

And there are plenty of grasping people to take the money away from the incompetents who inherit it.

I don't think we have to worry about a whole class of incompetents ruling the world as their money cascades ever higher.

So I like a fair amount of charity, and certainly some testamentary charity is OK. But I feel it's an individual choice that people have to make.

WARREN BUFFETT: They get a choice there.

24. Two conditions needed for a market that's not overvalued

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: My name is Samuel Wong from Irvine, California. I have two questions.

Question number one, do you think the U.S.A. market is overvalued today?

And question number two, would you buy Berkshire Hathaway stock today, considering the fact that they've had a nice ride up already this year?

And if yes, presuming I have a kid, 20 years old, and he has $150,000 to invest in Berkshire Hathaway, and you won't need the money until five years later, gradually, would you recommend to buy A share or B share, or the combination? Thank you.

WARREN BUFFETT: If you decide to buy Berkshire, I don't think it really makes much difference whether you buy A or B.

But we don't make any recommendations about whether people buy or sell Berkshire. We never have and that's a game we don't want to get into.

In terms of — overvalue — the question whether the market's overvalued, generally, it's simply as we said last year here in the annual report.

It's not — the general market is not overvalued if two conditions are met, which is — in our view — which is that interest rates remain at or near present levels or go lower or — and that corporate profitability in the U.S. stay at the present — or close to the present — levels, which are virtually unprecedented.

Now, those are a couple of big ifs, as we pointed out. A lot of the stories that came out after the annual report would emphasize one aspect or another but it's simply — and they say, "What does he mean by that?" Well, it means exactly what I say. If the two conditions are met, I think it's not overvalued. And if either of the conditions is breached in an important way, I think it will turn out to be overvalued.

And I don't know the answer, which is why I put it in the form that I did.

It's very tough at any given time to look forward and know what level of valuation is justified. You do know when certain dangerous things appear, and certainly if you're predicating your answer that stocks are OK at these prices — if you come to that conclusion — you have to also come to the conclusion, in our view, that corporate earnings, at present levels, are likely to be maintained. And that's a conclusion you would have to come to. I don't think it's obvious that that's the case.

25. No exact formula on retaining earnings

WARREN BUFFETT: Area 10, please.

AUDIENCE MEMBER: Good afternoon. My name's Stanley Harmon (PH) and I'm from Boston.

You say that companies should only spend a dollar on capital expenditures if it will create more than $1 of market value. I'm wondering, how do you determine this?

Is it based on A, historical returns on capital; B, a qualitative judgment of the company's competitive position; C) a quantitative projection of returns on capital; or D, something else?

WARREN BUFFETT: Yeah. Well, it's based on all of those factors you mention and more. But in the end we can say to date every dollar we've retained has been worthwhile, because on balance those dollars have produced more than a dollar of market value.

It's — actually, with a great many companies you can say that now, because things have turned out so well.

But it would be a case — the check on it is, if after three or four years, you've found that the dollars we've retained hasn't created more of that in value, then the presumption becomes very strong at that point that we should start paying out money.

But almost any management that wants to retain money is going to rationalize it by saying, "We're going to do wonderful things with the money we retain." And we think there should be checks on that, which is why in the report, in the ground rules, I suggest making checks on the validity of those projections.

Charlie and I, if you ask us today whether the single dollar we retain from the earnings today, we've got a use for today that will produce more than a dollar of value, the answer is no.

But we do think that based on history, that the prospects are better than 50 percent — well over 50 percent — that in the next few years, we would have an opportunity to do that. But there's no certainty to it.

Charlie?

CHARLIE MUNGER: Nothing more.

26. Berkshire stock tracks intrinsic value "better than most"

WARREN BUFFETT: OK. Area 1, please.

AUDIENCE MEMBER: Good afternoon. My name's Gary Bialis (PH), I'm from Southern California.

I want to thank you again for producing this Owner's Manual that you did a couple of years ago. I find it quite useful and use it quite often.

Two questions: can you tell me if the rule of thumb is still applicable regarding the statement in the Owner's Manual, that the percentage increase in the book value tracks pretty well with the percent increase in intrinsic value?

Or is the fact that you now have more owned businesses, especially ones like GEICO and FlightSafety, mean that the spread between those two has possibly narrowed?

WARREN BUFFETT: Well no, the two have tracked pretty well over the years. I mean, compared to the record of most businesses that are publicly owned, I would say that over the 33 or so year span, our market price has tracked intrinsic value more closely than, you know, 80 or 90 percent of the companies that we view, probably 90 percent.

But that doesn't mean it does it all the time. And there are times when the market price will outpace intrinsic value — the change in intrinsic value — and there are times when, obviously then, that it will lag behind. So it's far from perfect but it's better than most.

Ideally, we would like it to track it perfectly. If we ran this as a private company and we met once a year, and set a price on the stock to have it traded once a year, and Charlie and I were responsible for setting that price, we would try to set a price that was as close to intrinsic value as we could.

And that would be — to the extent that we could do it — it would be a perfect tracking. The market isn't like that, and the market responds to a lot of other things. So it's perfect. It's not getting more perfect, in our view. But we still think that Berkshire tracks it better than most companies.

Charlie, you have —

CHARLIE MUNGER: Nothing to add.

27. KKR sale of Gillette shares "means nothing to us"

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: I'm Elizabeth Cruz (PH) from New York City. I have a question about Gillette.

Another significant Gillette investor, KKR, recently sold over a billion dollars in Gillette shares, shares that they had acquired through Gillette's acquisition of Duracell.

Knowing that KKR has also been a successful investor, do you see this as a negative signal about Gillette's future prospects, particularly on the eve of the launch of the Mach 3 razor? And what do you think their plans are for the remainder of their shares?

WARREN BUFFETT: Well, I think they may have even publicly stated — I'm pretty sure they have — the Duracell shares from which the Gillette shares came were held by a specific investment fund that was formed in, I don't know what year, but a given year, and which is scheduled to disband at a certain point.

So those shares, whether they were of Duracell or whether they're of Gillette, were scheduled for disposition at some point within a given term. And I think that KKR made the decision — and they've made it with other stocks, too — is to have maybe three or so offerings between now and that terminal date for their partnership.

And why they pick any one of — any given date, you know, is up to them and their advisors.

It means nothing to us. I mean, if they didn't have that kind of a fund and they decided to sell, it wouldn't make any difference to them [us]. And I presume if we made a decision to sell, it wouldn't make any difference in their case.

So we, you know, we form our ideas of valuation independent of anybody else's thinking on it. But in the case of KKR, specifically, they have a termination date on a partnership that owned those shares, and have to dispose of them one way or another between now and the termination date, and probably decided that with the quantity of stock they had, that they were going to have several sales.

The Mach 3 is terrific, incidentally. I've been using it since October. So Henry did not decide to sell that stock based on the Mach 3. (Laughter)

28. No split means "better class of shareholders"

WARREN BUFFETT: Area 3, please.

AUDIENCE MEMBER: I am Gertrude Goodman (PH) from Palm Springs, California.

Mr. Buffett and Mr. Munger, there are many stocks that rise and eventually split. My question is, do you foresee in the near future a split for Berkshire Hathaway Class A?

WARREN BUFFETT: Well, that's an easy one. (Laughter)

No. The answer is no. We have no plans to split the A.

In effect, we let people who want to split the A split it themselves into a B. So that anybody who owns the A can have a 30-for-1 split any morning they wake up and want to have such a split. (Laughter)

Charlie, do you have any additional comment?

CHARLIE MUNGER: No, I think you said "no" perfectly. (Laughter and applause)

WARREN BUFFETT: We don't take that attitude because we're cavalier about how shareholders feel. We really think that in the long range interest of Berkshire that the policy we followed on not splitting has benefitted the company and shareholders.

Nothing dramatic about it, but I think that we have a better class of shareholders, in aggregate, in this room, than we would have if we were selling at $3 a share, or $30 a share, or maybe even $300 a share.

29. "Book value is not a factor we consider"

WARREN BUFFETT: Area 4, please.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. My name is Jack Sutton (PH) from New York City. I have two questions.

The Japanese stock market has been likened to the U.S. market in 1974. With Japanese stocks selling at very low price-to-book values, as compared to U.S. stocks, would it not make sense to invest in a basket of Japanese stocks or an index fund of Japanese stocks?

Question number two: Berkshire Hathaway tends to invest in companies with high margins and high return on common equity. Berkshire's investment in the airline business seems to have digressed widely from those principles.

Could you elaborate on why Berkshire invested in the airline industry, and would Berkshire consider new investments in the industry in the future?

WARREN BUFFETT: I'm going to the first question. The reason that — and I don't know the exact figures — that Japanese stocks would sell at a lower price-book ratio than U.S. stocks is simply because Japanese companies are earning far less on book than American companies.

And earnings are what determine value, not book value. Book value is not a factor we consider. Future earnings are a factor we consider. And as we mentioned earlier this morning, earnings have been poor for a great many Japanese companies.

Now, if you think that the return on equity of Japanese business is going to increase dramatically, then you're going to make a lot of — I mean, and you're correct, you're going to make a lot of money in Japanese stocks.

But the return on equity for Japanese businesses has been quite low, and that makes a low price-to-book ratio very appropriate because earnings are measured against book. And if a company's earning 5 percent on book value, I don't want to buy it at book value if I think it's going to keep earning 5 percent on book value. So a low price-book ratio means nothing to us. It does not intrigue us.

In fact, if anything, we are less likely to look at something that sells at a low relationship to book than something that sells at a high relationship to book, because the chances are we're looking at a poor business in the first case and a good business in the second case.

30. Airlines not "intriguing" enough to buy stock

WARREN BUFFETT: What was the other question on, Charlie?

CHARLIE MUNGER: Buying — airlines.

WARREN BUFFETT: Airlines. Yeah, I always repress everything on airlines. I don't want to — (Laughter)

No, we've never bought an airline common stock that I can remember. So what we did was we lent money to USAir for a 10-year period and we had a conversion privilege there.

It looked like it — it was a terrible mistake. I made the mistake. But we got bailed out. But we — we never made the determination — when we bought our stock, USAir was selling at $50 a share or thereabouts, the common. And we didn't have an interest in buying USAir at 50, or 40, or 30, or 20. And we got a chance to as things went along — (laughter) — all the way down to 4. (Laughter)

And we never bought it. And we've never bought American, or United, or Delta, or any other airline. It is not a business that intrigues us.

We did think it was intriguing to lend money to them with a conversion privilege and it's worked out now because we got lucky, and because Steve Wolf came along and really rescued the company from right at the brink of bankruptcy.

But we're unlikely to be in airlines, although again, we wouldn't mind lending money to a lot of businesses that we wouldn't buy common equity in. I mean, that could happen again in various industries, including the airline industry.

Charlie, do you have anything to say on either the airlines or the Japanese market?

CHARLIE MUNGER: Well, the airline experience was very unpleasant for us. The net worth just melted. It was (inaudible) a billion and a half, and it just went a hundred million, a hundred million, a hundred million, and finally the cash is running down. It is a very unpleasant experience. (Laughter)

We try and learn from those experiences but we're very slow learners. (Laughter)

31. No "good returns" on Japanese stocks unless profits increase

WARREN BUFFETT: Japanese market (inaudible)?

CHARLIE MUNGER: Oh, the Japanese market.

I suppose anything — (Laughter as Buffett reaches for box of candy)

I suppose anything could happen. After all, we bought silver. (Laughter)

But we have never made a big sector play on a country. In fact, we've almost never made a big sector play.

WARREN BUFFETT: We would have to come to the conclusion that Japanese business, instead of earning whatever it's earning on equity now, is going to earn appreciably more on equity.

I've got no basis for it — I wouldn't argue if anybody else feels that way — I wouldn't argue with them. But I have no basis for coming to that conclusion.

And unless you come to that conclusion, you're not going to make good returns. I mean, unless that happens, you're not going to make good returns from Japanese stocks.

You can not — you can't earn a lot of money from businesses that are earning 5 percent on — or 6 percent — on equity. And I look at the reports but I don't see the earning power now.

Now, maybe it'll all change. I mean, there's talk of — there's already been a small temporary tax cut, but corporate tax rates are quite high, as you know, in Japan.

And they used to be 52 percent here in the United States, now they're 35. So you could have things happen that increase corporate profits, but I don't have any special insight into that that anyone that reads the press generally would not have.

CHARLIE MUNGER: There are also readings in corporate culture that have to be made. Owning stock in a corporation where you know that if shareholders or somebody else has to suffer, the choice is likely to be that somebody else will be chosen.

That is a different kind of a company to invest in than one that thinks that the principal purpose of life is to keep some steam boiler company going in a particular community or something, no matter how much the shareholders suffer.

I think it's hard to judge corporate culture in the foreign countries as well as we can judge it in our own.

32. "We're only interested in price and value"

WARREN BUFFETT: Area five?

AUDIENCE MEMBER: Yvonne Edmonds (PH) from Cedar Mountain, North Carolina.

I have a specific question but not a trivial one. You regularly compare Berkshire Hathaway's performance to the S&P 500, which is very helpful and very interesting.

But I haven't seen a correlation coefficient between the S&P 500 daily — from day-to-day — performance — to close, say — and Berkshire Hathaway's close.

Now, it so happens for me — and I'm sure some other people in the audience — that I don't always have access to newspapers — or the internet, for that matter — newspapers that publish Berkshire Hathaway performance on a daily basis, or even a weekly basis for that matter, or a monthly basis.

It would be very helpful to know the extent of a correlation coefficient between those two variables. If you have that, would you let us know what it is? And if you don't, would you please consider calculating it in the future?

WARREN BUFFETT: Well, it could be calculated but I don't think it would have much meaning. I mean, it would be an historical correlation coefficient which, you know, I would be very reluctant to have people place any weight in.

I try to indicate even the limitations of the yearly comparison of the relative performance, because what was doable by us in the past is not doable today. I mentioned in my annual report, the best decade I ever had on comparative performance by far was the 50s.

Now, I don't think it was because I was a lot smarter then — (laughs) — unwilling to accept that.

But you know, I had some edge of — well, it's probably 40-plus points per year. But I was working with it — that has no relevance to today whatsoever. It would be misleading to publish it or make calculations based on it.

So I think that you would find — I don't know what you'd find on a specific correlation between Berkshire and the S&P.

You'd find a lot of correlation — well, you might not find so much — you'd find it in intrinsic value between that and Coke, and a few stocks like that.

But I don't really think that's particularly useful information going forward. We have no objection, anybody wants to make the calculation. But it wouldn't be something that would be of any utility to us, and if we don't think it's utility to us, we don't want to put it out for shareholders as being of possible utility.

We do think that the S&P annual calculation has some meaning because it's an alternative for people to invest. They don't need us to buy the S&P. So unless, over time, we have some advantage over that, you know, what are we contributing? What value is added by our management?

So we think that that's — people should hold us accountable even though we would prefer not to be. Because it is a tough comparison for us as a tax-paying entity against a non — pre-tax calculation on the S&P.

But we don't pay any attention to beta or any of that sort of thing. It just doesn't mean anything to us. We're only interested in price and value. And that's what we're focusing on all the time, and any kind of market movements or anything don't mean anything.

I don't know what Berkshire is selling for today and it really makes no difference. You know, it just doesn't make any difference.

What does count is where it is 10 years from now. And I can't tell you what it was selling for on May 4th, 1983, or May 4th, 1986, so I don't care what it sells for on May 4th, 1998.

I do care, you know, where it is, in general, 10 years from now, and that's where all the focus is.

Charlie?

CHARLIE MUNGER: Yeah, we're publishing data in the form where we would like it if we were the passive shareholder. And so you're getting the data and you're getting it on a time schedule based on what we would want if we were in your position. And we don't think — (laughter as Buffett holds up a Dairy Queen Dilly Bar that was just given to him) — and we don't think the correlation coefficients would help us.

WARREN BUFFETT: We don't think anything that relates either to volume, price action, relative strength, any of that sort of thing — and bear in mind, when I was in my teens I used to eat that stuff up. I mean, I was making calculations based on it all the time, and kept charts on it, even wrote an article or two on it.

But it just — it just has no place in the operation now.

CHARLIE MUNGER: One of the pleasant things about dealing with Warren all these years is he's never talked about a correlation coefficient. (Laughter)

If the correlation isn't so extreme you can see it with the naked eye, he doesn't compute it. (Laughter)

33. Beware of companies that must "spend money like crazy"

WARREN BUFFETT: OK, we're going to go to zone 6 and I'm going to have a Dilly Bar, and Charlie has got one here, too. (Laughter and applause)

These are terrific.

AUDIENCE MEMBER: My question has to do with what you mentioned earlier about how companies have to reinvest a certain amount of cash in their business every year just to stay in place.

And if one could say that the best businesses are the ones that not only throw off lots of cash, but can reinvest it in more capacity. But I suppose the paradox is that the better a company's opportunities for making expansionary capital expenditures, the worse they appear to be as consumers of cash rather than generators of cash.

What specific techniques have you used to figure out the maintenance capital expenditures that you need to do in order to figure out how much cash a company is throwing off? What techniques have you used on Gillette or other companies that you've studied?

WARREN BUFFETT: Well, if you look at a company such as Gillette or Coke, you won't find great differences between their depreciation — forget about amortization for the moment — but depreciation and sort of the required capital expenditures.

If we got into a hyperinflationary period or — I mean, you can find — you can set up cases where that wouldn't be true.

But by and large, the depreciation charge is not inappropriate in most companies to use as a proxy for required capital expenditures. Which is why we think that reported earnings plus amortization of intangibles usually gives a pretty good indication of earning power, and —

I don't — I've never given a thought to whether Gillette needs to spend a hundred million dollars more, a hundred million dollars less, than depreciation in order to maintain its competitive position. But I would guess the range is even considerably less than that versus its recorded depreciation.

Businesses you have to worry about — I mean, an airline business is a good case. In the airlines, you know, you just have to keep spending money like crazy. And you have to spend money like crazy if it's attractive to spend money, and you have to spend it the same way if it's unattractive. You just — it's part of the game.

Even in our textile business, to stay competitive we would've needed to spend substantial money without any necessary — any clear prospects of making any money when we got through spending it.

And those are real traps, those kind of businesses. And they make out one way or another, but they're dangerous. And in a See's Candy we would love to be able to spend 10 million, 100 million, $500 million and get anything like the returns we've gotten in the past.

But there aren't good ways to do it, unfortunately. We'll keep looking, but it's not a business where capital produces the profits.

At FlightSafety, capital produces the profits. You need more simulators as you go along, and more pilots are to be trained, and so capital is required to produce profits. But it's just not the case at See's.

And at Coca-Cola, particularly when new markets come along, you know, the Chinas of the world or East Germany or something of the sort, the Coca-Cola Company itself would frequently make the investments needed to build up the bottling infrastructure to rapidly capitalize on those markets, the old Soviet Union.

So those are — those are expenditures — you don't even make the calculation on them, you just know you've have to do it. You got a wonderful business, and you want to have it spread worldwide, and you want to capitalize on it to its fullest.

And you can make a return on investment calculation, but as far as I'm concerned it's a waste of time because you're going to do it anyway, and you know you want to dominate those markets over time. And eventually, you'll probably fold those investments into other bottling systems as the market gets developed. But you don't want to wait for conventional bottlers to do it, you want to be there.

One of the ironies, incidentally — and might get a kick out of it, some of the older members of the audience — that when the Berlin Wall went down and Coke was there that day with Coca-Cola for East Germany, that Coke came from the bottling plant at Dunkirk. So there was a certain poetic — (crowd noise) — irony there.

Charlie, do you have anything on this?

CHARLIE MUNGER: I've heard Warren say since very early in his life that the difference between a good business and a bad business is usually the good business just throws up one easy decision after another, whereas the bad business gives you a horrible choice where the decision is hard to make and, is this really going to work? And is it worth the money?

If you want a system for determining which is a good business and which is a bad business, just see which one is throwing the management bloopers time after time after time.

Easy decisions. It's not very hard for us to decide to open a new See's store in a new shopping center in California that's obviously going to succeed. It's a blooper.

On the other hand, there are plenty of businesses where the decisions that come across your desk are just awful. And those businesses, by and large, don't work very well.

WARREN BUFFETT: I've been on the board of Coke now for 10 years, and we've had project after project come up, and there's always an ROI. But it doesn't really make much difference to me, because in the end almost any decision you make that solidifies and extends the dominance of Coke around the world in an industry that's growing by a significant percentage, and which has great inherent underlying profitability, the decisions are going to be right and you've got people there that will execute them well.

CHARLIE MUNGER: You're saying you get blooper after blooper.

WARREN BUFFETT: Yeah. And then Charlie and I sat on USAir, and the decisions would come along, and it would be a question of, you know, do you buy the Eastern Shuttle, or whatever it may be?

And you're running out of money. And yet to play the game and to keep the traffic flow with connecting passengers, I mean, you just have to continually make these decisions — whether you spend a hundred million dollars more on some airport.

And they're agony because, again, you don't have any real choice, but you also don't have any real conviction that it's going to translate — those choices are going to — or lack of choices — are going to translate themselves into real money later on.

So one game is just forcing you to push more money in to the table with no idea of what kind of a hand you hold, and the other one you get a chance to push more money in, knowing that you've got a winning hand all the way.

Charlie? Why'd we buy USAir? (Laughter)

Could've bought more Coke.

34. Berkshire is prepared for adversity

WARREN BUFFETT: Area 7.

AUDIENCE MEMBER: My name is Bakul Patel (PH). I am from upstate New York.

And my question is, is Berkshire prepared for 1929 style of depression or, like, a prolonged bear market that exists in Japan? And would it be as successful in those situations?

WARREN BUFFETT: Well, we are probably — we don't expect what you're talking about, but we are probably about as well-prepared as any company can be for adversity, because Berkshire has been built to last.

Net, we would benefit over a 20-year period by having some periods of terrible markets periodically in that 20-year period. That doesn't mean we're wishing for them and it doesn't mean they're going to happen, but —

We make our money by allocating capital well, and the lower the general stock market would be, the better we can allocate capital. So we're well-prepared but we're not necessarily expecting.

Charlie?

CHARLIE MUNGER: Yeah, we are not going to ever sell everything and go to cash and wait for the crash so we can go back in.

On the other hand, we are structured so that I think, net, a lot of turmoil in the next 20 years will help us, not hurt us. I don't mean it'll be pleasant to go through the downcycle, but it's part of the game.

35. "We're never going to give out advice on Berkshire stock"

WARREN BUFFETT: Area 8.

AUDIENCE MEMBER: My name is Pete Banner (PH) from Boulder, Colorado. First of all, Mr. Buffett and Mr. Munger, thank you for your genuine generosity today.

Berkshire closed yesterday, the A share was about — or Friday — $69,000 and the B share was about $2,300. Do you feel that price is grossly overpriced, or grossly underpriced, or reasonably priced?

WARREN BUFFETT: Well, I'll let Charlie answer that one. (Laughter)

CHARLIE MUNGER: I'm not going to say. (Laughter)

WARREN BUFFETT: No, we're just never going to — we're never going to give out advice on Berkshire stock. There's no —

You know, that is up to people who want to buy and sell it, and anything we would say could easily get magnified, and people would be acting on it months later, and who knows all the problems that it could produce, so —

CHARLIE MUNGER: It would be quite eccentric if we were to every day put out an announcement, "Now's the time to buy, now's the time to sell," our own stock.

Eccentric we are, but that eccentric we aren't. (Laughter and applause)

36. George Burns: role model for surviving unhealthy habits

WARREN BUFFETT: Area 9.

AUDIENCE MEMBER: Irene Finster, your longtime partner from Tulsa, Oklahoma —

WARREN BUFFETT: Hi, Irene. Yeah, Irene has a soda fountain. You ought to go visit her. (Laughter)

AUDIENCE MEMBER: First I want to thank you for giving your shareholders the opportunity to select their own charities.

And second, I'm very concerned about your health due to your diet — (Laughter) — of red meat —

WARREN BUFFETT: Irene. (Applause)

Irene, these are our products that I'm eating. (Laughter)

AUDIENCE MEMBER: Red meat, candy, ice cream — (laughter) — and —

WARREN BUFFETT: And that's just what I do — that's what I do in public —

AUDIENCE MEMBER: —and Coke. (Laughter)

And I want to know what your doctor says. (Laughter)

WARREN BUFFETT: My doctor says I must be heavily relying on my genes. (Laughter)

No, I will tell you, I — I mean, Charlie and I are both very healthful. If you were in the life insurance business, you would be happy to write us at standard rates, I could assure you of that. (Laughter)

CHARLIE MUNGER: You know, they asked George Burns when he was 95, "What does your doctor say about smoking these big, black cigars?" And he said, "My doctor's dead." (Laughter and applause)

WARREN BUFFETT: Charlie and I played bridge with George when he was about 97, I'd say, at the Hillcrest Country Club. And there was a big sign behind him that said, "No smoking by anyone under 95." (Laughter)

And actually, at his 95th birthday party, he had about five very good-looking young girls that were there to greet him with a big cake and everything. And he looked them over one after another and he said, "Oh girls," he said, "I'm 95. One of you is going to have to come back tomorrow." (Laughter and applause)

We're very big on George Burns in recent years. (Laughter)

37. "We wait indefinitely"

WARREN BUFFETT: Area 10.

AUDIENCE MEMBER: My name is Hubert Vose (PH). I'm from Santa Barbara, California.

Earlier this morning, you made a comment that if the market fell you would be spending less time on the internet because you'd be very busy. And this is reinforced an impression I have had that the cash flows of Berkshire Hathaway are enormous, but that possibly in the last 12 months you've been investing less than you had previously.

And if so — if this is correct, what does that say about waiting for attractive values? How long are you willing to wait, and what does that say to the investment public in their own habits?

WARREN BUFFETT: Well, you're correct that we have not found anything to speak of in equities in a good many months, and —

The question of how long we wait, we wait indefinitely. We are not going to buy anything just to buy something. We will only buy something if we think we're getting something attractive.

And that — and incidentally, if things were 5 percent cheaper that — or 10 percent cheaper — that wouldn't change anything materially.

So we have no idea when that period ends. We have no idea whether — as I've said, it can turn out that these valuations are perfectly appropriate if returns on equity stay where they are. But even then, they aren't in the least mouthwatering, so we won't feel we've missed anything particularly if returns stay where they are.

Because if it turns out that these levels are OK, they still will not produce great returns from here, in our view. That doesn't mean you couldn't have a tremendous market in the short-term or something of the sort.

Markets can do anything. And you look at the history of markets and you just see everything under the sun.

But we will not — you know — we have no timeframe. If the money piles up, the money piles up. And when we see something that makes sense, we're willing to act very fast, very big. But we're not willing to act on anything that doesn't check out in our view.

There's no — you don't get paid for activity, you only get paid for being right.

Charlie?

CHARLIE MUNGER: Yeah. An occasional dull stretch for new buying, this is no great tragedy in an investment lifetime.

Other things may be possible in such an era, too. I mean, it isn't like we have a quiver with only one arrow.

WARREN BUFFETT: We sat through periods before. I mean, the most dramatic one being the early '70s — late '60s and early '70s.

For a long time it seemed — doesn't seem so long when you look back on it, seems long when you're going through it — but it — like having a tooth pulled or something, but it's, you know, what can you do about it?

The businesses aren't going to perform better in the future just because you got antsy and decided you had to buy something. We will wait till we find something we like.

We’ll love it when we can swing in a big way, though. That’s our style.

38. “Certified record of failure” in real estate

WARREN BUFFETT: Area 1.

AUDIENCE MEMBER: Larry Pekowski (PH), Millburn, New Jersey.

Berkshire seems never to have made any real, pure real estate investments, not counting facilities the operating companies might own, with the exception of Wesco’s involvement in the residential project in California.

I was wondering if you’ve ever looked at a real estate transaction and tried to apply the same filters, meaning competitive advantages, returns on capital, that you do in operating companies.

And if not, is it a circle of competence issue, or is there something you find disinteresting about real estate?

CHARLIE MUNGER: (Inaudible)

WARREN BUFFETT: You want to take it? OK, Charlie wants to take this one.

CHARLIE MUNGER: Let me take this one, because here’s an area where we have a perfect record that extends over many decades.

We have been demonstrably foolish in almost every operation that had to do with real estate we’ve ever touched.

Every time we had a surplus plant and didn’t want to hit the bid and let some developer kind of take an unfair advantage of us, we would of been better off later if we’d hit the bid and invested the money in fields where we had the expertise.

That housing tract that I developed because I didn’t want to let the zoning authorities rob me the way they wanted to. I wish I had let them. (Laughter)

We have a certified record of failure in this deal. (Laughter)

WARREN BUFFETT: And the funny thing is, we understand real estate. (Laughter)

CHARLIE MUNGER: And we’re good at it. (Laughter and applause)

Right.

WARREN BUFFETT: Actually, (inaudible), we do understand real estate. And Charlie got his start in real estate.

CHARLIE MUNGER: Yeah, be we understand other things better. And so the chances that we're going to be big in real estate are low.

WARREN BUFFETT: Yeah. We've seen lots of things, and we've — the prices, you know, just don't intrigue us, in terms of what we get for our money.

I tried to buy a town when I was, what, 21 years old. The U.S. government had a town in Ohio for sale and it would of worked out very well. I'm always — there's nothing about the arena that turns us off, but we don't see great returns available.

And like Charlie says, the few things — (inaudible) old plant or something, that is not — we have not been great at working our way out of those.

Fortunately, they haven't been very important in relation to the net worth of Berkshire.

39. Nike: "We keep all of those views to ourselves"

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: Good afternoon. My name is Fred Costano (PH) from Detroit, Michigan. My question concerns Nike.

Nike is a company experiencing some short-term problems, but it's a great company with an excellent track record. Phil Knight is similar to Bill Gates in the respect that he's a marketing genius and is a very hard worker. Making sneakers is a very simple business with high margins.

How do you view Nike and what do you think of the company?

WARREN BUFFETT: Well, I think Phil Knight is a terrific operator. I think — and he's a competitor. He's got a lot of money in Nike.

But as terms of what we think of the stock, you know, we keep all of those views to ourselves pretty much.

40. Buffett doesn't expect litigation over fats in food

WARREN BUFFETT: Area 3? (Laughter)

AUDIENCE MEMBER: Hello, my name is Ed Clinton and I'm from Chicago, Illinois.

I'm wondering about the tobacco litigation. There's also — there have been some comments about fatty food.

Do you think there's going to be a new trend of fatty food litigation coming out of the tobacco problems?

WARREN BUFFETT: Well, I sign a waiver before I — (laughs) — do any of that myself.

No, I would doubt — I would — I do not see those two as being remotely similar.

But Charlie, do you have any different views on it?

CHARLIE MUNGER: Well, I think the traditional tort system is particularly ill-suited for solving what might be called the tobacco health problem. So I regard that whole thing as sort of a Mad Hatter's Tea-Party. And we sit out from afar.

41. Lots of credit to go around for strong economy

WARREN BUFFETT: Area 4.

AUDIENCE MEMBER: Yes, I'm Fred Bunch from near Tightwad, Missouri.

In light of the current —

WARREN BUFFETT: What was the name of that town? (Laughter)

AUDIENCE MEMBER: Tightwad, Missouri.

WARREN BUFFETT: Tightwad, Missouri, huh? (Laughter)

AUDIENCE MEMBER: There's a bank there.

WARREN BUFFETT: Did they name it after me or Charlie? (Laughter)

AUDIENCE MEMBER: Well, either one, really. (Buffett laughs)

You'd both fit in. (Buffett laughs)

In light of today's healthy growth and stability of the American economy at the present time and over the last five years or so, how much credit, if any, do you give the Clinton administration and why?

WARREN BUFFETT: Well, I give credit to — I give credit going back to Volcker, significant credit to Volcker.

I give credit to Reagan. I give credit to — certainly to Greenspan and to Rubin, and I give credit to Clinton on that — I think that first tax bill was very important. It carried by one vote. And I think he may listen to Rubin.

So I think there's a lot to give credit for and I think you can spread it around a fair amount.

Charlie may be less charitable here. Let's see. (Laughter)

CHARLIE MUNGER: No, I've got no great quarrel with the way the country — the economy's reformed. I think it's way better than any of us would've predicted.

42. How Phil Fisher's "scuttlebutt" method changed Buffett's life

WARREN BUFFETT: Area 5?

AUDIENCE MEMBER: My name is Travis Heath (PH). I'm from Dallas, Texas.

And my question regards what Phil Fisher referred to as "scuttlebutt." When you've identified a business that you consider to warrant further investigation — more intense investigation — how much time do you spend commonly, both in terms of total hours and in terms of the span in weeks or months that you perform that investigation over?

WARREN BUFFETT: Well, the answer to that question is that now I spend practically none because I've done it in the past. And the one advantage of allocating capital is that an awful lot of what you do is cumulative in nature, so that you do get continuing benefits out of things that you'd done earlier.

So by now, I'm probably fairly familiar with most of the businesses that might qualify for investment at Berkshire.

But when I started out, and for a long time I used to do a lot of what Phil Fisher described — I followed his scuttlebutt method. And I don't think you can do too much of it.

Now, the general premise of why you're interested in something should be 80 percent of it or thereabouts. I mean, you don't want to be chasing down every idea that way, so you should have a strong presumption.

You should be like a basketball coach who runs into a seven-footer on the street. I mean, you're interested to start with; now you have to find out if you can keep him in school, if he's coordinated, and all that sort of thing. That's the scuttlebutt aspect of it.

But I believe that as you're acquiring knowledge about industries in general, companies specifically, that there really isn't anything like first doing some reading about them, and then getting out and talking to competitors, and customers, and suppliers, and ex-employees, and current employees, and whatever it may be.

And you will learn a lot. But it should be the last 20 percent or 10 percent. I mean, you don't want to get too impressed by that, because you really want to start with a business where you think the economics are good, where they look like seven-footers, and then you want to go out with a scuttlebutt approach to possibly reject your original hypothesis.

Or maybe, if you confirm it, maybe do it even more strongly. I did that with American Express back in the '60s and essentially the scuttlebutt approach so reinforced my feeling about it that I kept buying more and more and more as I went along.

And if you talk to a bunch of people on an industry and you ask them what competitor they fear the most, and why they fear them, and all of that sort of thing. You know, who would they use the silver bullet of Andy Grove's on and so on, you're going to learn a lot about it.

You'll probably know more about the industry than most of the people in it when you get through, because you'll bring an independent perspective to it, and you'll be listening to everything everyone says rather than coming in with these preconceived notions and just sort of listening to your own truths after a while.

I advise it. I don't really do it much anymore. I do it a little bit, and I talked in the annual report about how when we made the decision on keeping the American Express when we exchanged our Percs for common stock in 1994, I was using the scuttlebutt approach when I talked to Frank Olson.

I couldn't have talked to a better guy than Frank Olson. Frank Olson, running Hertz Corporation, lots of experience at United Airlines, and a consumer marketing guy by nature. I mean, he understands business. And when I asked him how strong the American Express card was and what were the strengths and the weaknesses of it, and who was coming along after it, and so on, I mean, he could give me an answer in five minutes that would be better than I could accomplish in hours and hours and hours or weeks of roaming around and doing other things.

So you can learn from people. And Frank was a user of it. I mean, Frank was paying X percent to American Express for his Hertz cars. And Frank doesn't like to pay out money, so why was he paying that? And if he was paying more than he was paying on Master Charge or Visa, why was he paying more? And then what could he do about it?

I mean, you just keep asking questions. And I guess Davy [Lorimer Davidson] explained that in that video we had ahead of time. I'm very grateful to him for doing that, because that was a real effort for him.

But that was really what I was doing back in 1951 when I visited him down in Washington, because I was trying to figure out why people would insure with GEICO rather than with the companies that they were already insuring with, and how permanent that advantage was.

You know, what other things could you do with that advantage? And you know, there were just a lot of questions I wanted to ask him, and he was terrific in giving me the answer. It, you know, changed my life in a major way. So I have nobody to thank but Davy on that.

But that's the scuttlebutt method and I do advise it.

Charlie?

CHARLIE MUNGER: Nothing to add.

43. "Real test is the gain in intrinsic value"

WARREN BUFFETT: Area 6.

AUDIENCE MEMBER: Hi, my name is Richard Lontok (PH) from Toronto, Canada. I have a question for both of you.

Mr. Buffett, Berkshire Hathaway's earnings in 1997 is less than that of 1996. What do you intend to do in 1998 to improve that earning. (Laughter)

And Mr. Munger, I've been watching you and Mr. Buffett eating the See's candies and drinking the Coca-Cola the whole day.

WARREN BUFFETT: Join in. (Laughter)

AUDIENCE MEMBER: Do you intend to do any commercials in the future like what Dave Thomas does with Wendy's? (Laughter and applause)

WARREN BUFFETT: Which of us do you think should do them? (Laughs)

Now you're talking.

CHARLIE MUNGER: We aren't old enough to be really good in a commercial. (Laughter)

What we would like to do is have somebody up here happily eating See's candy and answering these questions who's about 110 years old. Now, that would really be helpful.

WARREN BUFFETT: We — in terms of the earnings, the final bottom line GAAP reported earnings mean absolutely nothing at Berkshire to us.

Now, the look-through earnings which we publish do have some meaning, but even those have to be interpreted in terms of whether there was a super-cat occurrence, or whether GEICO had an unusually good year, and we try to mention those factors.

But we do hope that the look-through earnings do build at a reasonable clip over time.

But our final earnings include capital gains and we can report those in any number that we wanted to, and we pay no attention whatsoever to realized capital gains at Berkshire.

The IRS does, but — and that's why we may send them a billion or more dollars this year. But they mean nothing in terms of measuring our progress.

The look-through earnings say something about it. That table, the first couple of pages, it shows our change in book value versus the S&P says something about it, not perfect.

The real test is the gain in intrinsic value, for sure, over time. And there's no hard number for that, but so far Charlie and I judge it satisfactory, but we also judge it as non-repeatable.

Charlie, anything more —?

CHARLIE MUNGER: No.

44. "We prefer what other people call risk"

WARREN BUFFETT: Area 7, please.

KEIKO MAHALICK: Good afternoon, Mr. Buffett and Mr. Munger. My name is Keiko Mahalick (PH) and I'm an M.B.A. student at Wharton, but please don't hold that against me.

WARREN BUFFETT: We won't. (Laughter)

I never made it that far. I was an undergraduate student. (Laughs)

AUDIENCE MEMBER: Could you please explain how you differentiate between types of businesses in your cash flow valuation process, given that you use the same discount rates across companies?

For example, in valuing Coke and GEICO, how do you account for the difference in the riskiness of their cash flows?

WARREN BUFFETT: We don't worry about risk in the traditional — the way you're taught, actually, at Wharton. We — (Laughter)

But it's a good question, believe me. But we are — if we could see the future of every business perfectly, it wouldn't make any difference whether the money came from running streetcars or from selling software, because all the cash that came out, which is all we're measuring between now and judgment day, would spend the same to us.

It really — the industry that it's earned in means nothing except to the extent that it may tell you something about the ability to develop the cash. But it has no meaning on the quality of the cash once it becomes distributable.

We look at riskiness, essentially, as being sort of a go/no-go valve in terms of looking at the future businesses. In other words, if we think we simply don't know what's going to happen in the future, that doesn't mean it's necessarily risky, it just means we don't know. It means it's risky for us. It might not be risky for someone else who understands the business.

In that case, we just give up. We don't try to predict those things.

And we don't say, "Well, we don't know what's going to happen, so therefore we'll discount it at 9 percent instead of 7 percent," some number that we don't even know. That is not our way to approach it.

We feel that once it passes a threshold test of being something about which we feel quite certain, that the same discount factor tends to apply to everything. And we try to do only things about which we are quite certain when we buy into the businesses.

So we think all the capital asset pricing model-type reasoning with different rates of risk-adjusted return and all that, we tend to think it is — well, we don't tend to — we think it is nonsense.

But we do think it's also nonsense to get into situations, or to try and evaluate situations, where we don't have any conviction to speak of as to what the future is going to look like. And we don't think you can compensate for that by having a higher discount rate and saying it's riskier, so then I don't really know what's going to happen and I'll have a higher discount rate. That just is not our way of approaching things.

Charlie?

CHARLIE MUNGER: Yeah. This great emphasis on volatility in corporate finance we just regard as nonsense.

If we have a statistical probability of putting out a million and having it turn into —

Put it this way: as long as the odds are in our favor and we're not risking the whole company on one throw or anything close to it, we don't mind volatility in results. What we want is the favorable odds. We figure the volatility, over time, will take care of itself at Berkshire.

WARREN BUFFETT: If we have a business about which we're extremely confident as to the business result, we would prefer that it have high volatility than low volatility. We will make more money out of a business where we know where the endgame is going to be if it bounces around a lot.

I mean, for example, if people reacted to the monthly earnings of See's, which might lose money eight months out of the year and makes a fortune, you know, in November and December — if people reacted to that and therefore made its stock as an independent company very volatile, that would be terrific for us because we would know it was all nonsense. And we would buy in July and sell in January.

Well, obviously, things don't behave that way. But when we see a business about which we're very certain, but the world thinks that its fortunes are going up and down, and therefore it behaves volatile — with great volatility — you know, we love it. That's way better than having a lower beta.

So we think that — we actually would prefer what other people would call risk.

When we bought The Washington Post — I've used that as — it went down 50 percent in a matter of a few months. Best thing that could've happened. I mean, doesn't get any better than that.

Business was fundamentally very nonvolatile in nature. I mean, TV stations and a strong, dominant newspaper, that's a nonvolatile business, but it was a volatile stock. And you know, that is a great combination from our standpoint.

45. We want shareholders who look at Berkshire the same way we do

WARREN BUFFETT: Area 8.

AUDIENCE MEMBER: Good afternoon, and thank you for staying around to answer our questions.

I have two. First of all, would you give us what logic went into your decision to both buy and sell McDonald's?

And my second question goes to a term that you've used. You talked about the caliber of the shareholders at Berkshire Hathaway. How do you define the caliber and what difference does it really make?

WARREN BUFFETT: Well, it makes a lot of difference. Our idea of a high-caliber group is one that is just like us. (Laughter)

And that's not entirely facetious in that we basically want shareholders who look at the business the same way we do. Because we're going to be around running something, and what could be worse than having a group out there had a whole different set of expectations than we did, and evaluated us in a different way, and all of this sort of thing?

I mean, if you are going to — you're going to have a given number of shares outstanding. Let's say we have an equivalent of a million, two-hundred and some thousand A shares. Somebody's going to own every single share.

Now, would you rather have them owned by people who understand your business, who understand your objectives, who measure you the same way you do, who have similar time horizons, or would you rather have the reverse? It makes a real difference over time to be in with people that are compatible with you.

So it's a significant plus to us, the operation of the business, and it leads to a more consistent relationship between price and intrinsic value when you have a group like that, because they understand themselves and the business, and they're not likely to do silly things in either direction.

So you get a much more consistent relationship than if we had a whole bunch of people who were thinking that the most important thing in evaluating this business was next quarter's earnings.

Question about McDonald's simply is, you know, it's an outstanding business and we don't talk about it when we buy it, we don't talk about it if we sell it.

Charlie?

CHARLIE MUNGER: Yeah. The question of what difference does it make to the management who the shareholders are, well, if you are into what I call trustee capitalism, where the shareholders aren't just a faceless bunch of nothings, you feel as a kind of a hair shirt, an obligation to do as well as you can by the shareholders. Well, wouldn't you rather feel an obligation to people you liked instead of people you didn't like? (Laughter)

WARREN BUFFETT: Yeah, let's say you were running a business and — (applause) — and you had a choice of three owners.

You could have a hundred percent of it owned by whatever your favorite philanthropy is, you could have a hundred percent of it owned by the U.S. government, and you could have a hundred percent of it owned by, you know, the worst person you can think of, you know, in your hometown.

I mean, I think it would make a difference in how you felt about going to work every day.

46. “Get more quality than you’re paying for”

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: Yes, my name is Steve Jack (PH). I’m from Southern California. And my question has to deal with kind of quality versus price.

I’ve been to three annual meetings and I’ve heard great things about Coke every year. But as far as I’m aware, you have not bought any additional shares of Coke over the last three years even though the stock has done just fine.

If an investor has a relatively short timeframe, say three to five years, how much weight do you think one should give to quality versus price?

WARREN BUFFETT: Well, if your timeframe is three to five years, A) I wouldn’t advise it being that way. Because I think if you think you’re going to get out then, it gets more toward — leaning toward the bigger fool theory.

The best way to look at any investment is, how will I feel if I own it forever, you know, and put all my family’s net worth in it?

But we basically believe in buying — if you talk about quality meaning the certainty that the business will perform as you expect it to perform over a period of time, so the range of possible performance is fairly narrow — you know, that’s the kind of business we like to buy.

And all I can say is that we like to pay a comfortable price, and that depends to some extent on what interest rates are.

We haven’t found comfortable prices for the kind of businesses we like in the last year. We don’t find them uncomfortable, in the sense that we want to sell them. But they’re not prices at which we — we added to Coke one time about, I don’t know, five years ago or thereabouts, and it’s conceivable we would add again. It’s a lot more conceivable we would add than subtract.

But that’s the way we feel about most of the businesses. We did make a decision last year that we thought bonds were relatively attractive, and we trimmed certain holdings and eliminated certain small holdings in order to make a bigger commitment in bonds.

Charlie?

CHARLIE MUNGER: Yeah. You talk about quality versus price. The investment game always involves considering both quality and price. And the trick is to get more quality than you’re paying for in the price. It’s just that simple.

WARREN BUFFETT: But not easy.

CHARLIE MUNGER: No, but not easy.

47. No interest in spinning off subsidiaries

WARREN BUFFETT: Area 10.

AUDIENCE MEMBER: Gentlemen, good afternoon. Jeff Kirby from Green Village, New Jersey.

Would you comment please on tax-free spinoffs to shareholders in general, and particularly how you would feel about those were you to believe that a materially higher value would be ascribed to one of your operating companies in the public arena than as part of Berkshire Hathaway?

WARREN BUFFETT: Well, there's certainly been times in Berkshire's history when certain components of Berkshire might well have sold at higher multiples as individual companies than the amount they contributed to the whole of Berkshire, although I don't think that would be the case now.

But our reaction to spinoffs would be — even if we thought there was some immediate market advantage, it would have no interest, basically, to us.

We like the group of businesses we have as part of a single unit at Berkshire. We hope to add to that group of businesses. We will add to that group of businesses over time.

And the idea of creating a lot of little pieces because we could get a little more market value in the short term, it just doesn't mean anything to us.

Charlie?

CHARLIE MUNGER: Yeah, it would add a lot of frictional costs and overheads. We have the — I don't know anybody our size who has lower overhead than we do, and we like it that way.

WARREN BUFFETT: Yeah. (Applause)

Right now our after-tax cost of running the operation has gotten down to a half a basis point of capital value. And when you think that many mutual funds are at 125 basis points that means they have 250 times — (laughs) — the overhead ratio to capitalization that we have —

CHARLIE MUNGER: And all they've got is a bunch of marketable securities, and we got that plus businesses.

WARREN BUFFETT: Yeah. We don't need any more, incidentally —

CHARLIE MUNGER: We can get lower, Warren. (Buffett laughs)

We can get a lot lower —

WARREN BUFFETT: Yeah, I know. I know. (Laughter)

You think they'd [Berkshire's board of directors] work for $500 a year instead of $900, Charlie? (Laughter)

Groans from the front row.

48. Shareholders boost sales at Nebraska Furniture Mart and Borsheims

WARREN BUFFETT: Area 1.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger.

I was kind of curious if you could tell me, do you know or can you tell us how much business Nebraska Furniture Mart and Borsheims did this weekend?

And secondly, do you have any interest in investing in the auto industry? And if not interested now, what would change your mind about this industry in the future?

WARREN BUFFETT: Well, the first question, I don't know what the Mart did but I do know they had a lot of shareholders there. Got a verbal report on that.

There would be less change in their normal — they do — you know, you're talking about a company that — at the Mart — that does $800,000 a day on average. It is a big operation.

So our shareholders have an impact, but not the relative impact that they would have at Borsheims.

Borsheims did over twice as much this year as last year, and they had a big day. (Laughter)

49. No special insights into automobile industry

WARREN BUFFETT: And what was the other question, Charlie?

AUDIENCE MEMBER: — industry. The auto industry.

WARREN BUFFETT: Oh, the auto industry. Yeah, Charlie was big in General Motors in the mid-'60s, right Charlie? It was your biggest commitment?

CHARLIE MUNGER: I had a temporary delusion. (Laughter)

Luckily, it passed. (Laughter)

WARREN BUFFETT: Yeah.

No, he made money on it.

CHARLIE MUNGER: Yes, I did.

WARREN BUFFETT: We — it's the kind of industry that's — it's interesting for us to follow.

I mean, many years ago it was the dominant factor — or overwhelming factor — in the economy. It's diminished a fair amount but it's still a very important industry.

And it's the kind of industry that anyone can follow. I mean, you have experience with the product and competing products, and you — everyone in this room understands in a general way the economic nature of the industry.

But we've never felt that we understood it better than other people. So we've seen auto companies at very low multiples sometimes and with prices that in hindsight looked very attractive, but we never really felt that we knew who among the auto companies five years from now would have gained the most ground relative to where they are now, or that gained the most ground relative to what the market might expect. It just isn't given to us, that knowledge.

Charlie?

CHARLIE MUNGER: I agree.

50. Selling on internet could help Borsheims and GEICO

WARREN BUFFETT: Area two.

SCOTT RUDD: Hi, my name is Scott Rudd from Evening Prairie, Minnesota.

And my question is this: ten years from now — and I'm referring to Borsheims as the retail part of it to the consumer, not so much the corporate division — ten years from now, what would be the three things that you would expect to change on a day-to-day operating basis, to change the most and affect your ability to be dominant in that area.

WARREN BUFFETT: Well, I think — are you talking about Borsheims specifically?

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah, I think Borsheims — I won't have three things — but Borsheims may be one of a couple of our companies where the internet could be a huge — have a huge potential for us.

I don't know if that'll happen, but there's no question that we operate — and I've got a message on the internet — at considerably — very considerably — lower gross margins than does a Tiffany or publicly-held jewelry operations.

We are giving customers considerably more for their money. We've got way lower operating costs than the public companies.

And I say on the internet, our operating costs are 15 to 20 percentage points, and even more in some cases, less than publicly-owned competitors. So we've got a lot to offer.

Now, the big question people always have with jewelers is, "How do you know who to trust?" I mean, you know, it is an article that most people feel very uncomfortable buying.

And I think that the Berkshire Hathaway identification can help people feel comfortable on it. I think that the experience of customers around the country as they see it.

And I don't think that — I think it's a product — it's a high-ticket item, so saving money gets to be really important. Just like auto insurance, saving money gets to be really important.

So I think that the internet could be of significant assistance to Borsheims in terms of spreading and facilitating its nationwide reputation. So Borsheims could have a lot of growth and the internet could be a big part of it.

Our job is to get the message to people around the country that they can literally, you know, have us send a half a dozen items to them, that they can look at with no high-pressure salesmanship at all or anything of the sort, and look at the prices, decide what they want in their own homes, and they will do very well with us.

And we have a lot of people taking advantage of that now. But we could have 10, or 20, or 50 times that number as the years go by. And I think we should work very hard on that.

GEICO has possibilities through the internet, obviously, also.

Anything where you're offering a terrific deal to the consumer, but one of the problems has been how do you talk to that consumer, you know, the internet offers possibilities (inaudible). The thing is that everybody in the world is going to be there, and why should they click on you instead of somebody else?

Actually, the Berkshire Hathaway name may help a little bit on that, although GEICO's name is extremely well known. GEICO is — I said in the annual report we were going to spend a hundred million dollars in — basically in promotion this year. We'll spend more money than that.

The brand potential in GEICO is very, very big. And we intend to push and push and push on that.

Charlie?

CHARLIE MUNGER: Well all that said, if the internet helps some of our business, why certainly the CD-ROM and the personal computer combined to clobber World Book for us.

WARREN BUFFETT: Yeah, we paid our entry fee.

CHARLIE MUNGER: Yeah, we — (laughter) — it's not all plus.

WARREN BUFFETT: No.

51. McDonald's vs. Dairy Queen

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: My name is Jorge Gobbi (PH) from Zurich, Switzerland and my question refers to food businesses, mainly McDonald's and Dairy Queen.

Are there major differences in the investment territories fixed between McDonald's and Dairy Queen? And if yes, would you explain them?

WARREN BUFFETT: Yeah, there are major differences. McDonald's owns, perhaps, in the area of a third of all locations worldwide. I can't tell you the exact percentage, but if they've got 23,000 outlets, they own many, many thousands of them, and operate them. And then of the remainder, they own a very high percentage and lease them to their operators, their franchisees.

So they have a very large investment, on which they get very good returns, in physical facilities all over the world.

Dairy Queen has — counting Orange Julius— 6,000-plus operations, of which 30-odd are operated by the company. And even those, some are in joint ventures or partnerships.

So the investment in fixed assets is dramatically different between the two.

The fixed-assets investment by the franchisee, or the person — his landlord — obviously is significant at a Dairy Queen. But it's not significant to the company as the franchisor, so that the capital employed in Dairy Queen is relatively small compared to the capital employed in McDonald's.

But McDonald's also makes a lot of money out of owning those locations and receives —

Whereas Dairy Queen will, in most cases, receive 4 percent of the franchisee's sales, in terms of a royalty, at a McDonald's there's that — there's more than that percentage, plus rentals and so on.

So they're two different — very different — economic models. They both depend on the success of the franchisee in the end. I mean, you have to have a good business for the franchisee to, over time, have a good business for the parent company. Both companies have that situation to deal with.

Charlie?

CHARLIE MUNGER: I've got nothing to add. The 4 percent is not very much when you stop to think about providing a group of franchisees with a nationally recognized brand, and quality control, and all sorts of desirable business aids.

WARREN BUFFETT: No, 4 percent is at the low — if you look at the whole industry — 4 percent is in the lower part of the range. But it works fine —

CHARLIE MUNGER: Part of what attracted us was the fact that the charges to the franchisees are low at Dairy Queen.

WARREN BUFFETT: A successful franchisee can sell his operation for significantly more than he has invested in tangible assets. And we want it that way, obviously, because that means he's got a successful business, and it means that, over time, we will have a successful business.

You want — you want a franchise operation — you want the franchise operator to make money and you want him to create a capital asset that's worth more than he's put in it. That's the goal.

52. Making money with the Byrne family

WARREN BUFFETT: Area 4.

AUDIENCE MEMBER: Good afternoon, Mr. Munger and Mr. Buffett.

My name is Patrick Byrne, I'm a shareholder, and I'm here from Cincinnati, Ohio, back again this year to ask a question to see if I can get the two of you to disagree on a subject. I've picked education as an area where we might see some daylight between the two of you.

First though, on the subject of education, I'd like to offer some brief thanks.

I'm lucky in that my parents, in the late '70s, made the wise choice of buying some Berkshire stock and putting it in a college fund for my brothers and me, and that basically paid for our higher education.

I suspect there must be thousands of people like us who had our education paid for by wealth that the two of you created, and we owe you. Although we probably all have been a lot better to skip college and keep the stock. (Laughter and applause)

Well, on the subject of education, Milton Friedman has said, or has written, that if you really care about poverty in the U.S. and the disadvantage of women and minorities and so on, and you could cure one single thing in the U.S., it would be the public education system.

Mr. Buffett, of course you've been very publicly supportive and done many things, and I'm sure Mr. Munger has as well, for public education.

But I noticed last year, in this annual meeting, Mr. Munger — or both of you, of course, criticized some aspects of higher education, like business schools.

But Mr. Munger included — he was a tad critical, I would say, of the U.S. public education system.

And I wonder if you two agree with what Friedman says and what you think the importance of public education is, and what might be done to improve it.

WARREN BUFFETT: I'm going to let Charlie go in a second, but I just want to say, Patrick Byrne is the son of Jack Byrne, who made a fortune for us by resuscitating GEICO when it got into trouble in the mid-'70s.

In fact, I met Patrick's dad on a Wednesday night, about 8 o'clock at night, in Washington, when GEICO was — it was bankrupt and it was about — very close to being declared so.

And after talking with him about three hours that night, the next day I went out and bought 500 and some-thousand shares of GEICO, that Davy [Lorimer Davidson] referred to, at 2 1/8, so — which is forty cents on the stock that we paid $70 for later on.

So Patrick's dad — we may have made — (laughs) — we may have made the Byrne family more money; he made us a lot of money.

Patrick is now running Fechheimers in Cincinnati and doing a sensational job. His brother, Mark, on June 30, if we hit the target date, will be establishing a major operation in London and Bermuda that will — in which we will be a very large partner.

So he's only got one other brother left, and he's out playing golf in California. But if times get tough we're going to try and recruit him, too.

53. Fixing public education

WARREN BUFFETT: Charlie, with all that time to prepare, what do you have to say about education? (Laughs)

CHARLIE MUNGER: Well, I certainly agree with Milton Friedman, that there's — it would be hard to name one factor, if we could fix it, that would be more worthy of fixing than education in the United States, particularly the lower grades in education where the failures are so horrible, in many big cities particularly.

So yes, I think it's a terrible problem and it needs fixing.

Of course, it's a huge debate as to what the best way is to fix it. And I am skeptical, myself, of big city school systems getting fixed under their own momentums. In other words, I'm quite sympathetic to the people who say we may have to go to an alternative, like vouchers.

That the incentive structure has — (applause) — gotten so bad in some places that you can't fix it with evolution; it takes revolution.

Warren, you're more optimistic about big city public schools —

WARREN BUFFETT: Well, I'm not necessarily more optimistic. I probably feel, though, that democracy without a good public school system available to the entire population is sort of a mockery.

Because there's so much — (applause) — inequality to start with. I mean, it isn't just inequality of money. But I mean, my kids, whether they inherit any money, or your kids, whether they inherit any money, compared to the kids of somebody where both parents are struggling to keep the place going, or maybe just one parent, and living in poverty — I mean, it is so unequal to start with that if you accentuate that inequality by giving those who are generally higher up on the ladder also a far better education than you give those who have chosen the wrong womb, I think that's just — I don't think that society should tolerate that — a rich society — should tolerate it.

That doesn't mean it's easy to solve. Because I've said a lot of times that, unfortunately, it seems like a good public school system is like virginity, that it can be preserved but not restored.

And it's very hard, when you get a system that's lousy, to do much about it, because under those circumstances the wealthy people are going to all opt out of the system, and they're going to be less interested in the bond issues, they're going to be less interested in the PTA, they're going to be less interested in the outcome of the other people's children, if they have all opted out for their own system.

And to have one educational system for the rich and another for the poor, with the poor being — getting the poorer system — strikes me as doing nothing but accentuating inequality and other problems that result from that in the future.

So I don't know the answers on improving the system. You know, I read some of the experiments that take place.

But I do believe to start with that if you have a good public school system, as we do in Omaha, that you do your damndest to maintain that so that there is no incentive for the rich grandparent or the rich parent to say, you know, "I love the idea of equality, but I love my grandchildren or my child more, so I'm going to yank him from the public school system," and then you get this sort of exodus which leaves behind only those who can't afford to make that choice.

And the problem I have with the voucher system, if there were a way — the idea of competition I like, you know, and I think a good parochial system does, for example, create a better public system — and I think we've had that situation in Omaha — but I think the voucher system, if it simply amounts to giving everyone an additional amount, simply means that the rich get X dollars of the public school system subsidized, but the poor still are — whatever that differential is — remains.

I mean, you could have a golf voucher system — because I play golf — I don't play very often — but if I play at the Omaha Country Club then you could have a voucher system so that everybody in Omaha would have more access to the country club by giving everybody a thousand dollars a year to play golf.

But it just means it would reduce my bill by a thousand bucks, but it still wouldn't do the job for the guy who's on the public course because he'd still be beyond his means to move to full-scale equality with me.

I — you know, I don't think there's anything more important — and I agree with Charlie totally — I think the first eight grades, you know, you can forget it after that. If you have the first eight grades right, good things are going to flow. And if you have those wrong, you're not going to correct it as you get beyond that point.

And I think that — you know, I commend Walter Annenberg on the $500 million. I think it is very tough to see results in that arena. And if you find something that is producing results, I think it should be replicated elsewhere.

I think that, obviously — a fellow in Chicago says that the unions have caused considerable problems in getting adjustments made, but he had the political clout behind him to overcome some of those problems.

It ought to be a top national priority. We have the money to educate everybody well in this country, and the question is, can we execute? And that's something I hope good minds like Patrick's work on.

Charlie, you have anything for that?

CHARLIE MUNGER: Yeah. I think when something is demonstrably failing at performing the function to which it's assigned by a civilization, just to keep pouring more and more money into a failing modality is not the Munger system.

So I'm all for taking the worst places where there's failure and trying a new modality. And it wouldn't bother me at all to have vouchers only for the poor.

But I think we have to do something in our most troubled schools to change our techniques. I think it's insane to keep going the way we are.

WARREN BUFFETT: So you'd go for means-tested vouchers, basically?

CHARLIE MUNGER: Oh, I —

WARREN BUFFETT: I mean, I don't disagree with that idea.

CHARLIE MUNGER: All I know is we're — it is a terrible place to fail.

And part of the trouble is ideological. If you have an absolute rule there can't be any tracking by ability, no matter how much better reading can measurably be taught by systems that involve tracking, well, people that brain-blocked shouldn't have the power. You know, we should — (applause) — do what works.

WARREN BUFFETT: You know, we got plenty — I mean, in Omaha, it works. The problem is that once it gets beyond a certain point on a downhill slope, essentially you have the citizens that are able to do something about it, essentially, opt out. And that — I don't know —

CHARLIE MUNGER: I am a product of the Omaha public schools, and in my day, the people who went to private schools were those who couldn't quite hack it in the public schools. That is still the situation in Germany today. I mean, private schools are for people who aren't up to the public schools.

I'd prefer a system like that. But once a big segment of that system measurably fails then I think you have to do something. You don't just keep repeating what isn't working.

WARREN BUFFETT: Well, I agree with that.

Patrick, have you gotten your answer? (Applause)

54. “The truth is you can have the reputation that you want”

WARREN BUFFETT: Let’s go to area 5.

AUDIENCE MEMBER: My name’s Kevin Murphy, I’m from Camarillo, California.

And my question is, what do you look for when determining if a person is honest or not?

WARREN BUFFETT: Now, that’s a good question, Kevin.

You — I think, generally, Charlie and I can do pretty well with the situations we see, but we have to have some evidence of behavior in front of us. And I would say even there’s some occupations where we’re going to expect to find a higher percentage of people who behave well than in others.

But if we work with someone over a period of a few months or more, I think we’ve got — we can come up with a pretty high batting average, in terms of how they behave.

At Salomon, I think I was able to separate out the people who I felt very good about and the people I was a little more nervous about fairly quickly, among the ones I worked with actively.

But how you spot that precisely, you know — leave your lunch money on their — (laughs) — on their desk sometime, Kevin. Maybe you’ll find out in a hurry, but — (Laughter)

We like people — you know, I mean, the great example, you know, is somebody like a Tom Murphy, where they’re just bending over backwards all the time to make sure that you get the better end of the deal.

That doesn’t mean they aren’t competitive. I mean, if you play him at a golf game for money or something like that, you know, he wants to win in the worst way. But he —

But there are people that just — they don’t take credit for things that they didn’t do. In fact, they give you credit for some of the things that maybe they did. You can get a feel for it over time.

Charlie, you have any good guidelines on that?

CHARLIE MUNGER: Yes. I think that people leave track records in life. And so, somebody at your age should figure that by the time he’s 22 or ’3, well, he will have left quite a track record and the world will be able to figure you out.

So I think that track records are very important. And if you start early, trying to have a perfect record in some simple thing like honesty, you’re well on the way to success in this world. (Applause)

WARREN BUFFETT: [Italian industrialist] Gianni Agnelli one time told me, he said, “When you get older, you have the reputation you deserve.” He said you can get away —

CHARLIE MUNGER: Yeah, yeah.

CHARLIE MUNGER: — with it for a while early on. But by the time anybody gets to be 60 or so, they very probably have the reputation they deserve. And the truth is you can have the reputation that you want.

If you list all of the things that you admire in other people, you’ll find out that almost everything you list — you may not be able to kick a football 60 yards or something of that sort — but almost everything you list in the people that you admire and like, they’re qualities that you can have if you just set out to do that.

Didn’t Ben Franklin do that, Charlie?

CHARLIE MUNGER: Oh, sure. I always say that the best way to get what you want is to deserve what you want.

WARREN BUFFETT: I’ll have some more peanut brittle. (Laughter)

55. No expectations of investment problems due to Y2K

WARREN BUFFETT: Area 6.

AUDIENCE MEMBER: I’m Nancy Sill (PH) from Atlanta, Georgia.

You were asked earlier this morning a question about the year 2000 computer problem. Do you anticipate any negative financial impact to the economy or to our companies due to the millennium problem, and if so what financial strategies are you considering?

WARREN BUFFETT: Well, I don’t think there’ll be major problems for our companies. You know, there are going to be some problems — (laughs) — anytime you have something that big.

If people didn’t see it coming in 1980 or 1985, they’re not going to be perfect at solving it by 2000, you can count on that.

But I don’t think it has any investment consequences for Berkshire Hathaway that we should be considering now. And I do think you’ll see most of the problems in the governmental area.

You know, maybe they won’t find your tax return for two or three years. (Laughter) Who knows?

Charlie?

56. McDonald's will keep its real estate

WARREN BUFFETT: Area 7.

AUDIENCE MEMBER: In your description of McDonald's, you have a sense that there's a great business buried in McDonald's and two good businesses that are mixed in with it. And the problem is with the real estate and the operational business, that as the company is currently capitalized, they can't earn the same kind of returns they can earn in the franchising business.

You were, or still are, a significant shareholder of McDonald's. I guess my question is, the solution is obvious: why don't you push for a solution that creates the same opportunity to have at International Dairy Queen?

WARREN BUFFETT: Well, my guess is — I don't know the details on it — but my guess is that with 23,000 locations all over the world, I think it would be extraordinarily difficult to separate the real estate business out from the franchising business at this point.

I think they could've gone a different route. I'm not saying it would've been a better route at all. In fact, I think the odds are they followed the right route in owning and controlling so much real estate.

But I just think the problems would be horrendous. Certainly you wouldn't want to sell it and lease it back because you would not end up with more value, in my view, by doing that.

And spinning it off in a real estate trust or something, with operating in 100-plus countries, and with all of the franchise arrangements, I think it would be a huge, huge problem. I would not want to tackle it myself.

So I think that you should look at McDonald's — and I don't know anything about their plans on this — but I think you should look at McDonald's as being a very good business, but one that will continue in its present mode vis a vis the real estate. Although I think they've signaled that they're going to do less on new properties — somewhat less — in connection with ownership, than they've done to this point.

But there's 23,000 locations out there and every operator, his own arrangement is very important to him. And it just — it would be a mammoth job, and I'm not sure how much extra value would be created in the end anyway.

Charlie?

CHARLIE MUNGER: Yeah, the net returns on capital McDonald's has earned all these years are high, even though they have owned a lot of their real estate. I think it's hard to quarrel with the way they did it. They had the best record.

WARREN BUFFETT: And the multiple is not greatly different, in my view, than if the real estate were separate. You know, I mean, if you get all the real estate detached in some arrangement, you might get a little more out of it. But it doesn't strike me as a big deal.

57. Berkshire is "poorly" structured for owning securities

WARREN BUFFETT: Area 8.

AUDIENCE MEMBER: Yeah, hi. I'm Rachel White (PH) from Missoula, Montana.

And during the lunch break, I heard some people talking about double taxation and how that impacts Berkshire's investment philosophy. So I was wondering if you could talk a little bit about it. I'm not sure I understood it. And if you could explain whether that impacts your investments.

WARREN BUFFETT: Well, we are structured very poorly. And if you were looking — if you're going to start all over again and do most of the things we've done, you would probably not do it in corporate form, or precisely like we do it.

I mean, what that gentleman was talking about in connection with McDonald's applies much more to Berkshire Hathaway by far than McDonald's, in terms of de-taxing part of the income stream.

If we own Coca-Cola with a cost of a billion-two or a billion-three and a market value of 15 billion, we're not going to sell it.

But if we did sell it, we would incur a capital gains tax on the order, almost, of $5 billion.

That means that the 15 becomes 10 billion. Now, if that 10 billion is reflected in Berkshire's value and you bought your stock when we bought our Coke, then you pay a second tax, in turn, in reflection of the Coca-Cola appreciation that has taken place after tax. So it's a very disadvantageous way of owning securities, to have a corporation in between you and the securities themselves.

If we ran as a partnership that would not be the case. I ran Berkshire Hathaway — I mean, I ran Buffett Partnership for many years and we only had one tax at the individual level.

So our stockholders are — to the extent that we own marketable securities — and we own a lot of them — and to the extent that we have a lot of profits over time in those — own those securities in a disadvantageous way.

Now, we also have a float, which helps us own them, which is a big plus.

But corporate ownership of securities — if you have the option of owning them directly or through a partnership — corporate ownership is disadvantageous.

And we're stuck with it. We've had it for all these years. We've got no plans to do anything about it. We couldn't, probably, do anything about it if we wanted to.

So that is a drag on our performance, compared to what would be the situation if we operated as a partnership.

And Lloyd's syndicates, for example, didn't have that problem. Some insurance companies that operate in Bermuda may not have that problem to the same extent. Certainly partnerships don't have that problem, to the extent they own securities. But it's a fact of life with us and we're going to pay a lot of taxes.

Charlie?

CHARLIE MUNGER: Yeah, we have no cure for the corporate income tax, and it is a big disadvantage for the indirect owner of securities.

So far we've surmounted it well enough but we're carrying a load there.

WARREN BUFFETT: It's become a bigger disadvantage since the individual rate went to 20 percent with our corporate rate being 35 percent. If we make a dollar on a stock, it becomes 65 cents, and to the extent that you've owned Berkshire, that 65 cents, now 20 percent off that, becomes 52 cents. Whereas if you'd owned the stock directly, you'd have had 80 cents.

Now, when we owned GEICO and it wasn't consolidated with us, you carried that one more extreme. I mean, GEICO had capital gains and we had a capital gain proportionately in GEICO, and so on.

I mean, how you're structured does make a real difference. But usually once you get into a given structure, you're kind of stuck with it, as I indicated in the answer to the gentleman on McDonald's.

CHARLIE MUNGER: Now, to the extent we have very long holding periods at the corporate level, the real mathematical disadvantage shrinks.

WARREN BUFFETT: Yeah, and we might not have been able to get the float that we have, if we hadn't been operating it in a corporate structure, so that is a mitigating factor, too.

But we like to have the mitigating factors without anything to mitigate, if we get our choice. (Laughter)

58. Due diligence is useless and misses the point

WARREN BUFFETT: Area 9, please.

AUDIENCE MEMBER: Good afternoon. My name is Fred Strasheim (PH) and I'm from here in Omaha.

I have a question about your acquisition methodology. And I was intrigued to read in your annual report about your acquisition of Star Furniture.

And as I understand the process you followed, Mr. Buffett, you met with Mr. — or you — I'm sorry, you reviewed financials for a brief period, liked what you saw, then you met with Mr. Melvyn Wolff for two hours and struck a deal. And you wrote you had no need to check leases, work out employment contracts, et cetera.

WARREN BUFFETT: Right.

AUDIENCE MEMBER: I think that most companies, when they do acquisitions, would feel the need to do a significant amount of legal due diligence, to do things like check the leases, check into things like undisclosed environmental liability, or perhaps threatened litigation.

And I guess my question is, have you ever been burned by your approach?

WARREN BUFFETT: We've been burned by the — we've been burned only in the sense that we've made mistakes on judging the future economics of the business, which would've had nothing to do with due diligence.

We regard what people normally refer to "due diligence" as, as really sort of boilerplate in most cases.

It's a process that big companies go through. And they feel they have to go through it. And they're ignoring — oftentimes, in our view — they're ignoring what really counts, which is evaluating the people they're getting in with, and evaluating the economics of the business. That's 99 percent of the deal.

You know, you may run into an environmental liability problem, you know, one time in a hundred, or you may, you know, you may find a bad lease.

I asked Melvin about, you know, "Do you have any bad leases?" I mean, that's the easiest way to do it. And I could read them all and try and look for every clause or something, but it isn't going to — you know, that is not the problem.

We've made bad — lots of bad deals. We made a bad deal when we bought Hochschild Kohn, for example, the department store operation, back in 1966. But it had — fine people — but we were wrong on the economics of the business.

But the leases didn't make any difference. You know, that sort of thing just was not important. And I can't recall any time that what other people refer to as due diligence would've avoided a bad deal for us.

CHARLIE MUNGER: I can't either.

WARREN BUFFETT: No. That's 30-some years. And I —

The key thing — you just don't want to do — I go — I'm on various public company boards — I've been on 19 public company boards — and you know, their idea of the due diligence is to send the lawyers out and have a bunch of investment bankers come in and make presentations and all that.

And I regard that as terribly diversionary, because the board sits there, you know, entranced by all of that, and everybody reporting how wonderful this thing is and how they checked out patents and all that sort of thing. And nobody is focusing really on where the business is going to be in five or 10 years.

You know, business judgment about economics — and people to some extent — but the business economics — that is 99 percent of deal making. And the rest, people may do it for their protection. I think too often they do it as a crutch just to go through with the deal that they want to go through with anyway, and of course all the professionals know that. So believe me, they come back with the diligence, whether due or not. And — (Laughter)

We are not big fans of that. I don't know how many deals we've made over the years, but I cannot think of anything that traditional due diligence has had a thing to do with.

CHARLIE MUNGER: No, we've had surprises on the favorable side a couple of times —

WARREN BUFFETT: That is true. That is true.

The kind of people that we've generally dealt with have usually told us the bad things first and good things after we made the deal.

We made a deal with a fellow over in Rockford in 1969, Eugene Abegg, Illinois National Bank and Trust Company. I made that deal in a couple of hours and, I mean, there just wasn't any way that Gene was going to be hiding anything bad.

For the next ten years when I went over there, every time I'd go to lunch he'd point out some building in town that we owned that wasn't on the books, or some foundation we had that had money in it he hadn't told me about.

And he even gave me some bills, one of which I carry in my pocket, that he had still sitting around that were issued by the bank that were our own money which he never told me about.

We could cut them out like paper dolls. I mean, Gene was not a guy to show all his cards. (Laughter)

And those are the kind of people we've generally dealt with, and I would certainly say that Melvyn and [his sister] Shirley [Toomin] fit that description in spades.

Morning Session - 1999 Meeting

1. Formal business meeting begins

WARREN BUFFETT: Good morning. Really delighted we can have this many people come out for a meeting. It says something, I think, about the way you regard yourself as owners.

We're going to hustle through the business meeting. And then Charlie and I will be here for six hours or until our candy runs out — (laughter) — to answer any questions you have. We have people in a number of remote locations. And we have ways of bringing them into the questions as well.

Incidentally, if you hadn't figured it out already, this hyperkinetic bundle of energy here on my left is Charlie Munger — (laughter) — our vice-chairman. (Applause)

And we will now run through the business of the meeting.

The meeting will now come to order. I'm Warren Buffett, chairman of the board of directors of the company. I welcome you to this 1999 annual meeting of shareholders.

I will first introduce the Berkshire Hathaway directors that are present, in addition to myself. And if you'll stand up. It's a little hard for me to see — there, right down here in the front row.

We have Susan T. Buffett. You stand and remain standing, please. (Applause)

If you encourage her, she'll sing another song. (Laughter)

Howard G. Buffett. Don't encourage him to sing a song. (Laughter and applause)

Malcolm G. Chace. (Applause)

Charlie, you've already met.

Ronald L. Olson. Ron? (Applause)

And Walter Scott Jr. (Applause)

Also with us today are partners in the firm of Deloitte and Touche, our auditors. They're available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings. Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg. Proxy cards have been returned through last Friday, representing 1,133,684 Class A Berkshire shares and 3,485,885 Class B Berkshire shares to be voted by the proxy holders, as indicated on the cards.

That number of shares represents a quorum. And we will therefore directly proceed with the meeting. We will conduct the business of the meeting and then adjourn the formal meeting. After that, we will entertain questions that you might have.

Does the secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting, that was sent by first-class mail to all shareholders of record on March 5, 1999, being the record date of this meeting, there were 1,343,592 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting.

And 5,266,338 shares of Class B Berkshire Hathaway common stock outstanding with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 1,133,684 Class A shares and 3,485,885 Class B shares are represented at this meeting by proxies returned through last Friday.

WARREN BUFFETT: Oh, thank you Forrest.

The one item of business of this meeting is to elect directors. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholder that is present has not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you. Would those persons desiring ballots please identify themselves, so that we may distribute them.

2. General Re CEO Ron Ferguson declined to join board

WARREN BUFFETT: I'd like to make one comment before we proceed to the election of directors. And that's that in the General Re proxy material, material relating to the General Re merger, it was stated that the intention was to have Ron Ferguson, the CEO of General Re, join the board of Berkshire Hathaway.

And that offer was extended, and still remains open, and will remain open for his lifetime and mine, at least, for Ron to join the board.

After thinking about it, he decided that he preferred not to be on the board. And in that judgment, he concurs with my feelings, generally, about boards, in that they can restrict your — it can restrict your activities in purchase and sale of a stock.

For example, if you do it in a six-month period, then you're automatically in trouble with the — and you have to return any profit, as calculated in a rather peculiar way, to the company. It means that your compensation system is laid out for the world to see.

There may be some tax restrictions, in terms of the deductibility of salary paid. And so, Ron notified me a little bit before the proxy material went out that he preferred, at least, to defer any decision on joining the board.

3. Disadvantages of being a corporate director

WARREN BUFFETT: I can tell you that it has cost Berkshire significant money by the fact that Charlie and I have been on various boards, because your hands are tied, in many respects, even if you don't have any knowledge of anything that might be of material, plus or minus — the very fact that it might be imputed to you, can restrict actions significantly.

So, we make a point of not trying to be on very many boards. Charlie and I have only gone on boards where we have very significant investments by Berkshire.

And sometimes those have caused us to take on a job that we didn't intend originally, as that Salomon movie showed.

So, Ron — the offer is a hundred percent open to Ron at any time. And if he changes his mind in any way, he will be on the board.

But that explains the discrepancy between the actions that are being taken this morning and what was described as likely to happen in the proxy material.

4. Berkshire directors elected

WARREN BUFFETT: Now, with that explanation, I would like to recognize Walter Scott Jr. to place a motion before the meeting with respect to election of directors. Walter?

WALTER SCOTT JR.: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. be elected as directors.

WARREN BUFFETT: Is there a second? Somebody should second it.

VOICE: I second the —

WARREN BUFFETT: We got a second out there, Susan?

VOICE: I second the motion.

WARREN BUFFETT: Oh, good. OK. It has been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. be elected as directors.

Are there any other nominations?

Long enough. Is there any discussion?

Long enough. The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of election.

Will the proxy holders please also submit to the inspector of election, a ballot on the election of directors, voting the proxies in accordance with the instructions they have received?

Miss Amick, when you are ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders, in response to proxies that were received through last Friday, cast not less than 1,145,271 votes for each nominee.

That number far exceeds the majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as those cast in person at this meeting, if any, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. have been elected as directors.

5. Formal business meeting adjourns

WARREN BUFFETT: After adjournment of the business meeting, I will respond to questions that you may have that relate to the business of Berkshire, but do not call for any action at this meeting.

Does anyone have any further business to come before this meeting before we adjourn?

If not, I recognize Mr. Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT JR.: I move that this meeting be adjourned.

WARREN BUFFETT: Is there a second?

VOICES: I second the motion.

WARREN BUFFETT: A motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say "aye."

AUDIENCE: Aye.

WARREN BUFFETT: All opposed say, "I'm leaving." No, say, "No," I'm sorry. (Laughter)

OK, the meeting is adjourned.

6. We buy businesses and don't predict stock moves

WARREN BUFFETT: Now, we'll move forward. (Applause) Thank you.

I ask you, was Joe Stalin ever any better, I mean? (Laughter)

We will — we have this room broken into eight zones, and then we have five more zones from various off-site locations. And we will move in order. We have microphones that you can go to, and we have a monitor at each microphone that will line people up.

We will rotate around the 13 zones. There's just one question per person. I'd ask that you identify yourself and state where you're from.

Now, you have to be a little careful on that because a lot of people will say that — who really aren't — will say that they're from Nebraska for status reasons. But — (laughter) — if you get beyond that, we will try to identify where everybody is from. And we'll start off in zone 1, which is on the right here at the front.

AUDIENCE MEMBER: My name is Tim Spear (PH). And I'm from Hertfordshire, England.

I was thinking in Ben Graham's book, "The Intelligent Investor," he spends the first couple of chapters discussing the level of the market and whether it was safe for investment. I was wondering what you think of the market today?

WARREN BUFFETT: Well, we don't — Charlie and I don't think about the market. And Ben didn't very much. I think he made a mistake to occasionally try and place a value on it.

We look at individual businesses. And we don't think of stocks as little items that wiggle around on the paper and that have charts attached to them. We think of them as parts of businesses.

And it is true that, currently, we have great trouble finding businesses that we both like and where we like the management and that they — and find them at an attractive price.

So, we do not find bargains in this market among the larger companies that are our universe.

That is not a stock market forecast in any way, shape, or form. We have no idea whether the market is going to go up today, or next week, or next month, or next year.

We do know that we will only buy things that we think make sense, in terms of the value that we receive for Berkshire. And when we can't find things, the money piles up. And when we find — when we do find things, we pile in.

But the stock market — I know of no one that has been successful at — and really made a lot of money predicting the actions of the market itself. I know a lot of people who have done well picking businesses and buying them at sensible prices. And that's what we're hoping to do.

Charlie?

CHARLIE MUNGER: How could you say it any better? (Laughter)

WARREN BUFFETT: Yeah, but the question is whether you can say it better, Charlie. (Laughter)

7. Expecting slow short-term growth of Gen Re's float

WARREN BUFFETT: OK, we'll go to zone 2. That may be all you hear from him today. (Laughter)

Get used to it.

AUDIENCE MEMBER: Good morning.

WARREN BUFFETT: Morning.

AUDIENCE MEMBER: David Winters, Mountain Lakes, New Jersey.

Could you give us a few hints about the incremental value of Gen Re's float under the Berkshire Hathaway umbrella and the potential for the growth of Gen Re's float over the long term?

WARREN BUFFETT: Yeah. Gen Re's float, which is now available to Berkshire — it's a hundred percent-owned subsidiary, although part of that float is attributable to Cologne, which is only an 83 percent-owned subsidiary of Gen Re and also Berkshire.

But that, I would say, the incremental value today, because it's under the Berkshire umbrella, is zero. Because we are bringing nothing to the party that Gen Re's own investment people would not have brought to the party.

We obviously think that there will be important incremental value over a long period of time. We — but when that value will appear or how much of it develops, is a matter that's out of our hands.

We, right now, have close to 24 billion in total invested assets at Gen Re and Cologne. Like I say, 83 percent of the Cologne part is ours and 17 percent is — belongs to somebody else.

But we are bringing nothing to that party right now, in terms of any managerial skill that is going to add value. I would hope that over time, we would.

The second question, as to the growth of float, the growth of float at General Re and Cologne will certainly be very slow in the short term. The growth of float at GEICO will be significant, percentage-wise.

The reinsurance business does not have the same potential for growth as we have at GEICO. And growth is much slower to come about, because there are longer-term contractual commitments — that people are reluctant to change reinsurers. And they should be. We agree with that.

So you — at a level of 6 billion or so of premium volume and already 14 billion of float, you won't have growth of float unless premium volume is — becomes significantly higher in the future.

I think that will happen over time. It will not happen in the short term.

Charlie? If I may interrupt your breakfast? (Laughter)

CHARLIE MUNGER: I've got nothing to add.

WARREN BUFFETT: OK. (Laughter)

8. How Berkshire's enormous bid for Long-Term Capital Management failed

WARREN BUFFETT: Zone 3. (Laughs)

You could always direct your questions to Charlie, incidentally. (Laughs)

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. Thank you for hosting another wonderful weekend. My name is Che Wai Woo (PH). I'm a proud shareholder from right here in Omaha.

One of the most interesting financial news developments this previous year was the near collapse of the hedge fund Long-Term Capital.

I'd like to get your thoughts and Mr. Munger's thoughts about how these private partnerships operate, what your thoughts about the Long-Term Capital deal, and also the Fed's intervention to save it.

WARREN BUFFETT: Yeah, in that movie you saw, the time when Yellowstone was — when Old Faithful was performing in the background and Bill was trying to get me to watch that while I was on the phone —

A lot of that trip was spent talking to New York about making a bid for, what we'll call LTCM, Long-Term Capital Management.

And the caption on that photo, incidentally, is known as the geezer and the geyser. (Laughter)

And we were up in — we started in Alaska. And we were going down these canyons in a boat.

And the captain saying, you know, "Let's go over there and look at the sea lions." And I say, "Let's stay right where we are, where we got a satellite channel," because I was trying to talk on the phone all the time.

Charlie was in Hawaii. And we never did get a chance to talk during that whole period. I didn't want to bother him with a little thing like a bid for 100 billion-plus of securities, and I couldn't find him.

So it was — we were in an awkward place to pursue that. I think it's possible that if I'd been in New York or Charlie had been in New York during that period, that our bid might have been accepted.

There was just a report published within the last three or four days by a special committee representing the SEC, the Fed, I think, the Treasury and the CFTC — I think I'm right on those four. And it describes just a tiny bit of the events leading to the bid.

It referred, on page 14, I remember, it talked about our transaction unraveling. It didn't unravel from our side. I mean, we made a firm bid for 100 billion-plus of balance sheet assets and many hundreds of billions, in fact, over a trillion, of derivative contracts.

And, you know, this was in a market where prices were moving around very dramatically. And with that bulk of assets there, we thought we made a fairly good bid for a 45-minute or hour period. I don't think anybody else would've made the bid.

But in any event, the people at LTCM took the position that they could not accept that bid.

And therefore, the New York Fed in — had a group, largely investment banks there at the Fed. And that afternoon, faced with the prospect that LTCM could not or would not accept our bid, they arranged another takeover arrangement where additional money was put in.

9. The true first hedge fund

WARREN BUFFETT: It's interesting. If you read that report, which is put together by these four very imminent bodies, I think on the first page, it says that the first so-called hedge fund — which is a term generally applied to entities like LTCM — first hedge fund was set up in 1949.

And I probably read that or heard that 50 times in the last — particularly in the last year. And of course, that's not true at all, and I've even pointed this out once or twice before.

But Ben Graham had — and Jerry Newman — had a classical hedge fund back in the '20s. And I worked for — I worked dually for a company called Graham-Newman Corp, which was a regulated investment company and Newman and Graham, which was an investment partnership with, I think, a 20 percent participation in profits and exactly the sort of entity that, today, is called a hedge fund.

So, if you read anyplace that the hedge fund concept originated in 1949, presumably with A.W. Jones, it's a — it's not an accurate history. There are now — I ran something that would generally be called a hedge fund. I didn't like to think of it that way. I called it an investment partnership. But it would've been termed a hedge fund. Charlie ran one from about, what, 1963 to mid '70s or thereabouts.

And they have proliferated in a big way. Did he blink? (Laughter)

There are now hundreds of them. And of course, it's very enticing to any money manager to run, because if you do well, or even if you don't do so well but the market does well, you can make a lot of money running one.

This report that just came out has really nothing particularly harsh to say about the operation.

So, I think you will see hundreds and hundreds and hundreds of hedge funds. I think the current issue of Barron's may have a recap of how a large group did in the first quarter.

And there's a lot of money in those funds. And there's a huge incentive to form them. And there's a huge incentive to go out and attract more money if you run one. And when that condition exists in Wall Street, you can be sure that they won't wither away.

Charlie?

10. LTCM: Smart people's dumb risks with derivatives

CHARLIE MUNGER: Yeah, what was interesting about that one is how talented the people were. And yet, they got in so much trouble. I think it also demonstrates that — I'd say, the general system of finance in America involving derivatives is irresponsible.

There's way too much risk in all these trillions of notational value sloshing around the world. There's no clearing system, as there is in a commodities market. And I don't think it's the last convulsion we're going to see in the derivatives game.

WARREN BUFFETT: It's fascinating, in that you had 16 extremely bright — I mean, extremely bright — people at the top of that. The average IQ would probably be as high or higher than organization you could find, among their top 16 people.

They individually had decades of experience and collectively had centuries of experience in operating in these sort of securities in which the LTCM was invested. And they had a huge amount of money of their own, up. And probably a very high percentage of their net worth in almost every case, up.

So here you had superbright, extremely experienced people operating with their own money. And, in effect, on that day in September, they were broke. And to me, that is absolutely fascinating.

There was book written,"You Only Have to Get Rich Once." It's a great title. It's not a very good book. Walter Gutman wrote it, but it — many years ago. But the title is right, you only have to get rich once.

And why do people, very bright people, risk losing something that's very important to them, to gain something that's totally unimportant? The added money has no utility whatsoever.

And the money that was lost had enormous utility. And on top of that, reputation is tarnished and all of that sort of thing.

So that the gain/loss ratio, in any real sense, is just incredible. I mean, it's like playing Russian roulette.

I mean, if you hand me a revolver with six bullets — or six chambers — and one bullet and you say, “Pull it once for a million dollars,” and I say, “No.” And then you say, “What is your price?” The answer is there is no price.

And there shouldn’t be any price on taking the risk when you’re already rich, particularly, of failure and embarrassment and all of that sort of thing. But people repeatedly do it. And they do it —

Whenever a bright person, a really bright person, goes broke that has a lot of money, it’s because of leverage. It — you simply — you basically can’t — it would be almost impossible to go broke without borrowed money being in the equation.

And as you know, at Berkshire, we’ve never used any real amount of borrowed money. Now, if we’d used somewhat more, you know, we’d be really rich. But if we’d used a whole lot more, we might have gotten in trouble some times. And there’s just no upside to it, you know?

What’s two percentage points more, you know, on a given year, that year? And run the risk of real failure. But very bright people do it, and they do it consistently, and they will continue to do it.

And as long as explosive-type instruments are out there, they will gravitate toward them. And particularly, people will gravitate toward them who have very little to lose, but who are operating with other people’s money.

One of the things, for example, in the LTCM case — and Charlie mentioned it in terms of derivatives — in effect, there were ways found to get around the — and they were legal, obviously — to get around the margin requirements.

Because risk arbitrage is a business that Charlie and I have been in for 40 years in one form or another. And normally, that means putting up the money to buy the stock on the long side and then shorting something against it where you expect a merger or something to happen.

But through derivatives, people have found out how to do that, essentially putting up no money, just by writing a derivative contract on both sides. And there are margin requirements, as you know, that the Fed promulgates that, I believe, still call for 50 percent equity on stock purchases.

But those requirements do not apply if you arrange the transaction in derivative form. So that these billions of dollars of positions in equities, essentially, were being financed a hundred percent by the people who wrote the derivative contracts. And that leads to trouble.

You know, 99 percent of the time it works. But, you know, 83 and a thirds percent of the time, it works to play Russian roulette with one bullet in there and six chambers. But neither 83 1/3 percent or 99 percent is good enough when there is no gain to offset the risk of loss.

Charlie?

CHARLIE MUNGER: I would argue that there is a second factor that makes the situation dangerous. And that is that the accounting for being actively engaged in derivatives, interest rate swaps, et cetera is very weak. I think the Morgan Bank was the last holdout.

And they finally flipped to a lenient standard of accounting that's favored by people who are sharing in the profits from trading derivatives. And that's why they like liberal accounting.

So, you get an irresponsible clearing system, irresponsible accounting — this is not a good combination.

WARREN BUFFETT: JP Morgan shifted their accounting — I think — I'm not sure exactly when — around 1990. But Charlie and I, we probably became more familiar with that when we were back at Salomon.

And this is absolutely standard. You know, it's GAAP accounting. But it front-ends profits. And if you front-end profits and you pay people a percentage of the profits, you're going to get some very interesting results, sometimes.

11. "Right approach" to estimating Berkshire's intrinsic value

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Hi. Dan Kurs (PH) from Bonita Springs, Florida.

You've given many clues to investors to help them calculate Berkshire's intrinsic value.

I've attempted to calculate the intrinsic value of Berkshire using the discount of present value of its total look-through earnings. I've taken Berkshire's total look-through earnings and adjusted them for normalized earnings at GEICO, the super-cat business, and General Re.

Then I've assumed that Berkshire's total look-through earnings will grow at 15 percent per annum on average for 10 years, 10 years per annum for years 11 through 20. And that earnings stop growing after year 20, resulting in a coupon equaling year 20 earnings from the 21st year onward.

Lastly, I've discounted those estimated earnings stream at 10 percent to get an estimate of Berkshire's intrinsic value.

My question is, is this a sound method? Is there a risk-free interest rate, such as a 30-year Treasury, which might be the more appropriate rate to use here, given the predictable nature of your consolidated income stream? Thank you.

WARREN BUFFETT: Well, that is a very good question. Because that is the sort of way we think in terms of looking at other businesses.

Investment is the process of putting out money today to get more money back at some point in the future. And the question is, how far in the future, how much money, and what is the appropriate discount rate to take it back to the present day and determine how much you pay?

And I would say you've stated the approach — I couldn't state it better myself. The exact figures you want to use, whether you want to use 15 percent gains in earnings or 10 percent gains in the second decade, I would — you know, I have no comment on those particular numbers.

But you have the right approach. We would probably, in terms — we would probably use a lower discount factor in evaluating any business now, under present-day interest rates.

Now, that doesn't mean we would pay that figure once we use that discount number. But we would use that to establish comparability across investment alternatives.

So, if we were looking at 50 companies and making the sort of calculation that you just talked about, we would use a — we would probably use the long-term government rate to discount it back.

But we wouldn't pay that number after we discounted it back. We would look for appropriate discounts from that figure.

But it doesn't really make any difference whether you use a higher figure and then look across them or use our figure and look for the biggest discount.

You've got the right approach. And then all you have to do is stick in the right numbers.

And you mentioned, in terms of our clues, we try to give you all of information that we would find useful, ourselves, in evaluating Berkshire's intrinsic value.

In our reports, you know, I can't think of anything we leave out that, if Charlie and I had been away for a year and we were trying to figure out — look at the situation fresh, evaluate things — there's, you know, there's nothing, in my view, left out of our published materials.

Now, one important element in Berkshire, which is a secondary factor that gets into what you're talking about there, is that because we retain all earnings and because we have a growth of float over time, we have a considerable amount of money to invest.

And it really is the success with which we invest those retained earnings and growth and float that will have an important fact — that will be an important factor — in how fast our intrinsic value grows.

And to an important extent, the — what happens there is out of our control. I mean, it does depend on the markets in which we operate.

So, if our earnings, plus float, growth equals $3 billion, or something like that, in a current year — whether that $3 billion gets put to terrific use, satisfactory use, or no use at all, virtually, really depends, to a big extent, on external factors.

It also depends, to some extent, on our energy and insights and so on. But the external world makes a big difference in the reinvestment rate. And, you know, your guess is as good as ours on that.

But if we run into favorable external circumstances, your calculation of intrinsic value should — would — result in a higher number than if we run into the kind of circumstances that we've had the last 12 months.

Charlie?

CHARLIE MUNGER: Yeah. For many decades around here, we've had roughly a hundred percent — more than a hundred percent — of book net worth in marketable securities and had a lot of wonderful wholly-owned subsidiaries, to boot.

And then we've always had a very attractive place to put new money in as we generate it.

Well, we still got the wonderful businesses. But we're having trouble with the new money.

But it's not trouble, really, to have a pile of lovely money. (Laughter) This is not — I don't think there should be tears in the house. (Laughter)

WARREN BUFFETT: Have you ever run into any unlovely money, Charlie? (Laughter)

12. Internet will have a huge impact, but hard to predict winners

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Good morning. My name is Ronald Towell (PH). I'm from Brooklyn, New York, and very appreciative of your graciousness as a host for this wonderful weekend.

My question has to do with the — (Applause)

My question has to do with the retailing industry, particularly the department stores and mass merchants. My question has two parts.

Without resorting to comments about specific companies, may I ask your opinion as to the long-term prospects for growth and profitability of this industry group?

The second part of my question is, given the fact that it is difficult to pick up a newspaper or to be an investor without being bombarded by what is purported to be the potential for exponential growth in the internet e-business, particularly directly to consumers, which could possibly eat into the revenues of these retailers —

And even if we assume a relatively low impact of, say, 5 to 10 percent revenue reductions, and given the fact that top-line growth is critical to any business, especially the bricks and mortar retailers, with their high proportions of fixed overhead, what advice could you give to a CEO of such a company?

And in turn, based on the proceeding scenario, what would be your opinion of the medium and long-term prospects for this industry?

WARREN BUFFETT: Well, that's a good question, too.

And obviously, the internet is going to have an important impact on retailing. It will have a huge impact on some forms of retailing. Change them and maybe revolutionize them.

I think there's some other areas where it'll — the impact will be less. But anytime we buy into a business, and anytime that we've bought in for some time, we have tried to think of what that business is going to look like in five, or 10, or 15 years.

And we recognize that the internet, in many forms of retailing, is likely to pose such a threat that we simply wouldn't want to get into the business. I mean, it — not that we can measure it perfectly.

But there are a number of retailing operations that we think are threatened. And we do not think that's the case in furniture retailing. And we have three very important operations there.

We could be wrong. But so far, that, you know, that would be my judgment, that furniture retailing will not be hurt.

You've seen other forms of retailing where you're already starting to see some inroads being made. But it's just started. The internet is going to be a huge force in many arenas. But it'll certainly be a huge force in retailing.

Now, it may benefit us in certain areas. I would expect the internet to benefit Borsheims in a very big way. And you noticed in the movie that we talked about borsheims.com coming online in May. There's something up there now. But you'll see a new format within a month or so.

Now, you might say in jewelry retailing, you know, with millions of things that you can click onto, 10 years from now, you know, who is going to be important in terms of online retailing of jewelry? I would argue that two firms have an enormous advantage going in.

I would argue that Tiffany has such an advantage. We don't own any Tiffany. But I would say that because of their name — brand names are going to mean very, very much when you have literally, you know, thousands and thousands of choices.

People can't — they have to trust somebody. And I think that Tiffany has a name that people would trust.

And I think Borsheims has a name that people would trust. And Borsheims sells jewelry a whole lot cheaper than Tiffany's.

So I would say that people who are price conscious, but also want to deal with a jeweler that they trust implicitly, will find their way to Borsheims in increasing numbers, over the internet.

And I would say that people that like the blue box, you know, are going to find their way to Tiffany's, over time. And they'll pay more money.

But I don't see them going for Brand X and buying fine jewelry over the internet.

So, I think that, with the brand that Borsheims has, and with careful nurturing of that brand, I would say that the internet offers Borsheims a chance to have the advantage in cost that comes from a huge one store location. And yet, also go into the homes of people in every part of the world. And that kind of a company should prosper.

There are other of our companies, I worry about. You know, I can worry about them being hurt in various ways.

GEICO is going to be a big beneficiary of the internet. We already are developing substantial business through it.

But I — if I were to buy into any retailing business, whether I was buying a stock of it or buying a whole business, I would think very hard about what people are going to be trying to do to that business through the internet.

And you know, it affects real estate that is dedicated to retailing. If you substitute 5 percent of the retail volume via the internet, where real estate is essentially free, you know, you can have a store in every town in the world through the internet without having any rental expense.

So, I would be — I would give a lot of thought to that if I were owning a lot of retail rental space.

Charlie?

CHARLIE MUNGER: Well, I think it is tricky predicting the technological change. Either it will or won't destroy some business.

When I was young, the department stores had a bunch of, sort of, monopolistic advantages. A, they were downtown where the streetcar lines met. B, they had sort of a monopoly on extending revolving credit. And D, they had one-stop shopping in all kinds of weather. And nobody else did. And they lost all three of those advantages.

And yet, they've done well, a lot of them, for many decades since. At other times, you get a change and you just get destroyed.

Our trading stamp business was destroyed by changes in the economic world. And our World Book business has been seriously hurt by the personal computer, and the CD-ROM, and so forth.

WARREN BUFFETT: I —

CHARLIE MUNGER: We agree, it's a big risk. But it's not easy to make predictions in which you have great confidence.

WARREN BUFFETT: Yeah, if you go down to 16th and Farnam, where the streetcar tracks used to cross, that was the best real estate in town. And people signed 100-year, 50-year leases on it. And it looked like there was nothing more safe, because they weren't going to move the streetcar lines.

The only thing was that they moved the streetcars. They just took and converted them into junk. And it seemed very permanent.

The advantage of the big department store, the Marshall Field in Chicago or the Macy's in New York, was this incredible breadth of merchandise. You could go and you could find 300 different types of spools of thread, or 500 — you could see 500 different wedding dresses, or whatever.

And you had these million square-foot, and even two million square-foot, downtown stores. And they were these huge emporiums.

And then the shopping center came along. And of course, the shopping center created, in effect, a store of many stores. And so, you had millions of square feet now, but you still had this incredible variety being offered.

The internet becomes a store in your, you know, computer, and it has an incredible variety of offerings, too.

Some of them don't lend themselves very well, it seems to me, to the retailing. And, you know, and others do.

But Charlie's right. It's hard to predict exactly how it will turn out.

I would expect, you know, automobile retailing to change in some important ways. And in part — in very significant part, influenced by the internet.

But, I wouldn't — you know, I can't predict exactly how that'll happen. But I don't think it'll look the same 10 or 15 years from now.

13. Buffett praises analyst Alice Schroeder

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Ben Knoll, and I'm from Minneapolis. Although I'd like to enhance my status by noting that I was born and raised in Lincoln. (Laughter)

WARREN BUFFETT: You just moved up. (Laughter)

AUDIENCE MEMBER: Like, many others, I read Alice Schroeder's analysis of Berkshire Hathaway with great interest this last year. And she described her analysis as a toolkit for investors.

And I'm wondering if you see any substantial flaws in any of her toolkit. And in particular, the float-based valuation model that she put together. What are your views on that?

WARREN BUFFETT: Well, I don't want to comment on valuation.

But I can tell you that Alice is a first-class and serious analyst who spent a lot of time on Berkshire, and probably produced the first comprehensive report, at least that's been widely circulated, in the history of Berkshire.

It's kind of interesting that we got to a hundred billion dollars of market value before anybody really published a report about the company, but —

Alice understands the insurance business very well. She's an accountant, by background. So, she understands numbers. And she did a lot of work on the report. And I do recommend it to you as a toolkit. I make no comment at all about valuation.

Charlie?

CHARLIE MUNGER: Nothing to add.

14. Different compensation plans with the same goal

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Hello. I'm Martin Wiegand from Chevy Chase, Maryland. I want to thank you for the hospitality this weekend and the wisdom you share with us each year in your annual reports.

As a small businessman, one of trickiest jobs I have is dividing up the profits of our business between the employees who generate them.

Would you comment and share your thoughts on how you divide up the profits of the Berkshire Hathaway subsidiaries with the employees who generate them.

And the follow-up is, Mr. Munger, do you have any suggested reading on that subject?

WARREN BUFFETT: Yeah, we're glad to have you here, Martin. I went to high school and to the first couple years of college with Martin's father, who's also here today. And so, if you get a chance to meet Marty, Janie, and younger Martin, say hello to them.

In terms of the arrangements we have with compensation, they vary to an extraordinary degree among the various subsidiaries we have.

Because we have bought existing businesses. And we have tampered as little as possible with their cultures after we buy them. And some of those cultures are very different than others.

I mean, you know, you saw [Nebraska Furniture Mart's] Mrs. B earlier. You know, as you can imagine, she would leave a very strong imprint on any business with which she was involved.

And we have a number of very talented managers who have worked out the systems that they believe to be best for their companies.

Now, it is true that if we — if there's a stock option plan at a company, we will substitute a plan that is performance-based, which ties much more clearly to the performance of the business than any option plan could.

And we will have a — we will design one that has an expectable cost that's equal to the expectable cost of the option plan. So, we try to equate the cost.

And we try to make it even more — much more sensible from both the owner's standpoint and the employees' standpoint, in terms of the way it pays off based on how that business performs.

You probably read in our annual report how we put an across the board plan at GEICO that ties with our objectives. But basically, that was [CEO] Tony Nicely's work in terms of developing that plan.

I mean, he and I thought alike about what counted. And he developed a compensation grid that applied to everybody in the whole place, based on achieving the objectives that he felt were important and that we felt were important.

You will find — if you go to any Berkshire subsidiary — you will probably find that they have a compensation plan that's quite similar, with exception of options, to the plan that they had before we bought the operation. They have successful businesses.

And people get there different ways. Some people bat left-handed. Some people bat right-handed. You know, some people stand deep in the batter's box. Some crowd the plate. They all have different styles.

And the styles of our managers have proven successful in their own businesses. We keep the same managers. So, we don't try to superimpose any system from above, with the exception of what I've mentioned.

We do like the idea of paying for performance. I mean, that is kind of a fundamental tenant. Everybody says they like that. But then they design systems that payoff no matter what happens, in many cases. And we've been reluctant to do that.

Charlie?

CHARLIE MUNGER: Yeah, I think it's important for the shareholders to realize that we are probably more decentralized, in terms of personnel practices, than any company of our size, or bigger, in America. We don't have a headquarters culture that's forced on the operating businesses.

The operating businesses have their own cultures. And I think in every case I can think of, it's a wonderful culture. And we just leave them alone. It's — comes naturally to me. (Laughter)

WARREN BUFFETT: Charlie says we don't have a headquarters culture. Sometimes people think we don't have a headquarters. (Laughter)

We have no human relations department at Berkshire. We have no legal department. We have no investor relations. We have no public relations. We don't have any of that sort of thing.

We've got a bunch of all-stars, as we've put on the screen, out there running businesses. We ask them to mail the money to Omaha, but — (Laughter)

We'll even give them a stamp if they request it. (Laughter)

But beyond that, we don't really go. It would be foolish.

And what is interesting to me is how — I had a lot of preconceived ideas of what motivates people when I started out in business — but you can find certain organizations that resist paying stars on an individual basis. They like to think of themselves as a team and they'd rather have a team concept of payment.

And you can see others where they're much more individually oriented. Actually, Charlie can probably tell you that in terms of law firms. I mean, some law firms have a culture that is much more star-oriented than others. And, you know, you've seen successes in both places, haven't you, Charlie?

CHARLIE MUNGER: Absolutely.

WARREN BUFFETT: OK. (Laughter)

CHARLIE MUNGER: I can't remember a case when anybody has transferred from one operating Berkshire subsidiary to another. It's very rare.

WARREN BUFFETT: Yeah, we don't try and cross-fertilize. We just — we think we've got a good thing going in, you know, in every plot of ground and we just assume they'll do best if left to their own initiative.

15. Low-cost float generates money for investing

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: I'm Brian Phillips (PH) from Chickamauga, Georgia.

And my question is, with regards to an insurance company, if you can use the float for cheap financing, why would you issue a fairly-priced bond?

WARREN BUFFETT: Why would we do what?

AUDIENCE MEMBER: Issue a fairly-priced bond.

WARREN BUFFETT: Yeah, well, the best form of financing for us is cheap float. Now, most insurance companies don't generate cheap float. So, I mean, there are plenty of companies in the insurance business who have a cost of float that makes it unattractive, actually, to expand their businesses.

Our insurance companies have had a terrific experience on cost of float. And we would develop it just as fast as we can.

Right now, we would have no interest in issuing a bond because we have more money around than we know what to do with. And it comes from low-cost float.

But if there came a time when things were very attractive and we had utilized all the money from our float and from retained earnings and all of that to invest, and we still saw opportunities, we might very well borrow moderate amounts of money in the market.

It would cost us more than our float was costing us. But it still, incrementally, would provide earnings.

Now, we would try to gain more float under those circumstances as well. But we would not just quit when we ran out of money from float. We would go ahead and borrow moderate amounts of money. We would never borrow huge amounts of money, though.

Charlie?

CHARLIE MUNGER: Well, I agree.

WARREN BUFFETT: OK. You can see why we've been partners a long time. (Laughter)

16. Big returns are easier with small amounts of money

WARREN BUFFETT: Now, we go to some off — some sites away from this main hall. And not sure how exactly we're going to do this. But we'll go to zone 9 and see if zone 9 comes in.

AUDIENCE MEMBER: Hello. My name is Howard Love. I'm from San Francisco. Thank you very much for this weekend in general and this meeting in particular.

Recently, at a talk at the Wharton Business School, Mr. Buffett, you indicated that — you were talking about the problems of compounding large size, which I appreciate and understand.

But you indicated — you're quoted in the local paper as saying that you are confident that if you were working with a sum closer to a million dollars, that you could compound that at a 50 percent rate.

For those of us who aren't saddled with the $100 billion problem — (laughter) — could you talk about what types of investments you'd be looking at and where in today's market you think significant inefficiencies exist? Thank you.

WARREN BUFFETT: Yeah. I think I may have been very slightly misquoted. But I certainly said something to the effect that working —

I think I talked about this group I get together every two years and how I poll that group as to what they think they can compound money at with a hundred thousand, a million, a hundred million, a billion, and other types of sums.

And I pointed out how this group of 60 or so people that I get together with every couple years — how their expectations of return would go very rapidly down this slope.

It is true. I think I can name a half a dozen people that I think could compound a million dollars — or at least they could earn 50 percent a year on a million dollars — have that as expectation, if they needed it.

I mean, they'd have to give their full attention to be working on the sum. And those people could not compound money, a hundred million or a billion, at anything remotely like that rate.

I mean, there are little tiny areas which, if you follow what I said on the screen there, on that Adam Smith's interview a few years ago.

If you start with A and you go through and you look at everything and you find small securities in your area of competence that you can understand the business, I think you — and occasionally find little arbitrage situations or little wrinkles here and there in the market —

I think, working with a very small sum, that there is an opportunity to earn very high returns. But that advantage disappears very rapidly as the money compounds. Because I, you know, from a million to 10 million, I would say it would fall off dramatically, in terms of the expectable rate.

Because there are little — you find very small things that, you know, you can make — you are almost certain to make high returns on. But you don't find very big things in that category today.

I'll leave to you the fun of finding them yourselves. Terrible to spoil the treasure hunt.

And the truth is, I don't look for them anymore. Every now and then, I'll stumble into something just by accident. But I'm not in the business of looking for them. I'm looking for things that Berkshire could put its money in, and that rules out all of that sort of thing.

Charlie?

CHARLIE MUNGER: Well, I would agree. But I would also say that what we did 40 or so years ago was, in some respects, more simple than what you're going to have to do.

WARREN BUFFETT: Right.

CHARLIE MUNGER: We had it very easy, compared to you. It can still be done. But it's harder now.

You have to know more. I mean, just sifting through the manuals until you find something that's selling at two times earnings, that won't work for you.

WARREN BUFFETT: It'll work. It's just you won't find any. (Laughter)

CHARLIE MUNGER: Yeah.

17. "Surprisingly high" return on equity

WARREN BUFFETT: Zone 10, please?

AUDIENCE MEMBER: My name is Jonathan Brandt. I'm from New York City.

Warren, you wrote in 1977 that the return on equity and growth of book value for corporate America tended towards, and averaged, about 13 percent, no matter the inflation environment.

After properly expensing options and so-called non-recurring charges and taking into account the high price-earnings ratio paid for increasingly frequent acquisitions, do you think that 13 percent figure is still roughly correct?

Also, what quantitative method would you suggest that investors use for expensing the option grants of publicly traded firms where there is no realistic prospect for the substitution of such an options program with a cash-based performance incentive plan?

In other words, how do you derive the five to 10 percent earnings dilution referred to in this year's Berkshire's annual report? And is it possible that the dilution figure could be even higher than that? Thank you.

WARREN BUFFETT: OK. Thanks, John. Just like Martin Wiegand, Jon Brandt is the son of a very good friend of mine, where we worked together for decades. And Jon is now an analyst with Ruane Cunniff and a very good one.

He also — he says it didn't happen this way. But when he was about four years old, I was at his house for dinner with the parents. And he suggested to me, after dinner, he said, "How about a game of chess?"

I looked at this four-year-old. I thought, you know, "This is the kind of guy —"

I said, "Should we play for money?" (Laughter)

And he said, "Name your stakes." So, I backed off, and — (laughter) — we sat down.

And after about 12 moves, I could see I was in mortal trouble. So, I suggested it was time for him to get to bed. (Laughter)

The question about return on equity, it's true. Back in 1977, I believe, I wrote an article for Fortune and talked about this, more or less, this figure of 12 or 13 percent that return on equity kept coming back to, and explained why I didn't think it was affected by inflation, which was a hot topic of the day very much.

And it wasn't. But in recent — in the last few years, earnings have been reported at very high figures on the S&P, although you've had these very substantial restructuring charges, which every management likes to tell you doesn't count.

I love that, when they, you know, they say, "Well, you know, we earned a dollar a share in total last year, but look at the two dollars a share that we tell you we really earned. The other dollar a share doesn't count." And then they throw in mistakes of the past or mistakes of the future. And every three or four years, ask you to forget this as if it doesn't mean anything.

We've never had a charge like that that we've set forth in Berkshire and we never will.

It isn't that we don't have things we do that cost us money in moving around. But we do not ask you to forget about those costs.

The report — even allowing for options costs and restructuring charge and everything, return on equity has been surprisingly — to me — surprisingly high in the last few years.

And there's a real question in a capitalistic society whether if long-term rates are 5 1/2 percent, whether return on equity can be, across the board, some number like 18 or 20 percent.

There're an awful lot of companies out there that are implicitly promising you, either by what they say their growth in earnings will be, or various other ways, that they're going to earn at these rates of 20 percent-plus. And, you know, I'm dubious about those claims. But we will see.

18. Corporations hooked on "corrupt" stock option accounting

WARREN BUFFETT: The question about how we charge for stock options is very simple. If we look at what a company issues in options over, say, a five-year period and divide by fives — because the grants are irregular — or whatever's — if there's some reason why that seems inappropriate, we might use something else.

But we try to figure out what the average option issuance is going to be. And then we say to ourselves, "How much could the company have received for those options if they'd sold them as warrants to the public?"

I mean, they can sell me options on any company in the world. I'll pay some price for an option on anything.

And we would look at what the fair market value of those options would be that day if they were transferable options. Now, they aren't transferable. But they also — employees sometimes get their options repriced downward, which you don't get if you have public options.

So, we say that the cost to the shareholder of issuing the options is about what could be received if they sold — turned those options into warrants — and sold them public or sold them as options.

And that's the cost. I mean, it's a compensation cost.

And just try going to a company that's had a lot of options grants every year and tell them you're going to quit giving the options and pay people the same amount of money. They'll say, "You took away part of my earnings."

And we say, if you've taken away part of the earnings, then let's show it in the income account and show it as a cost. Because it is a cost.

And I think, actually, a number of auditors agreed to that position many years ago. And they started receiving pressure from their clients who said, "Gee, you know, that might hurt our earnings if we reported that cost."

And the auditors caved. And they put pressure on Congress when it came up a few years ago. And I think it's a scandal. But it's happened.

We are going to — in evaluating a business, whether we're going to buy the entire business or whether we're going to buy part of it — we're going to figure out how much it's costing us to issue — and when the company issues those options every year.

And if they reprice them, we're going to figure how much that particular policy costs us. And that is coming out of our pocket as investors. And I think people are quite foolish if they ignore that.

I don't think it's going to change. It's too much in corporate America's interest to keep it out of the income account and keep issuing more and more options percentage-wise, and not have it hit the income account, and to reprice when stocks go down. But that doesn't make it right.

Charlie?

CHARLIE MUNGER: Yeah, I go so far as to say it's fundamentally wrong not to have rational, honest accounting in big American corporations.

And it's very important not to let little corruptions start, because they become big corruptions. And then you have vested interest that fight to perpetuate them.

Surely, there are a lot of wonderful companies that issue stock options. And that stock options go to a lot of wonderful employees that are really earning them. But all that said, the accounting in America is corrupt. And it is not a good idea to have corrupt accounting.

WARREN BUFFETT: You can see the problem of the creep in it, once it starts.

It's much like campaign finance reform. I mean, if you let it go for a long time, the system becomes so embedded and the participants become so dependent upon it, that there becomes a huge constituency that will fight like the very devil to prevent any change, regardless of the logic of the situation.

I mean, once you get a significant number of important players benefiting from any kind of corruption in any kind of system, you're going to have a terrible time changing it. That's why, you know, it should be changed early.

And it would've been easier to change the accounting for stock options some decades back when it was first proposed, than now. Because, you know, basically corporate America's hooked on it.

This does not mean that we are against options, per se. If Charlie and I die tonight and you had two new faces up here who didn't have the benefit of having bought a lot of Berkshire a long time ago, and they had responsibility for the whole enterprise, it would not be inappropriate to pay them in some way that was reflective of the prosperity of the whole enterprise.

I mean, they would — it would be crazy to pay the people at Dairy Queen in options of Berkshire Hathaway or pay the people at Star Furniture or any one of our operations, because they have responsibility for a given unit. And what the price of Coca-Cola stock does could swamp their efforts in either direction. It just would be inappropriate.

But it would not be inappropriate to pay somebody that's got the responsibility for all of Berkshire in a way that reflected the prosperity of all of Berkshire.

And a properly designed option system, which would be much different than the ones you see, because it'd be much more rational, could well make sense for one or two people that had the responsibility for this whole place.

Charlie and I aren't interested in that. But I think that you may be looking at two people up here, 50 years from now, I hope, where it would be appropriate.

But any option system, A, should not involve giving an option of less than the place could be sold for today, regardless of the market price. Because once management's in control, they can make that decision. And it should reflect the cost of capital. And very, very few systems reflect the cost of capital.

But if we're going to sit here and plow all the money back every year into the business and, in effect, use your earnings, interest-free, to increase our own earnings in the future, we think there has to be a cost of capital to have a properly designed option system.

People aren't interested in that. The option consultants aren't interested in that, because that isn't what their clientele wants.

Charlie, you're probably wound up a little more now on this, too?

CHARLIE MUNGER: No, I've wound up enough.

WARREN BUFFETT: OK. (Laughter)

19. Why Buffett dissolved his partnership in 1969

WARREN BUFFETT: We'll go to zone 11.

AUDIENCE MEMBER: Warren and Charlie, good morning.

WARREN BUFFETT: Good morning.

AUDIENCE MEMBER: My name is Maurus Spence from Waterloo, Nebraska.

Some 30 years ago, you disbanded your Buffett partnership saying that you felt out of step with the market and you feared a permanent loss of capital.

Given today's market and current valuations, if Berkshire Hathaway was a partnership of 100 partners, instead of a corporation, would you consider disbanding it as you did 30 years ago? And if not, why not? And was that the right decision back then?

WARREN BUFFETT: Well, if our activities were limited to marketable securities, and I had less than a hundred partners, and we were operating with this kind of money, so that there was a real limitation on what we could do, I would simply tell the partners and let them make the decision. That would be easy enough.

We're not in that position. A, we've got a number of wonderful businesses. And those businesses will grow in value. And in some cases, very significantly, in value.

And it's not a feasible way. People have their own way, if they decide that — since we're unable to find things, that they'd rather go on to something else — they have their own way of getting out. And they can get out at, certainly, a premium to the amount of money they put into the business over the years.

So, if I were running a marketable securities portfolio now and were limited to that, I would explain very carefully to my partners how limited my ability to make money in this market would be. And then I would ask them to do whatever they wish to do. Some of them might want to pull out and others might want to stay.

In the 1969 period when I closed up, A, I had a somewhat similar situation in terms of finding things.

And B, I really felt that the expectations of people had been so raised by the experience we'd had over the previous 13 years, that it made me very uncomfortable. And I felt unable to dampen those expectations.

And I really just didn't find it comfortable to operate where my partners, even though they might nod their heads understandingly and say that, "You know, we really know why you aren't making any money while everybody else is."

I didn't think I wanted to face the internal pressure that would come from that. I don't feel any such internal pressure in running Berkshire.

Charlie?

CHARLIE MUNGER: Yeah, that — I think there are some similarities between 1969-70 and the present time. But I don't think that means that 1973-4 lies right ahead of us. We can't predict that.

You can argue it worked out wonderfully for Warren to quit in '69. And then have '73-4 to come into with his powder dry. I don't think we're likely to be that quite that fortunate again.

WARREN BUFFETT: Yeah, it was a long time from '69, though, to '73. I mean, it sounds easy, looking back. But the Nifty Fifties, you may remember, sort of hit their peak in '72. So, although there was a sinking spell for a while in that '69 -70 period, the market came back very strong.

But you know, that's part of the game. I mean, it stayed cheap a long time from the '73 period on.

And you will find waves of optimism and pessimism. And they'll never be exactly like they were before. But they will come in some form or other.

That does not mean we're sitting around with a bunch of cash because we expect stocks to go down, though.

We keep looking for things. We're looking for things right now. We're talking to people right now about things where we could expend substantial sums of money. But it's much more difficult in this period.

20. Buffett's musical family

WARREN BUFFETT: Zone 12?

AUDIENCE MEMBER: Good morning. My name is Jenna (PH). I'm from Long Island, New York.

And I was reading through your annual report.

You made reference to Wagner and some country western song I never heard of.

I was just wondering what kind of music influences you. And are you planning on doing, like, a musical video? (Laughter)

WARREN BUFFETT: Well, I think with the performance I gave earlier in the movie, I don't think there's any future for me. But I do have a very musical family.

And since you asked, I will point out that my son Peter's recent CD is available at the Disney booth outside. And Peter had a very successful experience here on public television in March and will be on tour later on. And my wife is extremely musical.

But I don't think I've got much of a future in it. So far, I get — no one ever asks me to come back. (Laughter)

I mean, I've had a lot of introductory appearances, but very few encores.

I like all kinds of music. You know, I really — I've always liked music. We started out around the house singing church hymns. And in 1942, my two sisters who are here today, joined me in a 15-minute program on WOW, then the leading radio station in Omaha. And we sang "America the Beautiful."

And my dad got elected to Congress on the back of that program. (Laughter)

We liked to take credit for it. And you — see my sisters at the end of the meeting.

Charlie, what kind of music do you like?

CHARLIE MUNGER: Well, the one thing I agree with is that if we're going to star Warren, it should be in a musical. The straight acting won't do. (Laughter)

WARREN BUFFETT: It took me an hour to get that bald for "Annie," incidentally. It takes a long time to get bald — dressing room.

21. Spotting a great industry doesn't guarantee you'll make money

WARREN BUFFETT: Zone 13, please.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. My name is Jack Sutton (PH) from Brooklyn, New York. Thank you for hosting today's meeting.

With reference to communication stocks, because of the growth of cellular communications and the internet, certain stocks hold the prospect of substantially above-average revenue and earnings growth.

AT&T and Nokia, as an example, earn respectable margins and return on common equity and would seem to fit Berkshire's criteria from a financial perspective.

Has Berkshire reviewed stocks in the area of communications? And would you consider an investment in this area at some time in the future?

WARREN BUFFETT: Yeah, there's certainly no question amazing things have happened in communications.

It's interesting that you mention AT&T. Because AT&T's return on equity over the last 15 years has been, you know, has been very, very poor. Now, they've had special charges time after time and said, "Don't count this."

But the overall return on equity, if you calculate it for AT&T for the last 15 years, it's not been good at all. They were the, you know, they were the leader in the field. But so far, what has happened has hurt them, at least relative to their competition, far more than it's helped them.

We have a fellow on our board, Walter Scott, who's right here in the front row — I can't quite see him — who knows a lot more about this.

He used to try to explain to me these changes that were taking place. We'd ride down to football games on Saturday and Walter would patiently explain to me like he was talking to a sixth grader, what was going to happen in communications. And the problem was that he had a fourth grader in the car with him, namely me. (Laughter)

So, I never got it. But Walter did. And he's done very well in MFS and Level 3.

And I think for people who understand it, and are reasonably early, you know, they could very well be substantial money to be made. There's been an awful lot of money made in this town of Omaha by people who've participated in this. But I'm not one of them.

And I have no insights that I bring to that game that I think are in any way superior, and — in, probably, many cases, not even equal to those of other participants.

There's a lot of difference between making money and spotting a wonderful industry. You know, the two most important industries in the first half of this century in the United States — in the world, probably — were the auto industry and the airplane industry.

Here you had these two discoveries, both in the first decade — essentially in the first decade — of the century. And if you'd foreseen, in 1905 or thereabouts, what the auto would do to the world, let alone this country, or what the airplane would do, you might have thought that it was a great way to get rich.

But very, very few people got rich by being — by riding the back of that auto industry. And probably even fewer got rich by participating in the airline industry over that time.

I mean, millions of people are flying around every day. But the number of people who've made money carrying them around is very limited.

And the capital has been lost in that business, the bankruptcies. It's been a terrible business. It's been a marvelous industry.

So you do not want to necessarily equate the prospects of growth for an industry with the prospects for growth in your own net worth by participating in it.

Charlie?

CHARLIE MUNGER: Well, it reminds me of a time in World War II when — where these two aircraft officers I knew, and they didn't have anything to do at the time. And some general came in to visit. And he said to one of them, he says, "Lieutenant Jones, what do you do?" He says, "I don't do anything."

And he turned to the second one. And he says, "What do you do?" And he says, "I help Lieutenant Jones." (Laughter)

That's been my contribution on communications investments. (Laughter and applause)

WARREN BUFFETT: You can address me as Lieutenant Jones for the rest of the meeting. (Laughter)

22. Thank you, shareholders

WARREN BUFFETT: Yeah, incidentally, some people have thanked us for providing this meeting. I want to thank you because the quality — I think we have the best shareholders meeting in the country.

And the quality of the meeting is absolutely — (applause) — in direct proportion to the quality of the shareholders.

We would have nothing without this participation. And I really thank you. It's a big effort to come here for a lot of you. And I thank you for that.

Our plan, incidentally, will be to take a break at noon. They have a lot of food outside that they will sell you. (Laughter)

And then we'll come back in 30 minutes or thereabouts or 45 minutes, depending on how the lines are out there.

And then we'll reconvene for the afternoon. And those of you who are not in this main hall, if you want to come over and join the main hall, there will be enough seats for everybody in the afternoon. And then Charlie and I will continue till about 3:30.

23. Do you ever get tired of being Warren Buffett?

WARREN BUFFETT: Let's go back to zone 1, please.

AUDIENCE MEMBER: Mr. Buffett, over here. Good morning. I'm Allan Maxwell. I live in Omaha.

When you walk down the street, heads turn to watch you. Do you ever get tired of being Warren Buffett? If you could come back again, would you want to be Warren Buffett? (Laughter)

WARREN BUFFETT: I think I'd probably want to be Mrs. B. She made it to 104, so I — (Laughter)

And incidentally, I think there were three siblings at her funeral. Now, that some set of genes. You don't have to worry about the Furniture Mart.

No, you see a lot of the publicity bit here for a couple of days around the time of the meeting. But life goes on in a very normal way.

And I've had a lot fun. I have fun every day of my life. I had a lot of fun when I was 25. But I have just as much fun now. And I think, you know, if my health stays good, it'll keep being the same way.

Because, you know, I get to do what I want to do. And I get to do it with people I like and admire and trust. And it doesn't get any better than that.

Charlie? Do you want to come back as Lieutenant Jones? (Laughter)

CHARLIE MUNGER: I think there are very few people who would change their skin for somebody else's. I think we all want to play our own games.

24. Goodwill costs should stay on the books

WARREN BUFFETT: We'll go to zone 2 with those remarks. (Laughter)

AUDIENCE MEMBER: Hi.

WARREN BUFFETT: Hi.

AUDIENCE MEMBER: I'm Liam O'Connor (PH). I come from County Kerry in Ireland. And I must admit the sun shines a little bit more over here than it does on the other side of the world.

I was wondering, today, if you could shed some light on accounting for goodwill.

You reference in your report, in several aspects, including your principles — owner principles — and as well as the fact — with the current merger of General Re.

It seems to me there are several different methods that are used worldwide, through amortization, to direct write-off.

And the fact, when a merger like this is taken, it kind of skews the balance sheet. And I was wondering, in your view, what would you recommend as a more appropriate method for accounting for goodwill?

And secondly, if I could direct it to Charlie, one of the ideas — why not tie goodwill to the share price and have an intangible and a tangible part of shareholder's equity, the intangible piece being the difference between the book value and the share value of a company?

WARREN BUFFETT: OK, I'll take the first part. And it's a good question about goodwill and the treatment of goodwill for accounting purposes.

I actually wrote on that subject. I think it was in 1983 in the annual report. And if you click onto to the berkshirehathaway.com you can look at the older letters. And you will see a discussion of what I think should be the way goodwill is handled. And then we've discussed it at various other times in the Owner's Manual.

To give it to you briefly, in the U.K., for example, goodwill is written off instantly so it never appears in book value. And there's no subsequent charge for it.

If I were setting the accounting rules, I would treat all acquisitions as purchases — which is what we've done, virtually, without exception at Berkshire — I would treat all acquisitions as purchases.

I would set up the economic goodwill, because we are paying for goodwill when we buy a General Re. I mean, we are playing billions and billions of dollars for it. Or when we buy a GEICO or when we buy an Executive Jet. That is what we are buying, is economic — what I call economic goodwill.

I believe it should stay on the balance sheet as reflective of the money you've laid out to buy it. But I don't think it should be amortized. I think in cases where it is permanently impaired and clear that it's lost its value, it should be charged off at that time.

But generally speaking — in our own case, the economic goodwill that we now have far exceeds the amount that we put on the books originally. And therefore, even by a great amount, exceeds the amount that remains on the books after amortization.

I do not think an amortization charge is inappropriate — is appropriate — at Berkshire for the goodwill that we have attached to the — our businesses. Most of those businesses have increased their economic goodwill — in some cases, by dramatic amounts — since we've purchased them.

But I think the cost ought to be on the balance sheet. It's what we — it shows what we paid for them. I think it should be recorded there.

I don't think that the coming change in accounting is likely to be along the lines that I've suggested here. But I do think it's the most rational way to approach the problem.

And I think that because there is this great difference between purchase and pooling accounting, that some really stupid things are done in the corporate world.

And I have talked to managers who deplored the fact that they were using their stock in a deal and going through some — various maneuvers to get pooling accounting because they thought it was economically a dumb thing to do.

But they did it, rather than record amortization charges that would result from purchase accounting. And, you know, they're very frank about that in private. They don't say as much as about it in public.

Charlie?

CHARLIE MUNGER: Yeah, generally speaking, I think that what Warren argues for would be the best system.

Namely, set up the goodwill as an asset and don't amortize it in the ordinary case.

Or there would be plenty of cases when — the cases wouldn't be ordinary cases when amortization would be rational and, in fact, should be required.

So, I don't think there is any one easy answer to this one. And there's a lot of crazy distortion in corporate practice because of all the changes.

I mean, Australia has cowboy accounting. And Europe has this write-it-all-off-immediately accounting, which is — what would you call it? — half-cowboy accounting. And maybe mining promoter accounting.

We think the system should be better than that.

25. "We are not in the business of being white knights"

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: Good morning.

WARREN BUFFETT: Morning.

AUDIENCE MEMBER: My name is Mike, from Omaha.

And it's been said that you're the white knight of the investment world because you rescue companies from hostile takeovers. Are there any companies you are now trying to help out? And would you please name those companies? (Laughter)

WARREN BUFFETT: You have a cell phone that you're going to place orders with? (Laughter)

No, we — what we really want to buy into are wonderful businesses, or at least extremely good businesses. And we want them to have managements we like. And we want the price to be attractive.

And we are not in the business of being white knights. We're in the business of being investors in things that look sensible to us. And I don't think I've been approached by anybody in connection with that.

We do get approached occasionally. I should say, we get approached when somebody, occasionally, when somebody has a takeover bid. And they say, "Would you like to top it or something?" To which our answer, invariably, is no.

Charlie?

CHARLIE MUNGER: Well, we're very good at saying no. (Laughter)

WARREN BUFFETT: Charlie's better than I am, even.

26. China offers opportunities, but hard to pick winners

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Good morning. My name is Matt Haverty (PH). I'm from Kansas City.

Twenty years ago, China unleashed capitalism within its borders. Since then, I believe it has benefited more from that economic system than any major country in history.

I also believe that this momentum, combined with China's size and demographics, will make it the most fertile economic environment in the world during the next few decades.

Nonetheless, there are many Chinese companies with easy-to-understand businesses and 20 percent per annum sales growth this decade, trading at five times or less last year's earnings.

What is your assessment of the risk/reward of investing directly in Chinese companies?

WARREN BUFFETT: Well, I don't know that much about them. But I — certainly if I could buy companies that were earning 20 percent on equity and had promises — gave promise — of being able to continue to do that while reemploying most of the capital, and they were selling at five times earnings, and I felt good about the quality of the earnings, you know, I would say that would have to be an interesting field.

My guess is that it's not a large enough field, in terms of the ones that meet those tests you named, for Berkshire to profitably participate. And whether you could buy all of those companies from the U.S., I think there'd be a lot of — there could well be a lot of problems in that.

But I would say, any time you can buy good businesses — really good businesses — which we define as businesses who earn high returns on capital at five times earnings — and you believe in the quality of the earnings, and they can reemploy a significant portion of those earnings, additionally, at the 20 percent rate, you know, you will make a lot of money if you're right in your assessment on that.

Charlie?

CHARLIE MUNGER: Yeah, I don't know much about China. (Laughter)

WARREN BUFFETT: But that is not to knock it in any way, shape or form. Because I mean, in terms of — there could well be opportunities in areas like that, if you can identify those kind of businesses. We would have trouble identifying those businesses, ourselves.

But that doesn't mean that, you know, you will have trouble or other people who are much more familiar with the economy there, would have trouble.

So, I encourage you to look at your own area of expertise in something like that. And you'll do much better.

If the conditions you describe exist and you can identify the right company, you will do much better in that than you will in American markets, in my view.

27. We prefer to buy companies, but stocks offer more bargains

WARREN BUFFETT: Zone 5.

AUDIENCE MEMBER: Good morning. My name is Fred Castano (PH), from East Point, Michigan. And I appreciate this opportunity.

With Berkshire's size becoming very large, are we to expect major future investments to be in the form of complete buyouts, such as the General Re acquisition? Or would you still consider nibbling in the stock market?

WARREN BUFFETT: Well, we don't want to nibble. But we would like to take big gulps in the stock market from time to time.

But we've always wanted to acquire entire businesses. People never seem to really believe that, back when we were buying See's Candy or the Buffalo News or National Indemnity. But that's been our number one preference right along.

It's just that we've found that much of the time we could get far for more our money, in terms of wonderful businesses, by buying pieces in the stock market, than we could by negotiated purchase.

There may have been — there may be some movement, in terms of the availability of the two, toward the negotiated purchase, although you — it's almost impossible to make a wonderful buy in a negotiated purchase.

I mean, you will never make the kind of buy in a negotiated purchase that you can in a bad — that you can make via stocks in a stock — in a weak stock market. It just isn't going to happen.

The person on the other side cares too much. Whereas, in the stock market, in a 1973 or 1974, you were dealing with the marginal seller. And whatever price they establish for the business, you could buy it.

I couldn't have bought the entire Washington Post Company for $80 million in 1974. But I could buy 10 percent of it from a bunch of people who were just operating, you know, based on calculating betas or doing something of the sort. And they were in a terrible market. And it was possible to buy a piece of it on that valuation. You never get that kind of buy in a negotiated purchase.

We always are more interested in a negotiated — large negotiated — deals than we are in stock purchases. But we are not going to find a way, probably, to use all the money that way.

And we occasionally may get chances to put big chunks of money into attractive businesses that are — which we buy through the stock market, five, 10 percent of company or something of that sort.

Charlie?

CHARLIE MUNGER: My guess is over the next five years, we'll do some of both. Both the entire business and the big gulps in the stock market.

WARREN BUFFETT: Yeah, I agree with that.

We'll keep working at both. We're not finding a lot in either arena. We might be a little more likely to find it in the negotiated business. It won't be any huge bargain. We're not going to get any huge bargain in the — in a negotiated purchase.

We are more likely to find what I would call a fair deal there under today's circumstances, than we will in the market. But I agree with Charlie. Over the next five years, I think you'll see us do both.

28. Being "wealthy" without having a lot of money

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. My name is Jane Bell (PH) from Des Moines, Iowa. (Mild applause)

In response to an earlier question, you spoke of people being rich and very, very rich.

It seems to me there's a difference between being rich and being wealthy. I assume you consider yourself to be both. Which is the more important to you?

WARREN BUFFETT: Well, I think we may ask you to define. I don't want to sound like President Clinton here, too much, but we may ask you — (Laughter)

I might want — if you'd really define the "rich" and "wealthy," so that I get the distinction, then I think we can give you a better answer on it.

AUDIENCE MEMBER: Well, in my mind, being rich is having an awful lot of money. Being very, very rich is having even more. And being wealthy doesn't necessarily equate to having a lot of money.

WARREN BUFFETT: What does it equate to, then? I just want — (Laughter)

I think I know what you mean. But I still want you to clear it up before I give you an answer on it.

AUDIENCE MEMBER: Well, this, of course, is my opinion.

WARREN BUFFETT: I mean, you could be wealthy in health, for example. And I agree with you, that certainly, there'd be nothing you'd value more than good health for you, you know, yourself and your family. But I — you go ahead.

AUDIENCE MEMBER: Well, I believe you're starting to get it. (Laughter)

WARREN BUFFETT: Have patience. (Laughter)

No, there's no question about it. I mean, being — the money makes very little difference after a moderate level. I tell this to college students that I talk to.

I mean, they are basically living about the same life I'm living. (Laughter)

You know, we eat the same foods. I mean, that I can guarantee you. (Laughter)

And, you know, there's no important difference in our dress. There's no important difference at all in the car we drive. There's no difference in the television set that we sit there and, you know, watch the Super Bowl on or anything of the sort.

There's really no difference in — you know, they've got air-conditioning in summer. And I got air-conditioning and I got heat in winter. Almost everything of any importance in daily life, we equate on.

The one thing I do is I travel a lot better than they do, you know, NetJets. (Laughter)

So the travel is — travel I do a lot easier than they do.

Everything else in their lives, it just — you know, I'll switch places any time. It doesn't make any difference.

So, the — then you get down to the things of health and who loves you. I mean, that's — you know, there's nothing — if you have a minimum level of — I mean, you want to have enough so that you eat three times a day, and that you sleep in reasonably comfortable surroundings, and so on.

But everybody in this room has that. And yet, some of the people, by the definition that you've given, are obviously much more wealthy than others. And it's not measured by their net worth, if you define it that way.

I don’t disagree with that definition. I might not use the term, wealth, in describing it. But I’d certainly maybe call it well-being or something of the sort.

Charlie? (Laughter)

He’s thinking.

CHARLIE MUNGER: Sure, there are a lot of things in life way more important than wealth. All that said, some people do get confused. I play golf with a man. He says, “What good is health? You can’t buy money with it.” (Laughter)

WARREN BUFFETT: Did I ever tell you about Charlie’s twin brother that he golfs a lot with? (Laughter)

No, I’ll take health any time, incidentally.

CHARLIE MUNGER: So will I.

WARREN BUFFETT: The important thing, even in your work, I mean, is — to an extreme extent, it seems to me, is who you do it with.

I mean, it — you can have — if you’re going to spend eight hours a day working, the most important isn’t how much money you make, it’s how you feel during those eight hours, in terms of the people you’re interacting with, and how interesting what you’re doing is, and all of that.

Well, you know, I consider myself incredibly lucky in that respect. I can’t think of anything I’d rather do. And I can’t think of any group of people I’d rather do it with.

And if you asked me to trade away a very significant percentage of my net worth, either for some extra years in life, or being able to do, during those years, what I want to do, you know, I’d do it in a second.

29. “We blew it” on pharmaceutical stocks

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Hi, my name is McCall Bang (PH). I’m from central Florida. It’s nice and sunny there.

WARREN BUFFETT: Not so bad here either, now. (Laughs)

AUDIENCE MEMBER: My question was, last year somebody asked about the pharmaceutical companies and the aging baby boomers, et cetera. And you said it was difficult to single out individual companies. And I believe Mr. Munger succinctly said that we blew it on that one.

I was wondering, however, if the idea of regulation and, you know, the specter of what happened in '92, '93 with an unelected politician kind of dampered the whole industry for a period, there — if that plays a part in giving you a little ambivalence about investing in that area for the future.

Is that simply an unknowable? Or with all the, you know, a lot of the political — the things we see here today — if that causes you some concern about, you know, the future of that area?

I know that you're concerned about the growth of — in companies having to spend money, in Washington with regulation, et cetera. So, I'd like to know your thoughts, specifically if you have some ambivalence because of future regulation with pharmaceutical companies?

WARREN BUFFETT: Well, if we could buy a group of leading pharmaceutical companies at a below-market multiple, I think we'd do it in a second. And we had the opportunity to do that in that 1993 period, as you mentioned. And we didn't do it. So, we did blow it.

Because clearly, the pharmaceutical industry, as a whole, has done very well. And it has some of the threats that you enumerated, in terms of regulation and so on.

But, you know, every industry has some problems. And the pharmaceutical industry has enough going for it that the threats you named should not cause, in my view, should not cause the securities to sell at a depressed multiple, which they did.

Now, that's no longer the circumstance. We don't like — you know, we're not going to buy them at present prices. But, we — at least I think they're, you know, as a group, they're good businesses.

I do think it's very hard to pick out the winner. You know, so if I did buy them, I would buy them — I would buy a group of the leading companies. But I wouldn't be buying them at these prices.

Charlie?

30. Munger defends "almost obscene amounts of money" for drug companies

CHARLIE MUNGER: Yeah. I would argue that the pharmaceutical industry has done more good for the customers than almost any other industry in America. It's just fabulous what's been invented in my lifetime, starting with all the antibiotics that have prevented so much death and so much family tragedy.

And I think the country has been very wise to have a system where the pharmaceutical companies can make almost obscene amounts of money. I think we've all been well-served by the large profits in the pharmaceutical industry.

31. Why Buffett buys small amounts of some stocks

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: Good morning Mr. Buffett, Mr. Munger. My name is Gary Rastrum (PH) from right here in Omaha.

My question is, somewhere I thought I'd read that you buy at least one share of every company on the New York — or on the exchanges — to get the annual report. Is that true or is that a thing of the past? And if it is true, how do you keep track of all that information?

WARREN BUFFETT: Well, it's got an element of truth in it. Many years ago, I did buy one share of a great many companies. And I'd get these dividend checks for eight cents and 10 cents. (Laughter)

And I used to pay my bridge losses by endorsing these checks by the hundreds and giving them to the people who'd just won a dollar. And they — and then no one asked me to bridge games anymore. (Laughter)

So I have adopted a new program where I buy a hundred shares of a great many companies. Actually, I buy them in my foundation so I don't go crazy at income tax time. And I probably, just as a guess, would have a couple hundred companies. So, it isn't every company, by a long shot.

But there are at least several hundred companies where I want to be a registered shareholder, and — to make sure I get the mailings promptly. And I do keep those around. And I very — even after I lose interest, I very seldom sell one. So, I'll just keep buying more.

And I'll only buy a hundred shares in something I might want to keep track of, but I'll probably buy a hundred shares in all of their competitors and — so that I keep reading about those companies as well.

It does pay to have a flow of information come in over the desk.

32. Why some shareholders get the annual report sooner

And the answer to that question reminds me of a point which I'd like to bring up, briefly, here.

And that is that our shareholders — unfortunately there's no way around this — unless they go to the internet on the Saturday that we designate to read the annual report, and where it's up on our home site, berkshirehathaway.com, are going to receive their reports at significantly different times.

And the ones who have their shares in their own names are very likely to get those reports faster than the ones that have it — have their shares held in street names. And from our standpoint, unfortunately, probably 90 percent of the shareholders we have, have their name — have their stock held in street names.

Now, what happens on that, is we print the reports up. We mail the ones to the shareholders who are of record, who have the stock in their own names. We send the balance to where their brokers or bankers tell us to send them.

About 90 percent go to one place in New Jersey, but that's out of our control. I mean, if Merrill Lynch or Charles Schwab or whomever, Fidelity, turns their list over to that firm, they are the ones that mail the reports. We truck those reports back to them.

We may, next year, try to figure out a way to get them printed closer. But it's out of our control when those reports go out. So our shareholders receive their reports on widely varying dates, which like I say, you know, I would rather not have that happen.

It means that in terms of sending in your request for tickets to this meeting, many people we had this year as late as maybe the 10th of April, still hadn't gotten their reports. And they wondered about their tickets.

So if it's convenient for you, you will — you know, it's better to have your stock in your own name. Now, that isn't convenient for many people. I understand that. But you will get our reports on a more reliable basis and a more prompt basis if you do it that way.

If you have your stock in street name, you know, I urge you to look on those dates we've laid out in the report for next year, to click onto our homepage. Because then you will have the information just as quickly as everybody — as your fellow shareholder does.

We want very much to have a level playing field. And we want everyone to have access to the information as close to simultaneously as possible and during a time when the market is not open.

We think that just makes sense. That's the way we'd do it if we were running a partnership.

But there is this problem with street name holdings of somewhat erratic distribution. And that's the reason why, when I want to keep track of, say, all of the companies in the pharmaceutical industry, I'll buy a hundred shares of each one and I'll stick them in the name of the foundation. And that mailing comes directly to me in Omaha.

33. "Deceptive accounting" at many companies

WARREN BUFFETT: So let's go onto zone 9.

AUDIENCE MEMBER: I'm Lola Wells (PH) from Florida.

You have been recently quoted in the newspapers as saying that some major corporations have used questionable practices to make their operations seem more favorable. Would you be willing to be more specific about these practices?

WARREN BUFFETT: Not until I'm on my deathbed. The — no, I have followed a policy of criticizing by practice and praising by name, and we will not —

You know, we do — Charlie and I both find certain practices very deplorable. And they aren't limited to a single, or a few, large corporations. But it would — we would probably be less effective in arguing for change if we went to a few specific examples.

A, they would not be that much different, probably, than hundreds of other, or at least dozens of other companies. And secondly, those who get critical of the world, find the world gets very critical of them, promptly.

And I think we do more good by, in a sense, hating the sin and loving the sinner. So, we will continue to point out the sin. But we will not name the sinners.

Charlie?

CHARLIE MUNGER: Warren, I think she wants you to name the practices.

WARREN BUFFETT: Oh, the practices?

CHARLIE MUNGER: Not the miscreants.

WARREN BUFFETT: Oh, well, the practices are some — (laughter) — the practices are some of the things of the things we've said.

They relate to accounting charges that are designed to throw, into a given period, a whole lot of things that should've been covered in subsequent periods in the earnings account. Or to smooth out or to inflate earnings in future accounts.

There's a lot of that being done. There's a lot that's been done. The SEC, under Arthur Levitt, who I admire enormously for his efforts on this, is making a concerted attempt to get corporate America to clean up its act on that.

But it'll only be because somebody hits them over the head. I mean, it has become totally fashionable to play games with the timing of expenses and revenues. And frankly, until the SEC got tougher, in my view, the auditors were not doing enough about it.

I think that, in terms of hiding compensation expense and not recording it, in the case of options and all of that, I think —

Companies now have the option of recording option costs in the income account. But you have not seen any great flood of people doing it.

And actually, the way they show it in the footnotes is quite deceptive, in my view, because they try to make assumptions that minimize what the income account impact would be.

But the cost to the shareholder is what counts. I mean, that is the compensation cost, as far as we're concerned. And that's been minimized.

The whole effort to engage in pooling rather than purchase accounting, I've seen a lot of — there's been a lot of deceptive accounting, in that respect. There's been deceptive accounting on purchase accounting adjustments. So those are the kind of things we're talking about.

Charlie?

CHARLIE MUNGER: Yeah, it's the big bath accounting, and the subsequent release back into earnings of taking an overly large bath, that create a lot of the abuse.

WARREN BUFFETT: We could name names. We won't. But I mean, we have seen, firsthand, managements who think they are doing — they say they're doing what everybody else does. The truth is, they are now because everybody else is doing it.

And it takes some outside force, in this case, probably the SEC — it should've been the auditors and — to clean up the act. Because once it becomes prevalent, the fellow who is — who says, "I'm going to do it fair and square," all of a sudden becomes at a disadvantage in capital markets.

He's penalized. And he says, "Why should I penalize my shareholders by doing something when, legally I can get away with doing something else?"

Charlie?

CHARLIE MUNGER: Nothing more.

34. Financial strength of our insurers is a big advantage

WARREN BUFFETT: Zone 10.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. My name is Robert McClure (PH), and my wife and I live in Singapore. My question concerns insurance.

In the 1994 annual report, you made the following remarks. And I quote, "A prudent insurer will want its protection against true mega-catastrophes — such as a $50 billion windstorm loss on Long Island or an earthquake of similar cost in California — to be absolutely certain.

"That same insurer knows that the disaster making it dependent on a large super-cat recovery is also the disaster that could cause many reinsurers to default. There's not much sense in paying premiums for coverages that will evaporate precisely when they are needed.

"So the certainty that Berkshire will be both solvent and liquid after a catastrophe of unthinkable proportions is a major competitive advantage for us." End quote. As I said, that was in the 1994 annual report. Please give us an update on those remarks.

Would you say that that competitive advantage you described is intact? Or would you go so far to say that it has been enhanced over the past five years with the merger of General Re and with what's happened in the super-cat insurance industry?

WARREN BUFFETT: Yeah, I would say that that reputation — certainly the reputation is a stronger — oh, it's stronger than ever.

I mean, Berkshire's preeminent position as the reinsurer most certain to pay after any conceivable natural disaster — that reputation is stronger today than it's ever been, and General Re's reputation right along with it.

I would say the commercial advantage inherent in that reputation is very important. I can't tell you exactly how it rates compared to 1994. But I can tell you that it's important.

It tends to be more important when we're reinsuring other very large entities, either primary insurers or large reinsurers, than it is with the smaller company. The smaller company probably focuses on that less.

But we are writing, probably this week, a very large cover for a very important reinsurer. I don't think they'd want to buy that from almost anyone else. I mean, a couple of people, maybe, but —

They may — they could decide not to buy it from us because they might not feel they wanted to buy it. I think in this case, they will. But I don't think they would have a list of 10 people from whom they'd buy it. They're too smart for that. Because it's a very high-level cover. And if that is called upon, there will be a number of people whose checks will not clear. And Berkshire's check, undoubtedly, will clear.

So, it is a big — the reputation has never been better. The commercial advantage is significant. How much it translates into — you know, it — that can vary from year to year. But I think it's a permanent advantage that Berkshire will have.

I mean, I think five years from now and 10 years from now and particularly after there has been a huge super-cat, it will be a great asset to Berkshire to be thought of as, essentially, as I've described it, as Fort Knox.

And we will pay under any circumstances. And there aren't many people in the insurance or reinsurance business that can truly say that. And when the very big cover comes along, we should have very few competitors.

Charlie?

CHARLIE MUNGER: Well, I think that's exactly right.

35. GEICO and Executive Jet boosted intrinsic value

WARREN BUFFETT: OK. Zone 11.

AUDIENCE MEMBER: Good morning.

WARREN BUFFETT: Morning.

AUDIENCE MEMBER: Richard Corry (PH) from England.

Could you please say what was the main factor which produced the very substantial gain in intrinsic value mentioned in your report?

I ask this because per share gains in portfolio and operating profits were modest. And you said that there was no (inaudible) gain from issuing shares for acquisitions.

WARREN BUFFETT: Well, we did increase the float per share very significantly last year, I mean, invested assets per share. And I would say that, in the — GEICO's business was worth far more at the end of the year than at the start of the year. And that was our largest subsidiary at the start of the year. And if anything, GEICO's competitive position continues to improve.

I would say that Executive Jet is a natural fit into Berkshire. And we paid a significant sum for it. But that it will be a very, very big company 10 or 15 years from now.

And perhaps — well, I'm almost sure it'll get there sooner as part of Berkshire, than it wouldn't gotten there otherwise. And its dominance may be even greater over the years as part of the Berkshire family than it would have independently. Although it would've done very well independently.

I mean, it had a terrific management. It had — it started early, and they had the most service-oriented company you could imagine. So, it would've done fine without us, but I think it will do even considerably better and get there faster with us.

So, I think there — I think in the aviation field, certainly in the primary insurance field, we had large gains in intrinsic value. And I think that, additionally, we had a significantly greater amount of invested asset per share to work with.

So, I feel good about what happened with intrinsic value last year. The problem is doing it year after year after year.

Charlie?

CHARLIE MUNGER: Just basically, we have a wonderful bunch of businesses. And we have a float that keeps increasing and a pretty good record of doing pretty well in marketable securities. None of that has gone away.

36. No need to "groom" potential Buffett successors

WARREN BUFFETT: Zone 12?

AUDIENCE MEMBER: Hello. My name is Elias Kanner (PH). And I am from New York City.

Mr. Buffett, thank you for this entire weekend. I met you at the ballgame on Saturday and at Gorat's yesterday. It was a great honor for me each time.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: My question is this: Mr. Buffett, will you groom a younger man or woman as your heir apparent? If so, when might you do this?

When I say younger, I mean a person 15 to 20 years younger than yourself. Of course, I'm not complaining. You're the best in the world.

WARREN BUFFETT: Well, 15 or 20 years younger is a lot easier to do than it used to be. (Laughter)

A large percentage of the world's population is now eligible.

The — we have, today, the people to take over Berkshire. There's no problem about that at all. They have been named in letters that the directors have. And they are in place.

Exactly who will be the two people will of course — or it could be one person — will depend on when Charlie and I are out of the picture.

I mean, if we'd written the letter 10 years ago, it might have been different than today. It might be different 15 years from now.

So, our death or incapacity, the timing of it, will determine exactly who will be the current person in that letter. But we have those people in place. They don't need to be groomed from this point forward.

They exist. They're ready. They'd be ready to run Berkshire tomorrow morning.

And I think you'd be quite pleased with the job they did. And that's why I don't worry about having — I've got 99 3/4 percent of my net worth in Berkshire. And, you know, I don't want any of it sold. If I knew I was going to die next week, I would not want it sold in the coming week. And I don't want it sold after I die.

I feel comfortable with the businesses and the managers and the successor top management that we have at Berkshire. But I just don't want them to take over too early. (Laughter)

Charlie?

CHARLIE MUNGER: Yeah. I actually think that the prospects for continuity of corporate culture, to the extent we have one at Berkshire, is higher than prospects for continuity of corporate culture at most other large public companies.

I don't see Berkshire changing its way of operating, even if Warren were to expire tonight. And I think that the capital, the fresh cash, would be allocated less well. But as I've said at past shareholder meetings, well, that's too damn bad. (Laughter)

WARREN BUFFETT: That's why we don't have a public relations department.

CHARLIE MUNGER: By the way — (Laughter)

I don't think the job would be ill done, I just don't think it would be done quite as well as Warren does it.

37. One way to add Berkshire to S&P 500 without market disruption

WARREN BUFFETT: OK, Zone 13. (Laughter and applause)

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. I'm Cary Flecker (PH) from Wellington, Florida. Thank you for stopping by the convention center before, Mr. Buffett. It's nice to see you again.

WARREN BUFFETT: My pleasure.

AUDIENCE MEMBER: Recently, much has been made of the fact that Berkshire is the largest company to not be included in the S&P 500.

Do you gentleman have an opinion as — or what is your opinion — as to whether Berkshire should be included and why? Thank you.

WARREN BUFFETT: Yeah, that's a question we've gotten asked quite often since the General Re deal was announced.

Berkshire, if you talk to the S&P people, I think they would say — I think they've even said it publicly, or at least a representative has — that we certainly qualify in every way that — except from what they might term the liquidity standpoint.

It's probable that maybe it's 6 percent, maybe 7 percent of the investment funds, the equity funds in the United States are indexed. And the number, or the amount, is going up somewhat as we go along. I saw an article to the contrary on that. But I think they had it wrong. The amount of index money is, in my view, rising month by month.

So, if you were to put Berkshire into the index tomorrow, in effect, you'd have a market order to buy 6 to 7 percent of the company, or roughly 100,000 shares a day.

That would not be good, you know, if the stock would obviously spike up dramatically as some stocks already have when they've been added. I mean, there've been some — I've looked at the list of all the companies that have been added and some have moved up substantially.

And we would have even — there'd be even more impact at Berkshire than the typical stock because our stock is fairly tightly held. Most people don't want to sell it.

There are two solutions to that. Three solutions, one of them being not to put us in the index.

But we are the most — I think, probably the most significant in the United States that isn't in the index, in terms of market value and a lot of other factors.

So, if you want to put Berkshire or a company like it in the index and not have some crazy market aberration, you could have one of two things happen. And this would be true, I think, more and more of other companies, as well, as they add them to the index and there's more money against index.

One, you could have the company agree that at the time it was added to the index that simultaneously, the company, itself, would sell an amount of stock that was about equal to the index buying that would be generated.

In other words, if we were to offer 100,000 shares, roughly, of A stock at the same as being added to the index, that would neutralize the index buying.

The only problem with that is we don't want to sell 100,000 shares or 10,000 shares or 100 shares of A stock at Berkshire unless we had some very good use for the money. It isn't going to happen. (Applause)

So we are not going to do something like that just because we want to be in an index.

The other possibility, and I believe this was used in Australia, when a very large mutual life company converted to stock. I think it was the largest company in Australia — AMP. And that would be to phase in the weighting of a stock like Berkshire.

And I think later on, I think they may have to do it for all stocks. But phase in the weighting, say, over a 12-month period. So that I was 1/12th weighted the first month, 1/12th weighted the second month and so on. That means, in effect, there would have to be a market order once a month for a half of 1 percent, roughly, of Berkshire.

Well, I don't think that would be very particularly disruptive. And I think there'd be a — once you knew that phase in was coming, there would be some anticipation so that you would not get big spikes in the stock and dips, subsequently.

I think that would be a logical way, but Standard and Poor's, to date, has not had to do that sort of thing. And they may have various reasons, and various good reasons for not wanting to do that.

Now, if indexation continues to grow as it has and you get a situation where 15 percent of the money becomes indexed, you know, I think they're going to have to come up with some approach similar to one of these two that I've named, or it will simply get too disruptive to the market.

It would be interesting. I know America Online has behaved very well since it was introduced to the S&P some time back.

But I would think that it might get to be the case that, if you simply shorted the companies that got added to the S&P after the S&P effect had been felt, that that might — you might find that those stocks would tend to underperform, as that one artificial buy order, in effect, its impact wore off.

So, I think something is going to happen. I think indexation has far exceeded what anybody anticipated, including S&P or including me or Charlie. And I think there's been a good reason for it to develop.

I think as it continues to develop it will have more and more impact on the market in ways that, probably, S&P is not that excited about, nor would the index funds be excited about.

So, there's likely to come a solution to the liquidity problem that might be particularly acute at Berkshire, but that prevails throughout the market, that occurs when stocks are added.

And I would think if they adopt some solution, that certainly, if they adopt a solution of gradual weighting, that Berkshire would be a very logical candidate for the S&P.

It really makes no difference to us what is done along that line. We would not unhappy being in the S&P, as long as it didn't have some huge market impact at the moment of putting it in.

On the other hand, you know, we love the owners we've got. And I don't see how we could improve on this group much by having the index funds.

So, it — we'll see what happens on it. It is not a big deal to us. And we want to be sure if we're ever added, it isn't too big a deal to the market.

Because I would not like — you know, the people who sold that day, might like it — but I would not like the stock to jump up, you know, $20,000 a share on one day because there's some market order for 100,000 shares, and then gradually work its way back down to where it should've been in the first place.

No one benefits from that except the people who sell in the very short-term. And that is not the group that I primarily worry about.

Charlie?

CHARLIE MUNGER: My guess is that Berkshire will eventually be in the S&P index. Somebody will figure out how to do that, sensibly. Maybe not soon. But someday.

38. What we'd need to make an international acquisition

WARREN BUFFETT: OK. Zone 1.

AUDIENCE MEMBER: My name is James Claus (PH), and I'm here from New York City.

Mr. Buffett and Mr. Munger, today we've already heard you talk about a few countries outside of the U.S., here.

And my question is, if you're directly investing in equities outside the United States, what would be your requirements for the market as a whole?

And by this, I mean things like the transparency of the accounting system, the breadth and liquidity in the market, the rights of shareholders, the stability of the currency. And it'd be nice if you'd mention a few of these countries.

Kind of just a little addendum, there, is — for the companies in these countries, how relevant do you believe the reconciliation to U.S. GAAP contained in Form 20F really is?

WARREN BUFFETT: Well, the answer is most of those points you mentioned would be of interest to us.

We'd have to rule out anything where the markets aren't big enough. I mean, we are looking to put hundreds of millions of dollars into any single investment, at a minimum. Certainly, we think in terms of 500 million as being a minimum. We make exceptions to that. And that's going to rule out a great many companies.

Transparency of accounting and accounting rules: we care about that but we can make adjustments mentally. In some respects, we may think, in certain countries, accounting is better than here.

And so, as long as we understand the accounting system, we will be looking toward the same kind of a discount model in our mind of how much cash is this business going to generate over years and how much is going to have to be put into it.

And it's the same sort of calculation that goes into our thinking here. And here, we don't follow strictly GAAP accounting in our thinking. So we don't — the accounting differences would not bother us, as long as we understood those accounting differences.

The nuances of taxes, the corporate governance that you mentioned could make a difference. If we thought corporate governance was far inferior to here, we'd have to make an adjustment for that fact.

But I would say that in most of the major countries, the countries that have stock markets that are big enough so we could take a real position, it's a possibility that we would invest in any of them.

We don't — we wouldn't rule out, you know, Japan, Germany, France, England, the major markets.

Now, it's important to recognize that in all the world's stock markets, something like 53 percent of the value is in the U.S. market. I mean, here we have 4 1/2 percent of the world's population. But 53 percent of the value of all publicly held companies in the world is represented in — with companies in the U.S. market. So, we are a big part of the pie.

But we're very willing to look at almost all of the rest of the pie as long as we're talking about markets that are big enough to let us put real money into them.

Charlie?

CHARLIE MUNGER: Well, so far, we haven't done much, as Warren has said. But we don't have a rule against it. What more can we say? (Laughter)

39. Bullish on Coca-Cola despite high P/E and dollar strength

WARREN BUFFETT: We can say, "Zone 2." (Laughter)

AUDIENCE MEMBER: Good morning, Mr. Buffett. My name is Jean-Philippe Cramers (PH), and I'm coming from London, England. I have a question regarding Coca-Cola.

The first part is, are you worried that the earnings of Coca-Cola might continue to be affected by the weakness in the emerging markets and the strength of the dollar over the next few years?

And the second part is on the P/E ratio of Coca-Cola at 35 times earnings. Are you worried about the potential rise in interest rates? And is it linked to your views on inflation that you are not worried about the rise in interest rate? Thank you.

WARREN BUFFETT: Well, in relation to the strength of the dollar, which means that profits in foreign currencies don't translate into as many dollars, we — I — we don't have any big feeling on that.

I mean, if I — if we had strong feelings about the dollar's behavior, vis-à-vis the yen, or the euro, or the pound, or whatever it might be — you know, we could give vent to those views by actually buying or selling large amounts of foreign exchange.

We don't know what — which way the dollar's going to go. So, I have no — I have nothing in my mind, in regard to any decision on buying or selling Coke, that would relate to any prediction in my mind about the course of the dollar.

The earnings of Coke have been affected by the strength of the dollar in the last few years, particularly the strength against the yen when, you know, when it went from 80-odd to 140-odd. That was a huge hit, in terms of what the — in terms of the yen translation into dollars from those profits. And the strength of the dollar generally would hurt.

But looking forward, I don't have any prediction on that.

It's in Coke's interest to have countries around the world prosperous. I mean, they will benefit from increased prosperity, increased standards of living, throughout the world. I think we'll see that over any 10 or 20-year period. I think people's preference for Coke will do nothing but grow Coca-Cola products.

So, what I am concerned about is share of market and then, what I call share of mind. In other words, what do people think about Coca-Cola now, compared to 10 years ago or 20 years ago? What are they going to think about it 10 years from now?

Coca-Cola has a marvelous share of mind around the world. Everybody in the world, almost, has something in their mind about Coca-Cola products and overwhelmingly, it's favorable.

You can't — you know, try to think of three other companies like it. I can't do it, in terms of that ubiquity of good feeling, essentially, about the product.

We measure it by unit cases sold and by shares outstanding. And we want a lot more unit cases sold. And we like the idea of fewer shares outstanding over time.

I'll give you — I'll be giving that same answer 10, or 15, or 20 years from now. And I think they'll be a lot more unit cases sold then.

It is true that the case growth slowed starting in the second half of last year and continuing through the first quarter of this year. But that's happened from time to time in the past.

In my view, you know, that is not — it's not an important item. It may be an important item in what the stock does, you know, in a six-month period or a one-year period. But we'll be around 10 years from now, and Coca-Cola will be around 10 years from now.

And right now, we own eight-point-one or two percent of Coca-Cola. And we'll probably own a larger percentage 10 years from now, because they'll have probably repurchased some stock.

The P/E ratio of Coke, like virtually every other leading company in the world strikes us as, you know, they all strike us as being quite full.

That doesn't mean they're going to go down. But it does mean that our enthusiasm for buying more of these wonderful companies is less than it was when the P/E ratios were substantially less.

Ideally, those are the kind of companies we want to buy more of over time. We understand their businesses.

And my guess is that there's a reasonable chance, at least, that sometime in the next 10 years, we buy more shares of either Coke or Gillette or American Express or some of those other wonderful companies we own.

We do not like the P/E ratios, generally. But, again, I stress that does not mean they're going down. It just means that we got spoiled in terms of how much we got for our money in the past. And we hope that we get spoiled again.

Charlie?

CHARLIE MUNGER: Yeah, I — if what matters to you is what you think Coke is going to look like 10 years out or even further out, you don't really pay much attention to short-term economic developments in this country or that, or currency rates, or any other such things.

They don't really help you in making the 10 or 15-year projection. And that's the one we're making. So, we have tuned out all this noise, as it's called and what —

WARREN BUFFETT: Sometimes.

CHARLIE MUNGER: — communication networks — tune out the noise. And if you look at the big picture, we think Coke is fine.

WARREN BUFFETT: It's hard to think of a better business in the world, among big businesses. You know, there's obviously companies that are starting from much smaller bases that could grow faster. But it's hard to think of a much more solid business.

40. Nothing to say about Berkshire's investment in silver

WARREN BUFFETT: Zone 3?

AUDIENCE MEMBER: — Newport Beach, California, Bruce Lindsay. And formerly from Omaha, Nebraska. And I have a question.

Some time ago I read that you were buying silver. I never knew the reason why you were buying silver.

WARREN BUFFETT: Well, we covered silver purchase in the 1997 annual report for a special reason. A, it was part of a group of three unconventional investments we made. And one of those investments was of sufficient size so we felt people ought to know about it, specifically.

And then we felt our shareholders ought to know that we sometimes do things that they might not have guessed that we would do, from reading past annual reports. So we named the three unconventional investments.

But in this year's report, we have stated we will not be naming those investments unless one of two things happened: one is that they become of a size that you should know about them specifically, in order to evaluate the kind of thing we do in Berkshire and the commitment of resources that has been made, or two, if regulatory authorities either — obviously, if they require us to report it, we'll report it immediately.

Or in the case of silver, a year-plus ago, an important regulatory authority indicated they would've — that they'd prefer if we report it. We weren't required to do so. But — and our desire is to cooperate on that, anyway. So, we did report it.

But we stated in this year's report that absent those factors, we will not be giving details on unconventional investments any more than we give any more details on our regular equity holdings, than we're, more or less, required to do.

We did say that we had changed certain of the unconventional investments that were described in the previous year's report. And we stated that we'd entered into several new ones.

So, we are in some things that most of you or maybe all of you don't know about. But they aren't of sufficient size so that they're going to, in any material way at all, affect your investment.

Charlie?

CHARLIE MUNGER: Nothing to add.

41. Year 2000 computer problem won't be a "big deal"

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Morning, Mr. Buffett. Wayne Lang (PH) from Toronto, Canada.

Last year, when you were asked about the Year 2000 computer issue, you expressed some concerns about the cost overruns and the federal government readiness.

Our two countries are in much better shape this year. But could you update us on your current thinking and what concerns you may have about the impact of the lesser readiness, internationally, on our company's revenues, supply chain, or on the stock market?

WARREN BUFFETT: Yeah, last year I think I also told you I didn't really consider myself an expert on this. And what I tell you is just what I pick up from being on audit committees or talking to people who are a lot smarter than I am in this sort of area.

But that doesn't mean they're right on it. Because they weren't talking about it 15 years ago, when they should have been talking about it.

So I — my general feeling — and all secondhand — my general feeling is that the part of the world that we have to worry about is in pretty good shape.

It's cost a lot of money in various places. It's cost us a fair amount of money. But it's — some companies, it's cost a terrific amount of money.

But I do not think it's going to be a big deal. And, I — you know, I could be wrong. And I'm less worried about it being a big deal today than I was a year ago.

You know, and Charlie, do you have anything to add?

CHARLIE MUNGER: No.

WARREN BUFFETT: Does that mean you think it's going to be less of a big deal than you thought a year ago?

CHARLIE MUNGER: No, it means I have nothing to add.

WARREN BUFFETT: OK. (Laughter)

That's probably what I should have said in the first place.

42. Japan's economic slump doesn't affect Berkshire

WARREN BUFFETT: Zone 5. (Laughter)

AUDIENCE MEMBER: Good morning. My name is Bob Brewer (PH). And I'm from down the road in Lincoln, Nebraska.

I just wanted to ask you how you think the continuing economic turmoil in Japan is likely to affect the global economy and the U.S. stock market over the next five to 10 years?

WARREN BUFFETT: Well, Charlie and I are no good on those macro questions.

But I would say this: I mean, the Japan problem has been around, now — in financial markets and banking systems — has been around for some time now. So, I see no reason why it should have more impact on the rest of world now than it has had in the last few years. And I would say it's had certainly very little effect on the U.S. in the last few years.

It's not — it's no factor in our thinking at all, in terms of what we would buy or sell tomorrow morning. I mean, if we got offered a good business tomorrow — unless it was directly involved and its primary business was in Japan — but if it was a business in this country, that's not something that we would be thinking about. We would be thinking about the specifics of that business.

We don't really get too concerned about the things that come and go. I mean, in the end, if we're right about a business over a 10 or 20-year period — take See's Candy.

We bought it in 1972. Look what happened in 1973 and 4, you know, and all the oil shocks and what this country was going through and inflation, all that sort of thing.

For us to — and let's say in 1972 somebody laid out a roadmap from 1972 to 1982, with the prime rate going to 21 1/2 percent, long-term rates going to 15 percent. And all of the things happening, the Dow going to 570 or what — or 560.

That wasn't the important thing. The important thing was that this peanut brittle tastes like it does, which is terrific. (Laughter)

And that over time, we could get a little more money for it. So, you know. See's made $4 million, pretax, in 1972, when we bought it. It made 62 million last year.

It doesn't — we don't want to be thinking about the wrong things when we're buying businesses. And that applies to marketable securities, just as much as it does as when we're buying 100 percent of the business.

If we're right about the business, the macro factors aren't going to make any difference, you know. And if we're wrong about the business, macro factors are not going to bail us out.

Charlie?

43. Munger's lesson on not allowing accounting "slop"

CHARLIE MUNGER: Yeah, what I think is interesting in Japan is interesting to one, as a citizen.

Here's a major industrial country. And we understand all about Keynesian economics and everything else. And when it starts sliding down into a big recession, it just keeps going and going, and floundering, and staying down. And year follows year, and you take the interest rates down to practically zero, and you run a big budget deficit. The economy still stays down.

I think this has been very interesting to the economists of the world. I don't think any of them would've predicted that as modern a country as Japan could contract for as long as it did.

And I think the cause is related to the extremeness of its booms in both land prices and security prices, and the corruption in its accounting practices and in its regulation of financial system, including banks.

I think it's an interesting lesson for the world, of how important it is not to let a lot of slop get into the accounting and regulatory systems. And how a lot of folly in markets doesn't help, either.

WARREN BUFFETT: Sort of fascinating to, you know — people keep saying, "Why doesn't Japan stimulate?" Well, they got short-term rates down to zero. And long-term rates at 2 percent. Well, that should stimulate me. But — (laughter) — it doesn't —

As Charlie says, it sort of defied, a little bit, some of the classical Keynesian theory on that. But in the '30s, we had the same problem in this country. We drove interest rates way down towards the latter half of the '30s, and —

CHARLIE MUNGER: And I would argue that probably the extreme prosperity in America is related to this so-called wealth effect, with stock markets going up and up. And I think people thought that was a smaller factor than maybe it is.

44. Analyst coverage won't affect Berkshire's stock

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. My name is Jeff Lilly (PH) from Denver, Colorado.

My question is as follows: over the last couple of years, I've read both of you quoted as not following the stock price on a day-to-day basis, not being terribly concerned about whether Berkshire is up or down.

You now have analyst coverage. Perhaps you requested it, or perhaps you acquiesced to it.

But my question is whether this reflects any change in your attention paid to the stock price or your philosophy about investor relations, and whether you think the analyst coverage is going to have any impact on the stock price going forward?

WARREN BUFFETT: Yeah, no. It reflects no change in our attitude toward stock price. I mean, we are concerned about building the intrinsic value per share of Berkshire at the highest rate we can, consistent with a couple of other principles that we've set forth.

And we hope very much that the stock price stays in a zone that is not too wide around intrinsic value — that there's is going to be some zone of some sort, because intrinsic value itself is not precisely calculable. And in addition, you wouldn't expect it to track it penny for penny.

But we don't want it to go crazy in either direction in relation to intrinsic value.

When we made the deal with General Re, that attracted more analyst attention and institutional investor attention because General Re's shareholder base was overwhelmingly institutional.

So, institutions had to decide whether they were going to continue with their investment or clean it out. And we knew we would end up with more institutional ownership, subsequently.

Alice Schroeder asked me, prior to the merger meeting, she said there were a group of institutions that were coming to the meeting, which I liked. I mean, the fact that they were serious enough about their investment to come and see what Berkshire was all about.

And a few of them even had a requirement, I think, from their own boards that they, at least, have sat down with management. So, we spent — or I spent an hour or so with a group that she had put together and they came to Omaha.

But that's the last contact I've had with any institutional investor. And we will have no special meetings with institutional investors or anything. I mean, they are absolutely welcome to attend this meeting to get all of the information that's dispensed.

I think it's very useful, frankly, to have an analyst or two that is well-versed in Berkshire and that thinks straight and does their homework. And that's a plus, because it means we don't have to do it.

And in effect, that if institutions want to talk to somebody about it, they don't call me. Because they're not going to have much luck calling me. And they can call Alice or some other analyst that wants to do it.

And that's perfect. We have a non-paid — it is not investor relations because that's thought of somebody as sort of pumping your stock — but at least we have a information office now — a non-paid information office.

And you know, that goes along the grain of my nature. (Laughter)

And we — people say, "Do you want individual owners? You want institutional owners?" What we want are informed owners who are in sync with our objectives, our measurements, our time horizons, all of that sort of thing.

I mean, we want people that are going to be comfortable owning Berkshire, and we don't want people who are owning it for reasons different — in a way different — that are different from our reasons for owning.

We don't want people that are concerned about quarterly earnings. We don't want people who are concerned about stock splits. We don't, you know — we don't want people that need to be pumped up about the stock, periodically.

It's just not of interest to us. Because it just means we have to keep living that way in the future. And it's not the way we want to live now, it's not the way we want to live in the future.

What we really want are a bunch of people, like we have in this audience, who sit down and read, and think and understand that they're making an investment. It's not just a little ticker symbol. They're buying part of a business. They know what the business is all about.

They know how we think, they know how we measure ourselves. They're comfortable with that.

And they can come in individual or institutional form. And when we get them, we like to keep them.

So there's no change in our attitude about that. There is a change in coverage, in that we — there is some limited amount of coverage in Wall Street, which I guess for a company with a 110 or 20 billion of market value, there should be.

45. Executive Jet's advantage

WARREN BUFFETT: We'll have one more question then we'll break for lunch. We'll go to zone 7. And after this question, we'll break. We'll come back in about 45 minutes or so, and those of you — as long as we see that everybody's gotten served with food in that time — and we'll — any of those who are offsite or over at the Holiday, I think, there are buses to bring you over, you can drive over, and there'll be plenty of room here. You can also go out and tour the Boeing business jet. We'll sell you as little as 50 hours a year, I believe, on it. So, take your wallets at lunch time. Yep?

AUDIENCE MEMBER: Good morning. My name's Marc Rabinov from Melbourne, Australia.

I was wondering if you could help us out with the flight operations, which are now a large part of Berkshire. I think we're still putting a lot of capital into them.

I was wondering, you've pooled both of them together in the annual report. And I was hoping, perhaps, you could help us out with what return on equity you're expecting for each of those divisions.

WARREN BUFFETT: Yeah, the more capital intensive is the flight safety operation. Because every simulator costs real money. And we will add a number of simulators each year.

So, flight safety — you can look at their figures before we acquired them, and it's reasonable to extrapolate those numbers out on a larger basis — base as we go along.

But flight safety's return on equity is not going to move up or down by a dramatic amount. I mean, our simulator training prices are related to the cost of the simulator. And so, there's not going to be way higher returns on equity, nor should there be way lower returns on equity.

There is a growth on the equity employed in the business, because it is a growing business and we're training more and more pilots every year. But that'll be a fairly steady thing.

The Executive Jet business is in an earlier part of its development, although it's the leader in its field, by far. But we're doing substantial investment spending in a place like Europe. And we'll be doing that on an accelerated pace, if anything.

In the end, though, our customers end up owning the plane. So, we have an investment in a core fleet of planes, which supplements the customer's planes.

But by its nature, it's not a capital-intensive business. We are moving around a lot of capital every day. We'll have 140 or so customer planes now and an aggregate, you know, just to pick a figure, that those planes are certainly worth a billion and a half or more.

And we've got 7 billion of planes on order, or some number like that. But we will sell those planes to our customers. So it could be, down the line, that it will be a business with a very good return on capital.

We’ll still have an investment in the core fleet and we’ll have some facilities — hanger facilities and that sort of thing. But our customers will have the big capital investment.

I should point out, they’ll have a whole lot less capital investment if they own their entire plane themselves. So, they will be getting a bargain as well.

Let’s take off for lunch. And I’ll see you back here in about 45 minutes, those of you who wish to rejoin us. Thank you. (Applause)

Afternoon Session - 1999 Meeting

1. General Re benefits won't be felt for several years

WARREN BUFFETT: OK, we're going to be ready to go in just a minute if everybody gets their seats.

VOICE: Warren? Just want to double check something. We're just going to stick in —

WARREN BUFFETT: One through eight.

VOICE: (Inaudible)

WARREN BUFFETT: One through eight.

VOICE: (inaudible)

WARREN BUFFETT: Yeah.

We've got 6 or 7000, anyway, sticking around, I think.

OK. If anyone who has questions wants to go to the microphone, we're going to start here in just a minute. And we will start — there will only be eight zones from this point forward, because we have everyone in attendance in the main hall. So we will rotate around eight zones. We'll stay until about 3:30. And we'll start in zone 1.

AUDIENCE MEMBER: My name is Charlie Sink (PH). I'm from Lexington, North Carolina, as you can tell by the accent.

My question relates to the General Re purchase. I wondered — I've read your letters through the years and I've been trying to learn a little bit investing in insurance companies.

Did you buy General Re, mostly because — I know mostly because of the float — because you think you can grow the float? I know it's not growing significantly now. Or did you buy it because you felt like you could do better with the investments?

I've read, also, that companies who seem to be trying to follow the Berkshire model are trying to get a certain amount of investments to equity — is that something that you focus on? That's my question.

WARREN BUFFETT: Yeah. The first two parts are correct. We certainly — we don't think the float will grow rapidly in the near-term future at all. The float changed, it actually declined very slightly in the first quarter.

And, at a level of 6 billion or so of premiums, the paid losses are likely to run at a rate that would cause the float to remain more or less steady. So it will take a period when premiums grow, for the float to grow.

And the premiums would have to grow fairly substantially to have any significant impact on the float. And like I say, that will not happen in the short term. We expect the float to grow over the longer term.

We expect that General Re will probably grow considerably faster in international markets than the domestic market.

We think that their reputation, which was a good as could be found, from an operational standpoint, from a technical standpoint, a managerial standpoint, will be further enhanced by Berkshire's capital strength.

So we think their reputation is likely to grow over the years and we think the premium volume will follow, but not in any major way at all for a few years, at least.

And then we addressed earlier in the meeting, we think there is the opportunity to do better with that float from time to time in the future.

But right now that is not a plus that it's in our hands, and it may not be a plus a year from now. We think at some point it will be a plus. We also pointed out in — that there are some — there could be some tax advantages to be included as part of Berkshire as well. So there's some things going for it.

But none of them will have — they will not have an impact in 1999, and they may well not have an impact in 2000.

We obviously think Berkshire, 10 years from now, will be worth more on a per share basis with General Re included than if it were — than if we had not made the deal.

We don't necessarily think that's the case on a one-year or two-year basis. But it is our judgment on a 10-year basis.

Charlie? (Laughter)

CHARLIE MUNGER: I would say that if we, in the future, do as — one-third as well with the new float that came to us with General Re as we've done on average in the past, it will work wonderfully.

If you take our past use of float in the history of this company, it would be an interesting study if anybody ever stretched it out.

2. Technological change is bad for investments

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Good afternoon. My name is Greg Kaza (PH) from Oakland County, Michigan. I'd like to thank both of you gentleman for your hospitality this weekend.

My question deals with price deflation. Could you please explain how technological advances and productivity increases are affecting our non-fixed income holdings, especially insurance?

WARREN BUFFETT: Well I think that, to the extent your question implies — the question, how has technology affected the inflation rate, the advances in technology? I've heard Alan Greenspan make a lot of interesting comments on that.

I think it baffles him to some extent, but he also recognizes that there's some important, very hard-to-measure factor that has caused inflation not to behave in the way that most people expected, with this drop of employment, general prosperity, et cetera.

And I think he attributes it, in some part — but again, immeasurable — to what has been happening in the information technology world.

Obviously, low inflation is good for fixed-income investments, but that's been reflected to a significant degree in a long-term rate that's at about 5 1/2 percent now.

You know, it is — it does look, at the moment, like an almost perfect world, in terms of the macroeconomic factors. And that probably is a reason why people are enthused about stocks.

And it's a reason — and it's a good reason, in terms of price inflation — it's a good reason why bonds have behaved well over the last, really, since 1982.

I don't know the answers to what it means for the future. I have to believe that it's very good for this country to have the lead in information technology that it does on the rest of the world. I mean, we —

It seems to me, as a non-expert, that we are so far ahead of the rest of the world, in terms of the leading — having the leading companies and the money flowing into it, the brainpower flowing into it, that it's hard to think of it — who's in second place.

And I think that's helped this country in some very significant way. But I don't know how to measure it.

Charlie?

CHARLIE MUNGER: Well I would say that Berkshire's businesses, on average, are less likely to be obsoleted by new technology than businesses generally. New steel-toed work shoes? I do not anticipate a significant change in the technology. (Laughter)

And I think we have more of the stuff that's sort of basic and hard to obsolete than many other corporations do.

WARREN BUFFETT: Yeah. As we mentioned in the report, we think all of that activity is very beneficial from a societal standpoint. Our own emphasis is on trying to find businesses that are predicable in a general way, as to where they'll be in 10 or 15 or 20 years.

And that means we're looking for businesses that, in general, are not going to be susceptible to very much change.

We view change as more of a threat into the investment process than an opportunity. That's quite contrary to the way most people are looking at equities now.

But we do not get enthused about — with a few exceptions — we do not get enthused about change as a way to make a lot of money.

We try to look at — we're looking for the absence of change to protect ways that are already making a lot of money and allow them to make even more in the future.

So we look at change as a threat. And whenever we look at a business and we see lots of change coming, 9 times out of 10, we're going to pass on that.

And when we see something we think is very likely to look the same 10 years from now, or 20 years from now, as it does now, we feel much more confident about predicting it.

I mean, Coca-Cola is still selling a product that is very, very similar to one that was sold 110-plus years ago. And the fundamentals of distribution and talking to the consumer, and all of that sort of thing, really haven't changed at all.

Your analysis of Coca-Cola 50 years ago can pretty well serve as an analysis now. We're more comfortable in those kind of business.

It means we miss some — a lot — of very big winners, but we would not have picked those out anyway.

It does mean also that we have very few big losers and that's quite helpful over time.

CHARLIE MUNGER: Yeah, the peanut brittle has very little technological change, too. (Laughter)

WARREN BUFFETT: They better not change it. (Laughs) We like it just the way it is.

3. Stocks can’t keep growing at the same rate

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: My name is Esther Wilson. I live in South Sioux City, Nebraska.

My husband and I will have some new money in the early 80s of our lifehood. We have a daughter, 50 years old, who will inherent anything we have.

My question is — I also have a four percent interest on a mutual fund that is non-taxable. Are there any better ways to invest our money? (Laughter)

WARREN BUFFETT: Well, those are tough questions. I mean, I — you know, I run into friends of mine all the time where they come into a lump sum at a given time.

And, you know, Charlie and I do not have great answers about investing sums of money for people who are not really active in the process.

I mean, if, as we said earlier, if we were working with small sums now, we would start looking at a whole bunch of very small situations and some things that we might know how to do on a small scale.

But for the average investor who wants to own equities over a 20 or 30-year period, we think regular investment in some kind of very low-cost pool of money, which might well be an index fund, probably makes as much sense as anything. But it’s important to keep the cost down.

You know, I have close to a hundred percent of my net worth in Berkshire. I’m comfortable with it because I like the businesses we own. And — but, you know, I didn’t buy it at this price either.

So I don’t like to go — I never recommend anybody buy or sell it. And, Charlie, do you recommend anything?

CHARLIE MUNGER: I think it’s — if there’s anybody in the room who thinks it would be very easy to come up with a one-liner for a great no-brainer investment tomorrow with a great slug of new money, I wish they’d come up and tell me what it is. (Laughter)

We don’t have any solution to that one. It’s harder for us now than it has been at other times.

WARREN BUFFETT: Yeah, there’s been a couple of times — in 1974 there was something in Forbes — in ’69, the reverse of that situation. And then, I think, I wrote an article for Forbes — I can’t remember exactly when it was — about how equities almost had to be more attractive than bonds at that time. And bonds weren’t that unattractive.

I mean, every now and then you can say you're getting a great deal for your money in equities. Or sometimes you can say you're getting a great deal for your money in fixed-income investments.

You can't say that now, so what do you do? You know? In terms of new money, we find ourselves sitting and waiting for something and we continue to look.

But we are forced to look at bigger ideas. So if we were working with smaller funds we'd be much more likely to find something than we are in our present situation.

As Charlie says, we really don't have any great one-line advice on it. I wish we did for you. Zone 4 —

CHARLIE MUNGER: I —

WARREN BUFFETT: Go ahead.

CHARLIE MUNGER: The real long-term rate of return from saving money and investing it has to go down, from recent experience in America, particularly equity-related recent experience.

The wealth of the world can't increase at the kind of rates that people are used to in the American equity markets. And the American equity markets can't hugely outperform the growth of the wealth of the world forever.

WARREN BUFFETT: Well, you —

CHARLIE MUNGER: We ought to have reduced expectations regarding the future, generally.

WARREN BUFFETT: Yeah, dramatically reduce them, because, you know — we mentioned earlier, 53 percent of the world stock market value is in the U.S.

Well, if U.S. GDP grows at four percent, five percent a year, with one or two percent inflation, which would be a pretty — would be a very good result — I think it's very unlikely that corporate profits are going to grow at a greater rate than that.

Corporate profits, as a percent of GDP, are on the high side already and you can't constantly have corporate profits grow at a faster rate than GDP. Obviously, in the end, they'd be greater than GDP.

And that's like somebody said that New York has more lawyers than people. I mean — (laughter) — there's certain — you run into certain conflicts with terminology as you go along if you say profits can get bigger than GDP.

So, if you really have a situation where the best you can hope for in corporate profit growth over the years is four or five percent, how can it be reasonable to think that equities, which are a capitalization of that corporate — of corporate profits — can grow at 15 percent a year?

I mean, it is nonsense, frankly. And people are not going to average 15 percent or anything like it in equities. And I would almost defy them to show me, mathematically, how it can be done in aggregate.

I looked the other day at the Fortune 500. They earned $334 billion on — and had a market cap of 9.9 trillion at the end of the year, which would probably be at least 10 1/2 trillion now.

Well, the only money investors are going to make, in the long run, are what the businesses make. I mean, there is nothing added. The government doesn't throw in anything. You know, nobody's adding to the pot. People are taking out from the pot, in terms of frictional cost, investment management fees, brokerage commissions and all of that.

But the 334 million [billion] is all that — is all the investment earns. I mean, if you want to farm, the — what the farm produces is all you're going to get from the farm.

If it produces, you know, $50 an acre of net profit, you get $50 an acre of net profit. And there's nothing about it that transforms that in some miraculous form.

If you own all of American — if you own all of the Fortune 500 now, if you owned a hundred percent of it, you would be making 334 billion. And if you paid 10 1/2 trillion for that, that is not a great return on investment.

And then you say to yourself, "Can that double in 5 years?" It can't — the 334 billion — it can't double in 5 years with GDP growing at 4 percent a year, or some number like that. It would just produce things that are so out of whack, in terms of experience in the American economy, it won't happen.

So any time you get involved in these things where if you trace out the mathematics of it, you bump into absurdities, then you better change expectations somewhat.

Charlie?

CHARLIE MUNGER: There are two great sayings. One is, "If a thing can't go on forever, it will eventually stop." (Laughter)

And the other I borrow from my friend, Fred Stanback, who I think is here. "People who expect perpetual growth in real wealth in a finite earth are either mad men or economists." (Laughter)

4. "Best contribution" is low-cost goods and services

WARREN BUFFETT: Zone 4, please.

AUDIENCE MEMBER: Good evening. My name is Sharukoi Chin (PH). I'm from Des Moines, Iowa.

While we have been discussing of how much return that a company has helped us to get in the past few years, and for the future, too, though, I believe there are many people who are concerned about how much have we given to the society in return.

And gentlemen, would you please share with us about your philosophy and the company policies and how much the Berkshire has done in terms of philanthropy and charities? Thank you.

WARREN BUFFETT: Yes. There are figures in the annual report that bear on that.

One thing we did wasn't entirely voluntary, is that I think we gave about 2.6 billion to the federal government last year in — (laughter) — in income taxes. (Applause)

I'm not sure. I looked at General Electric and Microsoft and a couple of large — we may have paid more in federal income tax than any other U.S. company. I'm not — don't take my word for that, because it could be Walmart paid more. I wouldn't be surprised if Walmart paid more.

But there's — I did look at a couple of the biggest ones and we did pay more than GE or Microsoft, both of which have market caps that are three times our size.

And the shareholder-designated contribution program was 18-or-so million, as I remember, and then we detailed the contributions in the report made by the other companies.

But I would argue that to the extent that GEICO, for example, is a more efficient way of delivering personal auto insurance than, overwhelmingly, than its competitors are, and that, if 15 percent is a fair indication of how much it is saving people, that — and then, on a $4 billion of premium volume — that there is something more than $600 million that consumers save by a more efficient way of distribution, which has been honed to a fine art by the GEICO management.

Really, delivering the goods and services that people want in an economical way is a very important part, I think, of the contribution that any company makes to society, as well as the taxes they pay and their actual corporate philanthropy.

We are not big believers in giving away the money of the owner — of Berkshire acting as their representatives and giving away their money to philanthropy. We think that the shareholder should — it's their money.

And if we had a partnership of 10 people, if I were the managing partner, I would not feel I should make the decisions on philanthropy for the other 9 people. I would let them all make their own decisions.

We do not think that corporations, generally, should be passing out money to the pet charities of the CEO. And we don't do it at Berkshire.

But we do let the shareholders make those designations. And, as I say, I think our primary — (applause) — thank you.

I think that the best contribution actually we can make, this is ideal, over 10 or 15 years, is find a — is finding ways to deliver goods and services, that people want, to them at lower cost than the alternatives that were previously available to them.

Charlie?

CHARLIE MUNGER: Yeah. Well, I applaud the questioner's yearning for an answer to the question of, "Isn't there something more in this game than making and piling up money?" and "Shouldn't we be thinking about what we owe in return and what's going to go back in return?"

In the Munger case, I think a hundred percent is going to go back in return, for a reason different from that of the Buffett case. You know, there's an old saying: "How much did old Charlie leave?" And the answer is, "I believe he left it all." (Laughter)

And in essence, the — it all has to go back one way or another. You can't take it with you, that's the iron rule of the game. And I do think it's important to think about what you do for other people and what example do you set with your own life or your own corporate life.

And I do think that Berkshire stacks up pretty well in that respect. And in due course, when we get into gargantuan charities bearing the name Buffett, my guess is that'll be done pretty well, too. This is likely to be a pretty good run.

5. No "insight" on oil or silver

WARREN BUFFETT: Zone 5. (Applause)

AUDIENCE MEMBER: Hi, my name is Michael from New York. First, I'd like to address Mr. Munger.

Mr. Munger, it's so — it's such a pleasure to be here with you, as well as Mr. Buffett. And if you could just say hi —

CHARLIE MUNGER: You got those in the right order.

AUDIENCE MEMBER: — to my — (laughter) — wife for a second, her name is Jane.

Next, I understand your secrecy on unconventional investments. But Mr. Buffett and Mr. Munger, could you please tell me your insight on market conditions for oil and silver? (Laughter)

WARREN BUFFETT: He asked you, Charlie. (Laughter)

CHARLIE MUNGER: But we've already said that we're not going to comment about commodity investments.

I will cheat a little on that. Eventually the price of oil has to go way up. (Laughter)

That does not mean you can make any money from buying it now, counting the interest factor.

WARREN BUFFETT: (Laughs) Zone 6. (Laughter)

Fortunately, I don't know whether — I listened carefully when he phrased his question. He said "insights" and — (laughs) — I don't have any insights, so —

6. Cable TV systems: more promise than results so far

WARREN BUFFETT: We'll go to zone 6.

AUDIENCE MEMBER: My name is Merritt Belisle from Austin, Texas.

And the company has a large investment in the Washington Post Company, which has many cable television systems serving non-major metropolitan areas, as well as a recent investment in TCA Cable.

And so, I was hoping to get a comment about the cable television business generally.

And the other question is about your philosophy of children handling money and inheriting money.

WARREN BUFFETT: The first question about cable, the Washington Post Company does have — and we own about 17, or so, percent of the Washington Post Company, and I believe they have 700,000-plus homes. And as you say, they're in largely — in smaller areas.

It's been a good business. And as you know, cable prices have been galloping here in the last year, or thereabouts. From the standpoint of the Post that's bad news, because the Post would have been a net buyer of cable and will not be a seller.

And it's very, very much like our attitude towards stocks and stock prices. It is not good news for the Washington Post Company when cable prices go up, because the Washington Post Company's going to be investing funds. It's going to be a generator of funds over time. And if it wants to put money in cable, it's way better off if cable prices go down than up.

The TCA is not — Lou Simpson runs a separate portfolio at GEICO — equity portfolio — so I've never read an annual report of TCA Cable. I know nothing about it.

If he still has it, it's an investment of Lou's at GEICO, for GEICO, and it's not something that falls under my management at all.

It's a point I should mention, because, periodically, the press picks up some item that says that Berkshire — or sometimes it says that I am buying X, Y or Z.

And sometimes that's true, but sometimes it isn't true, because filings are made on behalf of various other entities that are associated with us, and I don't know anything about them.

I saw one here a couple of weeks ago reporting that I was — I don't know if it was me or Berkshire — I think it was me personally — it was buying some real estate investment trust with the name Omega in it. I'd never heard of it. But that story appeared various places.

Well, I can assure you, I filed no form with the federal government that said that I was buying that stock, although you would have deduced that from certain press accounts.

But various other entities, I think that there may be a subsidiary of General Re, New England Asset Management, that may have to report periodically on what they do.

And since General Re is owned by Berkshire, and New England Asset Management's a part of General Re, you know, who knows what they pick up on that.

So I do caution you, generally, to be a little careful about reports as to what is being bought or sold by me or by Berkshire Hathaway.

Now, as I remember, there was second question that I didn't like quite as well to answer. (Laughs)

Charlie, you want to tackle that one?

CHARLIE MUNGER: Well, I think there was more interest in the future of cable. (Laughter)

That is, we have demonstrated a signal lack of aptitude in correctly diagnosing the future of cable in a way that made us a lot of money.

And we've done that in spite of the fact that in retrospect it seems like a lot that was perfectly obvious was lying around.

WARREN BUFFETT: Today cable is not, I mean, cable has been here for what, 30 years or so. Cable has not made extraordinary returns on invested capital, at all.

But it's always had the promise of greater returns and it's had the promise that you wouldn't have to keep investing money in it the way that you've had to date.

But currently, people think that unusual returns will be made in cable, relative to invested capital, not relative to the purchase price of them, but relative to the invested capital in the property itself. And, as I say, that has not really been the case as — it's been the case with cable programming. Cable programming, there's been a lot of money made in relation to capital investment.

But in terms of the actual investment in cable facilities, the capital investment has been such, the expenditures in developing systems have been such, that the returns so far have not been great.

But the prices for cable systems now would indicate that people think that those returns are finally going to start flowing in, in a big way.

7. Buffett and Munger differ on influence of inherited wealth

WARREN BUFFETT: What was the second part of that question that you had?

VOICE: Children and wealth.

WARREN BUFFETT: Oh, inherited wealth and children —

AUDIENCE MEMBER: It was about kids inheriting money.

WARREN BUFFETT: Yeah. Well — (laughter) — we have a minority viewpoint down here in the front row. (Laughter and applause).

I think my views on that subject changed when I was about 18. (Laughs)

Until that point I thought it would be a great idea.

No, I am quite a believer in a meritocracy and I think a part of that is not having people start way, way ahead of other people in life, based on whether they were lucky enough to come from the right womb or not.

So I've never been big on the idea that either society benefited or, in many cases, the kids — although I think that's much more problematic, but — by the fact that great transfers of wealth will go from one generation to another, I —

You know, I would rather see the degree of talent possessed by individuals determine the resources they command in this world, and their ability to influence other people's lives and command the labor of other people, and all of that, than any divine right of the womb.

So that's — and Charlie has a somewhat different view on that.

CHARLIE MUNGER: Yeah. I am a little more willing to let the world take the succeeding generations down. It's — (Laughter)

WARREN BUFFETT: He believes in crossing it —

CHARLIE MUNGER: I don't think they need much help. (Laughter)

WARREN BUFFETT: Charlie believes in passing it along, as long as you're sure they're going to blow it. (Laughter)

OK. Zone —

CHARLIE MUNGER: If you stop —

WARREN BUFFETT: Go ahead.

CHARLIE MUNGER: If you stop to think, Warren, of the great fortunes of yore — if you go back to 1900, 1870 and, you know — name me the people that have vast power because they are in the fourth generation in that family. Some of them are living awfully well, but they are not running the world.

WARREN BUFFETT: I would say the Rockefeller family had considerably more influence than if their name had been, you know, just plain Rock. (Laughter)

CHARLIE MUNGER: Well, I think that's true, but you're picking probably the strongest, single family of the piece. And now that it's dispersed among 60 or 70 or 80 Rockefeller, it —

I think it's true there were four or five brothers there that had an unusual share of worldly influence. I must say, in that case I think they handled it very well.

8. Avoiding tech: we're "willing to trade away a big payoff for a certain payoff"

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: My name is Alan Negan (PH) from Reston, Virginia.

I know you like to buy into success stories but you don't like to buy high tech. And it seems to me, say in the case of Microsoft, that 10 years from now they'll be doing software development, just like 10 years from now Coke will be selling sugared water.

And what I'm wondering is why you feel that way when it seems certain companies, high-tech companies, are predictable.

And it also seems that in the early '90s you were — you mentioned you were going to buy a pharmaceutical company, which also seems like high tech to me. So that's my question.

WARREN BUFFETT: Yeah. Well, we — I think we said that with the pharmaceutical companies we wouldn't have known how to pick out which one. We would have thought the industry as a group would do well.

From those levels of 1993, you cannot buy high tech companies at anything like — at levels that are commensurate with the levels that the pharmaceutical companies were selling at in '93.

You know, I would — and getting to the first part of your question, I think it's much easier to predict the relative strength that Coke will enjoy in the soft drink world than the strength — the amount of strength — that Microsoft will possess in the software world.

That's not to knock Microsoft at all. If I had to bet on anybody, I'd certainly bet on Microsoft, bet heavily if I had to bet. But I don't have to bet. And I don't see that world as clearly as I see the soft drink world.

Now somebody that has a lot of familiarity with software may very well see it that way and they're entitled to — if it's true they have superior knowledge and they act on it, they're entitled to make money from that superior knowledge. There's nothing wrong with that.

I know I don't have that kind of knowledge, and I simply — and I do think that it's — that if you have a general knowledge of business over decades, that you would regard the industry they're in as less predictable than the soft drink industry.

Now it may also be that even though it's less predictable that there's a whole lot more money to be made, so that if you're right, that the payoff is much larger.

But we are perfectly willing to trade away a big payoff for a certain payoff. And that's the way we're put together.

It does not knock the ability of other people to make those decisions. I mean, I asked — first time I met Bill Gates in 1991, I said, "If you're going to go away on a desert island for 10 years, you had to put your stock in two companies in the high-tech business, which would they be?"

And he named two very good stocks. And if I'd bought both of them, we'd have made a lot more money than we made, even buying Coca-Cola.

But he also would have said at the same time that if he went away he'd rather buy Coca-Cola, because he would have felt sure about that happening.

It's — you know, different people understand different businesses. And the important thing is to know which ones you do understand and when you're operating within what I call your "circle of competence."

And the software business is not within my circle of competence, and I don't think it's within in Charlie's.

Charlie?

CHARLIE MUNGER: Well, I certainly agree with that. I think there are interesting questions, too, about how far the whole field can go.

Take jet airplane travel below the speed of sound. It's been pretty static in terms of the technology for a long, long time. You know, the big Boeing airliner is much the same as it was 20 or 30 years ago.

And I think it's — a lot of these businesses are quite dependent on the technology continuing to gallop and do more and more for people.

Take pharmaceuticals, if they had never invented any more pharmaceuticals, it would be a terrible business.

I don't know what happens once you get unlimited bandwidth into the house and way more options, and —

Beyond a certain point, it strikes me that there might be a surfeit of anybody's interest in the field. I don't know where that point is, whether it's 20 years out or 30 years out, but it would affect me a little.

WARREN BUFFETT: The Dilly Bar is more certain — (Laughter)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — to be here in 10 years than any software application that we know. But that's, maybe, because we understand Dilly Bars and not software.

In the whole United States, which is, you know, is by far the most prosperous country in the world — the whole United States, there are probably around 400 companies, 400 total companies, that are earning $200 million a year, after-tax.

Of those 400, you could name them. I mean, you could start, you know — if you say "bank," you can say Citigroup and Chase and Wells Fargo, and you name 10 or 15 of them. And if you name consumer goods, you're going to say Procter & Gamble and Coca-Cola and Gillette, and you can name a whole bunch of them.

You can almost, of those 400, you can probably name 350. If, five years from now, instead of 400 being on that list, there'll probably 450 on the list, maybe 475.

A lot of those will be companies that are earning between 150 and $200 million now. So there'll probably be 20 — some number like 20 — that, call it, come from nowhere.

Now if you look at the number of companies that are selling today at a price which implies 200 million or more of earnings right today, you will find dozens and dozens in the high-tech arena. And, you know, a very large percentage of those companies are not going to fulfill people's expectations.

I can't tell you which ones, but I know there won't be dozens and dozens and dozens of those companies making a couple hundred million dollars a year. And I know they are now selling at prices that require them to be making that much money or more. It just doesn't happen that often.

You know, biotech was all the rage some years back. How many of those companies are making a couple hundred million dollars a year? It just doesn't happen.

It's not that easy to make lots of money in a business in a capitalistic society.

People that are looking at what you're doing every day and trying to figure out a way to do it better and to, you know, underprice you or bring out a better product, or whatever it may be. And a few companies make it.

But here in the United States, after all of these decades and decades and decades of wonderful economic development, we've got about 400 companies that have hit the level that would be required of a company that would have a market cap of $3 billion.

And some companies are getting $3 billion of market cap the day they come out, virtually, — so.

There's some — you want to think about the math of all this.

9. Don't "dance in and out of the companies you really love"

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: Hello. My name is Larry Whitman (PH) from Minot, North Dakota.

You've already hinted about Coke and Gillette's current valuations, and also about their great prospects for the future. But in the past year, both stocks have been down 30 to 50 percent from their highs.

How much farther would they have had to fall before your criteria of margin of safety had been satisfied and allowed you to purchase more shares?

And two, has the Disney/Cap Cities merger gone as well as you would have hoped, and has the future prospects of Disney changed in your opinion?

WARREN BUFFETT: First question, that's a good question on Coke and Gillette, because obviously, we think about the businesses that we're the most familiar with and where we're committed.

But neither one of those businesses got to the price that left us happy putting new money in. But we're quite happy, very happy, owning those businesses and will be happy owning them for a very long time to come. But they —

It's some evidence of where the market has been and is, that, even when they ran into some tougher business conditions than they anticipated, that their stocks did not go down to the prices that cause us to get excited about them.

Charlie, you want to comment on that or the second part?

CHARLIE MUNGER: No. But I do want to remind people that the Dilly Bar is a Dairy Queen product. (Laughter)

WARREN BUFFETT: And they are good. I can tell you that. (Laughter)

CHARLIE MUNGER: I wouldn't want the shareholders to believe that the commercial standards of this operation are faltering. (Laughter)

Generally speaking, trying to dance in and out of the companies you really love, on a long-term basis, has not been a good idea for most investors. And we're quite content to sent with — to sit with our best holdings.

WARREN BUFFETT: People have tried to do that with Berkshire over the years. And I've had some friends that thought it was getting a little ahead of itself from time to time. And they thought they'd sell and buy it back cheaper and everything.

It's pretty tough to do. You have to make two decisions right. You know, you have to buy — you have to sell it right first, and then you have to buy it right later on. And usually you have to pay some tax in-between.

It's — if you get into a wonderful business, best thing to do is usually is to stick with it.

Coke and Gillette both experienced disappointments to their management, below what they anticipated a year, a year and a half ago, or whenever it was, and below what we anticipated. But that will happen over time.

It happens with some of our wholly-owned business from time to time. Sometimes they do better than we anticipate, too.

But it's not the nature that everything — that things that — everything goes in a nice, straight, smooth line upward.

You mentioned Cap Cities. Parts of Cap Cities have done extraordinarily well, for example. But in the network business, if you go back 30 years and look at what network has been on top, you find that no one stays on top, or on the bottom, indefinitely there.

It's a competitive world, as I mentioned earlier. And sometimes your competitors' correct moves, your own incorrect moves, the world environment — all of those things can interrupt trend lines.

I see nothing that's happened in the last year, in terms of the long-term trend line, of the blade and razor business, which is the one I've referred to as "inevitables" at Gillette. I mean, they are in other businesses that are not in the same category as the blade and razor business.

Coke, fortunately, has virtually its entire business in soft drinks. And so it comprises almost a hundred percent of the whole there.

But I see nothing that would change my thinking about the long-term future of either the blade or — blade and razor business — or Coke's position in the soft drink business.

10. Deflation unlikely, but would be good for bondholders

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: Steve Cohn (PH) from Peoria, Illinois.

First of all, I just had my first Dilly Bar a half an hour ago, and thank you for introducing me to that.

WARREN BUFFETT: Good.

AUDIENCE MEMBER: You spoke —

WARREN BUFFETT: I'll sell you a second, too if — (Laughter)

AUDIENCE MEMBER: You spoke earlier about the threat of change. Can you comment on the threat of deflation and, if it were to occur, what its likely impact would be on the economy, Berkshire Hathaway, and personal investment decisions?

WARREN BUFFETT: Well now, displacement in what respect? I didn't —

AUDIENCE MEMBER: -flation.

WARREN BUFFETT: Oh, inflation.

AUDIENCE MEMBER and CHARLIE MUNGER: Deflation.

WARREN BUFFETT: Oh, deflation.

CHARLIE MUNGER: Deflation.

WARREN BUFFETT: Oh, I'm over — I'm getting there. (Laughter)

Well I think it's very, very unlikely, but I would — I have been wrong consistently now for a decade or more about the degree to which inflation has at least been tamed for that period.

I would have expected — if you'd showed me all the other things that were going to happen in the world in the last — if I'd seen that ahead of time 10 or 15 years ago — I would have thought we would have had more inflation, so —

I have trouble envisioning a world of — where the U.S. experiences deflation. But, you know, my record is not great on that.

And again, we don't — we do not spend a lot of time thinking about macro factors.

I mean, if you ran into deflation that means, you know, capital is appreciating, so you need much lower nominal rates of return on capital to be in the same place under deflation as would be the case if you had inflationary conditions.

So deflation, everything being equal — and it isn't equal — is good for investors because it — you know, the value of money appreciates. The buying power of money appreciates. But it would have other consequences, too.

I don't think it's likely. I'm not — I have no great record at all in macro forecasting and I — if it does happen, the truth is, I don't know what the effects would be.

Charlie.

CHARLIE MUNGER: Well, you've seen what deflation is doing in Japan, and it's been quite unpleasant for the people there. On the other hand, it hasn't been a catastrophe. I mean, nothing like the '30s in the United States.

WARREN BUFFETT: No, and actually, in Japan, if you had owned long bonds, you would have had a tremendous bonanza from deflation, because your — the value of your bonds would have gone up dramatically as interest rates came down. And then that money, in turn, would buy more.

So it would — it was a very — if you happened to be the person that owned longer bonds issued at higher coupons some years back, that's worked to your advantage.

But — and presumably that would work in this country. If we actually ran into consistent deflation, my guess is that people who owned long bonds, even bought at 5 1/2 percent, would find their position in the world dramatically improved compared to people who owned most other asset classes.

11. Markets are "fairly" efficient, but efficient market theory is "silly"

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Hello. I'm Murray Cass from Markham, Ontario. First off, Mr. Buffett, Mr. Munger, I'd like to thank you for being so generous with your time every year at these meetings.

Mr. Buffett, many in the academic community call you lucky, or a statistical outlier. Mr. Munger, I'm not sure what they call you. (Laughter)

WARREN BUFFETT: Well, you're free to speculate on what they call him. (Laughter)

AUDIENCE MEMBER: I know you don't like to forecast the equity markets, but maybe you would dare to forecast the evolution of the debate between proponents of the efficient market theory and value investors.

Do you think there will ever be a reconciliation? And I'm talking especially about what's taught at the business schools.

And as an addendum, are your designated successors, are they outliers as well?

WARREN BUFFETT: (Laughter) Well, we like to think they are. And then, they may be more outliers than we are.

The market is generally — you know, I — to me, it's almost self-evident if you've been around markets for any length of time, that the market is generally fairly efficient.

It's fairly efficient at pricing between asset classes, it's fairly efficient in terms of evaluating specific businesses.

But being fairly efficient does not make — does not suffice to support an efficient market theory approach to investing or to all of the offshoots that have come off of that in the academic world.

So, if you'd believed in efficient market theory, and been taught that and adapted — adopted it for your own 20 or 30 years ago, or 10 years ago — I think it probably hit its peak about 20 years ago — you know, it would have been a terrible, terrible mistake.

It would have been like learning the earth is flat. It just — you would have had the wrong start in life.

Now, it became terribly popular in the academic world. It almost became a required belief in order to hold a position.

It was what was taught in all the advanced courses. And a mathematical theory that involved other investment questions was built around it, so that, if you went to the center of it and destroyed that part of it, it really meant that people who'd spent years and years and years getting Ph.D.s found their whole world crashing around them.

I would say that it's been discredited in a fairly significant way, over the last decade or two. I mean, you don't hear people talking the same way about it as you did 15 or 20 years ago.

But the market generally is fairly efficient in most ways. I mean, it is hard to find securities that are inefficiently priced. There are times when it's relatively easy. But right now, for example, it's difficult.

There — I don't know exactly how much it's holy writ, still, in business schools.

I certainly get the impression, as I go around talking to business schools, that it is far less regarded as, you know, sort of unquestioned dogma that it — like it was 15 or 20 years ago.

The University of Florida now has some courses in valuing businesses. University of Missouri's putting in one.

And I think the high priests of efficient market theory are probably not in the same demand for speaking engagements and seminars and all of that as they were a decade or two ago.

It’s hard, though — it’s very interesting. It’s hard to dislodge a belief that becomes sort of — becomes the dogma of a finance department.

It’s so challenging to them and, you know, they have to, at age 30 or 40, to go back and say, “What I’ve learned up to this point, and what I’ve been teaching students and all of that, is silly,” that doesn’t come easy to people.

Charlie?

CHARLIE MUNGER: Well, you know, Max Planck, the great physicist, said that even in physics, the old guard really didn’t accept the new ideas. The new ideas prevail, in due course, because the old guard fades away, clinging to the asininities of the past.

And that’s what’s happened to the hard-form efficient market theorists. They’re an embarrassment to the scene and they will soon be gone. On the — (Laughter)

People who think the market is reasonably efficient, or roughly efficient, of course, are absolutely correct and that will stay with us for the long pull.

WARREN BUFFETT: Thinking it’s roughly efficient, though, does nothing for you in academia. You can’t build anything around it. I mean, that — what people want are what they call elegant theories. And it just — it doesn’t work.

You know, what investment is about is valuing businesses. I mean, that is all there is to investment. You sit around and you try to figure out what a business is worth. And if it’s selling below that figure you buy it.

That, to my — you can’t find a course virtually in the country on how to value businesses. You can find all kinds of courses on how to, you know, how to compute beta, or whatever it may be, because that’s something the instructor knows how to do. But he doesn’t know how to value a business. So, the important subject doesn’t get taught. And it’s tough to teach.

I think Ben Graham did a good job of teaching it at Columbia, and I was very fortunate to run into him many decades ago.

But if you take the average Ph.D. in finance and ask him to value a business, he’s got a problem.

And if he can’t value it, I don’t know how he can invest in it, so therefore, he — it’s much easier to take up efficient market theory and say it doesn’t make any difference because everybody knows everything about it, anyway.

And there’s no sense in trying to think about valuing businesses. If the market’s efficient, it’s valued them all perfectly.

I never known what you talk about on the second day in that course. I mean — (Laughter)

The first — you walk in, you say, you know, “Everything’s valued perfectly, and class dismissed.” So, it puzzles me. But I encourage you to look for the inefficiently priced.

WARREN BUFFETT: Zone 3. Berkshire, incidentally, was inefficiently priced for a long time. And it wasn’t on the radar screen of — if you asked an academic how to value it, they wouldn’t have known what to look at exactly. Yep.

12. We try to grow cheap float quickly

AUDIENCE MEMBER: My name is Ken Shuvenstein (PH). I’m from New York City. First, thank you very much for this great, educational forum.

You’ve taught us that a key concept of Berkshire is the amount of float it has, the cost of the float, and how fast it grows.

Can you please help us understand, currently, what amount of float Berkshire has and what the goals are in the future for that growth rate over a sort of one to two-decade period, understanding that it will be a lumpy advance?

Because, looking at the historical data you’ve provided us for Gen Re and Berkshire, regarding the amount of float and its cost, it’s grown at a great rate — high teens, lows 20s. And if you could please comment on the future expectations we should have, that would be great.

WARREN BUFFETT: Yeah. Well, it’s an important question. It — but I don’t know how to give you a good answer.

The — it’s grown at a much faster rate, since 1967 when we went into the insurance business, than I thought it would.

I mean, I did not — I didn’t anticipate it would grow that way. I didn’t anticipate necessarily we would get a chance to buy GEICO. I didn’t necessarily know we’d ever acquire a General Re or — so it’s been very hard to forecast.

What we’ve tried to do is grow cheap float as fast as we could. And sometimes it’s been easy, sometimes it’s been impossible.

But I don’t know — if you had asked me that question 30 years ago, I’d have given you an answer that really hasn’t proven out very well. And I —

So, I don’t know how to give you the answer now, except to tell you this: it’s very much a goal of Berkshire to grow that float at as fast as it can, while maintaining a very low cost to it.

And again, you mentioned it'd be lumpy. Well, it'll be lumpy on cost. It'll be lumpy on growth rate. But, I mean, we are — it's something we think about all of the time, in both our operating decisions and perhaps some big capital commitment decision.

It's — we know that if we can solve that problem of how to grow it at — with it costing us relatively little, that we will make Berkshire a whole lot more valuable in the process.

And people, I mean — we always laid out the facts as to what we were doing, but people basically seem to ignore that.

And we have had this growth rate, which we can't maintain, the numbers are too big. But it's something that Charlie and I think about all the time.

We've got some good vehicles for growing it. But we don't have any vehicles that will grow it in aggregate at anything like the rate it's been grown in the past.

So we may have to — we may get a chance to do something that adds to our ability to do it. If we get a chance and it's at the right price, we'll add it. If we won't, we'll do as much as we can internally.

But the question you ask, the growth in intrinsic value of Berkshire over the next 10 years, will be determined, in a very significant way, by the rate at which we do grow it and if — and also the added fact of what it costs us to achieve that float.

Charlie?

CHARLIE MUNGER: Yeah. If we grow very low-cost float at the same rate that it's grown in the past for another 30 years, you can be confident of one thing: if you look to the heavens there will be a star in the east. (Laughter and applause)

13. Two reasons Berkshire isn't selling life insurance

WARREN BUFFETT: Zone 4. (Laughter)

AUDIENCE MEMBER: I'm David Levy (PH) from Newport Beach, California.

Berkshire has been investing in the property and casualty and reinsurance business.

I notice, except for annuities, you've been avoiding the life insurance business. Do you have — do you anticipate investing in the life insurance business?

Also, I have a second question, and that is the relationship of Berkshire A and Berkshire B. Last year there was a slight premium for Berkshire B over Berkshire A.

About now, Berkshire B is selling at about a 3 to 4 percent discount. I also notice that certain people are shorting Berkshire A and Berkshire B. I wonder if you could comment on that.

WARREN BUFFETT: Sure. On the life business, we have no bias against the life business, we just — we are in the life reinsurance business in a fairly significant way through General Re. As you mentioned, we've done a little on annuities.

The problem with the life business is that it isn't very profitable — and you can look at the records of the big companies on that — and that a lot of the activity in the area is, in some way, equity-related.

And Charlie and I have never wanted to get in the business of managing equities for other people. I mean, we want our sole interest on equities to be Berkshire Hathaway itself. So, we do not want to wear two hats.

We would never go into the mutual fund management business or any kind of investment management business because, if we were to be managing 20 or $30 billion in the investment management business, and we get a good idea that we can put a billion dollars in, you know, whose money do we put in it?

So, we'd rather just be wearing one hat. And that we want that hat to be Berkshire Hathaway. And we don't want to be promising other people that for, you know, half of one percent or one percent fee that they're going to get our best ideas, because those ideas belong to Berkshire and we'd be misleading people if we promised otherwise.

So, anything that involves an equity component to it — and that's a big part of what's going on in the life business now — it's just something we wouldn't be comfortable being involved with.

If you look at term life insurance, we've looked at that, in terms of putting it on the internet. It's — it is priced at rates that we find very hard, even with the absence of commissions, to make sense.

But it's a business we understand. So, we're — we'd be perfectly willing to be in the life insurance business if we thought there was — if we had a way of doing it where we thought there was reasonable profitability attached to it.

Charlie, do you want to comment on the life business before I get to the A versus B thing, or —

CHARLIE MUNGER: No.

We do those structured settlements. That is sort of like the annuity business. And the life business we're doing is mostly annuities and on a very low-cost basis.

WARREN BUFFETT: Yeah. Anyone that wants to buy a non-equity-related annuity should go to our website and find, in terms of the — weighting for the safety of the product and everything, you'll find a very, very competitive product because we —

It's a low-cost operation. And if you're buying it to get paid 30 years from now, you are certain to get paid from Berkshire and you're not necessarily certain to get paid from various other entities. So, we've got a very competitive product there, but it's not a big business.

14. Price differences between Class A and B shares

WARREN BUFFETT: On the question of A versus B, I've written something — I wrote it some months ago and stuck it up on the website — regarding my own thoughts on that.

Obviously, the most the B can be worth is 1/30th of the A, because you can always convert an A into 30 shares of B.

The B may sell a slight bit above that 1/30th price before it gets to a level where it induces arbitrage between the two. So, it can theoretically sell, and it will sell, a fraction of a percent above 1/30th of the price of the A. But if it gets above that, you know, I'll buy the A and sell you the B.

There's an arbitrage profit to be made, and probably the way markets work, most of that profit will be captured by the specialist, because he's in the best position to effectuate trades of that sort.

But the B can never be worth more than a thirtieth of the A, and it can never sell for more than slightly above 1/30th of the A.

On the other hand, B is not convertible into A stock, so it can sell at a discount.

I put on the web some months ago that I thought — just my opinion — but I thought that when the B is selling for less — selling for more — than a two percent discount, I personally would rather buy B than A under those circumstances.

If it's selling for the same price as the A — 1/30th the price of the A, but it's selling on a parity basis — and I were buying 30 shares or more of B, I would rather buy A, because you can always go one direction and you can't go the other direction.

I think, if you take the next 10 years — I would think that a fair percentage of the time, it's going to be selling right about 1/30th of the price of the A, and there will be periods of time when it sells it at a modest discount.

And I would say that when it gets in the 3 to 4 percent range, I regard that as quite a wide discount. If I didn't have a tax to pay myself, I might sell A and buy B if I was getting four percent more in the — in economic equivalent on B. It's not practical for me to do it.

Some — I know of some tax-exempt investors that have actually done that sort of thing, and —

Long range, we will always treat the B exactly as we laid it out in the prospectus. There are two differences between the A and B. One is in the voting power, relatively. And the other is in the shareholder-designated contributions program. And otherwise, in all respects, B will be treated on the same basis as the A.

We have no — even though Charlie and I own a lot of A and we don't own any B to speak of, we regard the B shareholders as being 100 percent on a parity, except for those two differences we laid out at the time of issuance, with A shareholders.

We would never — there won't be a deal ever made for Berkshire anyway — but if there would be we would always treat the A and B on a 1-for-30 basis.

We would not — we've been in situations where people haven't done that and we've never been very happy with it. So we would always treat people proportionally.

Charlie.

CHARLIE MUNGER: Well, I certainly agree with all of that.

WARREN BUFFETT: The question about shorting, it doesn't make a difference whether anybody shorts any stock or not, really.

I mean, if you were arbitraging between A and B, and the B was selling a little higher than the A, you might be buying some A and shorting some B, and you might delay conversion because you might figure the B might go to a discount. And then you'd unwind the whole transaction rather than convert.

I mean, there's a lot of techniques that Charlie and I have engaged in over the years, and other securities that apply to that sort of thing.

But shorting doesn't hurt us in any way, shape or form. I mean, it doesn't make any difference.

I don't care whether the short interest in the A is a thousand shares or 100,000 shares. You know, somebody sells it at one point and somebody buys at another point, and whether you reverse the buying and selling doesn't make any difference.

What counts is the intrinsic value of Berkshire. And if we increase the value of Berkshire at a reasonable rate, you know, the shorts will have to figure out how to eat three times a day. (Laughter)

15. Investing advice: start early and think for yourself

WARREN BUFFETT: OK. Zone 5, please.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. My name is Grant Morgan (PH), I'm here from New York City.

Earlier, you had acknowledged that it is a more difficult investment and business environment today than it was when you first started out.

My question is, if you are starting out again today in your early 30s, what would you do differently or the same in today's environment to replicate your success? In short, Mr. Buffett, how can I make $30 billion? (Laughter)

WARREN BUFFETT: Start young. (Laughter)

Charlie's always said that the big thing about it is we started building this little snowball on top of a very long hill. So we started at a very early age in rolling the snowball down.

And, of course, the snowball — the nature of compound interest is it behaves like a snowball of sticky snow. And the trick is to have a very long hill, which means either starting very young or living very — to be very old.

The — you know, I would do it exactly the same way if I were doing it in the investment world. I mean, if I were getting out of school today and I had $10,000 to invest, I'd start with the As.

I would start going right through companies. And I probably would focus on smaller companies, because that would be working with smaller sums and there's more chance that something is overlooked in that arena.

And, as Charlie has said earlier, it won't be like doing that in 1951 when you could leaf through and find all kinds of things that just leapt off the page at you. But that's the only way to do it.

I mean, you have to buy businesses and you — or little pieces of businesses called stocks — and you have to buy them at attractive prices, and you have to buy into good businesses.

And that advice will be the same a hundred years from now, in terms of investing. That's what it's all about.

And you can't expect anybody else to do it for you. I mean, people will not tell — they will not tell you about wonderful little investments. There's — it's not the way the investment business is set up.

When I first visited GEICO in January of 1951, I went back to Columbia. And I — that rest of that year, I subsequently went down to Blythe and Company and, actually, to one other firm that was a leading — Geyer & Co. — that was a leading analyst in insurance.

And, you know, I thought I'd discovered this wonderful thing and I'd see what these great investment houses that specialized in insurance stocks said. And they said I didn't know what I was talking about. You know, they — it wasn't of any interest to them.

You've got to follow your own — you know, you've got to learn what you know and what you don't know. Within the arena of what you know, you have to just — you have to pursue it very vigorously and act on it when you find it.

And you can't look around for people to agree with you. You can't look around for people to even know what you're talking about. You know, you have to think for yourself. And if you do, you'll find things.

Charlie?

CHARLIE MUNGER: Yeah. The hard part of the process for most people is the first $100,000. If you have a standing start at zero, getting together $100,000 is a long struggle for most people.

And I would argue that the people who get there relatively quickly are helped if they're passionate about being rational, very eager and opportunistic, and steadily underspend their income grossly. I think those three factors are very helpful.

16. How Buffett learned the insurance business

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, thank you very much for your hospitality. Excuse me, my name is Yvonne Edmonds (PH) and I'm from St. Petersburg, Florida. And thank you also for being so kind as to spend all this time answering our questions.

I have two related questions regarding insurance. The first is, I suspect that many of us know less about insurance than about equities and I wonder if you could please put some references for us on the Berkshire Hathaway website that might help us increase our knowledge about insurance.

The second question is, perhaps, related to the first, I just — the fact that I don't understand it, but The Wall Street Journal, on March 19, published an article entitled, "When Insurers Pass Trash, Some Are Left Holding the Bag." And that "some" included Berkshire Hathaway.

It focused on passing the workers comp trash to, among other groups, to Cologne Re.

And to make a long story short, the assistant general counsel for General Re, which, as I understand, now owns most of Cologne Re, said this is a classic example of an insurance company seeking growth in a very competitive market by writing business outside its area of expertise — namely within workers' comp — when their area of expertise is life reinsurance.

Mr. Graham went on to say, and then I'll stop, "Don't write business you don't understand. Second, proper controls are critical in the insurance business. Lastly, if a business opportunity appears to be too good to be true, it probably is."

If this is true, could you tell us how this came about? What measures are being taken to see that it won't happen again? And what might be the ultimate cost to Berkshire Hathaway shareholders? Because I gather that the — only the tip of the iceberg has been represented in the charge to Cologne Re.

WARREN BUFFETT: OK. Those are good questions.

And let's take the first one first about the website and having a list of reference documents, or something that would help you understand insurance. You sound like you understand it pretty well already. The — (Laughter)

I can't think of a good book that I've read on the subject. I got my knowledge of insurance by reading — well I got this huge head start by having a fellow named Lorimer Davidson, who is now 96, spend four hours or so with me one Saturday morning in January 1951, explaining to me how GEICO worked.

And I — it was a marvelous education, and it got me so interested, in not only how GEICO worked, but how its competitors worked, how the industry worked, that I just started reading a lot of other reports.

I never — I guess I took one course in school on insurance. I don't remember a thing from it. I have no idea what the text book was or anything. It had no value to me.

So I never really had any background in insurance. My — you know, nobody in the family was in the insurance business.

And until I talked to Davy, I really — it just hadn't been something that crossed my mind. The only reason I was down there was because I'd — my hero, Ben Graham, was listed in "Who's Who" as being the chairman of Government Employees Insurance. That's —

If he had been the chairman of, you know — he was also the chairman of the Market Street Railway Company in San Francisco.

Fortunately, I went down to GEICO instead of out to see the Market Street Railway Company. (Laughter) It was closer.

But I — my own education about insurance came from just reading lots of, lots of reports.

I mean, I would say that if I started the day fresh and I didn't know anything about the insurance industry to speak of, and I wanted to develop some expertise, I would probably read the reports of every property-casualty company around.

And I would go back some time and I would read — I would probably get the best manuals and look at them.

I would just do a lot of reading. I used to go down to the Department of Insurance in Lincoln and go through the convention reports and the examination reports.

I'd — they'd give me some little table someplace and I'd keep asking them — (laughs) — for these reports and they'd have to go way down in the bottom of the Capitol to get them out for me. But they didn't have much else to do so they were always happy to do it.

And that's the way I learned about it. And it happened to be a productive field to learn about it that way. And I really think that something akin to that is the best way now. I can't think of — you know, you can read some analyst reports.

I think you can learn something, frankly, by reading the Berkshire Hathaway annuals for 20 years and reading the insurance section. I think it'll teach you something about the economics of insurance. So, I would do it by reading.

And if you can find somebody that knows the business well, who's willing to spend some time talking to you about it, they can probably shorten the educational period and give you some help on that.

17. Unicover losses are "rare lapse" for General Re

WARREN BUFFETT: The second question about what's been called — what's the Unicover [Managers Inc.] affair that Cologne Re set up a 275 million — Cologne Life, I should say — set up a $275 million reserve against.

First of all, I would say for the losses to be incurred on that business, the 275 still represents the best estimate.

In other words, it may be the tip of the iceberg in terms of the loss to the industry, because no one else has acknowledged any losses. This is amazing. I mean, believe me, there are plenty of other losses out there.

We said we were going to lose 275 million. I think that's a good estimate. But I think a lot of other people are going to lose very — they have to lose significant money. Somebody has to lose some significant money besides us on that.

And so what we have reported may be the tip of the industry iceberg. I don't think it's the tip of the General Re or Berkshire Hathaway iceberg.

It's our best estimate today of what that loss will be. If that estimate changes, I will let you know through the quarterly reports or, if it was really material, we'd have some announcement. But I don't anticipate that.

But we'll report to you faithfully, I promise to you, as to how that loss develops over time.

The — what you read makes a great deal of sense about when something's too good to be true, it usually is and that sort of thing.

The distribution of the losses in the Unicover affair will, probably, not be fully settled 10 years from now.

I mean, I have seen these things before in insurance and in other areas, but particularly in insurance, where there are multitudes of parties, and there are allegations of stupidity, there's allegations of fraud, there's allegations of misrepresentation, there's allegations of everything.

There are so many people involved, there are so many factual matters to be determined. There will be lots of litigation. It will take a long, long time to sort out the litigation. In the end, the losses will get paid by somebody. Our best estimate we've put up is 275 million.

But we may find out far more in coming months and years, as to the involvement of other parties or — we can find out a great many things, because there will be lots of litigation, not necessarily involving us, but that we will, as a — even as a viewer of — we will be learning things about what took place.

Unfortunately, there have been some similar things in insurance. We were involved in something that had some similarities to this at National Indemnity, 20-odd years ago. And it was very expensive to us.

It didn't cost us that many millions of dollars, but it happened at exactly at the time that the stock market was down around the 600 on the Dow, and we did not know how big the losses would be. And therefore, it caused us to have to be more conservative in investing in equities than would have otherwise been the case, if this hadn't been hanging over our head.

So conventional accounting will never pick up the loss that we suffered in that.

It was called the Omni affair. And like I said, it had some — I'm sure it had many differences, too, but it had some similarities. And, you know, it can — it's distracting to have something like this that obviously — there was some mix of mistakes, there's some mix of misinformation. All of that will have to get sorted out.

Our best guess right now is that, when it's all done — 10 years from now, 15 years from now — the 275 million will be our loss. That most certainly won't be the exact figure. But like I say, if there's any reason to revise that number upward, we'll let you know promptly.

It is the nature of insurance that you get unpleasant surprises from time to time.

Loews Corp. bought CNA in the early 1970s. And just in the last few years, there was a fiberboard settlement on a policy, I believe, that was written in the late '50s. And there was a, as I remember, a billion and a half dollar loss on something where the premiums were a few thousand dollars.

GEICO has lost, as I remember, $60 million on a book of business that was written in the early 1980s, where the total premium was less than $200,000. You know, how much of that is stupidity, how much of it is fraud, or who knows exactly? But you can get some very unpleasant surprises in insurance.

And unfortunately, this will not be the last one. It won't occur in the same place, it won't occur exactly the same way. But the nature of insurance is that the surprises are on the unpleasant side.

It's not the kind of thing that happens when you're writing personal auto insurance or anything of the sort. But when you write business where the claims pop up 10 or 20 or 30 years later — I think we've got a claim, a small workers' comp company that we have, that goes back 20-odd years, 25 years or so, and it's just popped up to life in the last year or so. And it costs real money.

So it's a business where the surprises can come big and they can come late. And that will happen even with good management. But with good managements, you'll have fewer such surprises.

Charlie?

CHARLIE MUNGER: Well, that was a marvelous question. And imagine anybody asking a question of how to get educated — who knows how to educate people? It's the same way you educate the dog by rubbing his nose in it. (Laughter)

And generally speaking, that was a dumb error. That was an amateur's mistake.

It doesn't mean that General Re is suddenly full of amateurs. It was a rare lapse, just as at Berkshire, we think the Omni affair was a rare lapse. I don't think we've repeated it since. Have we, Warren? I can't think of a single one.

WARREN BUFFETT: But again, you know, we don't know that we've repeated it.

CHARLIE MUNGER: Well but —

WARREN BUFFETT: These things pop up later. No. No, the answer is we haven't repeated it. (Laughter)

CHARLIE MUNGER: So yes, it was a dumb, amateurish error. These things do happen. We don't think it reflects a sudden lowering of the intellectual standards of General Re, which are probably the best in the world. It's just one of those things that does happen once in a while.

And there's one good side to these things, it does make you more careful. It really refreshes your attention to get banged on the nose like that.

WARREN BUFFETT: Yeah, and it remains to be seen where the costs of that will be born. Because the entire set of facts, in terms of what was committed to and all of that, it has not been resolved yet.

In the Omni situation, we had significant disputes on the facts for some time, and we eventually recovered a fair amount of money that, for a time, it didn't look like we would recover.

So, you know, the final chapter on this is not going to be written for some time, but it was appropriate to set up $275 million as a reserve, in terms of what we know at this time. And that number could go up. It could also go down, depending on the facts that we discover.

18. Berkshire buyback unlikely

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: My name is Mike Seeley (PH) from Summit, New Jersey.

Would you please revisit the question of share repurchase for Berkshire Hathaway?

We have heard, today, your comment about the price of Berkshire having been inefficiently priced from time to time in the past. We know that there are now more shares outstanding.

And I'm curious as to whether the buildup of cash is causing you to spend more time looking for investment situations where you're more comfortable on the 10-year outlook. Thank you.

WARREN BUFFETT: The question of repurchasing shares — and I made that comment about it being inefficiently priced at times — at those times it always seemed to us — and we were incorrect in some cases — it always seemed to us that there were other securities that were even less efficiently priced.

When Berkshire in 1974 sold at $50 a share, I might have thought it was cheap. But I also was looking at the whole Washington Post Company selling for 80 million when I thought it was clearly worth 400 million. And I did not think that Berkshire was underpriced then as the Washington Post Company was.

And that has been true at various times when — there have been times when I thought Berkshire has been underpriced, or even significantly underpriced, but at the same time I was finding other things which I felt were even more attractive.

And like I said, many times I was wrong. We would have been better off buying our own stock instead of buying the things that I was buying.

But the — if we have money around, and we think Berkshire is significantly underpriced, and we're not finding other things to do with money, it obviously makes sense for us to repurchase Berkshire shares.

I think it's difficult for most companies in this market, even though repurchases are probably at close to an all-time high, if not at an all-time high, I think it's difficult for most companies to be repurchasing — have a repurchase of shares make a whole lot of sense these days.

I mean, I do not think they're getting much for their money, because we don't want to buy those shares ourselves. And it's — and I'm talking about the stock of various companies in America.

And yet, companies are much more enthusiastic about repurchasing shares now than they were 20 years ago when they were getting far, far greater returns from repurchasing.

We will always — it's an option that we will always think about. And we're unlikely to do it unless we think it's fairly dramatically underpriced because it's simply — we would want a big margin for error in making that kind of a decision that — not want to — we would not want to buy a dollar bill for 95 cents, or 94 cents, or 93 cents.

But there is some level where we would start getting excited, if we didn't have other uses for the money. Charlie.

CHARLIE MUNGER: I've got nothing to add to that.

19. Strong reputation will help us with internet commerce

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: Good afternoon. Wes Thurman from Stanford, California.

You mentioned earlier about the power of the brands on the internet. And I really can't think of a better brand, at least in my name, as the Berkshire Hathaway brand.

And, I guess, going forward, have you thought about ways to use that Berkshire Hathaway name, you know, further on the internet to capitalize on the reputation you've built over the past decades as a —

WARREN BUFFETT: Yeah. That's a very good point and it is something that could be of real value. It's already probably of some value to us with the brands that we're associated with.

I mean, I do think that Executive Jet or the NetJets program associated with Berkshire Hathaway, that — Borsheims associated with Berkshire Hathaway, Berkshire Hathaway Life associated with Berkshire Hathaway — I think those brands are enhanced by the association with Berkshire, as some other brands would be.

But I think that's got a long way to go. I think you're dead right on that, that the internet reinforces the necessity for trust in dealing with people.

I mean, you are getting further and further removed from the face-to-face dealing where you can go back to the store the next day or look at the person who sold it to you the next day and get an adjustment or something of the sort.

You're really having to place more and more trust in somebody you're never going to see. And I think you're right that Berkshire Hathaway, if it behaves itself properly, can get a reputation for trust that will be far greater than that possessed by the average company.

And that when we properly associate that with some of our brands that those brands will be enhanced by the association.

So I — no, I've thought a lot about what you're talking about there and so have our managers. And it's something that we intend to capitalize on in the future.

It's rather interesting, I mean, if you look at the companies that do business with people where there's no face-to-face interaction, either with the company itself or some intermediary like a retailer or anything of the sort, I mean, you've got Dell Computer, now you have Amazon.com.

But GEICO is doing business with, now, 3.7 million policy holders and it'll do — before the year is out — it'll be close to 4 1/2 million, and probably 4 billion-8 or so of business with people that have never met anyone from GEICO, they've talked to someone on the phone.

But we are one of the largest companies in the United States, in terms of doing business on a direct-to-consumer basis. We're doing it with people who on average are paying us $1,200 a year or thereabouts for a promise.

So we have a connection that people that talk about the Amazons of the world, where people are buying X dollars' worth of books, we're — have a much more direct connection with people who tend to renew with us year after year.

That is based on trust. I mean, it's not based on the neighbor next door who is — who they can go to if they have a problem. It's based on the fact they trust this company that's in — back in the District of Columbia, Washington, to perform in the future.

And that's a huge asset. And it's growing daily. I mean, we are adding policy holders every day who are signing up with us, who have never met anybody from the company. And that, already, I mean, it's a very big asset. It will be many times bigger, in my view, 10 years from now.

The Berkshire Hathaway umbrella that gets involved in one company after another like that, that people trust, I mean, we can be in an awful lot of homes over the years.

And as more and more business becomes done on an indirect basis, or a direct basis with the consumer, the power of that, in my view, should grow. And we just have to be very smart about how we maximize that growth.

Charlie?

CHARLIE MUNGER: Nothing to add.

20. Management, moats, and the certainty of future earnings

WARREN BUFFETT: OK. Zone 1.

AUDIENCE MEMBER: Hi. My name is David Zelker (PH) and I currently live in Redmond, Washington where I work for one of your good friends. So if I get into trouble for having taken a busy Monday off work, maybe if I give you a call you could put in a word for me.

WARREN BUFFETT: If it's without pay, we won't complain. (Laughter)

AUDIENCE MEMBER: It's vacation, yeah.

My question is about how you two assign value to certain intangibles that I know you look at when you value companies.

Anyone who's read your writings knows that you look for great management and economic moats, as you call them, that enable companies to raise prices and margins.

I'd like you to drill down with us and tell us what, to you, are the signs of great management and economic moats.

And furthermore, do you try to put a dollar value on those management and moats and other intangibles when you value companies? And if so, can you guide us through your thinking there?

And lastly, I'm interested in how you pick your discount rate. I'm actually a — an alma mater of yours from business school and I learned a bunch of junk about beta, too.

I read that you just assign the Treasury rate. And I'm not sure if that's right, but I'd love for you to talk about your discount rate. And I'd really appreciate as much detail about your thinking as you can give us, please.

WARREN BUFFETT: Yeah. We do — we think, in terms of the Treasury rate, but as I said earlier, that doesn't mean we think once we've discounted something at the Treasury rate, that that's the right price to pay. We use the Treasury rate just to get comparability across time and across companies.

But a dollar earned from a horseshoe company is the same as a dollar earned from an internet company, in terms of the dollar.

So it is not worth more, based on whether somebody — it comes from somebody named dot-com, you know, or somebody that — named, you know, the Old-Fashioned Horseshoe Company. The dollars are equal.

And our discount rates, they reflect different expectations about future streams of income, but they don't reflect any difference in terms of whether it comes from something that the market is all enthused about or otherwise.

The moat and the management are part of the valuation process, in that they enter into our thinking as to the degree of certainty that we attribute to the stream of income — stream of cash, actually — that we expect in the future and the amount of it.

I mean it is, you know, it is — it's an art, in terms of valuation of businesses. The formulas get simple at the end.

But if you and I were each looking at the chewing gum business — we own no Wrigley, so I use Wrigley fairly often in class — pick a figure that you would expect unit growth of chewing gum, you know, to grow in the next 10 or 20 years.

Give me your expectations on how much pricing flexibility you have, how much danger there is that Wrigley's share of market is dramatically reduced. You can go through all of that. That's what we go through.

That is — and in the — in that case, we are evaluating the moat. We are evaluating the price elasticity, which interacts with the moat in certain ways. We're evaluating the likelihood of unit demand changing in the future. We're evaluating the likelihood of the management being either very bright with the cash that they develop, or being very stupid with it.

And all of that gets into our evaluation of what that stream of money looks like over the years.

But the value of — how the investment will — works out depends on how that stream develops over the next 10 or 20 years.

We had a question earlier today that made certain suppositions about what could happen at Berkshire. And the formulation was exactly right. The question of what numbers to use is another question, but the formulation was proper. And that formulation — the moat enters into that. If you have a big enough moat, you don't need as much management.

You know, it gets back to Peter Lynch's remark that he likes to buy a business that's so good that an idiot can run it, because sooner or later one will. Well — (Laughter)

That's — I mean, he was saying the same thing. I mean, he was saying that what he really likes is a business with a terrific moat where nothing can happen to the moat. And there aren't very many businesses like that. But then — so you get involved in evaluating all these shadings.

This [a can of Coca-Cola], not the cherry version, but the regular version — this one, has a terrific moat around it. There's a moat even in this, you know, in the container.

You know, I — there was some study made as to what percentage of the people could identify blindfolded what product they were holding just by grabbing the container. And there aren't many that could score like Coca-Cola in that respect.

So here you've got a case where that product has a share of mind. If there's 6 billion people in the world — I don't know what percentage of them have something in their mind that's favorable about Coca-Cola, but it would be a huge number.

And the question is, 10 years from now is that number even larger, and is the impression just a slight bit more favorable, on average, for those billions of people that have it? And that's what the business is all about.

If that develops in that manner, you've got a great business. I think it's very likely to develop in that manner, but that's my own judgment.

I think it is a huge moat at Coca-Cola. I think it varies by different parts of the world and all of that. And I think, on top of it, it has a terrific management.

But that — there's no formula that gives you that precisely, you know, that says that the moat is 28 feet wide and 16 feet deep, you know, or anything of the sort. You have to understand the businesses.

And that's what drives the academics crazy, because they know how to calculate standard deviations and all kinds of things, but that doesn't tell them anything. And that what really tells you something is if you know how to figure out how wide the moat is and whether it's likely to widen further or shrink on you.

Charlie?

CHARLIE MUNGER: Well, you aren't sufficiently critical of the academic approach. (Laughter)

The academic approach to portfolio management, corporate finance, et cetera, et cetera, is very interesting. It's a lot like Long-Term Capital Management. How can people so smart do such silly things? And yet, that's the way it is.

WARREN BUFFETT: That's the great book that needs to be written, really, is, you know, why do smart people do dumb things?

And it's terribly important, because we've got a lot of smart people working with us and, you know, if we can just exorcise all the dumb things, you know, it's just amazing what'll happen.

And to some extent, the record of Berkshire, to the extent it's been good, has been because we — not because we've done brilliant things, but we've probably done fewer dumb things than most people.

But why smart people do things that are against their self-interest is really puzzling. Charlie, tell me why. (Laughs)

CHARLIE MUNGER: Well the — you can argue that the very worst of the academic inanity is in the liberal arts departments of the great universities.

And there, if you ask the question, what one frame of mind is likely to do an individual the most damage to his happiness, to his contribution to others — what one frame of mind will be the worst?

And the answer would be some sort of paranoid self-pity. Couldn't imagine a more destructive frame of mind. Now you have whole departments that want everyone to feel a victim. And you pay money to send your children to places where this is what they teach them.

It's amazing how these pockets of irrationality creep into these eminent places.

One of the reasons I like the Berkshire meetings is I find fewer of those silly people. (Laughter and applause)

WARREN BUFFETT: He excluded the head table from (inaudible). (Laughs)

21. Berkshire B can sell at a discount to the A shares

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: My name is Gaylord Hanson. I'm from Santa Barbara, California.

And I'm a rookie as an investor with Berkshire Hathaway, because I only started investing last November. And if this is a typical annual meeting, I will be here every first Monday of May the rest of my life. (Laughter)

WARREN BUFFETT: And we'll be glad to have you. Thanks. (Applause)

AUDIENCE MEMBER: Now I'm very proud to have finally uncovered Berkshire Hathaway and am an investor. But I may have made a slight error in which issue to buy, A or B.

I watch my investments rather closely, and I do believe in buying and holding. I don't buy and trade at all. I buy — I've got things I bought 10, 15 years ago, and I still have them, and I've made a lot of money.

But I made an — I make an analysis, every December 31st, on my portfolio. And I looked at Hathaway A and I looked at Hathaway B on January 1st, and again on the 23rd of April. Hathaway A was up 10 percent since January 1st. Hathaway B was 5.3 percent. Now I don't like that.

Now, I must confess that I'm not inclined to buy a $77,000 stock and buy one of your 5 or 10 shares. But in this instance, because I bought a fair little bit of it, I bought the B and my increase in value, per share, is 4.7 percent less in B than in A. And I got to have that explained to me — (laughter) — by Mr. Buffett.

WARREN BUFFETT: OK. (Applause)

AUDIENCE MEMBER: Have one other — one further comment. (Laughter)

You mentioned the 30 times the B being an A value. Well, if I multiply the value on the 23rd of May — of April — of $2,474 per share by 30, I come up with 74,220 but the price of A was 77,000.

Now I want to know whether I'm stupid or some good intelligent answer from Mr. Buffett.

WARREN BUFFETT: OK. The — (Laughter)

If you read what we've got, both in the original offering on the B, as well as on the website, explaining everything, the A can always be converted into 30 shares of B.

So, it can't sell for anything other than a very tiny amount less than 30 shares of B. And if it went below that, arbitrage would occur. But it doesn't convert the other way.

So there's no question that, whereas a share of B can never be worth more than about 1/30th of A, it can be worth less, because the conversion doesn't run the other way.

Now at year-end, I didn't look at the prices, but obviously the A and B were at almost parity, or probably at parity from what you say.

And at that level we say that if you're buying at least 30 shares of B, you're better off buying the A because you can always go — you can always convert it into 30 shares of B. And without having paid any premium, you can't lose money and you can gain money if the B goes to a discount.

The B will periodically go to a discount against the A. It depends on the supply and demand of the two securities. The B will not go to a premium above the A of any significant amount because then conversion occurs. And we've had a lot of conversion occur.

I have personally said on the website, for example, that I think when the B is at more than a two percent I would rather buy the B, if it was me.

But if it's at less than a two percent discount, I'd probably buy the A, because I just think that you've always got the right to go one direction and you don't have the right to go the other direction.

I would predict, as I think I did just a little earlier, that if you take the next 10 years, you're going to find a significant number of months when the two stocks trade at parity, at 30-to-1 relationship, and you're going to find a significant number of months when the B sells at a discount.

When people who are buying smaller amounts are the more aggressive buyers of the stock, they will push the B up to the point where A gets converted into B. And that means that the B is selling at a slight, very slight, premium over the A.

And when you find times when people are, on balance, preferring their larger buyers, maybe institutional buyers, then the A will tend to sell at some premium.

I think that — you may have picked on April 23rd. My guess is it's narrowed a little bit, because I think it's a 3-and-a-fraction percent discount at the moment.

But I would sort of use that guideline I stuck on the website, although there's nothing magical about it. Those will be the prevailing facts.

I mean, if the B is selling at 2,500 and the A is selling at 75,000, a 30-to-1 relationship, and you were buying at least $75,000 worth of stock, I'd advise you to buy the A because you — the next day, if you wanted to you could convert it into 30 shares of B. And —

But you can't buy 30 shares of B and convert it into one share of A.

So, I'm not sure on the day you actually bought — if you bought B, it sounds as if you did — on the day that you actually bought B, I don't whether you were buying it at a discount or not. Most of the time last year it did not sell at a discount.

Most of the time this year it has sold at a discount. There will be times when it will sell at parity and there will be times when it sells at a discount.

Charlie?

CHARLIE MUNGER: Yeah. When you made your original decision to buy the lower priced of the two stocks, you made a mistake. (Laughter)

WARREN BUFFETT: Well, if he was buying at least 30 shares —

CHARLIE MUNGER: Yeah. Yeah. If you were buying at least 30 shares.

And now that the stock, the B stock, is down to such a discount versus the A, Warren is saying he would hold the B. What could be simpler? (Applause and laughter)

WARREN BUFFETT: We'll try and make both the A and B work out fine. (Laughs)

But it — there — you should understand the relationship of the two. And we tried to be extremely clear about that when we brought up — we had a page that — which we devoted precisely to that point.

And we have put — I put this thing up on the website because I was getting some mail that was questioning this. People clearly didn't understand it, so I put this up on the website.

And if you click on the — our homepage, you will see some reference to something else you can click that says the relative situation on the A and B. And I hope it's clear.

22. "The average insurance company is going to remain very average"

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Hi, my name is John Loo (PH) from New York City.

First, let me start out by thanking both of you for the incredible education that you've provided me through your annual reports and various presentations that you've given in public and in publication.

I was about to send you my tuition check last week, but instead I decided to buy more shares of your company. I hope you'll forgive me.

WARREN BUFFETT: No, you learned well. (Laughter)

AUDIENCE MEMBER: My question basically centers around the insurance industry at present.

Right now, there's excess capacity, which comes and goes, typically speaking. But there seems to be a trend towards international consolidation. And also, there seems to be a trend towards demutualization in the life insurance companies in the U.S.

I was wondering if you could give us your thoughts on what the future face of the insurance industry will look like.

WARREN BUFFETT: Yeah, I — both of those trends do exist, that you talked about.

I don't think that consolidation usually solves many problems. I mean, if you have two lousy businesses and you put them together, you've got a big, lousy business, usually. (Laughter)

And I am not a big fan of consolidation where the theory is that you're going to — you really have two very mediocre businesses and you're going to wring the costs out of one. And it doesn't — it just doesn't work that way in my experience.

But the consolidation will go on, and the demutualization of life companies will go on.

It's not inconceivable that we would play some part in one or the other in some way, although it's not high on our list. But I've learned in this business never to say never because things do happen that have caused me to want to retract some earlier statements.

The winners are going to be the people that have some franchise based on specialized talents, on terrific distribution systems, managerial know-how, even the ability to use the float effectively.

And in the case of something like GEICO, on the superior — it's combined with a franchise — a superior distribution system. We have the low-cost method of distributing personal auto insurance on a — on an all-comers basis.

USAA does a terrific job of delivering low-cost insurance to a specialized group.

GEICO actually came — in a sense — came out of USAA. Leo Goodwin and his wife, Lillian, who founded the company in 1936, were both employed by USAA. And I — Leo, as I remember, was an officer of the company.

So the idea of GEICO came out of a USAA, but they've limited it to a given class. We offer it to everybody in the country, except we can't offer it in New Jersey or Massachusetts because we can't figure out any way to make any money there.

Twentieth Century has done a terrific job of becoming a low-cost operator in a given urban area, in the greater Los Angeles area.

But in terms of an all-comers, all-geography, all-occupation-type operation, in my view, GEICO is the best operation in the United States. And better yet, consumers around the world are agreeing — around the country — are agreeing with that view.

GEICO gained, last year, 20.8 percent policy holders. This year, in the 12 months ended March 31st, it's up 22.5 percent policy owners.

These are on big numbers. The base and the growth has accelerated. So that kind of — that sort of advantage will make for a good insurance — a very good insurance business over time.

I think the average insurance company is going to remain very average, and there is a lot of capital in the industry, as you pointed out. There's more capital in the industry than there is opportunity to use it intelligently.

And nevertheless, it doesn't go away. You are not seeing consolidation that takes away a lot of the capital of the industry, you're not seeing massive repurchases or anything of the sort.

So the capital is there. It's seeking an outlet in premium volume. That actually hurts a General Re to an extent because it means that the primary companies want to retain more of the premium they generate, just so they can show some kind of growth against this capital base.

I think generally, we're very well positioned in the industry. I think the industry will be tougher in the next few years by a significant margin in the personal auto business. But frankly, I look forward to it because I think we — it may offer us the opportunity to grow even faster.

We — you know, we have the best vehicle in a very, very big industry, the auto insurance business. And we've got incredibly good management to take advantage of that. And we've got policies available as you leave at the door. (Laughter)

Charlie?

CHARLIE MUNGER: Nothing to add.

23. China: huge growth potential for Coca-Cola and Gillette

WARREN BUFFETT: Zone 4.

AUDIENCE MEMBER: Good afternoon and thank you. My name is Paul Worth. I'm from Wichita, Kansas. And my question is as follows.

For the consumer franchise companies that Berkshire owns, Coca-Cola and Gillette in particular, in which emerging markets do you see the greatest 10-year potential for unit sales growth? And what economic, political, or social changes are precipitating that growth?

Secondly, do you believe that the U.S. market cap, as a percent of the world's, at 53 percent, is near its zenith? And which countries do you believe will likely show the greatest percent growth in total market cap?

WARREN BUFFETT: Well, I wish I had the answers. The first question, though — obviously, when you're dealing with something like Coke, is raw numbers. I mean, there's huge potential in a country, you know — with the largest country in the world, and in China, where the per capita consumption is very, low but is growing very fast.

So it's very easy for me to predict, and probably be right, absent some tremendous upheaval or some real surprise, that China would be the fastest growth market among countries of any size in the world for Coke from this level.

But that's based on the fact that you've just got a huge number of people that clearly like the product, that are starting from a very low base, and where a lot more bottling infrastructure is going to be needed, but which will be supplied to facilitate that growth.

With Gillette, it's a little different. People are already shaving. What you do is you upgrade the shaving experience that they have. So you have great differences in the quality of the blades available throughout the world. They call them shaving systems when you get into the more advanced ones.

And what happens is that, as people's disposable income grows, they are — they trade up. And they get a much more enjoyable shaving experience, and they get better shaves than was the case when they were forced to rely on the lowest-priced product.

But both of those companies have tremendous opportunities as the prosperity around the world — as the standard of living grows.

And there's just no doubt in my mind that in the blade and razor business for Gillette, which is only a third of their business, but — and in the soft drink business for Coke, they're going to share in it. It'll be uneven in the years that it happens and all of that sort of thing.

But I would almost guarantee you that 10 or 20 years from now, both of those companies will be doing a lot more business in their — in those areas I named than currently.

And, you know, it — we don't fine tune it a lot more than that. I mean, I do not sit and work out — try and work out — country by country, what's going to happen with a Gillette or Coke. It would be a waste of time. I wouldn't know the answer anyway.

But I'm pretty sure the conclusion that both of them will prosper a great deal — and I would hate to be competing with either one of them — here or anywhere else in the world. I mean, they have the winning hand.

Charlie?

CHARLIE MUNGER: Well, I agree with everything you said. And I'd like to add that, if I knew for sure that the United States share of worldwide market capitalization was going to go from 53 percent down to 40 percent, I wouldn't know how to make money out of that insight by running around buying foreign securities.

WARREN BUFFETT: Yeah, we just don't operate on that basis. And, I mean, you know, a few years ago emerging markets were all the rage.

And every institution in the country was getting promoted by somebody who said, "I'm going to run an emerging markets fund." And they felt they had to participate in it and their advisors told them they had to participate.

We regard that all as nonsense. You know, in the end, you've just got to think for yourself about what you know and what you don't know and go where that leads you.

And you don't do it by buying into things with names on them, or sectors, or country funds, or that stuff. You know, that's merchandise that's designed to sell to people and it's usually sold to people at the wrong time.

CHARLIE MUNGER: Yeah. Our game is to find a few intelligent things to do. It's not to stay up on every damn thing that's going on in the whole world.

WARREN BUFFETT: Yeah.

24. Munger recommends a book about Buffett

WARREN BUFFETT: Zone 5. (Applause)

AUDIENCE MEMBER: Hello, my name is Everett Puri. I'm from Atlanta, Georgia and I've two questions.

One is for Mr. Munger in our never-ending effort to have the Munger Book Club surpass the Oprah Book Club. I was wondering if you could make some recommendations.

CHARLIE MUNGER: Yeah.

AUDIENCE MEMBER: The second is, it seems that with the pharmaceutical industry earlier, that the threat of government regulation or government appropriation of those cash flows led to a reasonable market opportunity, and the same thing with Sallie Mae.

And I'm wondering if you feel that that's going on with the tobacco industry now or if that is a larger threat to that industry, larger and permanent threat.

CHARLIE MUNGER: Well, number one, the books.

[Robert] Hagstrom sent me chapters of his latest book on Warren Buffett called, "The Buffett Portfolio." And I didn't read them because I thought his first book was a respectable book, but didn't contribute too much to human knowledge, and — (Laughter)

(Inaudible) sent me the second book, a full version, and I read it and I was flabbergasted to find it not only very well written, but a considerable contribution to the synthesis of human thought on the investment process. And I would recommend that all of you buy a copy of Hagstrom's second Buffett book.

I notice the airport was heavily promoting it. It's called, "The Warren Buffett Portfolio." It doesn't pick any stocks for you, but it does illuminate how the investment process really works, if you think about it rationally.

Another book that I liked very much this year was "Titan", the biography of the original John D. Rockefeller. That's one of the best business biographies I have ever read. And it's a very interesting family story, too.

That is was just a wonderful, wonderful book. And I don't know anybody who's read it who hasn't enjoyed it. So I would certainly recommend that latest biography of John D. Rockefeller the first.

The third book is sort of a revisitation of the subject matter of the book I recommended a year or two ago called "Guns, Germs, and Steel," which was a physiologist's view of the economic history of man. And it was a wonderful book.

And much of that same territory has now been covered by an emeritus history professor from Harvard, who just knows way more economics and science than is common for a history professor. And that gives him better insight.

And his book is a takeoff in title on Adam Smith, and the title is, “The Wealth and Poverty of Nations.” And the guy’s name is [David] Landes. So I would heartily recommend those 3 books.

25. Tobacco far more threatened than pharmaceuticals

CHARLIE MUNGER: Now what was the third question?

WARREN BUFFETT: The other question was about tobacco and pharmaceutical —

CHARLIE MUNGER: Oh, tobacco.

I don’t know about Warren, but I think the legislative threat to tobacco is serious, and I haven’t the faintest idea of how to predict it.

WARREN BUFFETT: Yeah. I would say that there’s no comparison between the threat to tobacco, currently, with the threat to pharmaceuticals in 1993 — that the problems of the tobacco companies are of a far different order than the problems of the pharmaceutical companies.

Nobody was against pharmaceuticals. They were just — had different ideas about maybe pricing, and distribution, and all of that. But tobacco’s a different story. I mean, tobacco companies — well, you can figure it out for yourself.

26. Buffett’s book recommendations

WARREN BUFFETT: The — in terms of books, I would recommend — many of you have may have read it, but this goes back more than a year, but I would — if you haven’t read Katharine Graham’s autobiography [“Personal History”], it is one terrific book.

It’s a very incredibly honest book. And it’s a fascinating story. I mean, it’s a life that’s seen all kinds of things in politics and in business and in government. So I — it’s a great read.

A book that came out just in the last few months in the investment world that I would certainly recommend to everybody is “Common Sense on Mutual Funds,” by Jack Bogle.

Jack is an honest guy, and he knows the business. And if mutual fund investors listen to him, they would save billions and billions of dollars a year. And he tells it exactly like it is. So I — he asked me for a blurb on the book, and I was delighted to provide it.

27. Expect “huge impact” from internet, but too hard to pick winners

WARREN BUFFETT: Let’s go to zone 6, please.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and good afternoon, Mr. Munger. My name is Mohnish Pabrai and I'm from the Chicago area.

Mr. Buffett, I'd like to thank you for all your insights over the years. I'm especially amazed at the pace of which you answer my letters, point by point.

I have a question for you related to circle of competence. I have a notion that both Mr. Munger and yourself understand the Kleiner Perkins model of early-stage venture capital investing and, currently, their focus in the internet space, extremely well.

My notion is that I think it is well within your circle of competence to understand what they do, just like you understand what your managers at See's Candy or Executive Jets do.

So the question is, that with the internet, I think we're seeing a change that has not been seen in the last 500 years as humans. We haven't seen something that is as dramatic and as profound that's going to come upon us.

If, let's say, a John Doerr at Kleiner Perkins approached you and said that they were starting, let's say, a billion-dollar early-stage or later-stage internet investment fund that Kleiner would manage, would you consider that — would you consider participating in that investment to be within your circle of competence, if it were offered at terms that looked attractive?

WARREN BUFFETT: I agree with the first part of what you said. I mean, I'm not sure that it'll, necessarily, will be the most important in the last 500 years in the commercial world. But it could well be. And if it isn't, it's right up there.

I mean, it is — and we talked about this last year and maybe even the year before — I mean, it is a huge development. But — and I would say that Charlie and I both understand the process of early investment/promotion probably as well as anyone.

We haven't participated in it. There are certain things we don't even like about it. But we do understand it. Right, Charlie? (Laughs)

And I would say that no, we would not have an interest in investing in the fund. It — we do not necessarily regard the internet —

There's no question, if you're in the early stages of promotion, and you — particularly if you've got a reputation as a successful in that — but in this case, it wouldn't make much difference, because the whole field has gone wild — you will make a lot of money selling to the next stage, and the next stage, and the next stage.

But, in terms of picking out businesses that are going to do wonderfully as businesses — not as stocks for a while, but as businesses — I don't think it's necessarily so easy in the internet world.

And I would say that, if you were to ask some very top names in the field to name the next five companies out of the chute, or the next 10 companies out of the chute, and predict that one of them will earn, say, the $200 million I used as a threshold, six or seven years from now, I'm not so sure, if they gave you a list, that they would name a single one.

That doesn't mean they might not make a lot of money by being early investors in them because they sell out to the next group and so on.

But in the end, they have to succeed as businesses. And a few will succeed as businesses. The internet will have a huge impact on the world. But I'm not so sure that makes it an easy investment decision.

Charlie?

CHARLIE MUNGER: Well, at least it's not an easy investment decision for us. And that's what we're looking for.

28. "We will never turn our money over to somebody else"

WARREN BUFFETT: Yeah. We will never turn our money over to somebody else. You know, if we're going to lose your money as Berkshire shareholders, we're going to lose it ourselves and we're going to come back and look you in the eye and tell you how we lost it.

We are not going to say this game is too tough, so we'll give our money to somebody else. You can give your money to somebody else, and you don't need the intermediaries of me and Charlie to do it for you.

So, we get approached all the time. I had a call, you know, within the last couple of days, on something you would know very well about participating in some fund or — they always have — it's always stage one, stage two, stage three.

And the idea is we get some more people to come in later at twice the price, and maybe the fact that our name is involved, and it will cause people to pay even more, and all of that sort of thing. We're not in that game.

And we're not going to turn the money over to someone else to manage. It's your money. You gave it to us to manage. We'll manage it. If you decide you don't want us to manage it, you decide who you give it to. We're not going to be intermediaries on it.

And if we don't understand something ourselves, we're not looking for anybody else to do it for us. It — the world doesn't work very well that way, anyway.

I mean, it — usually you end up in the hands of the promoters and not the hands of the people who really know how to make money.

Charlie? You want to? He said it.

29. Selling McDonald's was bad; postmortems are good

WARREN BUFFETT: OK. Zone 7.

AUDIENCE MEMBER: Peter Kenner from New York City. Good afternoon, Warren, Charlie.

WARREN BUFFETT: Hi, Peter.

AUDIENCE MEMBER: Good to see you. I'd like to ask you what your thought process was when you, or share with us your thoughts, when you decided to sell McDonald's.

WARREN BUFFETT: That must have been Charlie's idea, Peter. (Laughter)

Peter, incidentally, is in a family that four generations have essentially invested with us. And they're all terrific people, I might add. His dad was a wonderful guy.

The — you know, I said it was a mistake to sell it, and it was a mistake. And I just reported that in the interest of candor. And there were some reasons why I thought it was something we — I didn't think it was, obviously, that it was any great short sale, or even a great sale.

But I didn't think it belonged in the list of eight or 10 of the businesses, of the very few businesses, that we want to own in the world. And I would say that that particular decision has cost you, hmm, in the area of a billion dollars-plus.

Charlie?

CHARLIE MUNGER: You want me to rub your nose in it? You're doing a — (Laughter)

You're doing a pretty good job by yourself. (Laughter)

By the way, that's a good practice around Berkshire. We do rub our own noses in it. We don't even need the help of the Kenners. (Laughter)

WARREN BUFFETT: We believe in postmortems at Berkshire. I mean, we really do believe — one of the things I used to do when I ran the partnership is I contrasted all sale decisions versus all purchase decisions.

It wasn't enough that the purchase decisions worked out well, they had to work out better than the sale decisions. And managers tend to be reluctant to look at the results of the capital projects or the acquisitions that they proposed with great detail a year or two earlier to a board.

And they don't want to actually stick the figures up there as to how the reality worked out against the projections. And that's human nature.

But, I think you're a better doctor if you drop by the pathology department, occasionally. And I think you're a better manager or investor if you look at every one of the decisions you've made, of importance, and see which ones worked out and which ones didn't and, you know, what is your batting average.

And if your batting average gets too bad, you better hand the decision making over to someone else.

Charlie, want to rub my nose anymore?

CHARLIE MUNGER: No.

WARREN BUFFETT: No, that's OK. OK. We're —

30. Looked "a little" at health insurance partners

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: Good afternoon. Ian Sacks from New York City.

This afternoon, through various questions and comments, we've mentioned the fact that the word "trust," which Berkshire Hathaway and the brand has. We've mentioned, basically, health, and the importance of health, and that being above everything else.

With Berkshire's competencies in the insurance industry and with the health care services sector being relatively depressed, is — although the dynamics would be different in the industry how risk is managed on an overall basis — has Berkshire looked at all, in terms of taking a position or buying a health insurance business?

WARREN BUFFETT: Charlie runs a hospital so I'm going to let him talk about this.

CHARLIE MUNGER: Sure. We've looked a little. We've looked at everything in turmoil that's important in the world. But so far it hasn't seemed to yield our particular mental approach.

WARREN BUFFETT: Yeah. I don't know who I would want to get in with in that business at the moment. That's not — I'm not condemning the people in the business, it just means I don't know. I'm not — I haven't been able to evaluate that.

And I think it would make an enormous difference, in terms of wanting to get in with a quality operation and quality people and at a sensible price. And we haven't seen that, but that doesn't mean we've canvassed the whole field either.

CHARLIE MUNGER: There is a significant percentage of schlock operators in the field who are painting the reality different than it is. That makes it harder.

31. "Journalistic process" good for learning about companies

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: Eric Tweedie from Shavertown, Pennsylvania.

I just wanted to express our appreciation of — regarding all the operating businesses that we've visited. They've been very warm and hospitable.

In fact, when we visited Executive Jets at the airport, the tour was so impressive my wife wanted to buy an airplane. (Laughter)

WARREN BUFFETT: What's her name? What's her name? (Laughter)

AUDIENCE MEMBER: Well, I won't say that —

CHARLIE MUNGER: Spell it out!

AUDIENCE MEMBER: American Express declined the $500,000 we tried to put on my card. (Buffett laughs)

But you can thank the chairman for me next time you see him. Just kidding, but —

My question regards, basically, approach to investing. I've been investing my own money in equities for about 10 years. And my results, overall, have been relatively good.

In the process, however, I've taught myself some very painful and costly lessons. For instance, my first equity ever purchased was a share of Berkshire Hathaway for $5,500 in 1990 and I sold it 3 months later for something over $8,000 and congratulated myself for the rapid and shrewd profit. (Laughter)

And earlier this year, I repurchased the same share for $70,000. (Laughter) And I intend to own it for the rest of my life. (Laughter) So you can see I'm growing. (Laughter)

My question is, I have no formal education in accounting and finance. And I would just like some advice from you regarding an approach to educate myself and a reading list of basic texts, obviously, starting with the Berkshire Hathaway annual reports. Thank you.

WARREN BUFFETT: Thank you, particularly for your comments about the people from our operating companies, because they have just been terrific. They come out here — (Applause)

They are here at five in the morning. They — I mean, they do a tremendous amount of work over this weekend. They're cheerful. I've met with them all on Saturday at lunch and, I mean, they're just one sensational group of people, and —

You know, I'm very proud of them. And the managers should be very proud of the people they brought with us. And I hope you get a chance to thank as many of them as possible personally.

Incidentally, at the See's counter you'll find Angelica Stoner, who's been with us for 50 years and, you know — here she comes from California to help us out and sell peanut brittle, and she's having a good time doing it. (Applause)

And the question you ask is a very good one about — you know, in terms of accounting and finance — what's the best way to teach yourself?

I was always so interested in it from such a young age, that I — my approach was go to the Omaha — originally, was to go to the Omaha Public Library and just take out every book there was on the subject. And I learned a lot — (laughs) — I learned a lot that wasn't true in the process, too. I got very interested in charting and all that sort of thing and buying stocks.

But I did it by just a tremendous amount of reading, but it was easy for me because, you know, it was like going to baseball games or something of the sort.

And in terms of naming specific texts in accounting, you know, I think you may want to read some of the better, even, magazine articles that have appeared. I mean, there've been - or newspaper articles.

There have been some good commentary about accounting there.

I don't have — can you think, Charlie, of any specific texts or anything that we could recommend?

CHARLIE MUNGER: I think both of us learned more from the great business magazines than we do anywhere else. It's such an easy, shorthand way of getting a vast variety of business experience, just to riffle through issue after issue after issue, covering a great variety of businesses.

And if you get the mental habit of relating what you're reading to the basic structure of the underlying ideas being demonstrated, you gradually accumulate some wisdom about investing.

I don't think you can get to be a really good investor over a broad range without doing a massive amount of reading. I don't think there's any one book that will do it for you.

WARREN BUFFETT: Yeah. You might think about picking out five or 10 companies where you feel quite familiar with their products, maybe but not necessarily so familiar with their financials and all of that.

But pick out something, so at least you understand what — if you understand their products, you know what's going on in the business itself. And then, you know, get lots of annual reports. And, through the internet or something else, get all the magazine articles that have been written on it — on those companies for five or 10 years.

Just sort of immerse yourself as if you were either going to work for the company, or they'd hired you as the CEO, or you're going to buy the whole business. I mean, you could look at it in any those ways.

And when you get all through, ask yourself, "What do I not know that I need to know?"

And back many years ago, I would go around and I would talk to — I would talk to competitors, always. Talk to employees of the company, and ask those kinds of questions. That's, in effect, what I did with my friend Lorimer Davidson when I first met him at GEICO, except I started from ground zero. But I just kept asking him questions.

And that's what it really is. You know, one of the questions I would ask if I were interested in the ABC Company, I would go to the XYZ Company and try and learn a lot about it. Now, you know, there's spin on what you get, but you learn to discern it.

Essentially, you're being a reporter. I mean, it's very much like journalism. And if you ask enough questions — Andy Grove has in his book — he talks about the silver bullet, you know.

You talk to the competitor and you say, "If you had a silver bullet and you could only put it through the head of one of your competitors, which one would it be and why?" Well, you learn a lot if you ask questions like that over time.

And you ask somebody in the XYZ industry and you say, "If you were going to go away for 10 years and you had to put all of your money into one of your competitors — the stock of one of your competitors, not your own — which one would it be and why?" Just keep asking, and asking, and asking.

And you'll have to discount the answers you get in certain ways, but you will be getting things poured into your head that then you can use to reformulate and do your own thinking about why you evaluate this business at this or that.

The accounting, you know, you just sort of have to labor your way through that. Might — I mean, you may be able to take some courses, even, in that. But the biggest thing is to find out how businesses operate.

And, you know, who am I afraid of? If we're running GEICO, you know, who do we worry about? Why do we worry about them? Who would we like to put that silver bullet through? I'm not going to tell you. (Laughter) That the —

You know, it's — you keep asking those questions. And then you go to the guy they want to put the silver bullet through and find out who he wants to put the silver bullet through. It's like who wakes up the bugler, you know, in the Irving Berlin song?

And that's the way you approach it. You — and you'll be learning all the time.

You can talk to current employees, ex-employees, vendors, supplies, distributors, retailers, I mean, there's customers, all kinds of people and you'll learn.

But it is a — it's an investigative process. It's a journalistic process. And in the end, you want to write the story. I mean, you're doing a journalistic enterprise. And six months later, you want to say the XYZ Company is worth this amount because, and you just start in and write the story.

And some companies are easy to write stories about, and other companies are much tougher to write stories about. We try to look for the ones that are easy.

Charlie?

CHARLIE MUNGER: Yeah. For the histories of the thousand biggest corporations laid out in digest form, I think Value Line is in a class by itself. That one volume really tells a lot about the histories of our best companies.

WARREN BUFFETT: Yeah. If you just look, there's 1,700 of them. If you look at each page and you look at sort of what's happened in terms of return on equity, in terms of sales growth, (inaudible), all kinds of things.

And then you say, "Why did this happen? Who let it happen?" You know, "What's that chart going to look the next 10 years?" Because that's what you're really trying to figure out, not the price chart, but the chart about business operation.

You're trying to print the next 10 years of Value Line in your head. And there's some companies that you can do a reasonable job with, and there's others that are just too tough. But that's what the game is about.

And it can be a lot of — I mean, if you have some predilection toward it, it can be a lot of fun. I mean, the process is as much fun as the conclusion that you come to.

CHARLIE MUNGER: Of course, what he's saying there, when he talks about why — that's the most important question of all. And it doesn't apply just to investment. It applies to the whole human experience.

If you want to get smart, the question you've got to keep asking is: Why? Why? Why? Why?

And you have to relate the answers to a structure of deep theory. And you've got to know the main theories. And it's mildly laborious, but it's also a lot of fun.

32. Creating value for subsidiaries by leaving them alone

WARREN BUFFETT: Zone 2.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. I'm Patrick Wolff, formerly from Cambridge, Massachusetts and soon to be from the San Francisco area.

Like many people around the world who want to learn about business, I've read all of your letters to the shareholders. And like many people here in this room, I was so impressed that I bought a piece of the company.

But I must admit that, in studying Berkshire Hathaway, there's one element that I didn't quite understand, and I'd love it if you could please explain it. And that is the following.

How does Berkshire Hathaway add value to the various wholly-owned companies in the manufacturing services and retail division?

And the reason I ask this question is, as you yourself said earlier this morning, it's very difficult in negotiated purchase agreement to buy a company for anything other than what it's truly worth.

So if Berkshire Hathaway is going to create value by buying such fantastic companies as the Nebraska Furniture Mart, or See's Candies, or any of the other fantastic businesses we have, there must be some way in which Berkshire Hathaway adds to that value. Could you please explain how we do that?

WARREN BUFFETT: In certain specific cases, the case of General Re being the most recent example, we actually laid out in the proxy material why we thought there was at least a reasonable chance that the ownership by Berkshire would add value.

And we got into various reasons about the ability to use the float, and tax advantages, and the ability to move faster around the world, and that sort of thing. So we've actually spelled that out in that case.

I think in the case of something like Executive Jet, you might well figure that there are some reasons why association with Berkshire would put Executive Jet on the map and in the minds of people who could afford to buy fractional ownerships of planes, faster than might otherwise be the case.

But usually the situation — so there are specific cases where we bring something to the party. But the biggest thing we bring to the party on a generalized basis is what I spelled out a little bit in the annual report this year in talking about GEICO.

We enable terrific managers to spend, in many cases, to spend a greater percentage of their time and energies on what they do best, and what they like to do best, and what is the most productive for owners than would be the case without our ownership.

In other words, we give them a very rational owner who expects them to spend all of their time focused on what counts for the business and eliminates the distractions that often come with running a business, particularly a publicly-owned business.

I would guess that the CEOs of most public companies waste a third of their time, at least, in all kinds of things they do that really don't add a thing to the business — in many cases subtract, because they're trying to please various constituencies and waste their time with them, that take the company backwards.

But we eliminate all of that. So, we simply can create an ownership — we think we can create the best ownership environment, frankly, that can exist — other than maybe owning it a hundred percent yourself — for any business.

And that happens to also go along with how we like to lead our lives, because we don't want to run around and attend a lot of meetings and do all of these things that people do. And that's — that can be a significant plus.

I think that GEICO has probably grown a fair amount faster as a subsidiary of Berkshire than it would have if it had remained an independent company, although it was a hell of an independent company and would have continued to be one.

But I think billions and billions of dollars will be added to the value of GEICO, over and above what would have happened if it had reminded a public company. Not because, as I put in the report —

Now we haven't taught the management one thing about the classification of insurance risk, or how to run better ads, or anything of the sort. We've just let them spend a hundred percent of their time focused on what counts. And that is a rare occurrence in American business.

Charlie?

CHARLIE MUNGER: Yeah. Just not having a vast headquarters staff to tell the subsidiaries what to do — that helps most of the kind of subsidiaries that we buy. They are not looking for a lot of people looking over their shoulder from headquarters, and a lot of unnecessary flights back and forth, and so on.

So, I would say most of what we do, or at least a great part of what we do, is just not interfere in a counterproductive way. And that non-interference has enormous value, at least with the kind of managers and the kind of businesses that have joined us.

WARREN BUFFETT: And a great many — you have to see it to believe it — but in a great many corporate operations, the importance of a large group of people is tied to how much they meddle in the affairs of other people who are out there doing the work.

And, you know, we stay out of the way. And we're appreciative owners and we're knowledgeable owners. We know when somebody has done a good job and we know when they've done a good job when industry conditions are terribly tough.

So, we can look at our shoe operations, for example. And, you know, they are in tough industry conditions now. We've got some absolutely terrific people. And we are knowledgeable enough about that, so we don't go simply by a bunch of figures and make a determination whether people are doing the right thing.

So, we've got — we're knowledgeable owners and we have no one whose job at headquarters is to go around and tell our managers how to run their human relations departments, or how to run their legal departments, or a dozen other things.

And not only do people have more time to work on the productive things, but I think they probably actually appreciate the fact that they're left alone.

So, I think you even get more than the proportional amount of effort out of them than would be indicated simply by the amount of time you free up, because I think you get even an added enthusiasm for the job.

And I think having people in a large organization that truly are enthusiastic about what they're doing, that doesn't happen all the time. But I think it does happen to a pretty good degree at Berkshire.

Charlie?

CHARLIE MUNGER: No more.

33. Intrinsic value of marketable securities

WARREN BUFFETT: OK. Zone 3.

AUDIENCE MEMBER: Gentlemen, hi, I'm David Butler from here in Omaha. A comment and then two quick questions. Comment is regarding the annual reports.

I read a lot of annual reports for a living, and I sort of start off with the assumption that I'm going to have to spend 20 to 30 hours looking at 5 years of 10-Ks and 5 years of annuals, probably some 10-Qs and going through a lot of numbers to have any kind of idea how the company really is working.

And comparing that to Berkshire, which has basically crystal-clear clarity, it's quite refreshing to read honesty, and it's quite refreshing to see accounting that's actually presented in a clear fashion and that doesn't try to hide facts.

So as a shareholder and as an investor, I'm very grateful for the effort and for the high quality of your annual report. And I think we ought to give Mr. Buffett and Mr. Munger a hand — (applause) — for that.

OK, now that I've brown-nosed a little bit. (Laughter)

WARREN BUFFETT: Here comes the zinger, huh? (Laughter)

AUDIENCE MEMBER: Yeah. I'm nervous about the derivative operations that General Re has. Now, right now the balance sheet figure says that there's a $400 million net asset position, but there are also some really hairy derivatives, the swaps and the floors and caps.

And knowing that, in the past, you haven't used those types of leveraged derivatives, I'm wondering if that's going to change now.

And then secondly, in terms of going through an intrinsic value calculation, when you and Mr. Munger think about intrinsic value, obviously, a big part of that is the marketable securities portfolio.

Do you think of intrinsic value, in terms of the marketable securities, as what their market value is, in terms of their look-through earnings, or is there a separate intrinsic value calculation that you sort of roll into the overall Berkshire intrinsic calculation?

WARREN BUFFETT: Yeah. I'll answer the second part first. On the intrinsic value, we tend to use the market prices in the way we think about things, although there are times when we feel that we own securities that are worth far more than they're carried for.

And we've mentioned that once or twice. There was a time in the mid-1970s, if you'd look back at our 1975 annual report — I may be off by a year, one direction or other — probably 1974, because I — we valued the securities at market.

But I — in the body of the report, I said we really think these things are going to worth — be worth a hell of a lot more than they're selling for currently. That was an unusual remark for somebody, if you knew me, that would be an unusual remark for me.

And at that time, I would have said that, in looking at the intrinsic value of Berkshire, I would have said that I was quite comfortable marking these things up in my mind. I wouldn't have done it with the public, but I would have done it in my mind.

But under most circumstances, we tend to think of the market value as being representative of it, that that is the price at which we could buy or sell that day.

And if we thought they were ridiculously high in relation to intrinsic value, we'd probably do something about it. And they certainly haven't been so low that we've ever felt like marking them up in recent — in our own minds — in recent years.

34. Must look "very carefully" at derivatives accounting

WARREN BUFFETT: The question about the derivatives business, it's a good business — it's a good question — because it involves big balance sheet numbers and big off-balance sheet numbers in relation to the amount of money made, and particularly in terms — in relation to the amount of money made in terms of the capital employed.

And the credit guarantees, the long-term nature, all of that makes that something that we will want — we do want to look at always very hard.

It's a business that people can get in trouble in and they can get in trouble while the accounting sails along merrily.

I remember when Charlie and I were at Salomon, we found — we didn't find it, other people found it finally, but — mismarked derivative positions that were very substantial that had gone on for a long period of time.

And this was with paying a lot of money to auditors to look at them.

Am I right about that, Charlie, on that? Charlie was on the audit committee.

CHARLIE MUNGER: The worst glitches were that the books just got so out of control, not in the derivative department, but there were just multimillion dollar errors.

WARREN BUFFETT: But we found mismarks, as I remember —

CHARLIE MUNGER: Yes.

WARREN BUFFETT: — in the 20-odd millions on —

CHARLIE MUNGER: Yes.

WARREN BUFFETT: — positions —

CHARLIE MUNGER: Yes. Both.

WARREN BUFFETT: In some cases, because the contracts got so complicated that the people that were valuing them didn't understand them, and — at least partially didn't understand them.

There's a lot of potential for mischief when people can write down a few numbers on a piece of paper and nothing changes hands for a long time and their compensation, you know, next month and this year, depends on what numbers are attached to a bunch of things that are not really — where they don't come to fruition for a long time. And particularly when you're guaranteeing credit or anything of the sort.

So, you're very correct in observing that, when the numbers are big in relation to the amount of profits, you want to look very carefully, because if anything goes wrong, it could go wrong on a fairly big scale, and you're not getting paid a lot for running that type of risk.

35. "We don't sugarcoat things"

WARREN BUFFETT: I very much appreciate what you said about the annual reports, though. We may disappoint you in how the business performs over time. I mean, that is not totally within our control. We'll try hard, but we can make no promises.

But we shouldn't ever disappoint you in either our accounting or in the candor of the reporting. I mean, that is in our control. We may not like what we have to tell you, but there's no reason for failure — there can be no reason for failure in the accounting or candor.

I mean, that is — there's — if we fail there it's because we set out to fail.

We can fail in terms of operating performance for a lot of reasons, some within our control and some without our control. But — and that can happen. And if so, we'll tell you about it.

But we're going to try very hard to make sure that you see the business in a form exactly like we see the business, and that we don't sugarcoat things, and we don't put spin on things.

And we'll judge ourselves in a — to a significant degree by how we handle that particular part of the problem. We'll also try to do a good job in operations.

Charlie, do you have anything to add on that?

CHARLIE MUNGER: No.

Morning Session - 2000 Meeting

1. Meeting introduction and welcome

WARREN BUFFETT: Good morning.

Well, first thing I'd like to do is to thank everybody that's helped us put this on.

As you saw in the movie, I think, at the time, we may have had 45,000 or so people working with Berkshire, with 12.8 at headquarters.

We're probably up to about 60,000 now, and we still have 12.8, and they take care of putting on this whole meeting.

We get help from people in internal audit, and we get terrific help from the people at all of our companies who work very hard to put on the exhibits. And we hope that you not only visit them, but patronize them, and we'll give you ample time to do that.

As you can see, I enlisted my family for the movie, and I want to thank them. I want to particularly thank Kelly Muchemore and Marc Hamburg for their work in putting this on. It's a real project to — (Applause)

A lot of companies have a whole department that does this and, at Berkshire, Kelly processes 25,000 requests for tickets, and coordinates everything with the exhibitors, and it's a fabulous job.

Now, we'll follow our usual routine. We do have a surprise at — a small surprise — at 11:45. It's not that Charlie's going to say anything — that would be a big surprise, but — (laughter) — we'll — well, we'll have this small surprise for you at 11:45.

The plan is to go through the business part of the meeting here in just a second, and we'll run from 9:30 to 12:00. Then, after conducting the business meeting, we'll take your questions. We'll go around the room. We have 10 stations. I guess we'll probably only be using eight stations in this room.

And we have microphones everyplace that the eight stations — that you'll see, and you can step up to those. And we'll just keep answering questions.

And we'll break at 12 o'clock, and there will be food available down below, where you can also purchase things from us.

And we'll reconvene about 12:45, and then we'll stay until 3:30 and we'll try and answer whatever questions you have. And then we will have to cut it off at 3:30.

We have — we had about the same number of ticket requests as in the past, but we had a different mix this year. We — as most of you know — we had change the venue, and the time, because Ak-Sar-Ben is winding down.

And so, there's a little different rhythm to this meeting. A much higher percentage of our tickets than usual were requested by people from Omaha.

And, of course, you've heard me say before that we're a little suspicious of these figures because we know that a lot of people claim to be from Omaha that aren't, for status reasons, and so — (laughter) — we can't really give you the geographical breakdown we normally would.

2. Introduction and election of BH directors

WARREN BUFFETT: I'd like to introduce, first, our directors, and then we'll proceed into the formal business of the meeting. On my left here is the ever-animated Charlie Munger, our vice chairman. (Applause)

And if the other directors will stand up as I announce their names. We have the better voice in the movie, my wife, Susan Buffett. Susie? (Applause)

We have Howard Buffett. (Applause)

You can see we find these names in the phone book, I mean —

And Kim Chace. Kim? (Applause)

Walter Scott, the star of "How to be a Gillionaire." (Applause)

And Ron Olson. Ron? (Applause)

OK, we'll now take on the formal part of the meeting.

We're going to try to set a new record, I think, 5:38.4, but the four-minute mile has always been our ambition on this. So I will go through this and then we'll get to the questions.

The meeting will now come to order. I'm Warren Buffett, chairman of the board of directors of this company.

I welcome you to this 2000 annual meeting of shareholders. I've introduced the directors. Also with us today are partners in the firm of Deloitte & Touche, our auditors. They are available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings. Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg.

Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at the meeting?

FORREST KRUTTER: I do. Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first-class mail to all shareholders of record on March, 3, 2000, being the record date for this meeting, there are 1,341,174 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting, and 5,385,320 shares of Class B Berkshire Hathaway common stock outstanding, with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 1,116,151 Class A shares and 4,342,959 Class B shares are represented at this meeting by proxies returned through Thursday evening, April 27th.

WARREN BUFFETT: Thank you. That number represents a quorum and we will therefore directly proceed with the meeting.

The first order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott Jr., who will place a motion before the meeting.

WALTER SCOTT JR: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICE: I second the motion.

WARREN BUFFETT: The motion has moved and seconded. Are there any comments or questions? We will vote on this question by voice vote. All those in favor say, “Aye.”

VOICES: Aye.

WARREN BUFFETT: Opposed? You can signify by saying, “I’m leaving.” The motion is carried. (Laughter)

The one item of business of this meeting is to elect directors. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholder that is present has not turned in a proxy, and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to the meeting officials in the aisles who will furnish a ballot for you. Would those persons desiring ballots please identify themselves, so that we may distribute them?

I now recognize Mr. Walter Scott Jr. to place a motion before the meeting, with respect to election of directors.

WALTER SCOTT JR.: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. be elected as directors.

WARREN BUFFETT: Is there a second?

VOICE: I second the vote.

WARREN BUFFETT: It's been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. be elected as directors.

Are there any other nominations? Is there any discussion? The nominations are ready to be acted upon. If there are any shareholders voting in person that should — they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of election.

Would the proxy holders please also submit to the inspector of elections a ballot on the election of directors voting the proxies, in accordance with instructions they have received? Miss Amick, when you are ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders, in response to proxies that were received through last Thursday evening, cast not less than 1,136,497 votes for each nominee.

That number far exceeds a majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as those cast in person at this meeting, if any, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Becki. Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. have been elected as directors.

Does anyone have any further business to come before this meeting before we adjourn? If not, I recognize Mr. Walter Scott Jr. to place a motion before the meeting.

WALTER SCOTT JR: I move that this meeting be adjourned.

WARREN BUFFETT: Is there a second? A motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say, "Aye."

VOICES: Aye.

WARREN BUFFETT: All opposed, "No." This meeting's adjourned. Thank you. (Applause)

We will advise Guinness of those results, and maybe we'll get in the book.

Just want to make one more announcement and then we'll start in the questions with area 1, which I believe will be right over here.

About — I think about 3,500 of you are attending the ballgame tonight. You know what you're supposed to do, incidentally.

And we — in the past, we've had some traffic jams at — where the interstate goes off into 13th Street. So, the police, who are wonderfully cooperative throughout this whole weekend, in many ways, are going to do their darnedest to make sure that we don't have much of a jam.

But if those of you who are attending the game would like to go a little early, that will probably be quite helpful.

And I might say that we have probably got — well, we think it's probably the best zoo in the world here, thanks in very large part to our director, Walter Scott, and his wife Sue, who have really turned our zoo into a huge attraction, draws well over a million people a year.

It's right adjacent to the ballpark. So if you get out a little early, and you want to go to the zoo, and then you won't even have to move your car. You can come over to the ballpark, and then there's also food there. And we have a — we serve Coca-Cola products.

And if you don't all try to come at 6:45, it will be a help to us.

I will be pitching at 7:05, but my fastball will arrive at the plate almost instantaneously with the moment that it leaves my hand, so unless you're there, you'll miss it. And — (Laughter)

3. Aesop's investing primer: Birds in hands and bushes

WARREN BUFFETT: So look with that, let's start in area 1, and we will go around. And feel free to ask any questions. You might identify yourself and where you're from before asking your question. Area 1?

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger.

My name is Steve Yates (PH), I'm from Chicago. I'm a Berkshire shareholder and this is my sixth year coming to this meeting. I'd like to thank you for all your time and advice through the years. It's been great.

I'd also like to thank all those wonderful people who sold Berkshire this year for giving us an opportunity to purchase more of the world's greatest company for dirt-cheap prices. (Applause)

WARREN BUFFETT: We will convey your thanks. (Laughter)

AUDIENCE MEMBER: I own another stock, which sells for four times current trailing earnings. Every quarter we get a report. Earnings go up, sales go up, cash flow goes up, the equity base expands, they gain market share, and the stock goes down.

The company has a 60 percent five-year annualized growth rate and sells at four times earnings. I have two related questions.

First, is this is a growth stock or a value stock, and could you please give us your definitions of these terms?

Second, the company sells recreational vehicles. Demographic trends in the recreation and leisure areas, RVs, cruise lines, golf equipment, et cetera, seem to be quite good. Do you see any opportunities for Berkshire here? Thanks.

WARREN BUFFETT: Well, the question about growth and value, we've addressed in past annual reports. But they are not two distinct categories of business. Every business is worth the present —

If you knew what it was going to be able to disgorge in cash between now and Judgment Day, you could come to a precise figure as to what it is worth today.

Now, elements of that can be the ability to use additional capital at good rates, and most growth companies that are characterized as growth companies have that as a characteristic.

But there is no distinction in our minds between growth and value. Every business we look at as being a value proposition. The potential for growth and the likelihood of good economics being attached to that growth are part of the equation in evaluation.

But they're all value decisions. A company that pays no dividends growing a hundred percent a year, you know, is losing money. Now, that's a value decision. You have to decide how much value you're going to get.

Actually, it's very simple. The first investment primer, when would you guess it was written?

The first investment primer that I know of, and it was pretty good advice, was delivered in about 600 B.C. by Aesop. And Aesop, you'll remember, said, "A bird in the hand is worth two in the bush."

Now incidentally, Aesop did not know it was 600 BC. He was smart, but he wasn't that smart. (Laughter)

Now, Aesop was onto something, but he didn't finish it, because there's a couple of other questions that go along with that.

But it is an investment equation, a bird in the hand is worth two in the bush. He forgot to say exactly when you were going to get the two in the — from the bush — and he forgot to say what interest rates were that you had to measure this against.

But if he'd given those two factors, he would have defined investment for the next 2,600 years. Because a bird in the hand is — you know, you will trade a bird in the hand, which is investing. You lay out cash today.

And then the question is, as an investment decision, you have to evaluate how many birds are in the bush. You may think there are two birds in the bush, or three birds in the bush, and you have to decide when they're going to come out, and when you're going to acquire them.

Now, if interest rates are five percent, and you're going to get two birds from the bush in five years, we'll say, versus one now, two birds in the bush are much better than a bird in the hand now.

So you want to trade your bird in the hand and say, "I'll take two birds in the bush," because if you're going to get them in five years, that's roughly 14 percent compounded annually and interest rates are only five percent.

But if interest rates were 20 percent, you would decline to take two birds in the bush five years from now. You would say that's not good enough, because at 20 percent, if I just keep this bird in my hand and compound it, I'll have more birds than two birds in the bush in five years.

Now, what's all that got to do with growth? Well, usually growth, people associate with a lot more birds in the bush, but you still have to decide when you're going to get them.

And you have to measure that against interest rates, and you have to measure it against other bushes, and other, you know, other equations.

And that’s all investing is. It’s a value decision based on, you know, what it is worth, how many birds are in that bush, when you’re going to get them, and what interest rates are.

Now, if you pay $500 billion — and when we buy a stock, we always think in terms of buying the whole enterprise, because it enables us to think as businessmen, rather than as stock speculators.

So let’s just take a company that has marvelous prospects, is paying you nothing now, and you buy it at a valuation of 500 billion.

Now, if you feel that 10 percent is the appropriate rate of return — and you can pick your figure — that means that if it pays you nothing this year, but starts paying next year, it has to be able to pay you 55 billion in perpetuity, each year.

But if it’s not going to pay until the third year, then it has to pay you 60.5 billion in perpetuity — in perpetuity — to justify the present price.

Every year that you wait to take a bird out of the bush means that you have to take out more birds. It’s that simple.

And I question, in my mind, whether — sometimes, whether people who pay $500 billion implicitly for a business by buying 10 shares of stock at some price, are really thinking of the mathematical — the mathematics — implicit in what they are doing.

To deliver, let’s just assume that’s — there’s only going to be a one-year delay before the business starts paying out to you, and you want to get a 10 percent return and you pay 500 billion. That means 55 billion of cash that they have to be able to disgorge to you year, after year, after year.

To do that, they have to make perhaps $80 billion, or close to it, pretax.

Now, you might look around at the universe of businesses in this world and see how many are earning 80 billion pretax, or 70, or 60, or 50, or 40, or 30. And you won’t find any.

So it requires a rather extraordinary change in profitability to give you enough birds out of that particular bush to make it worthwhile to give up the one that you have in your hand.

Second part of your question, about whether we’d be willing to buy a wonderful business at four times earnings, I think I could get even Charlie interested in that. But let’s hear it from Charlie.

CHARLIE MUNGER: I'd like to know what that is. (Laughter)

WARREN BUFFETT: He was hoping you would ask that. That fellow that's got all his net worth in this stock — (laughter) — and who has a captive audience.

Tell us what it is. You've got to tell us. We're begging you. (Laughter)

AUDIENCE MEMBER: You want the name of the company?

WARREN BUFFETT: We want the name of the company. We're dying to get the name. Wait till I get my pencil out. (Laughter)

AUDIENCE MEMBER: It's called National RV, and it's based in California, and they sell recreational vehicles.

WARREN BUFFETT: OK, well, you've got a crowd of people with — who have birds in the hand, and we will see what they do — (laughter) — in terms of National RV.

Charlie, do you have anything further on growth and value, et cetera?

Watch him carefully, folks. (Laughter)

CHARLIE MUNGER: Well, I agree that all intelligent investing is value investing. You have to acquire more than you really pay for, and that's a value judgment. But you can look for more than you're paying for in a lot of different ways.

You can use filters to sift the investment universe. And if you stick with stocks that can't possibly be wonderful to just put away in your safe deposit box for 40 years, but are underpriced, then you have to keep moving around all the time.

As they get closer to what you think the real value is, you have to sell them, and then find others. And so, it's an active kind of investing.

The investing where you find a few great companies and just sit on your ass because you've correctly predicted the future, that is what it's very nice to be good at.

WARREN BUFFETT: The movie was G-rated even though — (Laughter)

Is that it, Charlie? (Laughter)

4. Munger on internet stocks: "If you mix raisins with turds, they're still turds"

WARREN BUFFETT: OK. We will move to area 2.

AUDIENCE MEMBER: Good morning, gentlemen. Wayne Peters. And where I come from our ladies are referred to as birds. (Laughter)

And I'm sure I know a lot that would trade one in the hand for two in the bush — (laughter) — irrespective of the interest rate. (Laughter)

I have two small questions.

Firstly, with the speculation, and some would say rampant speculation, in the high tech and internet arenas, could you share your views on the potential fallout from the speculation for the general economy?

And secondly, how long did it actually take you to perfect that curveball, and are we going to see it tonight?

WARREN BUFFETT: The — I don't think I want to give anything away about my pitches tonight. (Laughter)

Ernie Banks may be in the audience, I know he's in town, and I just can't afford to do that. But you'll see it tonight, and you can describe it anyway you'd like.

The question about the high tech stocks and possible fallout, any time there have been real bursts of speculation in the market, you know that — it does get corrected, eventually.

Ben Graham was right when he said that in the short run it's a voting machine, and the long run it's a weighing machine. Sooner or later, the amount of cash that a business can disgorge in the future governs the value it has — that the stock commands — in the market. But it can take a long time.

And, I mean, it's a very interesting proposition. For example, if you take a company that, in the end, never makes any money, but trades — changes hands — representing a valuation of 10 or $20 billion for some time, there's no wealth created. There's a tremendous amount of wealth transferred.

And I think you will see, when we look back on this era, you will see this as a period of enormous amounts of wealth transfer, but in the end the only wealth creation comes about through what the business creates.

There's no magic to it. If a company that's not worth anything sells for 20 billion and 5 percent of it changes hands, somebody takes a billion dollars from somebody else. But investors as whole gain nothing.

They all feel richer. It's a very interesting phenomenon. But they can't be richer except — as a group — unless the company makes them richer.

And it's the same principle as a chain letter. If you're very early on a chain letter you can make money. There's no money created by chain letters. In fact, there's the frictional cost of envelopes, and postage, and that sort of thing.

So the net, there's some money destroyed a little bit. And there's money destroyed by the frictional cost of trading and investing, and that comes out of investor's pockets.

But the manias that periodically take place — and not just in stocks. We had a similar mania — not necessarily similar — we certainly had a mania in farmland here in Nebraska 20 years ago.

And land which couldn't produce, we'll say, more than 70 or $80 an acre would sell for 2,000 an acre at times when interest rates were 10 percent.

Well, that math will kill you. And it killed the people who bought it at those prices, and it killed a great many banks here in Nebraska who lent based on that sort of thing.

But while it was going on everybody thought it was wonderful, because every farm was selling for more than the similar farm had sold for a month earlier. And it was momentum investing in farmland.

And, in the end, valuation does count. But it can go on a long time, and when you get a huge number of participants playing with ever increasing sums, you know, it creates its own apparent truth for a — what can be for a very considerable period of time.

It doesn't go on forever. And whether it has fallout to the whole economy, like it probably did in the late '20s, or whether it's just an isolated industry where the — or sector — where the bubble bursts and it really doesn't affect other values, who knows? But five or 10 years from now, you will know.

Charlie?

CHARLIE MUNGER: Well, I think the reason we use the phrase "wretched excess" is that there are wretched consequences.

If you mix the mathematics of the chain letter or the Ponzi scheme with some legitimate development, like the development of the internet, you are mixing something which is wretched and irrational, and has bad consequences, with something that has very good consequences.

But, you know, if you mix raisins with turds, they're still turds. (Laughter)

WARREN BUFFETT: That's why they have me write the annual report. (Laughter)

5. Evaluating the internet's threat to Berkshire's businesses

WARREN BUFFETT: So, I think we better move on to sector 3. (Laughter)

Way back there.

AUDIENCE MEMBER: My name —

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: My name is Thomas Kamay (PH). I am 10 years old and I go to Bacich School in Kentfield, California. I have been a shareholder for two years. This is my third annual meeting. Here's my question.

I know you won't invest in technology companies, but are you afraid that the internet will hurt some of the companies that you do invest in, such as The Washington Post or Wells Fargo? Thank you.

WARREN BUFFETT: Well, that's an absolutely terrific question. You know, I may turn my money over to you. (Laughter and applause)

There's probably no better question we'll get.

And I hope Charlie answers in an appropriate vein considering your age. (Laughter)

We do not — we have no — you know, it's no religious belief that we don't buy into tech companies.

We just don't — we have never found one — as conventionally defined — we've never found one where we think we know enough about what the business will look like in 10 years that we can make a rational decision as to how much we pay now for that business.

In other words, we have not been able to find a business where we think we know what that bush will look like in 10 years, and how many birds will be in it, so that we know how many birds we can give up today to participate in that future.

Not any — there will be wonderful things, as Charlie so colorfully explained, that will evolve from many of these companies, but we don't know how to make that decision.

And you're absolutely right that we should be thinking all of the time about whether developments in that tech area threaten the businesses that we're in now, how you might counter those threats, how we might capitalize in opportunities because of it.

It's a very, very, very important part of business now and will become more important in the years to come, including many of our businesses.

For example, you mentioned The Washington Post. Even closer to home, we own a newspaper called The Buffalo News in Buffalo, New York. We own all of that. So we're in a position to make our own decisions of an operating nature as to what we should do in respect to the internet.

And believe me, Stan Lipsey, who's here today, who runs that paper, and I have talked many, many hours, including considerable time yesterday about what we are doing on the internet, what we should be doing, what other people are doing, how it threatens us, how we can counter those threats, all of that sort of thing.

And newspapers are a category that, in my view, are very threatened by the internet because we had an example —

The internet is terrific for delivering information. We have a product, World Book, that's terrific for delivering information. And 15 years ago, print encyclopedias were the best tool, probably, for educating not only young children, but for educating me or Charlie when we wanted to look up something on a subject.

And the World Book is a marvelous product. But it requires chopping down trees, and it requires operating paper mills, and it requires binding it and printing, and it requires a delivery of a 70 pound, you know, UPS package. And it's a —

It was put together in a way that was, for 4- or 500 years, the best technique for taking that information and moving it from those who assembled it to those who wanted to use it. And then the internet changed that in a very major way.

So we have seen firsthand, and experienced the business consequences of the improvement offered by the internet and the delivery of information.

And newspapers, although not as immediately susceptible to that problem, still face that overpowering factor.

When you eliminate the delivery cost — I mean, we pay a significant percentage of our circulation revenue to our carriers, and we pay additional money to the district managers, and we pay for the trucks to deliver the product out, and we pay for huge printing presses, and all of that sort of thing.

And people do chop down trees in order to give us the raw material to transmit information in Buffalo, you know, about what the Buffalo Bills did yesterday, on Sunday, with all the details.

And now you have the internet that has virtually no incremental unit cost to anything and can deliver the information instantaneously. So it's a big factor for newspapers.

And the newspaper world in my view will look very, very, very different in not that many years.

And I find it kind of interesting, because the people in the newspaper business are a little schizophrenic about this. They see this. They're afraid of it. They're, in almost all cases, trying to combat it on some way operationally.

But some of them, at least, continue to go out and buy papers at a price that sort of reflects the economics that used to exist 20 years ago, when it's — to me it's very clear that it doesn't exist anymore.

So they sort of have their billfold, you know, in the past, even though they see the future. And, you know, I think, probably, they're making mistakes in many cases.

All of our businesses, virtually — Coca-Cola will not be affected in any significant way by the internet, you know? The razor and blade business won't be. Although you could dream up things about distribution or so on, but I think that it's very unlikely.

But other businesses we have — our insurance business, particularly at GEICO, will be very affected by the internet. Now, that may turn out to be a big advantage to us over time. I wouldn't be surprised if it is.

But our retailing businesses are all threatened in one way or another by internet developments, and there may be some opportunities there, too. But it's a change.

It's a change in — it's going to be change in the world — how the world gets entertainment. It's going to be a change in the world — how the world gets information. And it is incredibly low cost compared to the — most of the methods of conveying entertainment and information now.

Charlie?

CHARLIE MUNGER: Well, he asked if we were afraid that the internet would hurt some of our business and I think the answer is yes. (Laughter)

WARREN BUFFETT: I'm learning to appreciate these short answers, though, more as the day goes by. (Laughter)

I want to thank you for coming to our meeting, incidentally. You're way ahead of me. I didn't buy my first stock until I was 11, and so you've got a real jump on me. And I wish you well.

6. "There's nothing magic about a one-year period"

WARREN BUFFETT: OK. Area 4.

AUDIENCE MEMBER: Warren and Charlie, good morning. This is Mo Spence (PH), Waterloo, Nebraska.

In 1999, Berkshire Hathaway managed to produce a positive gain in net worth of one-half of one percent.

That means that since present management took over 35 years ago, Berkshire Hathaway has realized a positive gain each and every year, and produced an average annual gain of 24 percent.

Including the years you ran the Buffett Limited Partnership, you have had a run of 48 consecutive years of positive gains and net worth without one single down year, producing a compounded rate of return of almost 26 percent annually.

On behalf of the long-term shareholders of Berkshire Hathaway, we want to thank you from the bottom of our pocketbooks. (Applause)

WARREN BUFFETT: Well, thank you. I hope your question isn't going to be whether we can continue that, but go — you have a question?

AUDIENCE MEMBER: My question is, don't you think you could have ended the millennium with a bigger bang than one-half of one percent? (Laughter)

WARREN BUFFETT: Well, I certainly wish we could have. But the interesting thing about those figures — and, actually, the figures go back before that, because the very best period was pre-the partnership days, because the amount I was working with was so small.

But the — there's nothing magic about a one-year period. I mean, it's the way the measurements come out. We've — if you took all the half-year periods, for example, I'm sure — well, I know that there were a number that were down, you know —

There're going to be lots of years in the future — assuming I live long enough, that — we will have plenty of down years. It's been a fluke, to some degree, that we have not had any down years in terms of underlying value.

The stock has gone up and down in ways that are not related to intrinsic value a few times, but that is totally a fluke. I mean, we're not going to be up every day. We're not going to be up every week. We're not going to be up every month, or even every year.

And it's — the fact that, you know, the Earth revolves around the sun really is not totally connected to most business activities, or the fruition of most investment ideas, or anything of the sort.

So we have to report every year, and, you know, I care about the yearly figures in that sense. I don't really care about them, totally, as a measure of what we're doing.

And, like I say, if we could've — we were — the capital allocation job that I did in 1999 was very, very poor. And it was partly because some of our main businesses did poorly.

I mean, Coca-Cola and Gillette had bad years last year. They'll have good years over time.

I wrote a few years ago — it's interesting, I called their soft drink business and their razor and blade business as "Inevitables."

And the truth is they've got a higher market share now than they've ever had in history. They're selling more units than any year in history. But certain other factors hurt their business and therefore hurt their stock performance.

But I would still call the soft drink — Coca-Cola's position in the soft drink business, and Gillette's position in the razor and blade business — I would characterize them as "inevitable," that they will gain share over time.

Gillette has over 70 percent of the blade and razor business in the world, which is — measured by value. And that's an extraordinary share.

Coke has 50 percent of the soft drink business in the world. That's well over a billion eight-ounce servings per day. A billion per day.

Eight percent of those are for the account of Berkshire, so over 80 million eight-ounce servings of soft drinks per day are being consumed by people for — where the economic benefit comes to Berkshire Hathaway.

In effect, we have over six percent of the — for Berkshire Hathaway's account — of the blade and razor business in the world. And it'll go up.

So I don't worry about the businesses in the least, long term. They will have bad years from time to time. And when they do, our performance will not look good in those years.

Charlie?

CHARLIE MUNGER: Well, it's been a very interesting stretch. One of the most interesting things about the stretch is that, during pretty much the whole period, the company has owned marketable securities in excess of its net worth.

And so you have this extraordinary liquidity in a company that has performed very well, to boot. That advantage has not gone away and, in fact, it's been augmented.

Give us reasonable opportunities and we are prepared.

WARREN BUFFETT: Well you've heard what you're supposed to do, now we'll do the rest. Just give us the opportunities.

7. We want a "mathematical edge in every transaction"

WARREN BUFFETT: Area 5.

AUDIENCE MEMBER: My name is Greg Blevins (PH) from Bargetown, Kentucky.

I have a question about intrinsic value. It comes from comments that you made in your annual report this year. In there, you describe the extraordinary skills of [Berkshire reinsurance chief] Ajit Jain in judging risk.

When I think about Berkshire and its ability to increase intrinsic value, it seems to me that judging risk has been at least as important as an ability to calculate a net present value.

So my question to each of you is, would you give us some comments on how you think about risk?

WARREN BUFFETT: Well, we think of business risk in terms of what can happen — say five, 10, 15 years from now — that will destroy, or modify, or reduce the economic strengths that we perceive currently exist in a business.

In some businesses that's very — it's impossible — to figure — at least it's impossible for us to figure — and then we just — we don't even think about it then.

We are enormously risk averse. We are not risk adverse, in terms of losing a billion dollars if there were an earthquake in California today. And we're thinking of writing a policy, for example, in the next week or so, on a primary insurance risk of over a billion dollars.

That doesn't bother us as long as the math is in our favor. But in terms of doing a group of transactions like that, we are very risk averse. In other words, we want to think that we've got a mathematical edge in every transaction.

And we think that we'll do enough transactions over a lifetime so that, no matter what the result of any single one, that the group expectancy would — gets almost to certainty.

When we look at businesses, we try to think of what can go wrong with them. We try to look [for] businesses that are good businesses now, and we think about what can go wrong with them.

If we can think of very much that can go wrong with them, we just forget it. We are not in the business of assuming a lot of risk in businesses.

That doesn't mean we don't do it inadvertently and make mistakes, because we do. But we don't intentionally, or willingly, voluntarily, go into situations where we perceive really significant risk that the business is going to change in a major way.

And that gets down to what you probably heard me talk about before, is, what kind of a moat is around the business?

Every business that we look at we think of as an economic castle. And castles are subject to marauders. And in capitalism, any castle you have, whether it's razor blades, or soft drinks, or whatever, you have to expect the —

And you want the capitalistic system to work in a way that millions of people are out there with capital thinking about ways to take your castle away from you, and appropriate it for their own use. And then the question is, what kind of a moat do you have around that castle that protects it?

See's Candy has a wonderful moat around its castle. And Chuck Huggins has taken that moat, which he took charge of in 1972, and he has widened that moat every year. He throws crocodiles, and sharks, and piranhas in the moat, and it gets harder and harder for people to swim across and attack the castle. So they don't do it.

If you look, since 1972, Forrest Mars tried with Ethel M — I don't know, 20 years ago. And I hate to think of how much money it cost him to try that. And he was a very experienced businessman.

So we think of the — we think in terms of that moat and the ability to keep its width and its impossibility of being crossed as the primary criterion of a great business.

And to our managers, we say we want the moat widened every year. You know, that does not necessarily mean that the profit is more this year than last year, because it won't be sometimes. But if the moat is widened every year, the business will do very well.

When we don't have a — when we see a moat that's tenuous in any way — getting back to your question — it's just too risky. We don't know how to valuate that, and therefore we leave it alone.

We think all of our businesses — virtually all of our businesses — have pretty darn good moats, and we think the managers are widening them.

Charlie?

CHARLIE MUNGER: How could you say it better? (Laughter)

WARREN BUFFETT: Here, have a — have some peanut brittle on that one. (Laughter)

8. Insurance “attracts chicanery” and we’ll have surprises

WARREN BUFFETT: OK, 6.

AUDIENCE MEMBER: Good morning.

WARREN BUFFETT: Good mrning.

AUDIENCE MEMBER: My name is Hugh Stevenson (PH). I’m a shareholder from Atlanta.

WARREN BUFFETT (to Munger): Why don’t you open that?

AUDIENCE MEMBER: My question involves the company’s activities before and shortly after the Gen Re acquisition.

I remember you saying once that, in insurance, virtually all surprises are negative ones. And I’m wondering, given the company’s operating experience in insurance over long period of time, could you tell us what happened in the Unicover situation?

How come in Gen — with Gen Re’s experience and the company’s experience, that it happened, they didn’t foresee it, we didn’t foresee it? What has the company done? I know they’ve taken a large reserve for the situation.

And how do they plan to operate in the future to prevent these things, find them out, and strengthen the company from these kind of situations in the future?

WARREN BUFFETT: Yeah, the Unicover situation was discovered in about, I don’t know, February of last year, or thereabouts. And it was a mistake, I mean, it should not have been made. A lot of other people made the same mistake, but that still didn’t mean that we should have made that mistake.

We set up a reserve of $275 million when the mistake was discovered, and that reserve looks like it’s about right still. There have been quite a few developments at Unicover that have defined the limits of it better and resulted in the resolutions of many of the issues attached to it. Still looks like about a $275 million mistake.

Now, that’s a big mistake, but we’ve made bigger ones. We had one in the mid-’70s that probably cost Berkshire, measuring opportunity cost and everything, because we didn’t know how bad it was going to be —

I would say that Berkshire would now be worth at least 10 percent more if that mistake hadn’t occurred. Wouldn’t you say so, Charlie? The Omni situation?

CHARLIE MUNGER: Absolutely.

WARREN BUFFETT: Yeah, so we had a mistake whose present value would be 8 or $9 billion. It cost us at least that.

CHARLIE MUNGER: Yeah, it cost us less than 4 million at the time.

WARREN BUFFETT: Yeah. Though, it — but we didn't know it for sure it was 4 million, so it tied our hands in other respects, too.

In insurance you will get surprises. Now, the test of good management is how many surprises you get. But there's no way you'll get no surprises.

And if you look at our history, you will see some years when our float cost us a lot of money. You will also see a history where over 33 or so years that it's been a very, very attractive business.

But we have had cases, I mean, our name causes problems. I think National Indemnity — we had a fraud, as I remember, down in Texas where an agent was using our paper, which incidentally was the same problem we had, the one that cost us so much.

And some guy is out there writing bonds on — surety bonds — on construction of schools. And he says he represents National Indemnity and the contract proceeds, and of course, we've never heard of the guy.

But if you get a school district in Texas with a half-finished school, and the choice is whether the taxpayers ante up more or whether you find that this guy had apparent authority as an agent, and so on, and therefore we should pay on a policy we never heard of, written by a guy we never heard of, you know, on a school we never heard of. You know, we'll end up paying.

So the surprises are unpleasant nine times out of 10. We'll have more. We had another one last year that shouldn't have happened. But they do happen.

And General Re has a terrific record over time.

We knew last year would not be a good business in the reinsurance business. It was worse than we thought it would be. But that had nothing to do — if you told me the figures that General Re would have at the end of the year, we would have made the same deal in a moment.

And, you know, we didn't do so well with Coke and Gillette ourselves. So that the ratio of mistakes was probably fairly equal between the two organizations with me contributing our — my share.

I think insurance, which will continue to have surprises in it, will turn out to be a very, very good business for Berkshire over time. It's the best one I know about that we can do in increasing scale over time.

As a matter of fact, some of you may not have noticed but we announced another small insurance acquisition just last week.

It's a tough field. The average company is going to do poorly. We think we have some very special companies, and we really do think, over time, we will acquire and utilize float at a cost that's very, very attractive.

It won't be zero like it's been in the past. I mean, we are in some lines of business where intentionally — I mean, we would be crazy to try to hold it to zero, because it's way better to have twice as much money at one or two percent as have half as much money at 0 percent.

But we will fully acknowledge that — I mean, Unicover was a surprise. But I don't know how many surprises I've had in insurance over the 33 years or so we've been in it.

One of the surprises, incidentally, you know, worked to our incredible benefit.

GEICO has been a great, great company since I first went down to Washington, and even before that, and met Lorimer Davidson almost 50 years ago. But they made a mistake in the early '70s that really did bankrupt the company.

But fortunately, there was an insurance commissioner named Max Wallach in the District of Columbia, who saw that it could be resuscitated, and that mistake enabled us to make many, many billions of dollars. So mistakes can be useful on occasion, too.

Charlie?

CHARLIE MUNGER: All that said, it is perhaps the most irritating way to lose money there is, is to be taken by a sort of obvious lie. And — but it happens.

I don't think it's likely to happen again on that scale.

WARREN BUFFETT: Well, I wouldn't say that. (Laughs)

I would say that it's unlikely that — in any 20 year period, or anything like that, we will get a big surprise. And it will come about, very often, through one form or another of three or four methods of obvious fraud that we've observed in the past.

But they spring up again. And there are plenty of people that are, I'd have to say, "crooked," in insurance because it's a product where you deliver a piece of paper and somebody hands you money.

And that intrigues people. You know, you don't even hand them a Dilly bar, you know, or — (laughter) — or anything in exchange. They hand you a lot of money and you give them a little piece of paper.

And of course, when you get into reinsurance and all that, then you hand that little piece of paper to somebody else and try and get them to hand you money.

And all the way along the line you have brokers who are getting big chunks of money for sort of papering over some of the weaknesses in the project, and sometimes they may even be in on it.

So it's a field that attracts chicanery. And often they — the same people — come back again and again. It's amazing to me.

So, I would say that we will get a surprise or two over any 10-year period in insurance. It's almost impossible to avoid.

We should try to minimize it. We do try to minimize it, but I would not want to bet my life that we've seen the last of a Unicover-type situation.

They're always just a little bit different enough so that it doesn't get spotted, or somebody down the line doesn't get the message, but —

I don't know. Don't you think, Charlie, we'll see another one? (Laughs)

CHARLIE MUNGER: Well, perhaps so, but it was a long time from one to the other, and maybe I'll be able to get through without another. (Laughter)

One of these fraud artists, Warren caused me to meet years ago, and his proposition was that he had this perfectly marvelous business.

He says, "I — we only write fire insurance on concrete bridges that are under water." He says, — (laughter) — "It's like taking candy from babies." And —

WARREN BUFFETT: We were the babies. (Laughter)

CHARLIE MUNGER: I looked in his eye. I thought he was kidding or something. He wasn't kidding. I mean, these people believe this kind of stuff.

WARREN BUFFETT: The truth is Charlie — if Charlie and I could see everybody we dealt with, we would screen out some perfectly honest people, too. I think we could probably screen out the crooked propositions. I mean, they do have similar characteristics to them.

And what happens is you get somebody out in the field who is eager to write business or is being wooed by producers, and the intermediaries get very good at it. It's the same way lousy stocks get sold.

I mean, you'll get people who are getting paid very well to part, you know, separate you from your money. And that's worked over the years. The good salesmen find out they can make more money, you know, selling phony products with big tickets attached to them than they can selling lollipops.

9. Rules and fees for Buffett's 1950's partnerships

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Good morning Mr. Buffett, and good morning Mr. Munger. My name is Monish Pabrai (PH) and I'm from Long Grove, Illinois.

I have been a student and disciple of yourself, Mr. Buffett, for some time, and especially Mr. Munger. And I have adopted, quite intensely, your theories of capital allocation, in the manner in which I run my business, as well as my portfolio, and quite pleased with the results so far.

My question has to do with the original 1950s Buffett partnerships. There is some conflicting data in the various books about you pertaining to the rules of the partnership and the fees of the partnership.

What I wanted to understand is, I think some of the books allude to the principle being guaranteed — I think six percent a year being guaranteed — and then you took a fourth, and the partners got three-fourths.

In some cases they talk about four percent, and some cases they say there was no guarantee. I would just appreciate a clarification on that.

WARREN BUFFETT: OK, we'll make it short because I'm not sure how much general interest there is to that. But there was never any guarantee.

There was a guarantee that I wouldn't get a penny myself — there was none of this one percent fee and all that sort of thing that hedge funds now normally have. After a short period of time I told people I'd have all my capital in it, basically.

So there was a guarantee I would follow — have a common destiny. There was never any guarantee of principle of any sort.

Originally, the thing started by accident, so that there 11 different partnerships before they all got put together on January 1st, 1962, into Buffett Partnerships.

So with the 11 different partnerships, they had different — some different arrangements — based on the preferences of the limited partners. I offered them an option of three or four different choices, and different families made different choices.

When we put them together we settled on the 6 percent preferential with a quarter of the profits over that, with a carry forward of all deficiencies. Nobody was guaranteed anything on them.

Charlie had a much better partnership. His was a third, as I remember, wasn't it Charlie? (Laughter) ?

CHARLIE MUNGER: Yes, but we were smaller and operating specialist posts on the stock exchange. (Buffett laughs)

The facts were different.

WARREN BUFFETT: Yeah.

10. American Express isn't "inevitable" but has "huge value"

WARREN BUFFETT: OK. Let's go to 8.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, good morning. My name is Pete Banner (PH), and I'm from Boulder, Colorado.

In the 1996 annual report, Mr. Buffett, you stated companies such as Coca-Cola and Gillette might well be labeled "The Inevitables," and you just reaffirmed your view of Coca-Cola and Gillette.

My question to you is, do you have the same view of American Express? That is, do you view American Express as, quote, "The Inevitable"?

WARREN BUFFETT: Yeah. I would like to clarify one point, too. I didn't really say I regard the companies as "Inevitables." I regarded the businesses, their dominance of soft drinks, or their competitive strength in soft drinks and in razors and blades.

And as a matter of fact, I actually pointed out in talking about that — a few paragraphs later, I pointed out the danger of having a wonderful business is the temptation to go into less wonderful businesses.

And to some extent, for example, Gillette's stumble in the last year or two has not been the product of their razor and blade business, but it has been some other businesses, which are not at all inevitable.

And that, you know, that is always a risk. And it's a risk I pointed out, that when a company with a wonderful business gets into a mediocre business, that usually the reputation of the mediocre business prevails over the supposed invincibility of the management of the wonderful business.

American Express, an interesting case study, because it does have a — we always think in terms of share of mind versus share of market because, if share of mind is there, market will follow.

People — virtually — probably 75 percent of the people in the world — have something in their mind about Coca-Cola. And overwhelmingly it's favorable. Everybody in California has something in their mind about See's Candy, and overwhelmingly it's favorable.

The job is to have it in a few more California minds — or world minds in the case of Coke — over the years, and have it even be a little more favorable as the years go by. If we have that, everything else follows. And consumer product organizations understand that.

American Express was — had a very special position in people's mind about financial integrity over the years, and ubiquity of acceptance. When the banks closed in the early '30s, American Express traveler's checks actually substituted, to some extent, for bank activity during that period.

The worldwide acceptance of this name meant that when American Express sold traveler's checks — for many years, their two primary competitors were what are now Citicorp — First National City — and the Bank of America.

And, despite the fact that American Express charged you one percent when you bought your traveler's checks, and you had two other premier organizations, Citicorp, imagine, and BofA, and — actually, Barclays had one and Thomas Cook had one.

And American Express still had two-thirds of the market after 60 or 70 years — two-thirds of the worldwide market — while charging more for the product than these other very well-known competitors charged.

Anytime you can charge more for a product and maintain or increase market share against well-entrenched, well-known competitors, you have something very special in people's minds. Same thing came about when the credit card came around.

Originally, American Express wanted the credit card because they thought they were going to get killed on traveler's checks. And they thought it was going to be a substitute, and therefore, they had to go into — it was a defensive move.

It came about because a fellow named Ralph Schneider, and Al Bloomingdale, and a couple people came up with the Diners Club idea. And the Diners Club idea was sweeping, well, initially New York, and then the country in the mid-'50s.

And American Express got very worried because they thought, you know, people are going to use these cards. Nobody had ever heard of Visa at that point, or anything of the sort.

But people were going to use these cards instead of traveler's checks. So they backed into the traveler's check business — I mean, it backed into the credit card business.

Immediately, despite the jump the Diners Club had on the — on this business — because Diners Club had the restaurants signed up already, and they already had the high rollers carrying around their card, and nobody had an American Express card.

But American Express went in and they started charging more than Diners Club for the card, and they kept taking market share away.

Well, that is a great position to be in people's minds where they are willing to — when faced with a choice — they're willing to go with the newer product, at a higher price, and leave behind the entrenched product.

And it just showed the power of American Express. American Express had a special cache. It identified you as something special.

When you pulled out your American Express, as opposed to your Diner's Club card, and as opposed to the Carte Blanche card, which was the third main competitor at the time. Visa still did not exist. And you could see this dominance prevail.

That told you what was in people's minds. It's why I bought into the stock in 1964. We bought 5 percent of the company for — a huge investment at the time for us. I was only managing $20 million at the time.

But you could see that this share of mind, this consumer franchise had not been lost.

In the — considerable period of time, American Express got into other businesses, they got into — Fireman's Fund Insurance was a very big acquisition. And, to some extent, they let the Visas of the world and all of those get established. They still had this preeminent cache position, but it was eroding.

But I would say that Harvey Golub, along with a lot of other people in the management, have done an extremely good job of reaffirming — intensifying — the cache. There will be probably $300 billion worth of charges, something in that area, put on American Express this year.

The — 300 billion, those are big numbers, even in today's world. The average discount fee is about 2.73 percent. If you look at the average discount fee on Visa, MasterCharge, you know, it's going to be a —probably, a full percentage point beneath that.

So you've got a percentage point on $300 billion, which is $3 billion of revenue that your competitor doesn't get. You can do a lot of things for your clientele.

And they've segmented the card, as you know. They've even recently gone to this black card, and — which sells for a thousand dollars. It's got a very special cache.

I would say that — I wouldn't use the word "inevitable," but I would say that nourished properly, that the American Express name has had — excuse me — has huge value and is very, very likely to get stronger and stronger as the years go by.

But I don't — I think that what they went through showed that it could take quite a beating and come back. But I don't want to — I don't think you'd want to test it that way indefinitely.

Incidentally, that's one of the things we look for in businesses, is how — you know, if you see a business take a lot of adversity and still do well, that tells you something about the underlying strength of the business.

The classic case was on that was — to me, is AOL. Four or five years ago — you know, I'm no expert on this, but I got the impression there for a period of time when they were having a lot of problems, that a very significant percentage of AOL's customers were mad at them.

But the number of customers went up every month. And that's a terrific business. I mean, if you have a business where your customers are mad at you and you're growing, you know, that has met a certain test, in my mind, of utility.

And you might argue that American Express had that, to some degree. It wasn't that bad. But they had a lot of merchant unrest and all of that. So, occasionally, you will find that an interesting test of the strength of a business.

Coca-Cola had some problems, you know, in Europe. But it comes back stronger than ever. They certainly had problems with New Coke, and they came back stronger than ever.

So you do see that underlying strength. And that's very impressive as a way of evaluating the depth and impenetrability of the moat that we talked about earlier.

Charlie?

CHARLIE MUNGER: Well, I think it would be easier to screw up American Express than it would Coke or Gillette. But it's an immensely strong business, and it's wonderful to have it.

WARREN BUFFETT: We own about 11 percent of American Express. So when there are 300 billion of charges, we're getting 33 billion of those for the account of Berkshire, and it's growing at a pretty good clip. The first quarter, it grew very substantially in both cardholders and charges.

My guess is that our 11 percent becomes more valuable over time. It's hard to think of anything that would destroy it.

CHARLIE MUNGER: The business is very interesting. They made a deal to put American Express cards into Costco. I think that is a very intelligent thing for American Express to have done. And it's a very aggressive place that does a lot of interesting things.

WARREN BUFFETT: Charlie is a director of Costco, so he's a — Costco is an absolutely fabulous organization. We should have owned a lot of Costco over the years and we — I blew it. Charlie was for it, but I blew it.

11. "We don't think in terms of absolutes"

WARREN BUFFETT: OK, we'll go to number 1 again.

AUDIENCE MEMBER: My name is Jin Xi Wan (PH) from San Diego, California.

First, I would thank both of you. My question is also about growth and value.

If you look at the business in this country, most of them, if not all of them, are cyclical to various degrees. Certain businesses are, of course, more cyclical than other businesses.

So when you buy a business or make a investment in a new stock, do you ever cut off — like if a business lose money in a downturn, we are not going to buy.

If its earning begin to decline or downturn, we're not going to buy. But if the earning growth slows down, then we can look at a business and make an investment. So do you have a cutoff, in terms of this cyclical factor?

And also, when you buy a business — in terms of the current P/E ratio, also do you have a cutoff? Let's say, if it's P/E ratio is more than 15, 16, we are not going to buy the business, no matter how much the earning will grow in the future. So basically, it's about the growth and the value.

WARREN BUFFETT: Yeah, we have — to answer your question directly — we have no cutoff, whatsoever.

We don't think in terms of absolutes that way because, again, we are trying to think of how many birds are in the bush. And sometimes the number that are currently being shown could be negative.

One of the best buys we ever made was in 1976 when we bought a significant percentage — what became through repurchases — 50 percent of GEICO at a time when the company was losing a lot of money and was destined to lose a lot of money in the immediate future.

And, you know, the fact they were losing money was not lost on us, but we thought we saw a future there that was significantly different than the current situation.

So it would not bother us in the least to buy into a business that currently was losing money for some reason that we understood, and where we thought that the future was going to be significantly different.

Similarly, if a business is making some money — there's no P/E ratio that we have in mind as being a cutoff point at all. There are businesses — I mean, you could have some business making a sliver of money on which you would pay a very, very high P/E ratio. But it's basically —

We look at all of these as businesses. We're, for example, in — at Executive Jet — NetJets — we're losing money in Europe. Well, we expect to lose money in Europe getting established.

So does that mean it's a bad thing to buy a hundred percent of, if you own the whole company, or three percent of, if Executive Jet was a public company and you were buying into? No. I mean, it —

There are all kinds of decisions that involve the future looking different, in some important way, than the present. Most of our decisions relate to things where we expect the future not to change much.

But you get this — well, American Express was a good example. And when we bought it in 1964, a fellow named Tino DeAngelis had caused them incredible trouble. You know, it was one of those decisions that looked, for a time, as if it could break the company.

So, we knew — if you'd been charging for what Tino had stolen from the company against the income account that year, or the legal costs that were going to be attached to it, you were looking at a significant loss.

But the question was, what was American Express going to look like 10 or 20 years later? And we felt very good about that.

So there are no arbitrary cutoff points. But there is that focus on, how much cash will this business deliver, you know, between now and Kingdom Come? Now as a practical matter, if you estimate it for 20 years or so, the terminal values get less important.

So — but you do want to have, in your mind, a stream of cash that will be thrown off over, say, a 20-year period, that makes sense discounted at a proper interest rate, compared to what you're paying today. And that's what investment's all about.

Charlie?

CHARLIE MUNGER: Yeah, the answer is almost the exact reverse of what you were pointing toward. A business with something glorious underneath, disguised by terrible numbers that cause cutoff points in other people's minds, is ideal for us, if we can figure it out.

WARREN BUFFETT: And we've had a couple of those in our history that have made us a lot of money. I mean, we don't want to wish anybody ill, but —

CHARLIE MUNGER: Oh, I wouldn't go that far —

WARREN BUFFETT: OK, well Charlie — (Laughter)

I think he's speaking for both of us. (Laughter)

12. Speculate a bit in tech? Not if we don't understand it

WARREN BUFFETT: OK, we'll move on to number 2.

AUDIENCE MEMBER: Mr. Buffett, I would like to start my question by giving you and Charlie 10 lashes with a wet noodle, not because of 1999 and what happened to your net worth or our net worth, but because you have spoiled your shareholders into expecting 25 percent growth every year, since 1965.

And then comes the bad, bad 199[9] and it hits all of us. But by my calculations, you personally, Mr. Buffett, have lost over 10 billion dollar — not million — billion dollars during 1999.

So I don't think we should get too mad at you because probably all of us have, at this point in our life, increased our net worth and made a lot of money. So you don't get a wet noodle today. (Laughter)

WARREN BUFFETT: Hmm.

AUDIENCE MEMBER: And the shareholders have, I'm sure, lost thousands. And some have lost millions of dollars during the year 1999.

Now after reading your biography in November of 1998 — unfortunately I didn't know about you earlier — I started investing on November the 24th of '98. And of course, I'm a poor little investor, so I bought your B stock at 23.08.

Then, because the market dropped, I bought some more on the 4th of December at 22.29. And then I bought, on January the 24th of 2000 at 16.89, so I do believe in dollar-cost averaging and I've been doing that for probably 30 years of my life.

My January investment, I'm happy to say, is up 15 percent, so the worst may be over.

Now, I read your annual report and I want to compliment you that that is the easiest and most entertaining annual report I think created in the whole world. And your — and I hope you continue that kind of a report. (Applause)

WARREN BUFFETT: Thank you.

VOICE: (Inaudible) Your name and —

AUDIENCE MEMBER: Oh!

VOICE: — where you're from

AUDIENCE MEMBER: I'm sorry. I was just told that I should have said who I am. My name is Gaylord Hanson and I'm from Santa Barbara, California — where investor Munger puts his big, multimillion-dollar boat in the water. (Laughter)

WARREN BUFFETT: I'm not going to make any comment on that.

AUDIENCE MEMBER: Please don't. (Laughter)

Now, with technology, computers, electronics, and software transforming our entire world — not just here — the world, I must admit that I personally invested in four technology computer software and aggressive growth mutual funds and made up all of my 1999 losses on Berkshire Hathaway. (Laughter and applause)

Are we asking too much as shareholders of Berkshire Hathaway for you men to put your brains to work and possibly speculate a little bit, maybe 10 percent of our money, into the only play in town, which seems to be technology, electronic?

And I read your report, and I understand a lot of your reasoning that it's difficult — and it is difficult — to project earnings of a lot — people are going to be a little bankrupt. Are they going to out of business?

But isn't there enough left in your brainpower to maybe pick a few and — (laughter) — see what's going on? Because I made over a hundred percent profit in 1999 on my aggressive position in the technology field, so that's —

WARREN BUFFETT: OK, well —

AUDIENCE MEMBER: — my question.

WARREN BUFFETT: The answer is we will never buy anything we don't think we understand. And our definition of understanding is thinking that we have a reasonable probability of being able to asses where the business will be in 10 years.

But, you know, we'd be delighted — we have a man here who's done very well. And if he has any business cards, you know, you could always invest with him, and — (Laughter)

And we'd welcome — you know — you can — we'll give you a booth in our exhibitor's section. And anybody that wants to do that is perfectly — obviously — free to do it with you or through any other — through anybody else that they select.

Now, you have a whole bunch of people out there that say they can do this. And maybe they can and maybe they can't and maybe you can spot which ones can and can't. The only way we know how to make money is to try and evaluate businesses.

And if we can't evaluate a carbon steel company, we don't buy it. It doesn't mean it isn't a good buy. It doesn't mean it isn't selling for a fraction of its worth. It just means that we don't know how to evaluate it.

If we can't evaluate the sensibilities of putting in a chemical plant or something in Brazil, we don't do it. If somebody else knows how to do it, you know, more power to them.

There are all kinds of people that know how to make money in ways that we don't. But, you know, it's a free world and everybody can invest in those sort of things. But they would be making a mistake, a big mistake, to do it through us.

I mean, why pick a couple of guys like Charlie and me to do something like that with — when you can pick all kinds of other people that say they know how to do it.

I would say this. Incidentally, you mentioned a point earlier, which is how the popular press tends to think of things. But we don't consider ourselves — Charlie and I don't — richer or poorer based on what the stock does. We do feel richer or poorer based on what the business does.

So we look at the business as to how much we're worth. And we do not look at the stock price, because the stock price doesn't mean a thing to us. I mean, it doesn't for a variety of reasons, but beyond that, imagine trying to sell hundreds of thousands of shares at the stock price.

We can always sell the business — we're not going to do it — but we could always sell it for what the business is worth. We can't sell our stock for what the — necessarily — what the stock price is. So we look at the business, entirely, in terms of evaluating our net worth.

We figure our net worth went up very, very, slightly — very slightly — in 1999. And we would figure that no matter what the stock was selling for — it just doesn't make any difference — because we do look at the businesses.

We really look at it as if there wasn't any quote on the stock. Because we don't know what the stock is going to do.

If we do — if the business gets worth more at a reasonable rate, the stock will follow, over time. But it won't necessarily follow week by week, or month by month, or year by year.

We had a lousy year in 1999, but the stock price did not calibrate with that in any perfect, or close to perfect, manner.

And we've had good years other times, when the stock price is way overpriced or over-described what happened during the year.

So we really measure all the time by the business. We think of it as a private business, basically, for which there's a quotation. And if it's handy to use that quotation, either in buying more stock or something of the sort, we may do it. But it does not govern our ideas of value.

Charlie?

CHARLIE MUNGER: Yeah. Generally, I would say that if you have a lot of lovely wealth in a form that makes you comfortable, and somebody down the street has found a way to make money a lot faster, in a way you don't understand, you should not be made miserable by that process.

There are worse things in life than being left behind in possession of a lot of lovely money. I mean — (Laughter)

WARREN BUFFETT: Would you want to name a couple? (Laughter)

No, Charlie made — I mean, when farmland was — went from — farmland probably tripled here in the late '70s, without any real change in yields per acre or the price of the commodity.

You know, are we going to sit around and stew because, you know, they — we didn't buy farmland at the start?

You know, are we going to stew because all kinds of stuff — uranium stocks in the '50s — or you can go back — all kinds of things that have — the conglomerates in the late '60s, the leasing companies, I mean, you can just go down the line.

And it just doesn't make any — we're not in that game.

We would know how to create a chain letter, believe me. I mean, we've seen it down some many times. You know, we know the game. But it just isn't our game.

Charlie? (Applause)

13. Currencies are "important but not knowable"

WARREN BUFFETT: Number 3?

AUDIENCE MEMBER: Good morning Mr. Buffett, Mr. Munger. My name is Stacey Braverman (PH). I'm 15 years old, and I'm from South Setauket, New York. It was very nice meeting you Mr. Buffett, yesterday.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: I especially appreciated your internet stock tips. (Laughter)

WARREN BUFFETT: (Laughs) Yeah, keep it — keep it to yourself now, Stacey. That's our deal. (Laughs)

AUDIENCE MEMBER: I bought the B shares two years ago, when I decided that I needed to save some money for college. When the share price dipped below 1,500 I decided to investigate correspondence courses. (Laughter)

WARREN BUFFETT: Maybe you can get a scholarship. (Laughs)

AUDIENCE MEMBER: So I'm glad to see that things are back on track now.

My question is, a lot of the companies that you invest in, like Coca-Cola and Gillette, seem to do better when the dollar is weak and interest rates are falling. That seems to be the opposite of what's happening now.

So how is Berkshire positioning itself to take advantage of the current economic position, with that assessment in mind?

WARREN BUFFETT: Yeah, well, that's a good question. But if we thought we knew what the dollar was going to do, or interest rates were going to do, we would — we won't do it — but we would just engage in transactions involving those commodities, in effect, or futures directly.

In other words, it would not be — if we thought that the dollar was going to weaken dramatically — and we won't get those kind of thoughts — but if we did, you know, we would buy other currencies.

And it would be — it might benefit Coke, in dollar terms, if that happened.

But it would be so much more efficient, directly, to pursue a currency play or an interest rate play than an indirect way through companies that have big international exposure. We would probably do it directly.

We don't really think much about that. Because — just take currency. If you look at what the yen has traded at, you know over the last — well, since World War II, you know. From — what was it? Three-sixty down to — what? Seventy-some, Charlie? At lowest?

CHARLIE MUNGER: Uh-huh.

WARREN BUFFETT: And, you know, back up to 140-some. And now, I don't know, 105, or wherever it may be. I mean, those moves are huge.

But, in the end, we're really more interested in whether more people in Japan are going to drink Coca-Cola. And, over time, we're better at predicting that than we are at predicting what the yen will do.

And if Coca-Cola satisfies people's needs — liquid needs — for more and more people, we will probably get a reasonable percentage of their purchasing power of those people around the world for their right to drink Coca-Cola, or for shaving, or whatever it may be.

So, if the world's standard of living improves, bit by bit over time, in an irregular fashion, and we supply something the world wants, we will get our share in dollars, eventually.

And what it — quarter-to-quarter or year-to-year — how that moves around, because of currency moves, really doesn't make any difference to us.

It makes a difference to reported earnings in that quarter or — but in terms of where Coca-Cola's going to be 10 or 20 years from now, it would be a big mistake, I think, to focus on currency moves as opposed to focusing on the product itself.

And Japan offers a good example of that because you had this — I mean, you really had a move from 360, or whatever it was, to the high 70s or thereabouts. I mean, that is an incredible move in currency, and it can overshadow in the short run, even, what's happening in the business.

But long-range, what's really made Coca-Cola strong in Japan is the fact that the Japanese people have accepted their products in a big way. And Coca-Cola's built this tremendous, for example, vending machine presence.

And the Japanese market is very different than all the rest of the markets in the world, virtually, in that such a high percentage flows through vending machines.

And my memory is that, you know, we may have something like 900-and-some thousand, out of something over 2 million, vending machines in the country.

So we've got this tremendously dominant position. It's a little like billboards might be in this country. Plus, we have this terrific product, Georgia Coffee, which is huge over there.

And that's the sort of thing we focus on, because that's something we understand.

We don't understand what currencies are going to do week-to-week or month-to-month or year-to-year. And we always try to figure on what — focus on what's knowable and what's important.

Now, currency might be important, but we don't think it's knowable. Other things are unimportant, but knowable. But what really counts is what's knowable and important.

And what's knowable and important about Coca-Cola is the fact that more and more people are going to consume soft drinks around the world, and have been doing so year after year after year, and that Coca-Cola's going to gain share, and that the product is extraordinarily inexpensive relative to the pleasure it brings to people.

Coca-Cola — in the '30s, when I was kid, I bought, you know, for — six for a quarter and sold them for a nickel each. That was a 6 1/2 ounce bottle for a nickel, at Coke.

And you can buy a 12-ounce can now at — pick a supermarket sale — for not much more than twice per ounce what it was selling for in the '30s. You won't find many products where that kind of value proposition has developed over the years.

So that's the kind of thing we focus on. And interest rates and foreign exchange rates, important as they may be in the short term, really are not going to determine whether we get rich over time.

The best time to buy stocks, actually was, in recent years, you know, has been when interest rates were sky high and it looked like a very safe thing to do to put your money into Treasury bills at — well, actually the primary got up to 21 1/2 percent — but you could put out money at huge rates in the early '80s.

And, as attractive as that appeared, it was exactly the wrong thing to be doing. It was better to be buying equities at that time, because when interest rates changed, their values changed even much more.

Charlie?

CHARLIE MUNGER: Yeah, we have a willful agnosticism on all kinds of things. And that makes us concentrate on certain other things. This is a very good way to think, if you're as lazy as we are. (Laughter)

14. We'll "probably" own M&T Bank stock 10 years from now

WARREN BUFFETT: We'll go to 4, please.

AUDIENCE MEMBER: Jerry Zucker, Los Angeles, California. Good morning, boss. (Laughter)

Calling your attention to the annual report and major investments, I'd appreciate your comments on two companies.

Number one, M&T Bank, a new name to that list, but not exactly a household name, at least on the West Coast.

And company number two, definitely a household name, but missing from the list this year, the Walt Disney Corporation.

WARREN BUFFETT: Well, we don't comment much on our holdings, particularly as to purchases or sales, but we do have the CEO — longtime CEO — of M&T here today, Bob Wilmers. Bob, would you stand up? He should be up here somewhere. There he is. (Applause)

Bob is a terrific businessman, a terrific banker, and a terrific citizen. I've known him a long time. A good friend of Stan Lipsey, our publisher in Buffalo. Bob runs the kind of a bank that allows Charlie and me to sleep very comfortably.

Someone once said there are more banks than bankers, which is something worth thinking about a little bit. But believe me, Bob is a banker and he's done a lot for Buffalo.

And he runs — he's got a — he has a very big ownership position, which he achieved, at least in very large part, through purchase with his own money, as opposed to having options.

He's got one of the largest ownership positions, probably, among the hundred largest banks in the United States.

And it's just a very attractive business for us to be in, and we're very comfortable with it. And 10 years from now, Bob will be here, and I hope I'm here. We will — we'll probably own M&T.

The Disney Company, our ownership in that fell below the threshold level which we used, although we had ownership. And we think Disney is a terrific business. Michael Eisner's done a great job there.

We have — as we put in the annual report — we have mildly reduced equities as prices began to — generally — began to get more and more full.

We do not think the general ownership of equities is going to be very exciting over the next 10 or 15 years, so we would like to buy businesses.

We bought a few last year. We had this one we announced last week in the insurance field. We got another small acquisition where we've got an agreement with somebody. It's very small.

But we would love it if those were 10 times that size or 20 times that size, because — you will see more of that, relative to marketable securities, as we go along.

Charlie?

CHARLIE MUNGER: Yeah, regarding equities generally, I think that Fortune article, which was sent out to the Berkshire shareholders this year, should be absolutely must-reading for everybody. In fact, it would be a good thing to read two or three times.

The ideas there sound so simple, that — you know, people have the theory that they must understand it. But I think the world is more complicated than that. I think we are in for reduced expectations eventually, with respect to the kind of returns people have had from investing in stocks.

WARREN BUFFETT: You want to offer any thoughts as to what — that might — what the corollary might be?

CHARLIE MUNGER: Well, I think if you have very unreasonable expectations of life, it makes life much more miserable. Much better to get your expectations within reason.

It's much easier to reduce expectations to some reasonable level than it is to get superhuman achievements.

WARREN BUFFETT: That's why my kids were almost delirious when they heard that announcement I was going to give them $300 each and they — (Laughter)

How to be — do you want to be a zillionaire, or whatever it was.

Incidentally, that was terrific of Regis Philbin to do something like that. I mean, all of those appearances [in the video shown to shareholders] are nonpaid, I can assure you. (Laughter)

And those people are good — very, very, good sports. And I thank them.

15. We'll "never have a conventional dividend policy"

WARREN BUFFETT: OK, we'll go to zone 5.

AUDIENCE MEMBER: My name is Monty Leffoltz (PH) from Omaha, Nebraska.

I have a two-part question. What is Berkshire's philosophy on paying dividends and under what circumstances would Berkshire pay a dividend in the future?

WARREN BUFFETT: Well, that's a good question. We paid a dividend in — what, 1969, Charlie? At 10 cents a share. The — I can't remember it, but it's in the records.

We would pay — we would be very likely to pay either very large dividends or none at all, because our test is whether we think we can use money at a rate — in a way — that it creates more than a dollar of market value for every dollar we retain.

Obviously, if we can keep a dollar and it becomes, on a present-value basis, worth more than a dollar, it's foolish to pay it out.

Forget all about taxes. Assume it's a tax-free society. We would have exactly the same dividend policy up to this point, whether there was any tax on dividends, capital gains, or anything else, or whether we were entirely tax-free.

Because we have retained money because, to date, we have felt that if we keep a dollar and use it in buying other businesses, or whatever it may be, that it becomes worth more than a dollar on a present-value basis — I mean, not that it's going to be worth a dollar-ten four years from now — but that it's worth more than a dollar when we look at what it'll be four years from now.

That's subjective, but any given decision like that is subjective. Over time, you get an objective test as whether that's met by — whether we do indeed create more value than — each dollar retained earnings, we create an extra dollar-plus of value.

If that changed — and it could change — then we would give the money to the shareholders. And it might be done through repurchases or it might be done through dividends, but we would — there's no reason to keep a dollar in the business that's worth 90 cents if you keep it in the business.

And there are companies that do that, but they don't — they're not necessarily intentionally doing it. They may have higher aspirations as they go along, but they're not realized.

We, I think, would be fairly objective about trying to figure out whether we are indeed creating value or destroying value by retaining earnings.

We would never have a conventional dividend policy. I mean, the idea of paying out 20 percent of your earnings, or 10 percent, or 30 percent of earnings in dividends strikes us as nuts. I mean, you may get yourself in a position where you have to do it because you build these expectations in people's minds, but it is — there is no logic to it whatsoever.

The logic is basic. If you create more than a dollar value for a dollar retained, why in the world would you pay it out, because the people who want to get that dollar as a dividend can instead get a dollar-ten by selling the stock for — or whatever it may be — a dollar-twenty— for the value that was maintained — or retained.

So, that — it's a very simple dividend philosophy, and one, I think, that's in one of the past annual reports. We explain the logic of it. And I see no — nothing that would change, in terms of the principles of it.

Evaluating whether that's the case — I mean, obviously we aren't going to make a decision every week based on whether we can employ money that week at a higher rate of return, or every month.

But in terms of a reasonable expectancy over a couple-year period, whether we think we can use retained earnings advantageously, that's our yardstick.

Charlie?

CHARLIE MUNGER: Yeah, what's interesting about what Warren is saying about logical dividend policy is that if you went to all the leading business schools of the United States, all the leading economics departments, all the professors of corporate finance — this wasn't — wouldn't be the way they teach the subject.

In other words, we're basically saying we're right and all the rest of academia is wrong. (Laughter)

WARREN BUFFETT: We love it when we do that. (Laughter)

16. We never sell a business and rarely sell a stock

WARREN BUFFETT: OK, we'll go to 6.

AUDIENCE MEMBER: I'm Mark Chere (PH) from Hong Kong.

And Mr. Buffett, I'd like to ask you a couple of questions. The first one is how many insurance companies does Berkshire Hathaway own?

WARREN BUFFETT: Let me —

AUDIENCE MEMBER: I can't figure out the total.

WARREN BUFFETT: Let me answer that and then you go on to your second one.

We have a great number of companies because, in many cases, a given strategy or a given operation operates through multiple companies.

The company we announced the purchase of the other day is really one business, but it has three companies.

I wouldn't be surprised — I've never looked at the number — but it wouldn't surprise me if we have 20 insurance companies or something. Maybe 25 or 30, who knows?

We have about nine or 10 basic insurance operations for which a given management has responsibility, but there's a lot of state laws applicable to insurance companies and different regulations.

It's often advantageous to have a number of companies operating under one management to achieve one operational goal.

The big operations are General Re, and GEICO, and the National Indemnity reinsurance operation run by Ajit [Jain].

And then we have a group of about five different operations that are all very decent businesses, but are not as big as the three I mentioned. Go ahead.

AUDIENCE MEMBER: Thank you. Yeah, my main question is this. Much has been written by you, and a lot more by other people, about your criteria, or the criteria you use when you make a purchase of a company, either in full or in part.

But almost nothing has been written by you, at any rate as far as I can tell, on your criteria for selling a company that you have already — you have previously purchased.

And I wonder if you could outline the criteria you might apply today to a sale of a company, and whether you would go — well, the simplest way to put it is this: Would you agree with Philip Fisher, who said there were two reasons to sell a company — or a stock?

One was when you'd discovered you've made a mistake in your analysis and the company was not what you thought it was.

And the second when — was when the — something within the company had changed, the management had changed or so on, so it no longer met your original criteria.

Would you — are those the principles that you apply or would you say there are different ones or others? Thank you.

WARREN BUFFETT: I'm glad you brought up Phil Fisher, because he is a terrific mind and investor. He's probably in his 90s now, and — but his —

A couple of books he wrote in the early '60s are classics and I advise everybody here who's really interested in investments to read those two books from the earlier '60s.

And he's a nice man. I went out to — 40 years ago, I dropped into his office in San Francisco, a tiny office. And he was kind enough to spend some time with me. And I'm a huge admirer of his.

The criteria that we use for selling a business that we own control of are articulated in the annual report, under the ground rules.

So in terms of businesses that we own, we have set forth — and I direct you there — we've written those same ground rules every year since 1983. And actually, we had those in our head for decades before that.

And we have this quirk, which you should understand, and we want our shareholders to understand it, that even though we got offered a price that was far above its economic value, as we might calculate it going in — but if we got offered a price for that for a business that we have now, we have no interest in selling it.

You know, we just — we don't break off the relationships that we develop simply because we get offered a fancy price for something. And we've had a chance to do that sometimes.

That may help us, actually, in acquiring businesses, because both of the companies that I've committed to buy in the last few weeks, both of them are very concerned about whether they have found a permanent home or not.

And people who build their businesses lovingly over 30, or 40, or 50 years, frequently care about that. A lot of people don't care about that.

And that's one of the things we evaluate when buying a business. We look at the owner, and we say, "Do you love the — " in effect, we ask ourselves, "Does he love the business or does he love the money?"

Nothing wrong with liking the money. In fact, we'd be a little disappointed if most of them didn't like the money. But in terms of whether the primacy is loving the money or loving the business, that's very important to us.

And when we find somebody that loves their business — and likes the money — but loves their business, we are a very, very desirable home for them, because we're just about the only people that they can deal with, of size, where we can commit that they are going to be part of this operation, really, forever, and be able to deliver on that promise.

I tell sellers that the only person that can double-cross them is me. I can double-cross them. But there's never going to be a takeover of Berkshire. There's never going to be a management consultant come in and say, "I think you'd better do this."

There's never going to be a response to Wall Street saying, "Why aren't you a pure play on this or that and therefore you ought to spin this off the—?" None of that's going to happen.

And we can tell them, with a hundred percent assuredness, that for a very long time — that if they make a decision to come with Berkshire, they — that decision will be the final decision as to where their company resides.

So, unless those couple conditions, which are extremely unusual, that are described in the ground rules prevail, we will not be selling operating businesses, even though someone might offer us far more than, logically, they're worth.

The question about stocks is, we're not quite with Phil Fisher on that, but we're very close. We love buying stocks where we think the businesses are so solid, have such economic advantage, that we can essentially ride with them forever.

But you've heard me talk about newspapers earlier today. We would have thought newspapers — 20, 25 years ago, I think Charlie and I probably thought a daily newspaper, you know, in a single newspaper town — which practically all are — is probably about the solidest investment you could find.

We might have thought a network TV-affiliated station was about as solid as you could find. And they were very solid.

But events have, over the last 20 or 25 years, have certainly changed that to some degree and maybe to a very, very big degree.

So we will occasionally reevaluate the economic characteristics that we see 10 years out from the ones that we saw 10 years ago and maybe come to a somewhat different conclusion.

The first 20 years of investing for me — or maybe more — my decision to sell almost always was based on the fact that I found something else I was dying to buy.

I mean, I sold stocks at — you know, at three times earnings to buy stocks at two times earnings 45 years ago, because I was always running out of money. Now, I run out of ideas. I've got a lot of money but no ideas, and —. (Laughter)

You know, I'd — I'm not sure which is better. What do you think, Charlie? (Laughter)

CHARLIE MUNGER: I think you were way better off when you had 50 years ahead of you — (laughter) — and less money.

WARREN BUFFETT: I still think I have 50 years ahead of me, Charlie. (Laughter)

You want to elaborate any more on selling?

CHARLIE MUNGER: Yeah. We almost never sell an operating business. And when it does happen, it's usually because we've got some trouble we can't fix.

17. Compensation based on stock price is a "lottery ticket"

WARREN BUFFETT: OK, number 7.

AUDIENCE MEMBER: Hello, I'm Martin Wiegand from Chevy Chase, Maryland.

And, though you've given yourself a D in capital allocation, on behalf of the shareholders, we would like to give you an A-plus in honesty and accounting, temperament for a long-term investing view, and hosting an annual meeting.

WARREN BUFFETT: Thanks. (Applause)

I went to school with Martin's father. Good to see you here.

AUDIENCE MEMBER: Thank you. Now my question. Do General Re's competitors pay their employees with a rational incentive plan aimed at growing float and reducing its cost, or do they use something similar to General Re's old plan, and is this a new, sustainable, competitive advantage for General Re?

WARREN BUFFETT: Well, I think a rational compensation plan — and I think we have rational compensation plans — we certainly aim at that, and we don't care what convention is.

Over time, we'll select for people who are rational themselves, who have confidence in their abilities to deliver under a rational plan, and who really appreciate operating in that kind of an environment.

Now, who wouldn't want a lottery ticket, you know? I mean, if anybody here wants to buy a few lottery tickets at the lunch break and come up and present them to me, I'll be glad to take them.

I don't think it will have anything to do with, you know, my performance at Berkshire Hathaway or anything in the future.

And so, we try to make plans that are very rational. And incidentally, we've never had any real problems at all in working with managements to do just that.

The two operations that I've just recently agreed to buy, we will have rational compensation plans at those places. And they'll be somewhat different, perhaps, than the ones they've had in the past, although not much different, as I think about it.

I think it’s been a huge advantage at GEICO to have a plan that is far more rational than the one that preceded it. And I think that advantage will do nothing but grow stronger over time because, in effect, compensation is our way of speaking to employees, generally.

And with a place as large as GEICO, you can’t speak to them all directly. But it speaks to them all the time. It says what we think the rational measurement of productivity and performance in the business is.

And over time, that gets absorbed by thousands and thousands of people. And it’s the best way to get them to buy into their goals.

Whereas, if you use as your test what the stock market is going to do, people, I think, inherently know they got a lottery ticket. I mean, you’ve seen that in a lot of tech stocks in the last three or four months.

You will find all kinds of options being repriced, or issued in great abundance at lower prices without repricing them because they don’t want to have the accounting consequences. Those people know they’re getting lottery tickets, basically.

And, you know, the market’s attitude toward tech stocks is what’s going to determine results far more than their own individual results.

So, it’s silly to think of somebody working very hard at some very small job at Berkshire, with our aggregate market value of 90 billion, thinking that their efforts are going to move the stock.

But their efforts may very well move the number of policy holders we gain or the satisfaction of policy holders. And if we can find ways to pay them based on that, we are far more in sync with what they can do. And they know it makes more sense.

So, I hope our competitors do all kinds of crazy things on comp and everything else. I mean, the more dumb things they do, the better life is for us. And I think that —

Well, we’ve had incredible success at keeping managers. I don’t think there’s probably any company in the United States of size that has had better luck on that than Berkshire.

And partly, it’s because we appreciate, in terms of the comp plan, and partly because we just appreciate, generally, managers that do a terrific job for us. And we’ve got the best group in the world.

Charlie?

CHARLIE MUNGER: Yeah, here again, we’re very much out of step with the conventions of the world.

When I read annual reports, and I read a lot of them, I'm very frequently irritated by the presence of things that are totally absent from the Berkshire Hathaway annual report.

I think promising people free medical care forever, between age 60 and the grave, and maybe for a younger spouse after the grave, but the first one, regardless of what's invented and regardless of what it cost, I don't see how anybody who cared about the shareholders would be making promises like that.

There's a lot of insanity in conventional corporate conduct on the pay front. And — but if convention determined what was sane and what was insane, we're the oddballs. I mean, we're the unusual example.

WARREN BUFFETT: I think per — and I think it's very subconscious, but I think, sometimes, that the desires of the top person to get an outrageous amount gets pyramided through the organization.

Because if they're going to have some scheme that rewards them based on a lottery ticket, they feel they have to give lottery tickets to everybody else, although on a much-reduced scale.

And they really do. I mean, it's just — it becomes accepted in the course. And then you hire consultants who come around and say, "Well, you're getting more lottery tickets at someplace else. And we've got some added new schemes." It becomes very, very reinforcing.

But what has happened at the top level is really unbelievable. I mean, it — if an executive said to his company, "I want an option on 300 — just for working here — I want an option on $300 million worth of S&P futures for the next 10 years," you know, people would regard that as outrageous. They'd say, "What have you got to do with that?"

But in effect, if they get one on their own stock and it goes up based on the fact the S&P appreciates over 10 years, they think that that's perfectly acceptable to have that kind of a ride.

So I would say that, you know, there's been a lot of talk about the huge gap between, you know — that exists in pay. But it seems to me that the primary gap that is eating at American CEOs is the gap between the rich and the super-rich. That seems to be motivating the adoption of many plans.

It's really — it's gotten out of hand, but it isn't going to change. The CEO has his hand on the switch as a practical matter. I know people, and I've been on them myself, but on comp committees. And as a practical matter, you don't stand a chance.

CHARLIE MUNGER: Yeah, a lot of the corporate compensation plans of the modern era worked just about the way things would work for a farmer or if you put a rat colony in the grainery. It — (Laughter)

WARREN BUFFETT: Put him down as undecided. (Laughter)

Good to see you, Martin.

18. We ignore book value for our stock investments

WARREN BUFFETT: OK, let's go to 8.

AUDIENCE MEMBER: Good morning Mr. Buffett and Mr. Munger. My name is Ram Tarecard (PH) from Sugar Land, Texas.

I've been a Berkshire shareholder since 1987 and always battling with the idea of what really is the intrinsic value for the company.

We have seen that, over time, a change in book value is a big indicator of the change in intrinsic value of Berkshire. Although in absolute terms, you have said again and again, that intrinsic value far exceeds book value.

In calculating the book value of Berkshire, our partly-owned businesses, like Coke and Gillette, are valued at their market value. This component of book value fluctuates, often irrationally, depending on the mood of the market.

Do you think that using a look-through book value, just like you used look-through earnings, is a superior measure for tracking changes in intrinsic value?

In fact, I had written a letter to you last August and I was very pleased to get a response from you personally saying that this approach makes sense.

My question is, does this approach really give you a better measure for tracking intrinsic value? And if so, would you consider publishing it in the annual report? Thank you.

WARREN BUFFETT: Yeah, thanks for the question. I would say that — I'm not sure how you phrased it when you wrote me and how I phrased it going back, but look-through book value would not mean much, actually.

The very best businesses, the really wonderful businesses, require no book value. They — and we are — we want to buy businesses, really, that will deliver more and more cash and not need to retain cash, which is what builds up book value over time.

Admittedly, the prices of marketable securities, at any given time, are not a great indication of their intrinsic value. They are far better, though, than the book value of those companies in indicating intrinsic value.

Berkshire's book — Berkshire's intrinsic value, in a very general way, and trends in it, are better reflected in book value than is the case at a very high percentage of companies. It's still a very — it's not a great proxy.

It's the best — it's a proxy that is useful in terms of direction, in terms of degree, in a general way over time. But it's not a substitute for intrinsic value.

It — in our case, when we started with Berkshire, intrinsic value was below book value. Our company was not worth book value in early 1965. You could not have sold the assets for that price that they were carried on the books, you could not have — no one could make a calculation, in terms of future cash flows that would indicate that those assets were worth their carrying value.

Now it is true that our businesses are worth a great deal more than book value. And that's occurred gradually over time. So obviously, there are a number of years when our intrinsic value grew greater than our book value to get where we are today.

Book value is not a bad starting point in the case of Berkshire. It's far from the finishing point. It's no starting point at all of any kind in — you know, whether it's The Washington Post or Coca-Cola or Gillette.

It's a factor we ignore. We do look at what a company is able to earn on invested assets and what it can earn on incremental invested assets. But the book value, we do not give a thought to.

Charlie?

CHARLIE MUNGER: Well, I think that's obviously correct. (Laughter)

WARREN BUFFETT: Oh. He'll come back next year.

19. Markets: "Wild things create their own truth for a while"

WARREN BUFFETT: Number 1. (Laughter)

AUDIENCE MEMBER: Hello, gentleman. My name's Dan Sheehan. I'm from Toronto, Canada.

First of all, I'd like to thank you for this weekend. It's become more and more important to me as it's become more and more difficult to find a rational discussion about the stock market. And this weekend really is a breath of fresh air for most of us, I think.

One of the places I refer to a lot is Benjamin Graham. And what worries me now is what he referred to — is a period in 1929, in the early '30s — as a lab experiment that — where normal intrinsic values and margins of safety broke down, or seemed to, anyway.

And I wonder how much you think that might happen now or in the next few years, and how much you worry about that with the investments you're making.

WARREN BUFFETT: Well, we generally believe you can just see anything in markets. I mean, just extraordinary what happens in markets over time. It gets sorted out, you know, eventually.

But, I mean, we have seen companies sell for tens of billion dollars that are worthless. And at times, we have seen things sell for 20 percent — a number of things, not hard to find, perfectly decent running them — sell for literally 20 percent or 25 percent of what they were worth.

So we have seen and will continue to see everything. It's just the nature of markets. They produce wild, wild things over time.

And the trick is, occasionally, to take advantage of one of those wild things and not to get carried away when other wild things happen.

Because the wild things create their own truth for a while and you have to — you know, you — that's the reason they're happening, and people are getting pleasant experiences and all that. You'll see everything if you're around markets for a reasonable period of time.

We don't see any great cases of dramatic undervaluation by this market. So it isn't like we're seeing — because there's this — perhaps this speculative mania in a particular area of the market, we do not see that creating incredible undervaluation other places.

What's happening there may lead to undervaluation, you know, a few years from now. Or it may not, I don't know that, but we're —

It isn't like you can find things that are worth double or thereabouts what you're paying because, frankly, there's so much money sloshing around that if you found such a thing, it would be very likely corrected by some buyout types.

I mean, we would love to find businesses that are selling for half of what they're intrinsically worth. We don't find that. We do find a lot of cases where we think the evaluations on the high side are just — are unbelievable.

We have been in periods in the past where we felt almost everything was being given away, too. So you'll get those extremes. Most of the time the market's in a position where there's a little of both, but every now and then, it gets into a position where there's a lot of one or the other.

And we would — you know, we would love it if we could find a lot of reasonable-sized companies that were selling at what we thought were half of the intrinsic value. We're not finding them.

Charlie?

CHARLIE MUNGER: Well, I do think that the present time is a very unusual period. It's hard to think of a time when residential real estate, and common stocks, and so on, rose so rapidly in price and there was so much easy money floating around. I mean, this is a very unusual period.

WARREN BUFFETT: What's fascinating — and I'm sure you've thought of it — is that you can now have a business — we saw a few of them, you know, earlier this year we'll say — that might've been selling for $10 billion where the business itself could not have borrowed, probably, a hundred million dollars in debt, with an equity evaluation of 10 billion.

But the business itself would not — as a private business — would not have been able to borrow a hundred million. But the owners of that business, because it's public, can borrow many billions of dollars on their little pieces of paper, because they have this market valuation.

If it's a private business, the company itself couldn't borrow one-twentieth or so of what individuals could borrow.

That's happened, to a degree, before. But this has probably been as extreme as anything that's happened, probably, including the '20s. That doesn't mean there's a parallel to it, but it's been pretty extreme.

Charlie?

CHARLIE MUNGER: I think it probably is the most extreme that has happened in modern capitalism. In my lifetime, I would say the '30s were the — it created the worst recession in the English-speaking world in 600 years.

And it was very extreme. You could buy a "all-you-can-eat" in Omaha through the '30s for a quarter from Henderson's Cafeteria.

And now we're seeing the other face of what capitalism can do. And this is almost as extreme as the '30s were, but in a different direction.

It's zero unemployment, rampant speculation, et cetera, et cetera. It's an amazing period.

WARREN BUFFETT: That does not make it easy to predict, however, the outcome.

It says to us, though, certain things we want to stay away from. I mean, basically that's — it's precautionary to us. It does not spell opportunity.

Although, there's no question that the — in the last year, the ability to monetize shareholder ignorance has never been exceeded, I think. Wouldn't you say so, Charlie? (Laughter)

20. “It’s so easy to copy in the internet”

WARREN BUFFETT: OK, number 2.

AUDIENCE MEMBER: Good morning, gentleman. David Winters, Mountain Lakes, New Jersey.

Thanks again for Berkshire Fest 2000 and having it on Saturday, for those of us who tap dance to work on Monday. (Buffett laughs)

You know, over the previous 30 years or so, Berkshire has been a tactical participant in the insurance business. With the acquisition of Gen Re and the broadening of GEICO’s scope, the company’s been transformed into a mainstream activity.

How will this transformation result in growth and low cost float over time? I.e., how do you avoid becoming average?

And to follow on with the very perceptive 10-year-old from California’s question, will Berkshire’s newspaper interest be able to make the successful transformation to the new electronic world, especially the unique content of the Washington Post? Thank you.

WARREN BUFFETT: Those are both good questions. I think, to answer your second one, I think the Buffalo News will do just as well as, if you take the top 50 papers in the country, in making a transition. How well the top 50 will do is really an open question.

And — but there is — you know, the industry factors will, in my view, just overwhelm any specific strategy. Because any strategy is —

It’s so easy to copy in the internet. That’s one of the problems of the internet. It’s one of the problems of capitalism.

I mean, if you open a restaurant that’s successful, somebody’s going to come in and figure out what your menu is and how — you know, the whole thing. And then they’re going to try to do it in a little bit better location, or at a lower price, or whatever. That’s what capitalism’s all about and it’s terrific for consumers.

The internet accentuates that process. I mean, it gives everybody in the world real estate. You know, there are no prime locations to speak of. I mean, I can give you the argument for how you develop one and all of that, but it really changes the world in a big way.

You know, if you were at 16th and Farnam in Omaha in the ’20s, with Woolworth — that’s the place where the streetcar tracks crossed, you know, and a whole bunch of them were going north/south there and east/west — and there wasn’t any better real estate in town.

I'm not sure if that's worth as much now in nominal dollars as it was in the 1920s. But — and that looked permanent, incidentally. Who was going to rip up the streetcar tracks or — in 1910 or whenever it was?

So now, you rip up the tracks every day. You know, and so the fluidity is incredible, in terms of moving economic resources around compared to what it was.

The newspaper industry is going to try and figure out how to be a very important information source in a new medium. And it may solve that problem, to a degree, and still have lousy economics. That's — you know, that's — unfortunately, the newspaper industry's always —

Historically, the way the industry structure worked, once you got into the majority of households and everything, somebody else could bring out a way better paper, but it wasn't going to go any place against you.

I mean, you had such structural advantages that you could, you know — you could put your idiot nephew in and he would do fine — wonderfully — you know. And nothing could happen to him except when this different medium came along.

Now you can put in a genius and whether that will make any difference is an open question. I would say that it's quite doubtful. If you own a newspaper, you want to do everything that you can think of and, fortunately, everything anybody else can think of, because you can copy them so fast.

And it may work in terms of product and it may not work in terms of product. And it may work in terms of product and still not work in terms of economics very well. And I don't know the answer to that question.

I know that we will play it out — at the Buffalo News, for example — as strongly as we can. I don't think other people are going to get way better results than we are. I don't know what the other people are — what their results are going to be and how it will work.

It would be crazy to sit on the sidelines and simply ignore what's going on. So we will do our darnedest to have good economics when this is all through. But nobody knows how it's going to play out, in my view.

21. "Average is going be terrible in insurance"

WARREN BUFFETT: The question about insurance, about whether we become average — average is not going to be good insurance. Average is going be terrible in insurance over time. It's not —

It’s a commodity businesss, in many respects. And if you are average, you’re going to have a very poor business. You may limp along because you got a lot of capital that’s supporting the lousy business, but it’s not — it won’t be a good business, per se.

But I think in GEICO, and in General Re, and some — and our other operations as well — we do not have average businesses, and there is nothing about the way the industry is going that would force us or lead us to have average operations.

I mean, we have special things we bring to the party in both cases I’ve named, and actually, in other cases as well. We have things we bring to the party that should make us considerably better than average.

It’ll show more in some periods than others, and it’ll be different in the way it is applied at GEICO or at General Re or at National Indemnity’s reinsurance operation. But none of those, in my view, will be average.

But average — and there will be a lot of average, by definition — average is not going to be good.

The other problem about it is average is not going to go away, either. So that is an anchoring effect, to some extent, on what even the skillful operator can achieve. I think insurance will be a very good business for us over time.

Charlie?

CHARLIE MUNGER: Yeah. Every once in a while, we have a business sort of die under us. Trading stamps is now off 99 3/4 percent from its peak volume, and we were able to do nothing to prevent that except wring all the money out and multiply it by about 100. (Laughter)

WARREN BUFFETT: We actually did about, what, 120 million, in the late ’60s, per year in trading stamps, far more dominant in our area than S&H was nationally.

And we have — by skillful management, Charlie and my constant attention to detail — have taken that business from 120 million a year down to, what, about 300,000 a year or so?

CHARLIE MUNGER: Oh, way less than that. (Laughter)

WARREN BUFFETT: We thought of having the sales chart here and turning it upside down to impress you, but it wouldn’t have worked very well.

CHARLIE MUNGER: I think it’s the nature of things that some businesses die. It’s also in the nature of things that, in some cases, you shouldn’t fight it. There is no logical answer, in some cases, except to wring the money out and go elsewhere.

WARREN BUFFETT: Yeah, and that's very tough for managements, too. In fact, they almost never face up to that. It's very, very rare.

And it's logical that it'd be rare. In a private business, you can understand why people face up to it. In a public company, if you take the equation of the manager, he or she may be far better off ignoring that reality than accepting it.

22. Competitive advantage is more important than short-term profits

WARREN BUFFETT: Let's go to number 3.

AUDIENCE MEMBER: Good morning, gentleman. My name's Marc Rabinov from Melbourne, Australia.

You've emphasized the importance of the moat around a business, or the sustainable competitive advantage. My question really relates to learning more about that.

Professor Michael Porter at Harvard has made a detailed study of this. Did you find his work useful and can you recommend any other sources of information on this?

WARREN BUFFETT: Yeah, I've never really read Porter, although I've read enough about him to know that we think alike, in a general way. So I can't refer you to specific books or anything. But my guess is that what he writes would be very useful for an investor to read.

I mean, I — again, I've never — I've just seen him referred to in some commentary. But I think he talks about durable or sustainable competitive advantage as being the core of any business. And I can tell you that that is exactly the way we think.

I mean, that — in the end, you — if you are evaluating a business year-to-year, you want to — the number one question you want to ask yourself is whether the — could the competitive advantage have been made stronger and more durable before — and that's more important than the P&L for a given year.

So I would suggest that you read anything that you find that's helpful or —

Actually, the best way to do it is study the people that have achieved that and ask yourself how they did it and why they did it. I mean, why is it that in razor blades, which could —

I mean, everybody grows up in business school hearing that as a great example of a product that's very profitable and why —

With it obvious that there's going to be no reduction in demand for the next hundred years for the product, why are there no new entrants into the field? What it is that gives you that moat around the razor blade business?

Normally, if you've got a profitable business, you know, a dozen people want to go into it. If you've got a dress shop here in town and it looks like it's doing well, you know, a couple of other people are going to want to open up a shop next door to it.

And here's a worldwide business, nothing can go wrong with the demand, to speak of. And yet, people don't go into it.

So, we like to ask ourselves questions like that. We like to ourselves, "Why was State Farm successful, you know, against people that had incredible agency plants and lots of capital?"

And here's some farmer out in Bloomington, Illinois named George Mecherle , you know, who's in his forties. And he sets up a company that defies capitalistic imperatives.

I mean, it has no stock, it has no stock options, it has no big rewards. It's, you know, it's kind of half socialistic. And all it does is take 25 percent of the market away from all of these companies that had all these characteristics.

We believe you should study things like that. We think you should study things like Mrs. B out at the Nebraska Furniture Mart, who takes $500 and turns it, you know, over time, into the largest home furnishing store in the world. There has to be some lessons in things like that. What gives you that kind of a result and that kind of competitive advantage over time?

And that is the key to investing. I mean, if you can spot that — particularly if you can spot it when others don't spot it so well — you're on the — you know, you will do very well. And we focus on that.

Charlie?

CHARLIE MUNGER: Yeah, it — these factors — every business tries to turn this year's success into next year's greater success. And they all use pretty much every advantage they have in every direction from this year to make next year's better.

Microsoft did exactly that, year after year after year and happened to win big.

And it's hard to see — for me at least — to see why Microsoft is sinful because they tried to improve the products all the time and make next year's business position stronger than last year's business position. (Applause)

If that's a sin, every subsidiary at Berkshire is a sinner, I hope. (Laughter)

WARREN BUFFETT: Yeah, yeah, yeah. We declare ourselves for sin. (Laughter)

23. Promo for See's Candies Barbie doll

WARREN BUFFETT: At this moment, I think we have a small interruption in the program here.

Charlie, on your left. (Laughs)

It's just a sample of what it's like to be an officer at Berkshire. (Laughter)

Oh, OK.

This is the new See's Barbie doll. And — never before seen, it will be in the exhibitors section, lower level.

And believe it or not, we've come up with three more just like this young woman. And they will be down there to take your orders. We can't ship them now, we won't charge your credit card until they — until they're available for shipment, which will probably be, I guess, around September or so.

But we wanted our shareholders to be the first ones to have a shot at this new product, and —

The model is not included in the — (laughter) — delivered price.

Afternoon Session - 2000 Meeting

1. Most companies hide the true cost of stock options

WARREN BUFFETT: OK, if area one is ready, we're ready to start answering.

AUDIENCE MEMBER: Hi.

WARREN BUFFETT: Hi.

AUDIENCE MEMBER: My name is Steve Check. I'm from Costa Mesa, California.

My question is regarding stock options. I've taken your suggestion and have been attempting to subtract stock option compensation from reported income when evaluating companies. When I read annual reports, I usually find companies estimating option costs using the Black-Scholes model.

However, the assumptions going into the Black-Scholes model seem quite different from company to company. These assumptions, of course, are what is used for risk-free interest rates — quote unquote, "risk-free" interest rates, expected option lives — even though options have stated lives, and expected volatility.

Help me out a little bit. What is the best way to calculate option costs? Do you think Black-Scholes is appropriate? If so, how should we normalize the assumptions?

And just one short follow-up: how can we possibly estimate future earnings for companies, when companies, such as even Microsoft last week, in response to a lower stock price, simply reissue a bunch of new options?

WARREN BUFFETT: Yeah, the — I can tell you, from some personal experience, that companies attempt to use the lowest figure they can, even though it doesn't hit the income account.

So they like to make fairly short assumptions as to the life of the options, even though they're granted on a ten-year basis. Because they'll make certain assumptions about exercise date or forfeiture and so on.

I think the most appropriate way, when you've got a pattern, which you have at many companies, of what they do on options, is simply to make an educated guess as to the average option issuance that they're going to incur, or they're going to elect to do over time.

And, generally, what you really want to — if you were to be precise — you would try to figure out what they could've sold those options for in the open market. Because that's the opportunity cost of giving them to the employees instead of selling the same option in the market.

I think you'll find, generally, that if you take a value of about a third, for a ten-year option, if you take a value of about a third — obviously, it depends on dividend rate and volatility and a whole bunch of things — but about a third of the market value, strike price, at the time they're issued, that's the expectable cost.

We believe in using the expectable cost versus the actual cost. I mean, that is how we would look at it.

If we were issuing options at Berkshire, and we issued options on $100 million worth of stock a year, we would figure it was costing us, probably in our case, with no dividend, at least $35 million a year to issue those options.

And we would figure that if we gave people $35 million in some other form of result-oriented compensation, that it would be a wash. And that is not the way most managements, of course, figure. At least that's my experience.

And we would figure we could use that 35 million in a more shareholder-oriented way and one where the employee (who) was productive would be sure of getting results, as opposed to having it be at the whims of the market.

And I think you'll see a lot of option repricing. Everybody says they won't reprice their options, until they do it. And, you'll see that with a lot of schemes.

It would be interesting to see whether CONSICO is willing to bankrupt all the executives who made loans to buy the stock and had those loans guaranteed by the company.

And the company initially said they would enforce those loans. And we'll see whether they do it. I would say, in many cases, they won't. I don't know what CONSICO will do.

But, a lot of things that are said in connection with executive option schemes and that sort of thing are what they'll do if it works in their favor. And then they'll do something else if it doesn't work in their favor. And that's not spelled out in the initial approval that's granted.

Charlie, you have anything to add?

CHARLIE MUNGER: Well, Warren's somewhat critical attitude is very understated compared to mine. (Laughter)

WARREN BUFFETT: We're going to leave raisins out of this particular — (laughter) — analysis. Let's go to area 2.

We do believe, incidentally, if a company is going to end up giving out 10 percent of the, company over a 10-year period or 15 percent on options, that is like buying an apartment house and letting the seller keep a 10 or 15 percent interest in the upside.

Or it's like buying an oil field and giving somebody a 10 or 15 percent interest-free override. It changes the value of the property. Make no mistake about it.

It is a — it has a huge economic impact on the value of a property. And just go out and try and sell your house and say, "I want to keep 15 percent of the appreciation in it," and ask the buyer whether he's going to pay the same price for the house.

Options subtract value the moment they are granted. And, like I say, unless companies — some companies follow a practice of making a mega-grant every three or four or five years. A lot of them just issue a fairly constant amount annually. And you can figure out the cost.

And, you know, they don't want to tell the shareholders there's a cost. And that's why they fought through Congress and everything else in order to prevent it from being the truth. But, you know, Galileo had that problem many years ago and finally won out. So maybe we will, too. (Laughs)

2. Moody's moat has "poisonous characters"

WARREN BUFFETT: Yeah, area 2.

AUDIENCE MEMBER: My name is Dennis Jean-Jacques from Chatham, New Jersey. I first would like to thank you personally for taking the time out of your busy schedule to visit MBA students throughout the country on a regular basis.

In fact, I consider your visit to the Harvard Business School campus many years ago my personal rational awakening.

My question is in regard to Dun & Bradstreet. Many academics would argue that two of the many factors that determine a firm's sustainable competitive advantage are the threat of new interest through imitation, and the threat of substitution through technological advances, such as, you know, the internet and things of that nature.

My question is, how deep is the moat around Moody's and the operating company?

WARREN BUFFETT: Yeah, we don't want to go into too much detail about our marketable investments.

But I would say that the moat is, just in our view, is far wider, deeper, and infested with far more poisonous characters, in the case of Moody's, than in the case of the operating company.

We've had experience — just in terms of making decisions about how you either obtain credit information, in the case of the operating company, or if you want to obtain ratings on securities or something — I think you'd conclude that Moody's is a much stronger franchise than the operating company.

Doesn't mean the operating company can't turn out to be a better business. It might have more upside under certain circumstances, too.

But if you're really thinking of, you know, what bad can happen to you, I think that you would regard Moody's as a considerably stronger franchise than the operating company.

Charlie?

CHARLIE MUNGER: Well, I'd certainly agree. The —

Moody's is a little like Harvard. It's a self-fulfilling prophecy. (Laughter)

You know, I hate to think of how much you could mismanage Harvard now and still have it work out pretty well.

3. Harvard Business School isn't affected by supply and demand

WARREN BUFFETT: If you cut the price of the admission to the Harvard Business School by $10,000 a year, you would have less demand, in all probability, than an increase in demand.

I mean, it's totally counterintuitive in that respect. Because the cachet of the school, in that case, is not only reinforced, it almost makes it necessary, that it be priced toward the top.

So, it — you can throw away the demand and supply curves that they teach you in Economics 101 on something like that.

I — frequently, I have a little fun with — when I attend business schools. Because I ask them, you know, what the definition of a wonderful business is, and we go through all this stuff.

And then I say, you know, I tell them that — really — the best business I've seen is the Harvard Business School or the Stanford Business School, because the more they increase the price, the more people want to get in, and the more people think the product is worth.

And that is a marvelous position to be in. (Laughter)

And I thank you for your comments on the — you know, I was lucky enough to have a great, great teacher in Ben Graham at Columbia. And Ben didn't need to go up to Columbia once a week, on Thursday afternoon, to talk to a bunch of us.

So it — I really feel it's — I enjoy, sort of, passing that along. I haven't had any original ideas in this field at all. But I, you know, I had a terrific teacher. And it's fun to talk to students.

If you talk to a bunch of guys my age, nothing happens. I mean, they just want to be entertained. (Laughter)

But they want predictions always and that sort of thing. So I don't do any of that at all. I'd rather talk to students. And I thank you for coming.

4. Energy and transportation need a lot of capital

WARREN BUFFETT: Let's go to number 3.

AUDIENCE MEMBER: My name's Jared Placeler (PH). I'm 15 from St. Louis.

Are you considering investing in energy and transportation companies, such as ones that deal with fuel cell and environmentally friendly energy resources?

And if you are, will you thus be replacing any other energy-based investments you may currently hold, such as your newly acquired holdings in MidAmerican Energy?

WARREN BUFFETT: Yeah. I would say that energy and transportation, in the very broad sense, are both things that we've at least got a chance of understanding. So those are the kind of areas in which, we would think about making investments.

We would probably think about it less in connection with new technology. We might expect the people who run MidAmerican Energy to be thinking about that all the time.

But Charlie would be better at it than I am, because he has a different background and thinks better about that, anyway, in terms of evaluating newer technologies. I wouldn't be very good at it at all.

But those fields are, they're big, in terms of capital investment, for one thing. So they're very big fields.

And then secondly, we would probably think we were capable of evaluating the potential, some years down the road, of many companies in energy and transportation.

So those would be fields we would consider. And of course, as you mentioned, we made an investment in MidAmerican Energy.

I doubt if the technology changes dramatically in any near term as to the product that they're delivering.

But if there were changes on the horizon, I think we've got the management there that would be very good at spotting that ahead of time and capitalizing on it in a proper way.

I wouldn't take that function on myself.

Charlie?

CHARLIE MUNGER: Well, historically, we've done very little in either field. And mostly, the past is a pretty good guide to the future.

WARREN BUFFETT: Historically, the transportation field, I mean, it's been a terrible place to have money, and, whether it's been in airlines or in the rails. If you — we've mentioned Value Line from here — from time to time.

If you go to the rail transportation section and just run your eye across on the revenues and look at the capital investment, the amount of capital required to produce incremental revenues is just — is horrible.

And on the other hand, there's not much alternative here in the game to doing that. So there — many railroads will spend hundreds and hundreds and hundreds of millions of dollars. And it will not move the top line hardly at all. The ones where the top line has changed is where there's been acquisitions or mergers.

Airlines, you'll see just the opposite. You'll see this great movement in the top line, but again, a disastrous amount of capital investment and very little in the way of returns. So, it hasn't been a great field.

Most fields that require heavy capital investment, most of the time, they don't turn out very well over time. There are plenty of exceptions to that.

But if you find a business that has to keep adding up huge sums of money every year, there always will be a reason why they're doing it. But the net result, after five or 10 or 20 years usually isn't very good.

Charlie, got anything?

5. Buffett defends Coca-Cola CEO Doug Ivester's big exit package

WARREN BUFFETT: Area 4?

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. My name is Bob Odem (PH) from Seattle, Washington.

I'd like to say, first of all, how nice it is to come out to Omaha, and how I am made to feel comfortable by its people. I hope you both are as enthusiastic about the meeting as you seem to be in years to come. Mr. Munger, by the way, I am looking forward to your book coming out.

My question has to do with Doug Ivester's severance package and what justifies it, considering he had a very short tenure as CEO and that he took the reins from some very strong performance from Goizueta and to be relieved of his dismal performance by Doug Daft.

My brother, still in the bottling and distribution business of Coke, cut this article from Bottlers' World Magazine concerning the severance package. He said he also would retire, if he were offered this — (laughter) — 97.4 million in stock, 3 million per year for 2000 to 2002, 2 million per year, 2002 to 2007, 1.4 million per year from 2007 for the rest of his life.

Anyway, I don't see how — or here, car and cell phone, he gets that. That's a Mercury Grand Marquis and mobile telephones, laptop computer, and the like. I don't know why he'd need that. (Laughter)

Anyway, I have been wondering how you voted on this, whether you supported it or not, or what degree, considering executive pay at Berkshire hasn't risen except, perhaps, for the CFO who last got a raise, I believe, in 1997.

WARREN BUFFETT: You asked — no, CFO's gotten a raise every year.

But the — you asked whether I supported it. Yeah, I can tell you, I supported it. Because with my 35 percent interest in 8 percent of Coca-Cola, I paid almost 3 percent of it myself, personally.

I probably paid more severance pay than any man in the history of the world, personally. (Laughter)

I was not on the comp committee. But I will say this. Doug Ivester did all kinds of really wonderful things for the Coca-Cola Company, over time.

He was — for many, many years, when Roberto was running things, Doug — working with Don Keough, too, and I had this first hand from both of them. I wasn't in Atlanta. But there was no question that he was a huge, huge asset and conceived and carried out many of the things that other people may have gotten even more credit for.

Most of what you described, not the little things at the end, but most of what you described was contractually in place at the time that he left. I mean, those were deals that were made, restricted stock and all of that, that really occurred, in significant part, when Roberto was the chief executive officer and at Roberto's recommendation.

Doug's devotion to Coke, his knowledge of Coke, I mean, he lived and ate and breathed Coke. But in my opinion, Doug Daft was the man for the job. And a change was made.

But it was not because of any lack of attention by Doug Ivester. It was not because he hadn't done great things as CFO of the company.

But I think he was not the right man at the time he took over as CEO. He took over, as you know, when Roberto died quite suddenly. And there wasn't any real option in terms of the —

He was Roberto's hand-picked successor. It's almost inconceivable that somebody else would've been chosen at that time.

And we made a decision, within a couple of years, that the company would move faster and better with Doug Daft in charge. And we made a deal in severance which was about 80 percent, or some very high percentage, embedded.

And like I say, I paid more of it than anybody else. So it isn't like it was all academic.

And I think, considering some other factors, which maybe I'll put in a book sometime, that entered into it, it was definitely the right decision for the Coca-Cola Company.

Whether the computer should've been included or the car or anything, I can't — I would not want to defend small item by small item. But I can — I think the Coca-Cola shareholders are going to be many billions of dollars ahead over time by what was done then. And it wasn't easy to do.

We'll go to 5 — Charlie, do you have anything to add on that? You paid a fair amount, too.

6. Excessive CEO pay creates "hostility" to corporations

CHARLIE MUNGER: Generally speaking, I think it's a mistake for corporate America to create as much hostility as it does, which is based on the way it compensates principal officers of corporations.

It is simply maddening to add a little clause that the corporation will scratch the guy's back for just tiny, little bits of stuff that looks terrible. To me, that is extremely stupid.

And I see it where the corporation helps him prepare his tax return for 10 years after he leaves and so forth.

I think that makes a terrible impression on shareholders, generally. And I think corporate America's crazy to do it. They get sold this stuff by these damn consultants. (Laughter)

WARREN BUFFETT: I agree with Charlie. And what — it is true — (applause) — what Charlie says.

We don't have a contract, at least that I can think of, at Berkshire. It's perfectly easy to run a company without them.

We've got wonderful managers. You know, we've got things that might be called contracts. I mean, we've got deals with them, in terms of we work out compensation arrangements and all that.

But I can't remember a case of anybody that's been with us that ever has called in a lawyer or anything of the sort, or where we even had to reduce things to writing, basically. And it works fine.

And it is a little maddening, as Charlie says, to have a CEO, you know, show up with a lawyer with a 20-page contract. It's become standard operating procedure.

And once you get a big, public company with committees, consultants to the committees, consultants who, usually, are picked by the officers of the company, they look around at what everybody else is doing and say, "Well, that's the way the other guy does it. So I'll do it."

I think you can — I think the proxy statements of the last 20 years, what that's induced in the way of behavior by people at somewhat comparable companies that look at the proxy statements of their competitors and then say to their lawyer, "Well, Joe Blow got this. Why shouldn't I have it?"

It just escalates and escalates and escalates. And it ratchets. And it won't stop. I have never seen a compensation consultant come into a public company and suggest a plan that, net, reduces the cost of compensation.

At — and I see all kinds of people leave companies with — who have made tremendous amounts of money. And nobody wants to hire them at half the price, or a quarter of the price, or a tenth of the price. I mean, it's not a market system.

CEO compensation is not a market system. And it's not subject to market tests. And I don't know what you do about that, particularly. But I — it doesn't seem to bother shareholders very much. The ones that could change it —

CHARLIE MUNGER: Oh, I think it bothers them a lot, Warren. It's just they feel powerless.

WARREN BUFFETT: Yeah, but institutional shareholders could change that. My guess is that the top 30 institutions, probably, control — what — two-thirds of the big companies in the country. And they don't seem to care that much.

They — actually, they spend their time on what I regard as peripheral issues, usually. They talk about other things. They get involved in rituals of corporate governance that, frankly, don't mean a damn in terms of how the company performs. And they seem to ignore these other issues.

But, you know, there's — we've got enough to do running Berkshire. So we can't reform the world on that.

We will run Berkshire in a rational manner. And we have yet to hire a compensation consultant. And we've yet to lose an important manager.

7. Buffett: Economists aren't needed

WARREN BUFFETT: OK, we'll go to number 5. (Applause)

AUDIENCE MEMBER: Hello.

WARREN BUFFETT: Hi.

AUDIENCE MEMBER: I am Diane Ryan (PH) from Prairie Village, Kansas. This is the fourth year I've attended the stockholder meeting. And I'd like to say, every year, I feel like I've learned a little bit more.

This year, my question is, do you see a deflationary trend in the global economy? And if so, what is your investment advice?

WARREN BUFFETT: Well, Diane, I'm no good on the macro questions. And I've proven that by being way too worried about inflation for, probably, the last 20 years. Fortunately, it hasn't made much difference, the fact that I've been wrong on that.

So I don't really think my judgment is any better than yours, at all, in terms of assessing what's going to happen to global prices over time. My opinion would be that the world is not going in a deflationary situation.

But, you know, I've not earned any stars for my past economic predictions. And the good thing about my economic predictions, even if I do make them, is that I pay no attention to them myself, so. (Laughter)

I really — and the way we pick our investments is we just don't get into the macro factors. I can't recall a time when Charlie and I have looked at a business, either buying it in its entirety or buying pieces of it through the stock market.

I just — macro conclusions are — just never enter into the discussion. I mean, I'll pick up the phone. We've had these two in recent months. And I'll tell Charlie about it. And, you know, we talk about a few things. But we don't talk about anything remotely macro. And that's really the way it'll stay.

You know, I've seen a lot of bank mergers recently. And one of the things they do, because they want to cut the costs and justify a merger, which they're dying to do, I mean, that's the reason — so they cut costs they wouldn't have cut if they weren't dying to do the merger in the first place and get bigger.

But frequently — I know one in particular that I'm thinking of — you know, they'll cut out the economics department. You know, I always wondered why the hell they had it in the first place. (Laughter)

You know, because what do they do? You know, I mean —the guy comes in and says, “I think GDP will be 4.6 this year instead of 4.3.” So what?

You know, I mean, you’re still trying to make every good loan you can make. You’re still trying to take in deposits as cheap as you can. And you should be trying to cut costs wherever you can. It’s got nothing to do with running the business.

But, you know, it’s fashionable. And every bank had its economist and economics department. And when a big client would come in, they’d take him to lunch. And it just — it always has struck me as just a lot of nonsense.

So if we ever get an economics department at Berkshire, sell the stock short. (Laughter)

WARREN BUFFETT: Number 6, please. Oh, Charlie, I didn’t —

CHARLIE MUNGER: (Inaudible)

WARREN BUFFETT: Oh, OK. (Laughter) He’d rather eat peanut brittle.

8. “Take on the qualities of other people you admire”

AUDIENCE MEMBER: Hello, Mr. Buffett —

WARREN BUFFETT: Hi.

AUDIENCE MEMBER — Mr. Munger. My name is Aaron Wexler (PH). And I’m from Santa Maria, California.

I have — my question has two parts. The first part is, when you and Bill Gates had a television show some time ago, you were asked about the people who were — had different role models.

And you said, “Well, if I know a person’s role model, I can pretty well tell the kind of a person he is and what kind of a future he has.”

Mr. Buffett, my role model is Warren Buffett. Do you think I have a chance? (Laughter)

WARREN BUFFETT: Well, I hope you’re choosing me on the basis you hope to expect to live to an advanced age. I like to think that that’s what I bring to the party.

It does pay to have the right models. I mean, I was very lucky, early, very early in life, that I had certain heroes — and I’ve continued to develop a few more, as I’ve gone along — and they’ve been terrific. And they never let me down. And it takes you through a lot.

And I think that, you know, it just stands to reason that you copy, very much, the people that you do look up to, and particularly if you do it at an early enough age.

So I think, if you can influence the model — the role models — of a 5-year-old or an 8-year-old or a 10-year-old, you know, it's going to have a huge impact.

And of course, everybody, virtually, starts out with their initial models being their parents. So they are the ones that are going to have a huge effect on them. And if that parent turns out to be a great model, I think it's going to be a huge plus for the child.

I think that it beats a whole lot of other things in life to have the right models around. And I have — like I say, even as I've gotten older, I've picked up a few more. And it influences your behavior. I'm convinced of that.

And if you — you will want to be a little more, or a lot more, depending on your personality, like the person that you admire.

And I tell the students in classes, I tell them, you know, "Just pick out the person you admire the most in the class and sit down and write the reasons out why you admire them. And then try and figure out why you can't have those same qualities."

Because they're not the ability to throw a football 60 yards, or run the 100 in ten flat, or something like that. They're qualities of personality, character, temperament, that are — can be emulated. But you've got to start early. It's very tough to change behavior later on.

And you can apply the reverse of it. Following Charlie's theory, you can find the people that you don't like — (laughter) — and say, "What don't I like about these people?"

And then you can look — if, you know, it takes a little strength of character. But you can look inward and say, you know, "Have I got some of that in me?" and —

It's not complicated. Ben Graham did it. Ben Franklin did it.

And it's not complicated. Nothing could be more simple than to try and figure out what you find admirable and then decide, you know, that the person you really would like to admire is yourself. And the only way you're going to do it is take on the qualities of other people you admire.

Anyway, that's a two-minute answer on something Bill and I did talk a little bit about.

Charlie? (Applause)

CHARLIE MUNGER: Yeah. There is no reason, also, to look only for living models. The eminent dead are the — are, in the nature of things, some of the best models around.

And, if it's a model is all you want, you're really better off not limiting yourself to the living. Some of the very best models are — have been dead for a long time. (Laughter)

WARREN BUFFETT: Charlie has probably read more biography than any three people in this room put together. So he has put this into practice. And, as somebody mentioned earlier, Janet Lowe has a biography of Charlie coming out here in — later this year. So you can read all the secrets of Charlie's life. (Applause)

9. Buffett and Munger have no interest in running the Federal Reserve

WARREN BUFFETT: OK, number 7.

AUDIENCE MEMBER: Good afternoon, gentlemen. My name is Gary Bradstrom (PH) from here in Omaha, Nebraska.

And my question is, if Alan Greenspan just decided to retire, and that job was offered, to either of you, would you take it?

WARREN BUFFETT: Well, I can tell you my answer is no, in a hurry. (Laughter)

I think Charlie will give you his answer.

CHARLIE MUNGER: I would say "no" more quickly. (Laughter)

WARREN BUFFETT: You notice, we gave you very unequivocal answers. And of course, that alone would disqualify us from the job at the Fed. (Laughter)

I think it was Alan that said to one senator, he said, "Since you, you know, since you've seem to have stated my remarks so accurately, you must've misunderstood them." (Laughter)

I don't think you could find a job in public life that would entice either one of us.

And the truth is, we're having too much fun. I mean, this — we've got the best job in the world. We get to work with people we like and admire and trust every day of the year. We get to do what we want to do the way we want to do it.

We should pay, and this is true of some other CEOs, too, but we should pay to have this job.

I mean, it is really interesting. I've often thought, if you could get, you know, you had a sealed envelope, and you got — and you had the compensation committee say what they would pay to have the job filled, but then you had the chief executive also say what he would do before he would leave, there would be a huge, huge gap.

And I mean, it's — there are all kinds of — I mean, it's a lot of fun to start with interesting problems you come up with, interesting things to do, something different every day. You can't beat the job. And to get paid for it is just the frosting on the cake.

And I don't see any jobs like that in public life, myself.

Charlie, have you got anything to add? Charlie takes on these public jobs. He runs a hospital and a few things. And he can tell you the wonders of it. Charlie?

CHARLIE MUNGER: Oh, yeah. There's an old saying that, "He lied like a finance minister on the eve of a devaluation." I never wanted to have a job where lying was a required part of the activity. (Laughter and applause)

10. Berkshire is the "Metropolitan Museum of businesses"

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, my name is Norman Rentrop. I'm from Bonn, Germany. I want to thank you very much for so patiently listening and answering and sharing yesterday and today. And I'm a shareholder since 1992. And this is my first meeting.

I came here being inspired by Robert Miles' book, "101 Reasons to Own Berkshire Hathaway." And I was very careful, listening to you, the reasons how you pick good people, that it's love for the business and not so much love for the money.

And I'd like to hear a little bit more on your philosophies, now that Berkshire Hathaway is more and more buying companies. On this, how you make sure that it's true love and how you pick people.

WARREN BUFFETT: It's a terrific question. I don't know exactly how to answer. Maybe Charlie will think of it while I'm stumbling around, but —

I really — I think I can do that quite well. But I don't know of any way to give somebody else a set of questions to ask, or, you know — I don't know how to tell someone else how to select managers using those criteria: do they love the business or do they love the money?

It's very, very important. I mean, it's crucial. Because it — well, we see it all the time. I mean, you've got people around who love the money. And you see them in public companies and doing things that we wouldn't want to have associated with us.

And on the other hand, if they love the business, and we'll tell — I'll tell an owner this. I will say to them, "You built this business lovingly for 50 years, and maybe your parents before you, maybe even your grandparents." One of these businesses we're buying is fourth generation.

And the clincher, in fact, I used it with Jack Ringwalt back in 1967. I said to Jack, who had built it over a long period of time, “Do you want to sell this? You know, do you want to dispose of this, the most — you know, your creation, your painting? Or do you want some 26-year-old trust officer to do it the day after you die?”

And the thought of who was going to handle this masterpiece, which he’d created himself, was important to him. And I tell him, If they want to put it in our museum, we will make sure, A, it doesn’t get resold, that it gets the proper respect, and that you can keep painting it.

We won’t come in and tell you to use reds instead of yellows or anything like that. So even though it’s a masterpiece now, you can keep adding to it.

So we like to think that we’re the Metropolitan Museum of businesses and that we can get really outstanding creations to reside in our museum. But it — we’ve got to deliver the kind of museum to these painters of businesses, in effect, that we would want, if we were doing the same sort of thing.

To some people, that doesn’t mean a damn thing. I mean, all they want to do is auction their business, you know. And they probably cheat on their figures a little in the last year or two before they sell it to dress it up. And they do all kinds of things.

And they employ some investment banker who pretends that he’s getting bids from other people to jack it up some more. And that’s standard procedure for a lot of people.

We have no interest in buying in with them at any price because we don’t want to be on the other side of the table for the rest of our lives with somebody that’s going to do that.

If somebody loves their business — and I love Berkshire, I mean, you create something over a period of time — it means something to you.

Some people get it out of how they decorate their home, or some people get it out of all kinds of different things, their golf game or whatever. But some of us get it out of building a business. And it has to be enormously important, what kind of a home it finds.

And there comes a time, in many situations, for estate taxes, or because the kids don’t get along, or whatever the hell it may be, why people need to do something with that business. But they don’t want it auctioned off. And we get — we have a good home for that.

I think I can tell pretty well what people’s motivations are when they come in with a business. And so far, we’ve batted pretty well.

We’ve made mistakes. There’s no question about that. But in a sense, I think they’ve gotten fewer over the years.

And we have — our disappointments with people have been very, very few. We've been wrong about the economics of the business sometimes. But that's our mistake, not theirs. We've seldom been wrong about the people.

And I wish I could give you a checklist that you could go down, and you could say, "Well, this guy loves the money. So he's going to be gone in six months. And this one loves the business. So as long as I leave him alone to do his job and appreciate what he does, be fair with him, that he's going to stay around here as long as he can."

Charlie, have you got any thoughts on how you separate these people out?

CHARLIE MUNGER: I think our culture is very old fashioned. In other words, I think it's Ben Franklin and Andrew Carnegie. It's very old fashioned.

And what I think is amazing about Berkshire is how well these very old-fashioned ideas still work.

Can you imagine Andrew Carnegie calling in a compensation consultant or — (laughter) — an investment banker to tell him whether he should buy another steel mill? Or —

We don't get imitated much. We're imitating the behavior of a period that has been gone for a long time. But, I don't see — a lot of the businesses we buy are kind of cranky like us and old fashioned. And I hope we continue it that way.

WARREN BUFFETT: They're sitting out there, Charlie. (Laughter)

CHARLIE MUNGER: Yeah, yeah. Well, but I think the businesses do have standards. See's has standards. It has its own personality. But it's — but maintaining standards is a huge part of it.

WARREN BUFFETT: Charlie hit on one thing. The idea of asking investment bankers or somebody to evaluate the businesses you're going to buy, I mean, that strikes us as idiocy. If you don't know enough about a business to decide whether to buy it yourself, you'd better forget it.

It does not make sense. (Applause) You bring in somebody who's going to get a very large check if you buy it, and a very small check if you don't, that displays a faith in human nature that would strain Charlie and me. (Laughter)

It's a key point, which you raise. And frankly, if I think there's anything we're good at, I think we're pretty good at what you're talking about there.

It's an important part of capital allocation. Because we do not — we are not in a position to manage the businesses ourselves.

And we want management as well as the business. And we've gotten it. And we've gotten it in spades from people that stay on and have done a terrific job for us. And it makes life a lot easier, too.

11. What Buffett means when he can't "understand" a business

WARREN BUFFETT: Let's go to number 1 again.

AUDIENCE MEMBER: Hello, Warren. Hello, Charlie. My name is Doug Paterson. I'm from here in Omaha.

I teach down the road at the University of Nebraska at Omaha. And I teach in theater, which is also the greatest job in the world. And I have to say that I enjoy the theater that you provide every year. Thanks so much.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: Just sitting here, there are so many questions that come to those of us who have been sitting here for three or four hours. I've got three very disconnected questions.

WARREN BUFFETT: OK, we'll do them one at a time.

AUDIENCE MEMBER: Cool. In terms of these tech stocks, you say that you don't understand them. Can you say if you think — I can't imagine you not understanding something.

WARREN BUFFETT: Oh, we understand the product. We understand what it does for people. We just don't know the economics of it 10 years from now.

That, I mean, you can understand all kinds — you can understand steel. You can understand home building. But if you look at a home builder and try and think where it's going to be in five or 10 years, the economics of it, that's another question.

I mean, it's not a question of understanding the product they turn out or the means they use to distribute it, all of those sort of things. It's the predictability of the economics of the situation 10 years out. And that — that's our problem.

AUDIENCE MEMBER: Right, and I'm not trying to provoke you into doing it. I'm glad you haven't. Because I probably would've gone into cardiac arrest this last couple of months.

WARREN BUFFETT: Well, so would we.

AUDIENCE MEMBER: Yeah. So your projection is that you are not going to try to make an attempt to understand it. You think it's — is it not comprehensible? Is that it, it's not comprehensible?

WARREN BUFFETT: Yeah. Every business I look at, I think about its economics. It's built into me. It's built into Charlie.

So it isn't like, when some — if I'm with Andy Grove, or actually, I knew Bob Noyce back at Grinnell in 1968 and '69, when they were starting Intel.

I — when he talked to me about starting Intel, or anybody talks to me about a business, I think about its economics. I'll think about the economics of UNO, you know, if we talk for three or four minutes.

But — I — so it isn't that we shut off the valve. It's just that we don't get anyplace. We don't know what it'll look like. And it's, you know, there are a lot of things in life that, you can — they're just beyond comprehension for many of us. And —

AUDIENCE MEMBER: So you'd say that like, nobody, really, probably, can understand this, where it'll be in 10 years. Nobody could understand it.

WARREN BUFFETT: We would be very skeptical about it. I would say that — and incidentally, my friend, Bill Gates, would say the same thing. And actually, Bob Noyce would've, and Bob died some years ago, but — or Andy Grove — they would say the same thing. I've taken long walks with Andy.

And they would not want to put down on paper their predictions about where 10 companies you would choose in the tech field would be in 10 years, in terms of their economics. They would say, "That's too hard."

12. Buffett: Berkshire will be fine if I'm hit by a truck

AUDIENCE MEMBER: Cool. A second question, again, not related. But I've heard this question several times today. And it comes up every year.

I'd like to couch it in sort of a different phrase. Let's say that you stepped outside of this building and were hit by a bus.

WARREN BUFFETT: Yeah. We've got one fellow who objects to that here who's a shareholder. It's normally a truck.

AUDIENCE MEMBER: A truck, OK.

WARREN BUFFETT: And he happened to be in the trucking business, so he —

AUDIENCE MEMBER: Or, given —

WARREN BUFFETT: Just so it isn't a GEICO driver. But — (Laughter)

AUDIENCE MEMBER: Given Omaha, it could be a road grader.

What kind, I mean, that would be a sudden — maybe you'd come out of it with a great fastball. Maybe that's it. But you wouldn't have your facility at stocks.

What kind of advice would you give people that hold Berkshire Hathaway at a moment such as that?

WARREN BUFFETT: Well, it's — I've got the ultimate test on that. Because my estate, at that point, would be 99 3/4 percent invested in Berkshire. And I feel totally comfortable, considering the arrangements that have been made, and the businesses we own, and the managers we have in place, in terms of that.

But no one will be more affected, financially, let alone in other manners, by that truck than me. (Laughter)

So it's a thought that's crossed my mind.

And it's a more important question to me than to anybody else. And I've answered it to my satisfaction. The directors have some of my thoughts on the subject. But the world will go on. The businesses will go on. And I think you'll have terrific management in place.

AUDIENCE MEMBER: Thank you. I appreciate that. And thank you for taking all three of these. They're so disconnected.

WARREN BUFFETT: OK, thank you.

13. Buffett: No interest in buying the Omaha World-Herald newspaper

AUDIENCE MEMBER: Given your comments about newspapers, may we assume that you are probably not going to buy the Omaha World-Herald?

WARREN BUFFETT: I think that's a fair assumption. But that would probably be true regardless of my thoughts about newspapers. Because they're not going to sell.

Charlie, have you got anything to add on any of those?

CHARLIE MUNGER: Well, that story about the World-Herald is interesting. The truth of the matter is that, if Warren had been offered the Omaha World-Herald 20 or 25 years ago, he would've cheerfully bought it. And now he doesn't want it. And that isn't because of the economics.

WARREN BUFFETT: That's true. Yeah, I mean, there's no question — I have not been offered it, never will be offered it. And all — the ownership's all set. But what Charlie said is true.

If it were still owned by an individual, and they offered it to me, for economic reasons, I wouldn't want to buy it. And for other reasons, I wouldn't want to buy it.

CHARLIE MUNGER: But you wouldn't want to buy it now, because your life would be less congenial afterward than before. There'd be more people after you.

WARREN BUFFETT: There'd be no plus in life to owning the World-Herald, at all. Yeah. (Laughter)

And, as Charlie said, that's probably not the way we would've thought 30 years ago.

CHARLIE MUNGER: Not at all.

WARREN BUFFETT: I think we're right now.

14. Internet is good for society, bad for businesses

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Hi, Howard Winston (PH) from Chicago, Illinois. I wanted to thank Charlie and you for your hospitality.

My question is, Berkshire has benefitted enormously over the years from the low cost of its float. Do you think the internet will make the insurance business more competitive and, therefore, raise the cost of your float?

WARREN BUFFETT: Well, that's a good question. I would say that the internet, from what I see now, is unlikely to increase the cost of Berkshire's float.

It will have different effects on different aspects of our insurance business. And it will change the insurance industry in some ways, not — and I can't tell you exactly what. But I —

You know that any system of distribution is going to be affected by something that changes the economics of distribution as much as the internet does. So there's no question it'll have an impact.

I think in the end, the competitive advantages we have among our group of insurance companies, net, will not be hurt by the internet. But I could be wrong on that. And therefore, I don't think that our cost of float will be changed much.

I don't think industry economics, in aggregate, for insurance companies, are going to be changed very much. The economics haven't been that good. I think they'll be about, you know, in that same range.

And I don't think our competitive advantage will be cut. So therefore, I think our cost of float, in the future, is going to be higher than it has been in the past. But that's for reasons other than the internet. I still think we'll have an attractive cost of funds over time on float.

It's a good business for us. I don't think it's necessarily a good business for the average company.

Charlie?

CHARLIE MUNGER: Well, there's a marvelous issue buried in your question. Will the internet, by making competition so much more efficient, make business generally harder for American corporations, meaning more competitive, lower returns on capital? And my guess would be yes.

WARREN BUFFETT: Yeah. My guess would be yes, too. I would say that, on balance, for society, the internet is a wonderful thing. And for capitalists, it's probably a net negative.

CHARLIE MUNGER: So all of you can be happy that the progress of the species will affect your economic futures for the worse. (Laughter)

WARREN BUFFETT: A sacrifice, at which our ages, we're willing to do. But we wouldn't be at your age. (Laughter)

That — incidentally, that — there's plenty to think about there.

The internet, I mean, if you analyze it, you have to think it's much more likely that it will reduce the profitability of American business and improve it.

It will improve the efficiency of American business. But all kinds of things improve the efficiency of American business without making it more profitable.

And I think that the internet is likely to fall into that category. So far, it's improved the monetized value of American business.

But that will eventually follow the underlying economics of what the internet does. And I think it's way more likely to make American business, in aggregate, worth less than compared to what it would've been otherwise.

CHARLIE MUNGER: By the way, that's perfectly obvious and very little understood. (Laughter)

WARREN BUFFETT: So there. (Laughter)

15. Egos and proxy statements fuel excessive CEO pay

WARREN BUFFETT: OK, number 3.

AUDIENCE MEMBER: Yes, good afternoon. My name is Tom Gayner from Richmond, Virginia.

And in the current environment, it seems that the attacks on the moats of wonderful businesses are coming from inside the castle, in the form of option-based compensation, just as much as from outside competitors.

One of your role models, Ben Franklin, said, “Even a small hole can sink a great ship.” It seems like the holes are getting bigger.

Can you discuss what, if any, forces may cause this to change? Is it a problem that will get worse or get better?

My second is specifically, in your role as directors of companies like Coke and Gillette, are you seeking to change these practices? And what kinds of success do you expect there? Do they let you on the comp committee?

And three, if these compensation practices are irrational, does Berkshire benefit from this irrationality? Thank you.

WARREN BUFFETT: Well, to carry the castle analogy further, we not only look for a great economic castle, but we look for a great knight in charge of that castle. Because that’s important. He’s the one that throws the crocodiles into the moat and widens the moat over time.

And of course, the question is, you know, how much does the knight get of the castle for doing that? And I think, generally speaking, at Berkshire, you get a very fair deal in terms of the amount that —

We’ve got a lot of castles around. And we try to pay people fairly. But I don’t think that the division of — is unfair between the owners of the castle and the knights that are around there, protecting the moat.

The — it’s hard for me to imagine how the compensation practices — the question of how much the knight gets of the castle — how that changes in favor of the owners of the castle over time. The ratcheting effect is just unbelievable.

No one, no compensation committee in America, will be listening to a consultant who walks in and says, “I think your management should have an arrangement that ends up in them being in the lower half.”

And if no one wants to be in the lower half, believe me, the median is going to move up.

I mean, there is no way around that. I mean, these people meet yearly or more often. And they sit there with a proxy statement of every other company in their business. You know, and they pick out the ones that have the biggest numbers in them.

And they say, “Well, gee, we need a management at least as good as this. And how are we going to attract people?” and all this other stuff.

And it’ll only ratchet upward. And I think that’s a fact of life. And I think that it’s important for shareholders to understand that.

I’ve been on the board of 19 companies, not counting any Berkshire subsidiaries or anything like that. The last comp committee I was on was at Salomon. And I was chairman of the comp committee, I think. I may be wrong on that. There were three of us. And the other two guys were terrific guys.

And the earnings came in one year, $100 million or so — I think it was 1990 — below the previous year. And comp was up a fair amount.

And I’d found that there had been some earlier issues involved and so on. I just said, I couldn’t swallow it anymore. And I voted against it.

I can’t remember whether I was chairman or not. But in any event, it was two to one against me. And I think it would’ve been two to one against me if I’d been chairman.

And the other two fellows were perfectly rational. They said, “How do we keep these people? And, you know, how can we repudiate our management?” All the sort of things you get.

So as a practical — I’ve got one friend, terribly well-regarded businessman — and he’s been — they don’t throw you off the comp committee. They just don’t re-nominate you.

And he’s been bounced from two of them simply by raising some questions that — about things you would find outrageous.

I’m not on the comp committee. I’ve been on only one comp committee. And they saw what I did. So that was the end of it.

People say, “We love your ideas,” And, you know, “You think creatively. We don’t want to hear about your thoughts on compensation.” And that, you know, it’s understandable.

You know, and every — and you run into some terrific cases of people. I mean, the fellow who runs Fastenal, for example, they are just outstanding. And there are a number of cases where people behave very well.

But most of them, I think some — I don't think it's money so much, sometimes. I just think it's ego. They just can't stand to see some guy that they think is batting .280, and they're batting .300, and he's getting paid more money. And, you know, and that process is endless.

And that, I, you know, that's understandable. It's like who gets top billing in a movie or something of the sort. People care about, you know, where their name is compared to somebody else's. And their name, in this case, is compensation. And it — I doubt if it reverses itself.

Charlie?

CHARLIE MUNGER: No, I think we can confidently expect that the situation will get worse. And I think we can confidently expect that that is bad for Berkshire Hathaway to the extent that it's a passive shareholder in big corporations.

There is one place where we get an advantage: our own culture and attitude being so different, it does attract some of these people that own wonderful businesses.

I mean, we literally, on occasion, find people for whom we're the only acceptable buyer. They don't like this culture of other big corporations any better than you do. And that does give us an advantage.

WARREN BUFFETT: Yeah. You asked us a question, also, about the — how active we might be in saying this. We're not going to ever sit here and tell you what we say in other boardrooms, because it would reduce any effectiveness we might have. And we probably don't have that much effectiveness anyway. But —

You can only belch so many times at the dinner table and get invited back. And — (laughter) — we've probably done enough of our share of that. And you — we try to run Berkshire in a way that we find admirable. And we try to spell out our reasoning on it and everything else. And we hope that maybe somebody latches onto that as a model someplace.

But going around condemning people by name does not work. And so we, you know, we hate the sin and love the sinner and all that sort of thing. And it doesn't have much effect.

16. Hard to predict how demographics will affect markets

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Good afternoon, Warren and Charlie. My name is Erras (PH). I'm from Winnipeg, Manitoba, Canada. And my first time in Nebraska, in Omaha, first time hearing you guys live.

And there's a big ice cream man behind you.

WARREN BUFFETT: Hmm. There we go!

FEMALE VOICE: Here you go.

CHARLIE MUNGER: Oh, thank you.

WARREN BUFFETT: And you think there are no management perks at Berkshire.

AUDIENCE MEMBER: Oh, boy. (Laughter) All right, let's get down to business.

WARREN BUFFETT: OK.

AUDIENCE MEMBER: My question is in reference to your article in Fortune magazine last November, where you talked about corporate earnings and what the market — are you guys listening? Or…

WARREN BUFFETT: I'm listening. (Laughter)

We can chew gum and listen at the same time.

AUDIENCE MEMBER: All right, all right, all right. As I was saying —

WARREN BUFFETT: But if we had —

AUDIENCE MEMBER: — the point in your article in Fortune about corporate earnings and what the market is paying for them, painting a pretty gloomy picture for equities and market levels going forward.

Now, as you may know, there exists a very strong trend in demographics. We see, in Canada and the United States, the aging of the population and, more importantly, the bulk of this population reaching their peak savings years, all at the same time.

WARREN BUFFETT: You're getting a little rude. But go ahead. (Laughter)

AUDIENCE MEMBER: I can't believe this. Warren actually called me rude.

WARREN BUFFETT: I wanted to prove to you I was listening. Go ahead. (Laughter)

AUDIENCE MEMBER: Anyways, OK, so there's a major retirement crisis as a majority of Canadians and Americans between the ages of, especially between 22 and 55, are worried that they won't have enough money to fund their retirement or let alone, last.

So for this reason, I mean, this population is expected to invest in equities, as opposed to fixed-income instruments, to get the necessary long-term rates of return to fund their nest egg for retirement.

And therefore, many are calling for massive amounts of money to flow into the markets over the next five, 10, 15 years through stocks and mutual funds and, consequently, fueling market prices and market levels. Many predicting the biggest growth ever in the stock markets.

So what is your opinion on this potential trend, separately or in conjunction with what you said in that article in Fortune? Thanks very much.

WARREN BUFFETT: Good. To be, I'm not being rude here, but we don't think it means a thing, frankly. (Laughter)

The savings rate, the private savings rate, you know, is not high now. It doesn't need to be high.

What really determines how the people who are either aged or very young, because either way, the people who are in their nonproductive years depends, in aggregate, on aggregate production of goods and services, and then the division between those who are in their productive years and in their nonproductive years. And that's what Social Security argument's about and everything.

The biggest single thing working for people in their nonproductive years on both ends, young and old, is the fact that the pie keeps growing. And that makes it easier to attack the problems of the nonproductive.

And when I say, "nonproductive," there's obviously no — nothing derogatory about that term. It just relates to who's in the employable age and who isn't.

And our society is going to do extremely well in terms of being able to take care of the people in their nonproductive years.

If there — there is a shift, obviously, as people live longer. And of course, there should be a shift, perhaps, in defining — I think there should be — in defining what's productive, because 65 was decided back in the '30s. And I think that's changed.

But the fact that the pie keeps growing is what makes it — it makes the problem easy. And — not easy — but it'll be easier 30 or 40 years from now, in my view, you know, than it was 30 or 40 years ago.

Because there'll be so much more in the way of goods and services produced per capita that the productive can take care of the nonproductive and the — or the aged — in a way that will be easier for them to sustain than it was in the past. When —

It's low amounts of output that strains society. I mean, when you get very small amounts of output, or huge disparities in the division of that, that you put real strains on a society.

But a society whose output is growing 3 percent a year and whose population is growing 1 percent a year is going to have way less in the way of strains than existed 20, 30, 50, 100 years ago. The —

But, you know, we will need no big boom in savings or anything of the sort. The present savings rate will do — will just do fine for the world. In the United States, I mean, I'm not speaking to the — I shouldn't speak to the whole world on that.

Charlie?

CHARLIE MUNGER: Well, generally, you can say that stocks are valued in two different ways.

One, they're valued much the way wheat is valued, in terms of its perceived practical utility to the user of the wheat.

And there's a second way that stocks are valued, which is the way Rembrandts are valued.

And to some extent, Rembrandts are valued high, because in the past, they've gone up in price.

And once you get a lot of Rembrandt element into the stock market, and you fuel the stock market with massive retirement system purchases, you can get stocks selling at very high prices by past historical standards. And that can go on for a long, long time.

That's what makes life so interesting. It isn't at all clear how it's going to work out. It isn't even clear what the level of interest rates is going to be.

And nobody in this room ever expects to see 3 percent interest rates continue for a long time again. But that could happen. That would have an enormous effect on the price of equities.

You live in a world where you can't really predict these macroeconomic changes.

WARREN BUFFETT: No, you can argue that increases in savings will drive down the returns on capital. The more capital is around, that the lower the returns will be on capital.

But I don't think you'll — I don't think it will help you make any decisions about businesses, you know, over your lifetime by — actually by thinking about matters like that. We're a little biased on that. But you'll find all kinds of guys that will tell you. I mean, that's what books are written about. Because everybody likes predictions and books. So, you could all —

Go ahead.

CHARLIE MUNGER: In addressing this question, you can see that we have acted much as one of my old Harvard Law professors acted. He used to say, "Let me know what your problem is. And I'll try and make it more difficult for you." (Laughter)

17. Buffett: The best book on how I invest

WARREN BUFFETT: Area 5, please.

AUDIENCE MEMBER: My name is Eric Tweedie from Shavertown, Pennsylvania. Thanks again for another great meeting.

During last year's meeting, my wife picked up a copy of a book called "Buffettology" at one of the shops around town that is written by Mr. Buffett's former daughter-in-law, a very well-written book, very interesting. And it attempts to outline the Warren Buffett approach to investing.

My question is, I don't know if either of you gentlemen are familiar with the content or have read it. And if so, if you could comment on if you think it is a good outline of that type of investing.

My second question related to that, I wonder if you — if Mr. Buffett could comment on why you bought the original textile mill in Massachusetts, and if that represented an earlier phase, when you were more of a strictly Graham-style, value investor, versus your current investing style.

WARREN BUFFETT: Probably the best, I would say, the most representative book on my views is the one that Larry Cunningham has put together, because he essentially has taken my words and rearranged them in a more orderly — he's taken from a number of years. And what he has put together there best represents my views.

We've got 20 years of annual reports or so, or more, on the internet, plus articles in Fortune, all kinds of things.

So it's probably a bias I have. But I would — I like to think that I laid out those views better than somebody who's rewriting them. But that's — I'll let you make that decision.

But I do think Larry's done a very good job of taking a number of those reports and rearranging them by topic in a way that makes it a lot easier to read than trying to go through year after year.

And actually, you'll have this book about Charlie, pretty soon, to read, too.

We've said what — we've said in these meetings, we've said in the annual reports, we've said exactly what we do.

And some of the books, I would say, try to take that and — because people are looking for mechanistic things or formulas or whatever it may be. They try to hold — they may try to hold out that there's some secret beyond that. But I don't think there probably is.

Charlie? You've read the books.

CHARLIE MUNGER: Oh, I skimmed that book. The —

I think what we have done all these years is, it wasn't all that hard to do. And it's not that hard to explain. All that said and done, I think a lot of people just don't get it. (Laughter)

As Samuel Johnson said, famously, "I can give you an argument, but I can't give you an understanding." (Laughter)

18. Buying Berkshire Hathaway was a "terrible mistake"

WARREN BUFFETT: What was the second part again?

AUDIENCE MEMBER: I just asked you if you could maybe comment on why you bought the original —

WARREN BUFFETT: Oh.

AUDIENCE MEMBER: — Berkshire textile mill.

WARREN BUFFETT: That's why I didn't remember. (Laughter)

AUDIENCE MEMBER: If I could say —

WARREN BUFFETT: It was —

AUDIENCE MEMBER: — one of the things, someone tapped me on the shoulder and asked me for you not to forget to give the current year's recommended books.

WARREN BUFFETT: It's — I've got to recommend the book on Charlie. But I'll let Charlie recommend one, too.

The original purchase of Berkshire was a terrible mistake and my mistake. No one pushed me into it.

It was — I bought it, because it was what we used to call the cigar —

It was a cigar butt approach to investing, where we would look around for something with a free puff left in it. You know, it was soggy and kind of disgusting and everything. But it was free. (Laughter)

And Berkshire was selling below working capital, had a history of repurchasing shares periodically on tender offers. And it was selling, the first purchase was, I think, at $7 1/2 a share. In fact, I've got the broker's ticket up in the office, 2,000 shares.

And they — it looked to me like they were going to have a tender offer periodically. And it would probably be at some figure closer to working — net working capital — which might've been 11 or $12 a share, some such number.

And we would sell on the tender. And that was — we had other securities we owned that way. And we bought some that way.

And then, actually, I met Seabury Stanton one time, who was running Berkshire. And he told me and made me an insider, so I couldn't do anything, but he said he was thinking of having a tender. And he wondered what price we'd tender at.

And I — as I remember, I may be wrong on this, I could look back on it, but I think I said, "11 3/8." And he said again to me, "Well, if we have a tender at 11 3/8, will you tender?" And I said, "Yes, I will."

And then I was frozen out, obviously, of doing anything with the stock for a little while. But then he came along with the tender offer.

And as I remember, I opened the envelope, and it was 11 1/4. I may be wrong. It may have been 11 1/2, 11 3/8. But it was 1/8 below what he had said to me and what I had agreed to.

So I found that kind of irritating. And I didn't tender. And then I bought a lot of stock.

Kim Chace was a director. His father had some members of the family, not his direct family, but related family, that wanted to sell a block. And we bought several blocks. And before long, we controlled the company.

So at an eighth of a point difference, we wouldn't have bought it, the company, if they'd actually tendered at that price.

We had a somewhat similar thing happen with Blue Chip, actually, later on, too.

We would've been much better off, if we hadn't bought it. Because then things like National Indemnity and all of that, instead of buying it into a public company with a great many other shareholders, we would've bought it privately in the partnership. And our partners would've had a greater interest.

So Berkshire was exactly the wrong vehicle to use for buying a bunch of wonderful companies over time. But I sort of stumbled into it. And we kept moving along.

And when I disbanded the partnership, I distributed out to Berkshire. Because it seemed like the easiest and best thing to do. And I followed through. And I enjoyed it enormously. I'm glad it all worked out this way.

It did not work out the best way, economically, in all probability. It was the wrong base to use to build an enterprise around. But maybe, in a way, that's made it more fun.

Charlie, do you have anything to add on that? You can tell them about the Blue Chip story. (Laughs)

CHARLIE MUNGER: No, one such story is enough. (Buffett laughs)

But it is interesting that a wrong decision has been made to work out so well.

We've done a lot of that, scrambled out of wrong decisions. I'd argue that's a big part of having a reasonable record in life.

You can't avoid the wrong decisions. But if you recognize them promptly and do something about them, you can frequently turn the lemon into lemonade, which is what happened here.

Warren twisted a lot of capital out of the textile business and invested it wisely. And that's why we're all here.

WARREN BUFFETT: But Berkshire comes from three companies that came together: Diversified Retailing, Blue Chip Stamps, and Berkshire. Those were the three base companies.

And Diversified started when we bought a company called Hochschild Kohn in Baltimore in 1966, a department store. And that company disappeared over time.

Fortunately, in 19 — I think — 70, we sold it to Supermarkets General. Blue Chip, we've told you about the record of that.

So, we started out with three disasters, and put them all together. (Laughter)

And it's worked out pretty well.

But it was a mistake to be working from that kind of a base. Don't follow our example in that respect. Start out with a good business and then keep adding on good businesses.

CHARLIE MUNGER: But the example of quickly identifying the mistakes and taking action, there, our example is a good one.

WARREN BUFFETT: Yeah.

19. Buffett would never trade Berkshire stock for gold

WARREN BUFFETT: OK, number 6.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett, Mr. Munger. Kathleen Lane (PH) from New York.

I have a question out of left field for you. You say you like to be entertained? This question will entertain you. It's also a serious question.

I know you don't like to speculate about the future. You won't do so. I appreciate that.

But some people do. For example, Edgar Cayce was one. He didn't pick stocks or investments. But if he had, he would've probably gone for that farmland that you were talking about earlier this morning.

Because he had a dream that in the year 2158, Omaha would be located on the west coast of the United States. And you know how beachfront property goes. So it would be a good bet.

WARREN BUFFETT: It will be good for our super catastrophe business, if that happens. (Laughter)

AUDIENCE MEMBER: As you both said earlier, we're living in an extraordinary time, financially especially.

You can't help but to hear disaster scenarios concerning the impending collapse of worldwide financial markets, about major physical changes in the world as we know it, about a future when the world's resources will be better measured by their prospects for ensuring our basic survival than their value as speculative commodities. That's where that farmland would come in again.

Nobody does better what you two do. But even if your investment acumen wasn't what it is, I would invest with you, because you're honest.

In short, I came here to ask you, what would you tell a single mother to exchange her Berkshire share hold for gold coins? When, under what circumstances?

WARREN BUFFETT: Well, I can't imagine ever exchanging any of my shares for gold coins. But —

I would rather trust in the intrinsic value of a bunch of really fine businesses run by good managers selling products that people like to buy and have liked to buy for a long time, and then exchanging their future efforts, the money that comes from their wages, for See's Candy or Coca-Cola or whatever, than take some piece of metal that people dig out of the ground in South Africa and then put back in the ground at Fort Knox, you know, after transporting it and insuring it and everything else. (Laughter)

I've never been able to get real excited about gold. Now, my dad was a huge enthusiast for a gold standard. So I grew up in a family where gold was revered, if not possessed. And I would — I gave it its full chance.

But I've never understood what the intrinsic value of gold is. And, you know, we'll sell you some at Borsheims, but I would never exchange —

The idea of exchanging a producing asset for a nonproducing asset would be pretty foreign to me.

20. Why Buffett ignores predictions

WARREN BUFFETT: And I would say this: in terms of the predictions, and I know the spirit in which you asked the question, but in terms — there's a market out there all the time.

And people love to hear predictions. If I said I was going to offer a bunch of predictions today, we would have a million people here. I mean, they're dying to have predictions and speeches at rotary clubs or trade associations or whatever. That's — they just plain love it.

And that's what a whole industry is built upon, you know, the people coming out of Washington to talk about political predictions and the — I don't read those in the paper at all. Because it's just — it's space fillers, basically.

And, you mentioned Edgar Cayce. Ben Graham knew Edgar Cayce pretty well. But I just have never seen any utility to any of that at all.

There will be some huge surprises in the world. There's no question about that. But I don't think that betting on any specific one is a very smart policy.

In fact, our — we usually bet against them, in terms of super catastrophes. We know there will be a 7.0 or greater quake in California in the next 50 years. We don't know where it'll be or when it'll be or anything like that. We are willing to pay out a lot of money if it happens tomorrow.

And because people do worry about catastrophes. And in this case, it's perfectly proper, with insured values. But it just isn't any way, in our view, to get through economic life.

Charlie?

CHARLIE MUNGER: Well, I suppose the one time when a single mother might want to own gold compared to anything else is if she faced conditions like a Jew in Vienna in 1939, or —

I mean, there are conditions you can imagine where some form of transportable wealth would be useful, compared to anything else.

But absent those extreme conditions, I think it's for the birds. Now, silver… (Laughter)

WARREN BUFFETT: It's hard to think of anything other than fleeing the country. And Charlie and I don't give a lot of thought to fleeing the country.

21. Buffett: "I'm a little crazy, I don't mind paying taxes"

WARREN BUFFETT: Although, I must say that the one thing I really find reprehensible is the people that make a lot of money in this country and then leave to, you know, to get another tax jurisdiction or something like this. I really — I don't —

But I'm a little crazy. I don't mind paying taxes. (Applause)

WARREN BUFFETT: Let's go to 7.

There are plenty of reasons, I think, perfectly valid reasons — I mean, people may want to live someplace else — but the ones who carefully arrange it so that they actually live here as much as they can.

I think one of them wanted to be appointed — he wanted to go to some very small entity, where there was no tax. And then he wanted to be appointed an ambassador to the United States, so that he could enjoy living here but enjoy the taxes of something else.

And, you know, that is not my role model. Yup.

22. Costs vary for Berkshire's float

AUDIENCE MEMBER: Hello, Warren. Hi, Charlie. Two questions. First, was anybody dumb enough to sell you Berkshire at less than 45,000 a share?

WARREN BUFFETT: We did not repurchase any shares.

AUDIENCE MEMBER: My second question concerns float. The float has been low cost most years for Berkshire and probably zero cost in many years, except last year, possibly.

When you think about float in terms of intrinsic value, do you have an idea in mind when you add new float for how much it will increase the intrinsic value of Berkshire?

WARREN BUFFETT: Well we add — that's a good question — but we consciously add float sometimes at a given cost. And then we, other times, add float at no cost. So we have different layers of float, if you will, that we've entered into.

We've entered in some transactions in the last month or two, where we will take on some float, which will not have zero cost. But it's acceptable to us. And we couldn't get it at zero cost, although we're also creating float which, I think, will be close to zero cost or better.

So, we would be willing to take on float, obviously, at costs only modestly below the Treasury rate, if that was the only way we could get that float, and it didn't impede our ability to get other float, you know, at zero cost or something.

We don't want to raise the cost overall by a single transaction that would have an effect on other transactions.

But float, if you look at our historical record, and our future record can't be as good, but it's not —it's the cost of float, and it's the amount of growth of float.

I mean, if you told me I could add $50 billion of float and have a 3 percent cost to that, you know, I would take that any day over adding 10 billion at zero cost.

So there are a lot of different ways, in the insurance business, that we can and will think about developing float.

And usually, one doesn't preclude another. Occasionally, one bumps into another. But usually, one doesn't preclude another.

And believe me, we spend a lot of time thinking about that. And we'll continue to as long as we run Berkshire. It's a big part of our strategy.

Charlie?

CHARLIE MUNGER: Well, I've been amazed how well we've done with the float. And I've been watching it from the inside for a long, long time.

It is a very wonderful thing to generate millions and millions, and then billions and billions, of dollars of float at a cost way below the Treasury rate. There are people who would kill for such opportunities.

WARREN BUFFETT: Yeah. And of course, that makes it competitive. We do — we — there are plenty of other people that are thinking about it in a similar vein and probably observed what we do and all of that. So like everything else in capitalism, it's competitive.

We think we've got an edge in several very important respects. And we think that edge is sustainable for quite a — as far as we can see. And we intend to push it as hard as we can. And then we'll see where it leads.

I would've had no idea, 10 or 20 years ago, that we would have the present situation. But we do find, if you just show up every day, like Woody Allen said, and you answer the phone and read the paper, every now and then, you see something that makes sense to do.

And we do find them occasionally. The hard part is finding them where they are material relative to our present size. If we were running a very small business, we would find plenty of things that would make good sense.

We find a few things that make good sense now, relative to our size. And there's really no answer for that except to shrink dramatically, which is not a action we're contemplating.

23. Munger on Wesco succession

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: James Pan (PH) from New York City.

I really have a question on Wesco, which is your 80 percent-held subsidiary, just a couple questions dealing with that.

First question is, last time I checked, that was trading below intrinsic value.

And given that most of Wesco's assets are tied up in Freddie Mac, and Freddie Mac will arguably grow intrinsic value in the low teens for the next couple of years, how are you guys going to manage the, I guess, how would you manage the gap between intrinsic value, and what — the current price, and what intrinsic value will be two or three years from now?

And also, is there a succession plan at Wesco or some kind of roll-up plan at Wesco eventually?

WARREN BUFFETT: Charlie is the boss at Wesco. So —

CHARLIE MUNGER: Yes. We have paid almost no attention to the price of Wesco stock. So the chance to make any meaningful gain for the Wesco shareholders by buying in a few shares of Wesco stock is so tiny that we don't really bother thinking about it very much. The —

As to succession, we are gradually making me so useless that I won't be missed. (Laughter)

WARREN BUFFETT: Yeah, incidentally, you talked about Wesco being significantly undervalued compared to intrinsic value. I'm not sure that's the case. Charlie, would — you're more of an expert on that than I am.

CHARLIE MUNGER: Well, there's certainly no huge gap.

And, we don't spend a lot of time thinking about things that will make, practically, no money. (Laughter)

24. Munger: EVA valuation is "twaddle" and "medieval theology"

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: Hi, my name is Jason Tang (PH) from Traverse City, Michigan. Before I ask my question, I want to know that it's true that you guys are going to be here tomorrow at 9:30 to answer more questions. (Laughter)

My question, I just recently read the book, "Quest for Value," by — I think the author is Bennett Stewart, from Stern Stewart consulting firm.

And I want to talk to you a bit about — just ask you about different valuation methodologies, and EVA in particular, and how that may or may not be more valid than, let's say, other benchmarks of value, like P/E, or price-to-book, or price-to-sales.

Is that something closer? I noticed that the language that was used in this book was real similar to the type of language you guys use in your writings. So I'd like you to talk a little bit about EVA, if you could.

WARREN BUFFETT: Charlie, why don't you take EVA?

CHARLIE MUNGER: I think there's an awful lot of twaddle and bullshit. (Laughter)

WARREN BUFFETT: I knew that's what he was going to say. And I thought it deserved it, so I — and I didn't want to say it myself.

CHARLIE MUNGER: In EVA, we keep stating, over and over again, that the game is to turn the retained dollars into something more than dollars.

And EVA tends to incorporate cost of capital ideas that just make no sense at all. They make it sound very fashionable.

And, God knows, it's correct that a corporation that earns a huge return on capital and keeps retaining it for a long time has a great record in terms of EVA. But the mental system, as a whole, does not work. It's like medieval theology. (Laughter)

WARREN BUFFETT: I like that second term better than the earlier one. (Laughter)

25. How Buffett became friends with Bill Gates

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Good afternoon. My — excuse me — my name is Stewart Hartman from Sioux City, Iowa.

First, I'd like to thank you both for allowing a couple of Berkshire employees to migrate north to Sioux City. I work with Corey Wrenn and Mark Sisley (PH). They're both great guys. You did a terrific job training them.

Mr. Buffett, you've known Bill Gates for several years and probably spent more time with him than any of us in this room. Would you feel —?

WARREN BUFFETT: That isn't the case, if Jeff Raikes is here. I don't know. Is Jeff here?

Anyway, go ahead. But we did have a local fellow who comes from 30 miles from here, Jeff Raikes, who's a key Microsoft employee. And I think he's in town this weekend. I thought he was in the meeting.

AUDIENCE MEMBER: I didn't mean to make the broad generalization to be argumentative. (Laughter)

WARREN BUFFETT: I just didn't want to think Jeff — I was trying to muscle him out.

AUDIENCE MEMBER: Sure, sure. That being said, I guess, here's a way I'll rephrase this. Would you feel comfortable sharing with us how your relationship began and how it evolved with Mr. Gates?

And with regard to his spirit and competitive nature, how vigorous do you expect him to defend his company's position against the government and state's current antitrust suit?

And then for both of you, Mr. Munger included, what, in your opinion, are the odds that the government and the states will prevail and split his company into pieces?

And then since Mr. Munger mentioned, I guess I'd ask, could we have an update on the company's silver position and its future as an investment, as well? (Laughter) Thank you for opening that door.

WARREN BUFFETT: OK, well, he can close them, too. (Laughter)

Yeah, I really don't feel comfortable speaking for Bill at all in terms of what he's going to do. In fact, I think they've been quite outspoken, he and Steve Ballmer both, about what Microsoft will do.

So I don't want to try and rephrase that or modify it or do anything else. Because they know what they're saying when they say it. And I would take them at their word. And I really shouldn't be adding anything to it.

I met Bill, because a very good friend of mine, Meg Greenfield, was the editorial page editor at the Post. She called me one time, 10 or more years ago. And — she said, "Warren," — she loved the state of Washington and had grown up out there. So she said, "Can I afford to buy a second home?"

She was living in Washington, D.C. now. And so she says, "Can I afford to buy a second home in Washington?" And I said — and she said, "I'll send you all my financial information."

I said, "Meg, you don't need to." Anybody that asks me whether they can afford something can afford it. It's the people that don't ask me that never can afford it. So I said, "Just go do it." And, "It'll make you happy." And so she did.

And, then a year or two later, she wanted to have me come out and see what she'd done with my mild encouragement. And so I went out there and visited. It was the July 4th weekend in 1991. And they had this parade on this island and everything she wanted me to see. And she had a few other people out, too.

And then, she was a friend of the — of Bill's parents. And so we went down there, to the Hood Canal, to visit them when I was back there, to meet the parents. And I think Bill didn't want to come. But Kay Graham was coming. And he wanted to meet her. He didn't want to meet me.

And, so he came in. And then we hit it off immediately. We had a great time. And, I mean, he had this chimpanzee, to whom he was going to try and explain this technical stuff. But it was a — I was kind of an interesting chimpanzee to him. So, we — and he's a terrific teacher.

So, we spent a number of hours. And we just plain hit it off. And, I found it very interesting, what he had to say. And, we've had a good time good time ever since.

And we play bridge together and golf together. So I can tell you that he's quite competitive in those games. But I, can't tell you anything about Microsoft or anything. I don't know that much about it. And it wouldn't be right, if I didn't know anything personal, to be talking about it. Charlie, you know Bill.

CHARLIE MUNGER: Yeah. Well, I don't want to speak for anybody else, either. I happen to be quite sympathetic to the Microsoft side of the pending antitrust case. But — (Applause)

And regarding silver, all I can say is, so far, it's been a dull ride. (Laughter)

26. Buffett and Munger on the antitrust case against Microsoft

WARREN BUFFETT: I would say this about the Microsoft case. That — and I've expressed this to a couple news organizations who asked the question earlier.

Twenty years ago, this country really had sort of an inferiority complex about its place in the world economic order.

And we talked about having a country of hamburger flippers. And, we thought we were going to lose our steel industry and our auto industry. And we really didn't quite see how America fit into the world where it looked like the Japanese and the Germans, to some extent, and all those, were eating our lunch.

And that — there are many of you are too young to remember that. But there are many of you in this room who will remember that. And we were very depressed about our economic situation in this country.

And then this, whatever you want to call it, information age or whatever, came along, fueled by technology. And we've just swept the world aside. I mean, it — we are so far number one that it's difficult to think who's number two. So here we have —

And it's changed — in some way, it's contributed to a change, I should say — in the national mood. And it — whether — what part of our prosperity is accounted for by it, no one knows. But I think everybody in the room would agree that it's significant.

And that age is going to get — and that development — is going to get more and more important in the years to come. It's going to be fueling much of what happens in the world and for this country to be the world leader. And like I say, you can't even see who's in second place, and moving faster, even, to increase that lead, with all the benefits that brings, you know, I think that —

I think we've got something working very well that probably doesn't make a lot of sense to tinker with too much. So I would not want to go in with a meat axe into something that is pulling this country along, in my view, in a huge way.

And I just, I don't like to tinker with success. And it's an important success. It's really an important success.

Charlie and I may not understand how to play that, in terms of buying the companies that are going to do well 10 or 15 years from now. But we know some companies will do well. And we certainly know it'll have a huge benefit to society, even if it makes business less profitable but makes the society more efficient.

I mean, that is a huge edge to have. I would love to have the most efficient industry in the world in this country, even though it might pull down returns on capital against the less-efficient system.

So we — I think neither one of us would be inclined to go in there and mess around with something that's working.

CHARLIE MUNGER: I think — (Applause)

If you look at the big picture, in patriotic terms, having lost totally in radios, stereos, television sets, et cetera, and in many other places, and having lost position in other major industries to the Japanese and others, we finally get huge leadership in a new and wonderful field — software — that's needed all over the Earth.

And somebody who's drawing a salary from the United States government gets the bright idea that they should dramatically weaken the one place where we're winning big. (Applause)

And he actually goes home at night and is proud of himself. (Laughter)

27. GEICO benefits from smaller industry-wide profit margins

WARREN BUFFETT: OK, number 3.

AUDIENCE MEMBER: Good afternoon. Joe Levinson (PH) from New York.

You mentioned, in this year's annual report, that the operating environment that GEICO is facing, especially with regard to pricing, is going to get even tougher this year.

I'm wondering if this tough environment that GEICO's been facing over the last few years, is it something cyclical? Or is there something more structural going on here that we should be concerned about?

WARREN BUFFETT: Well, actually, what has happened is that it's been unduly benign the last few years. So I would regard this as much more a return to normalcy, what's happening.

The profits in auto insurance, industrywide, have been far higher than, I think, are sustainable and higher than I would've predicted, five years ago, would've occurred.

So the industry got very, very lucky for a while. That wasn't necessarily good for us, incidentally.

We made more money than we would've otherwise made. But there was a big umbrella over the industry, too, so that less-efficient competitors still did very well.

We do not find the environment, which is going to be lower profits, we do not find that undesirable at all. We do not like having a huge umbrella over an industry. We want the most efficient to be the ones that do well and the less-efficient ones to have plenty of problems.

So, we are not unhappy about the fact that margins in the auto insurance business are going down. We think they should go down.

We will — as long as we feel that we are adding policyholders at a cost that's less than their net value to us over time, we will continue to do it. We'll love to do it.

But we won't be making the kind of money, in the year 2000, that we made in 1999, which was not as good as 1998. But that doesn't — that's — as far as we're concerned, that's fine. Because we will be the low-cost producer, over time or will — that is our goal. And I think we've got a lot of things going in our direction to enable us to do that.

The low-cost producer in a huge industry is going to do very well over time.

And then question is just — is, it costs money to sign up people and bring them into our fold. Then we have to keep them in our fold. And we lose some every year. It's an hourglass problem, to a degree.

But that's all part of the equation. And the GEICO equation is fundamentally good. It's not as good as it was a couple of years ago, just in terms of overall profitability, because there isn't this big umbrella over the whole industry.

But that umbrella was going to go away. And it doesn't hurt us to have it go away at all.

The second thing is that we are, as I pointed out in the report, it is costing us more to develop inquiries than it did a couple of years ago. We knew that would be the case. It's going to cost more three years from now than it costs now.

So we believe in pouring it on. And we think that we can attract business at a lower cost and then run it at a lower cost than most of the competition, if not all. And we intend to plow ahead with that.

We will write — I said, in the annual report, I ventured that the industry might write at three points worse than last year. Well, three points on 120 billion of volume is $3.6 billion difference in the profitability, if that forecast happens to be correct.

That bothers us not at all. In fact, we will not only take that three points of industry worsening, but on top of that, we will spend even more money to bring in business, which will make our figures, specifically, look that much worse in the near term.

But that, you know — in the end, it is so much more attractive to bring in that kind of business, we'll say, than some e-retailer, who is losing cash by the ton, bringing in customers who are spending far, far less than our customers spend with us, and where the retention rate, I would venture to say, will be lower than our kind of retention rate.

We've got a very good business model. It's not as good as it was a couple of years ago. It's probably better than it will be a couple of years from now. But it's still far superior, I think, to the business model of most of the competition.

We've got a great machine at GEICO. And we've got a sensational man running it in Tony Nicely. He is the best in the world at running that business.

And he's been there since he was 18 years old. And he knows it every way from Sunday, in terms of how to run that business.

I've known Tony for a good many years. I've never heard him say anything that didn't make sense. It's really interesting.

If you take a whole bunch of people with 140 IQs, it's a very uneven performance in what they actually do. Some of them say all kinds of things that make a lot of sense about 90 percent of the time. And then 10 percent of the time, they go crazy.

And Tony is — everything Tony says and does makes sense. And he is a huge, huge asset to Berkshire. And he's working with a business model that — that's very, very powerful.

Charlie?

CHARLIE MUNGER: Nothing to add.

28. MidAmerican Energy: "Decent" but not "extraordinary" returns

WARREN BUFFETT: OK, number 4.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett, Mr. Munger. My name is Andrew Sole. And I'm from New York City.

I was hoping, if you wouldn't mind, turning your attention to MidAmerican Energy. You've spoken about how much you respect the management of that company.

But if you could elaborate upon what you see are the long-term competitive advantages of MidAmerican Energy, where you see the company 10 years from now, and is it your hope or your intention to make MidAmerican Energy the lowest-cost provider of electricity in the United States?

WARREN BUFFETT: Well, you — you're not going to do a great deal about the embedded cost that you have in generation. I mean, if you have a group of plants, they are, in the United States, they're relatively low-cost generation.

But if somebody else has a hydro plant or something that has built-in advantages that are going to enable them to turn out electricity cheaper than we can do it in Iowa with coal, so be it. I mean, it —

So it is relatively well positioned as a generator, but we have nothing we could do there to specifically, dramatically change the cost of generation compared to other competitors.

But — and you shouldn't expect to make extraordinary profits in a business that is selling an essential, like electricity, to virtually every consumer in the country.

The whole idea behind the utility industry is not to allow extraordinary profits. But we think it's a very good business.

We do think that Dave Sokol has demonstrated ability, in the time he has been running that, to come up with a lot of ideas about doing various things that have made sense, various projects.

Not everything works. But his batting average is very high. And a good mind like that, we will expect that he'll produce more ideas over time.

But, it's not the sort of thing you get fireworks in. It's conceivable that, you know, we would get a chance to do something very big in that field at some time, just because it's a big field. It is the kind of field where you can write a $5 billion check. So it's not the jelly bean business.

But whether we do or not depends on a lot of things, including regulatory restraints. Because there are a lot of rules in that business, starting with the Public Utility Holding Company Act of 1935.

But there may be ways to do some very big things. And we've got the right management to do it. We've got the financial wherewithal to do it. And we'll see what happens.

I think MidAmerican is a very — we'll get, in my view, we're very likely to get a very decent return on it. But we shouldn't get an extraordinary return, because it isn't that kind of business.

Charlie?

CHARLIE MUNGER: Nothing to add.

29. We can do almost anything with insurance float

WARREN BUFFETT: OK, number 5.

AUDIENCE MEMBER: Mr. Buffett, my name is John Shayne (PH) from Nashville, Tennessee. I want to join the other shareholders and thank you for the results you've achieved, but also for the example that you've set for business, generally.

My question is about float proceeds and whether they can go into common stocks. You've been asked that question before in prior years. Once, I asked you something on that. And I think at least one other shareholder has.

But I'm wondering if you might go into a little more detail. If I've understood you in the past, you've said, "Yes, you can — the float's available to go into common stocks."

I think it's an important question because it affects the intrinsic value of that float. If that float is locked into fixed income, it's worth one thing. If it could go into stocks at one point, it's obviously worth quite a bit more.

What I've had trouble understanding is, I think you must have some way that you can guarantee that the policyholders will be protected. Obviously, you can invest everything in a low market, and the market goes even lower.

Is it simply the size of the capital you've got that you think that'd be extraordinarily unlikely? Or do you use future insurance revenues, premium revenues, to pay off claims? Would you borrow to pay off claims?

If you could give some detail on that, maybe we could get some comfort as to how you're thinking about that.

WARREN BUFFETT: Yeah. The float, in no way, is limited to fixed-income securities. The float is really available for anything that we feel is the most intelligent at any given time.

And the reason we can say that, and other insurance companies can't say that, is because we have an incredible abundance of capital, plus other streams of earning power which are unrelated to the insurance business.

So we could have the float entirely in equities. And we have had that, in the past, or tantamount to that. And we could have a lot of it in operating businesses. We can have it anyplace it makes the most sense.

But the only reason we can do that is because we have extraordinary capital. And we don't have much debt.

We run the business differently than, or think about it differently, than probably 90 percent of managements do.

We look at the assets on a consolidated basis with a few little exceptions. We look at the asset and the liability side — completely absent any linkage for specific assets and liabilities.

So our job at Berkshire is to get the liabilities as cheaply as possible. We want all the liabilities we can get and not have any worries about fulfilling as cheap as we can, plus a lot of capital. And then we want all the assets to be employed as intelligently as possible.

And we don't match up, you know, a billion dollars of assets on the asset side against a billion of specific liabilities on the right-hand side. There's one or two exceptions to that, but that's — where we're required to — but that's the basic approach.

So, when Charlie and I think about Berkshire, we're thinking about, how do we get as much money as we can as cheap as we can without, in any way, endangering our ability, ever, to pay anybody, under any circumstances?

And then, how do we put it out in a way that we feel the most comfortable on the asset side, at the best returns? And frequently, that will be equities. And it has been, over the past. Sometimes, we — it won't be. We can't find them. But that's the goal.

And float is available just like — in virtually all cases — just like common equity. We don't distinguish those in our mind.

And that gives us — that flexibility gives us some edge and, perhaps, quite an edge, at times, over other — over our competitors.

Charlie?

CHARLIE MUNGER: Well, yeah, you can see that in the results to date. We have used that edge in the past. And we hope to use it in the future.

30. Liz Claiborne and Jones Apparel investments

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Hi, I am Kevin Pilon (PH) from Simsbury, Connecticut.

Let me just say, quickly, that I'm really looking forward to Charlie's book. And I hope it expands on the talks he gave that were reported in (inaudible) with regard to having a certain number of models that you need to understand and prosper in life.

I have two questions. And I'll ask them quickly, in succession. Because you may want to punt on the first one.

The first question is, I'm interested in any comments you might have that would expand on your general interest in the branded apparel companies, Liz Claiborne and Jones.

And the second question is, I wonder if you would comment on the future of Freddie Mac with all the current brouhaha.

Every year, there's new brouhaha, as you know, with the buyback of the 30-year bond and the search for a new benchmark and the Treasury saying that, perhaps, the agency securities were not backed by the full faith and credit of the government.

WARREN BUFFETT: Yeah, we — we're not going to be able to help you too much on some of those. Because we may have some views, but they may be things that we don't really want to talk about.

The Liz Claiborne and the Jones Apparel investments you're talking about, the Jones Apparel is a decision that was made by Lou Simpson at GEICO.

Lou runs a separate portfolio of equities for Berkshire. They're held in GEICO. But obviously, they're for the account of Berkshire. And that portfolio is well over 2 billion. And to some extent, it can be expanded or contracted based on what Lou would like to do.

And he runs that 100 percent on his own. And he's compensated based on how that portfolio does. He makes decisions, buying and selling, without talking to me at all, which is the way we like it.

Sometimes, there's an overlap in our decisions. But when I, for example, when I first found out about Jones Apparel, I'd never read an annual report of the company. I didn't know what they did or anything.

But that's Lou's baby. And he's very good at managing money. And he's a fellow that has 100 percent of my trust.

So I know his general criteria for investing, which is quite similar to mine, not identical, but quite similar to mine. And he's got a familiarity with businesses that, again, is quite similar to mine but not identical.

And he runs a good portfolio. And it makes life a little easier for me, not to have that two and a fraction billion added to all the rest that I'm having trouble investing.

Liz Claiborne came about a little differently. I got a call one weekend, actually, on purchasing a large block that someone was going to sell. And we bought that on a Monday morning in London, as I remember.

It was never reported on any exchange. I'm not quite sure even how it happened. But the broker that handled it arranged the trade over there.

And, you know, they've had a very, very decent record. They buy in their shares. I like the business that they run.

It's not a Coca-Cola-type business or a Gillette-type business or even an American Express business. But we were offered that stock at a very attractive price. And it's worked out fine.

The Freddie question, I'd rather not get into it, frankly. Because there's a lot of political overtones to that. But Charlie?

CHARLIE MUNGER: I can pass as well as you can.

WARREN BUFFETT: OK. (Laughter)

31. Berkshire's next CEO won't be a "caretaker"

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Garesh Paku (PH) from Croton, New York. First, regarding — I just have a couple of questions.

First, regarding the succession issue. I just can't imagine that you would allow someone else to paint over your picture afterwards, I guess, post-truck.

So I was wondering, would the — is your — is the nature of your succession plans more of a caretaker role of the museum? Or is it more active? That's the —

WARREN BUFFETT: It would be more active. No, the last thing in the world I would want would be a caretaker. That would be — no, that would not — I would not want that to be my legacy.

32. Potential impacts of inflation on GEICO

AUDIENCE MEMBER: And the second question is regarding inflation. While I appreciate your focus on the specific businesses and your insistence that you not try to predict it, we've been very fortunate by successively lower rates of inflation.

And I'm wondering, with all of the money sloshing around and between real estate and stocks and all the other places, whether you are concerned about inflation, what effect that would have on the insurance businesses at Berkshire, and what you can do to guard against those risks.

WARREN BUFFETT: My record is just terrible, in terms of predicting the inflation rate. So, it is not something that enters into our decision making.

The big danger in — a speed-up of inflation would lead to more dollar volume in the insurance business. And more dollar volume is basically good for us, even though there might be a lag in pricing, that would eventually catch up and all that.

So, absent the next factor I'm going to mention, inflation is not necessarily harmful at all to something like a GEICO.

As you get into longer-tail liability lines, such as a General Re might have, inflation has this effect of hitting liabilities that were created four, five, 10 years earlier, maybe, and they get resettled in current dollars. And obviously, that ratchets up the cost of settling those liabilities, in kind of an unpredictable way.

The danger in inflation to something like GEICO would be that people get, during inflation, they get irritated about the price of everything going up.

And there are some things they can do something about. And there's others they can't. And then there are some they think they can, even though they can't. And one of those might be the cost of insurance.

So the people might get very upset with the system of auto insurance, when they see a very significant part of their annual budget. Because an auto insurance policy, on average, is significant to people, and virtually every consumer in the country.

And there could be a lot of pressure on legislatures to do a variety of things that might change the system in a major way.

It wouldn't reduce the number of cars that crashed into each other or the injuries that were done or anything else. But it would be a way of striking out against higher rates.

And people would be unhappy about those rates. And that also might reflect itself in difficulty getting the increases that were required to take care of the costs that were ratcheting up fast.

So net, I think, inflation is bad for the auto insurance business. Although, you can argue that, you know, GEICO —

I think when I first got interested in GEICO, they had about a — it was in 1951, I wrote it up in "Security I Like Best." I think they had about 175,000 policies. And I think they were writing about 7 million of business, which would be about 40 bucks a policy.

Now, if we were getting $40 a policy now, you know, our premium volume would — the company would be a whole lot less valuable than it is.

And so one way or another, it ended up going from that period of $40 an average policy to 12 — or $1,100 an average policy without the roof caving in on it.

And it has been made more valuable, in dollar terms, by a combination of inflation and a great business model, without it getting destroyed in the process.

Nevertheless, I would prefer a noninflationary environment. It's better for the whole world, over time. And that the way our hope goes.

And then we have this, so far, unwarranted fear that the kind of conditions that have existed over the last 15 years might cause a re-ignition of inflation, which to date, it hasn't.

I don't know any more about what's going to happen than you do on that.

Charlie?

CHARLIE MUNGER: I don't know anything, either. (Laughter)

33. International expansion: interesting but not easy

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Good afternoon, gentlemen. My name is Zeke Turner, and currently finishing up my senior year at Taylor University in Indiana. So four more weeks, and I'm out of there. (Buffett laughs)

As someone studying finance, I do appreciate your comments as to the teaching of investment in academia. It certainly has some development it can make there. I do say that with hope that very few grad school admissions officers are listening right now.

But I do want to say a special thank you quickly, if I could, to all those professors who do have the intelligence and the guts to actually teach value investing on that level and go away from efficient market theories. I do kind of wish Benjamin Graham were still teaching.

Many questions have been asked as far as technology and its development into the business model. I think the greatest effect of this will probably be in the globalization of the economy. This has had, and will continue to have, a significant impact on the business model as we know it today.

Now, except for certain growth opportunities, this may have a smaller effect on companies such as See's Candy or Nebraska Furniture Mart, but has had and probably will continue to have a dramatic effect on companies like Gillette, Coke, who have significant international presence.

My question is, how does your approach change, if at all, in light of the international expansion?

I'm particularly interested in the introduction of greater difficulty in understanding the business models, in the understanding of the economic future and the economic risk associated with the international scene. In addition, do you actively search for a global scene for investment opportunities?

WARREN BUFFETT: Yeah. The answer is that we obviously like businesses that are good businesses at present volume and that have the chances to expand significantly with similar economics.

And with any business that's been around the United States a long time, there's probably more opportunity, potentially anyway, around the rest of the world than here.

And Coke has grown faster. Oh, it's grown well here. But it's grown faster around the world than here. And that's been true at Gillette, also, just because we were a more mature market.

So we love the idea of products that will travel. Some travel well. Some don't. I mean, it's an incredible world that way.

Candy bars don't seem to travel so well, you know. Soft drinks travel terrifically. And razor blades travel terrifically. But the Cadbury bars sell in England. And, you know, and the Hershey bars sell here. And it's very hard, with some items, to try —

In fact, within this country, it's amazing to me. We talk about having a mobile society. And people are moving all the time. And we're all watching the same television and everything else.

And the supermarket share of Dr. Pepper in Dallas is 18 and a fraction percent. And in Boston, it's six-tenths of one percent. I mean, 18 to 0.6, 30 times the market share.

Dr. Pepper's been around forever. You know, people move back and forth and everything. And how can you have that sort of a differential in this country?

Royal Crown Cola, 3 percent in Chicago, one-tenth of a percent, you know, maybe, in Detroit, a couple hundred miles away, same kind of people, all that sort of thing. And Royal Crown's been around for 75 years or whatever it may be, 50 years, at least.

And you get these incredible differences in what people do, even within this country. So it's not easy to predict how — if you can't predict how Dr. Pepper — if you can't figure out how to make Dr. —

If I owned Dr. Pepper and was selling 18 percent of the market in the supermarkets of Dallas, it would drive me crazy, you know, I was getting six-tenths of a percent in Boston. Or, I think it's five-tenths, maybe, in Detroit. That would drive me crazy, although maybe I should just be grateful that I've got 18 percent in Dallas.

It just — it's very hard to predict how products will travel. With See's Candy, you know, we have this incredible penetration in the West and particularly in California. We know it's the best candy.

Now, boxed chocolates just do not sell big in this country. The annual consumption is low. But it still seems that, if we can make a lot of money in California, we ought to be able to make some money in New York or Pennsylvania.

But we haven't figure out how to do it. And we've tried a lot of things.

So, the answer is we're always interested in geographical expansion, whether it's even in the United States or, going beyond that, into other countries.

It's not as easy as it looks. But when the chance to do it comes, then you ought to just pound and pound and pound.

And we occasionally have bought stocks in other countries. I wrote a fellow the other day that I read about in Germany about his business. I've never met him or anything else. But it sounded like he had a pretty good business. And it sounded like he might be my type of guy.

So I just wrote him a letter. Haven't heard back, either. But I may. The odds are against it. But it sounded to me like I'd buy his business, if he chose to write back and wanted to do something.

And we're very willing to do business, you know, in any country in the world, where we think we understand the nuances of the corporate governance system and taxation and that sort of thing.

We don't understand all 200 countries, by a long shot. But there's plenty we'd love to be in business in.

We looked at a very significant company in Japan a couple years ago. And some other fellow I know bought it and has done very well. It would've made sense for us. And we missed it.

We will continue to look at things, internationally. It makes a lot of sense. And we've got a lot of capital to employ.

We're more likely, by some margin, to find things here. But we may find a big one outside of this country.

Charlie?

CHARLIE MUNGER: Nothing to add.

34. Spending to expand GEICO's business

WARREN BUFFETT: OK. Number 1.

AUDIENCE MEMBER: I'm John Bailey (PH) from Boston, Massachusetts.

You commented, in the annual report, that only part of GEICO's marketing expense last year was required to maintain the business.

This seems to get to the heart of owner earnings, where, in the first part, you can value the existing business very well through this observation. And you get a direct measure of the dollars invested in new business.

And it seems that you should be able to make similar observations about other businesses that you may be interested in investing in.

So could you use this as a jumping off point to describe examples, perhaps, of how you contemplate companies' marginal investment opportunities or their return on marginal capital?

And how much weight do you give to the value of the existing business in your investment decisions or the value of the, so to speak, in-force book?

WARREN BUFFETT: Well, we, as we explained earlier, are looking for ways to create more than a dollar of value per dollar we lay out.

We'd love to create $3 of value or $4 of value. But we'll settle for $1.10, if that's all we can get.

We don't consciously make decisions that are 90-cent decisions for a dollar laid out. None of this is that precise, when you get into the application of it.

What we do know, is that there is enough of a margin at, say, a GEICO expansion effort, that it's pretty compelling that it makes sense. Part of the limitation there, as I explained in the report, too, is a question of infrastructure and all of that.

So, it isn't solely a question of saying, you know, "Can we lay out another dollar?" and "Will that have a value of $1.10?" because if we strain the organization beyond its ability to service people, we may be hurting the business already on the books.

I used the GEICO example in the report, because it's big enough, so it's meaningful to shareholders. I mean, we're doing things all the time that cost us money in the short run that we think will more that produce a commensurate value over time, but not on the scale that we're doing it at GEICO currently. And we may step up that scale even.

So, I thought it important to lay out those figures, even though I can't be precise. When I say, you know, that it might be $50 million to maintain, I don't know that figure. It could be 70. It could be 30. Maybe I'm off even more than that.

But that's my best guess. And I think the shareholders are entitled to my best guess. And they're entitled to know how much we are spending, beyond that maintenance cost, to build the business for the future, which we don't, obviously, capitalize on the balance sheet.

So those — GEICO's, by far, the most dramatic. And we don't have comparable expenditures like that going on elsewhere.

But we are spending significant money, for example, to take NetJets to Europe. And we'll be spending it this year and next year.

And then as soon as that starts looking good, we'll be going to Asia and spending more money. I mean, all of those decisions are made that way. They're not on the scale of the GEICO decision, though, at all.

We want to give you the information in the report that, related to the size of the enterprise, would be material to Charlie or me, if we were reading the report and not involved in the business, in trying to figure out what our investment was all about.

That's the goal in what we write and then to keep it to a size that doesn't have to be sent UPS.

35. Problems with Berkshire annual report distribution

WARREN BUFFETT: Incidentally, I'm glad I got wandering along on that line. Because we did have a lot of shareholders this year that got their reports even later than they received them in past years.

Now, they were delivered — the reports that go to registered holders were put in the mail a few days after we go up on the internet here in Omaha. And they seem to get delivered OK.

Street-name holders, which are ten times in number what the registered holders are, so we're really talking about nine out of ten shareholders, get their reports from a firm in New Jersey that is designated, by their broker, to take the reports from us and re-mail them. And we pay those people a fair amount of money to do that.

We know when we deliver those reports to them, which is promptly. And we know when they tell us that they send them out. And we inquire every day, or more than once a day, to find out whether they've gone out.

And we got a lot of complaints this year that people hadn't received them at a time when you would've thought they would've received them.

So, we can either — we know when the designated mailer received them. We don't know for sure when they got them out. And we don't know for sure what happens at the post office.

But we were — the mailing went out about the same as in previous years. But the receipt, apparently, was somewhat later. And all we can say is that we apologize, but we don't have any better system.

The people that have them in their own name will always get them dropped in the mail a couple of days after the report appears on the internet. We can assure you of that.

We can't assure you of when the street-name holders will get their reports, because that is a mailing that we don't handle. And no other companies handle them, to my knowledge.

There is a firm that seems to do about 95 percent of that and is designated by the specific broker with whom you have your shares.

Charlie, you got anything to add?

36. The internet's effect on GEICO and auto insurance pricing

WARREN BUFFETT: OK, number 2.

AUDIENCE MEMBER: Hi, Mr. Buffett and Mr. Munger. My name is Will Obendorf (PH). I'm from San Francisco, California, and I'm 11 years old. I have been a shareholder for six years at Berkshire Hathaway.

My questions are, what are GEICO's sustainable competitive advantages? And my other one is, what are the implications of the internet on pricing for the auto insurance industry?

WARREN BUFFETT: Well, we — we're going to get your name and send it to human relations or whatever they call those departments. We want to hire you. (Laughter)

The sustainable competitive advantage at GEICO is to be the low-cost producer providing very good service.

And there will be a number of companies that provide good services. So that does not distinguish us from a great many competitors.

Having the low cost is crucial. There are companies that specialize in given groups of policyholders, but smaller groups, such as USAA, that have very good costs. So they are very, very competitive with us in their chosen area.

There's another company in Los Angeles that, geographically, called 21st Century Insurance, that has costs like ours. And so they are extremely competitive within that geographic area.

I don't think anybody is any better than us who operates nationwide. We don't operate in Massachusetts or New Jersey. But in the other 48 states, we will have a quote for about anyone.

So, in terms of a broad-based insurance — auto insurance competitor — our competitive advantage has to be low cost over time.

Now, we also have to be as good at distinguishing among the risks posed by different kinds of drivers as other people. In other words, we have to be able to select people who are going to be better-than-average drivers. And we have to be able to understand who is likely to be a poorer-than-average driver.

But — and the ability to do that, to distinguish those people, would be a competitive advantage. I think that many companies tend to be fairly equal on that point. So it's really at this cost level.

And we care very much about cost, the same way that Charlie mentioned a company called Costco does, you know, in terms of retailing. They figure their expense ratios out to hundredths of a percent. And that is important.

So that is the competitive advantage. Now when you get — and we have to sustain and widen that, if possible.

The question of the internet, it's going to be very important. It already is important to GEICO. It will be more and more important. It will be important to the insurance industry.

Because when you have the internet, you have a situation where somebody thinking about insuring a car can click to one place, find out what that rate will be. They can click to someplace else and find out what that rate will be.

So, in effect, they can shop all around without going from place to place to place and driving all over town or calling lots of agencies. They can just do it right there in their den. And that makes it very important, again, that we be the low-cost company.

I think it's going to be an advantage for us, over time. For one thing, I think it makes brand very important. Because we want people to be thinking of GEICO as one of the possibilities to call.

And if you've got the XYZ Company that nobody's ever heard of, nobody's going to think about clicking on them.

And GEICO's brand is becoming extremely familiar to people throughout the country, and we're spending a lot of money to make it even more familiar.

So you've asked two very good questions. And I think we're in pretty good shape on both of them. Thank you.

Charlie?

37. We'll do real estate deals, but only at the right price

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Good afternoon, Mr. Berkshire and Mr. Hathaway. (Laughter)

My name's Anthony Priest. I'm from Washington, D.C.

A couple months ago, I saw an ad in the "Wall Street Journal," where it said, "Berkshire Hathaway wants to see real estate finance opportunities in excess of $100 million."

I was curious about your thoughts in this area, the real estate field, some of your goals, if you can talk about any of the deals you may have made, and if Donald Trump has given you a call yet. (Laughter)

WARREN BUFFETT: I don't think Donald Trump will give us a call.

We have got about, what, three deals that we've put on in the last couple of years in real estate. And they are in this $100-million-and-up category.

And we're willing to put billions and billions of dollars in, if we can find the right sort of opportunities. Or nothing may happen, depending on — just depending on the market. We don't have —

Most — a lot of places have a mortgage department, or they have a real estate department. And they sort of have a budget. And they put money out based on using up the budget. And they have a whole bunch of people that don't have a job, unless they do that.

That's not the way we operate at Berkshire. We're willing — if the deals are right, you know, we'll do many billions. If the deals aren't right, we don't have anybody whose job is dependent on keeping busy in a field like that. So, we look at the deals when they come in.

Mike Goldberg is in charge of that operation. And we kick things around. He's in the office right next to mine. So, if he hears about a deal, you know, we'll discuss it for three minutes. And we'll sort of know whether it passes the first threshold. And then we'll go on to the second and the third.

But we don't waste a lot of time on things. And we don't care whether we make another deal or not. We'd like to, if the terms are right. And that ad produced some inquiries, not from Donald Trump.

And, you know, one or — there's one or two of — a couple of them are alive at the present time. And we'll see whether they work out.

Real estate deals, by their nature, take longer to put to bed than the kind of thing we normally do. In fact, I can buy a business faster than we can make a real estate deal, usually. That's just the way they work. But we could end up with a —

We're very happy with the three deals that we've got. They're good uses of money. And I hope we find a lot more. But if we don't, I won't be upset.

Charlie, do you have anything to add? Charlie's our real estate expert.

CHARLIE MUNGER: Hardly.

WARREN BUFFETT: We are not financing Charlie's boat, incidentally, despite the rumors. (Laughter)

38. Berkshire is not a "fund"

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hi, my name is Joel. I'm an undergraduate student at the University of Virginia. Just — I have two questions.

My first question is, how important do you think the structure of your fund is to its long-term success?

And by that, I mean, in the last couple weeks, some other legendary investors, like Julian Robertson, Stanley Druckenmiller, have been forced to either close or restructure their funds as a result of a kind of vicious cycle of underperformance and subsequent redemptions and then even worse performance.

Do you think that the structure of your fund, as a publically-traded company, as opposed to a private partnership, like Tiger and Quantum, has protected your business from a similar fate?

Or phrased a different way, do you think that, if Tiger or Quantum were structured the way that Berkshire Hathaway is, that they might still be in business in the same way today?

WARREN BUFFETT: Yeah, we don't consider ourselves in remotely the same business as Tiger. I mean, they are managing a securities operation. And we aren't doing anything like what they do. So that — they have —

Thirty years ago, when I had the partnership, it was much more along their lines, although still far from what they do. But it was structured much more like what they did.

And I — and, although we had bought control of businesses and all that, we were functioning much more — or, focusing much more on securities.

We don't care whether we own a stock or a bond. We will over the next 20 years. But that's not what we're about. We're not a fund. We are an operating business that generates a lot of capital and uses that to buy other businesses in whole or part.

And we prefer in whole. But we sometimes do it in part.

But I would — I don't consider — which is a reason why I don't consider book value that important, although it — it's got the importance I attributed to it earlier.

But, we could easily have 90 percent of the value of Berkshire, ten years from now, be represented by businesses that we own and 10 percent by securities. Or we could very easily have 60 or 70 percent represented by securities, depending on how markets develop.

I hope it develops in the former way. But I'm perfectly willing to go the other way, too. But it just has no relationship to the kind of funds you talk about. They —

We are structured poorly, from a tax standpoint, compared to those fellows, and compared to what I used to have in the '60s.

But that's, you know, that's a decision we made. And we're stuck with it, more or less.

It's not a great tax structure, if you're going to own securities. But we may not own that many securities over time.

Charlie?

CHARLIE MUNGER: Well, I do think that the people in the relative performance game, who are trying to attract so-called hot money, are living in a totally different world from ours.

I mean, Soros, in the end, was not willing to have a lot of people make a lot of money in high-tech stocks and not be part of that game. And they got killed.

We're perfectly willing to let something we don't understand very well rage on while a lot of other people make a lot of money we don't.

WARREN BUFFETT: Yeah, we — it's just not a securities operation that we have. We own a lot of securities at present. And we'll probably own a lot five or 10 years from now. But it's not what Berkshire is necessarily about.

Ideally, you know, I would love it if we could move all the money in securities into businesses that we liked. But that's — that isn't going to happen, in all probability.

It's too tough, because we can't find multi-billion-dollar businesses to buy right and left. We find a few. But they tend to be small.

39. We wouldn't buy a company that lies to itself

WARREN BUFFETT: Number 5?

AUDIENCE MEMBER: My name is Paul Tomasik from Chicago. My question is about intellectual honesty and your incredible ability of rising intellectual honesty in organizations.

In particular, you look at General Re, a large, well-managed, publically-traded firm. And if you think about it, if you raise the intellectual honesty in an organization like that, initially, you're going to have an aberration, as you called it.

In particular, Berkshire Hathaway was the first company to write-down the Uni — what is it — Unicover write-down, whereas Aon pushed it on into the year 2000.

Can you comment, give us some hints, on how you raise the intellectual honesty in an organization?

And somebody whispered in my ear, they wanted to know Charlie's reading list. I guess they finished "Guns, Germs, and Steel." Thank you.

WARREN BUFFETT: We really don't want to buy into any organization that we felt would be lacking that quality, in the first place. Because we really don't believe in buying into organizations to change them.

We may, you know, we may change the comp system a little or something of the sort.

But, I'm not going to name names, but there are a whole lot of organizations that, if we bought into them, we wouldn't move their needle one point in terms of how they operate. And we wouldn't be comfortable with how they operated.

So, we try to buy into organizations that we think are very much like ours, at bedrock. And General Re would've recognized that Unicover loss just as quickly if we hadn't owned it, as we had.

Now, that was not true of some other people. But they didn't need any prodding from us in order to realize something like that.

We want people joining us who already are the type that face reality and that tell us, basically, tell us the truth but tell themselves the truth, which is even more important.

And once you get an organization that lies to itself, and there are plenty that do, I just think you get into all kinds of problems.

And people know it throughout the organization. And they adopt the norms of what they think is happening up above them.

And particularly in a financial organization — really in any organization — but particularly in a financial organization, you know, that is death over time. And we wouldn't buy into something that we felt had that problem, with the idea that we would correct it. Because we wouldn't.

You know, it — Charlie and I have had a little experience with some organizations that have had that sort of problem. And it's not correctable, at least, you know, based on the lifespan of humans. It's too much to commit to.

Charlie?

CHARLIE MUNGER: Well, I think you're totally right about General Re. We didn't improve behavior at General Re. They already had a behavior just like ours.

And regarding a reading list, by the mischances of life, I didn't read one book last year that I thought was a lollapalooza. Therefore, I didn't make any recommendations to that bookstore at the airport.

WARREN BUFFETT: Charlie, how many books do you think you've read, though? He reads a lot.

CHARLIE MUNGER: Well, I don't count. And some of them, I skim through pretty fast. But there was no lollapalooza. A book like "Guns, Germs, and Steel" doesn't come along every year.

WARREN BUFFET: OK —

CHARLIE MUNGER: And by the way, that guy was a little nuts in one way.

WARREN BUFFETT: It's hard to get an A from Charlie. (Laughter)

40. Berkshire's competitive advantages in reinsurance

WARREN BUFFETT: OK, is it 6 we're going to?

AUDIENCE MEMBER: Hello. My name's James Armstrong (PH) from Pittsburgh, Pennsylvania. Thanks for having us.

I'd like you to comment, please, on the reinsurance business and how it might look over the next 10 or 20 years.

At Berkshire, we've usually bought businesses that are insulated to some degree from easy entry by new competitors and from commodity-type pricing. We want businesses that possess defensible franchises, few substitutes, resistance to cyclical factors, et cetera.

The reinsurance business carries a lot of characteristics that are the opposite of what we usually look for. There's a lot of excess capacity. We're hindered by irrational and unwise pricing decisions by competitors.

For GenRe to prove out as an investment for us, we need better underwriting. And we also need prices to harden.

But in a world with great global liquidity, where capital moves very rapidly from place to place, why wouldn't the reinsurance business gradually evolve into a poor business, where all excess returns are competed away, where price is never firm for very long because a new entrant arises and throws capital at the business?

So I'd like you to comment on how GenRe could be made to work. And also, give us a broad view of how the reinsurance business might unfold in the next 10 or 20 years. Thanks.

WARREN BUFFETT: OK. You made some good points. And, I — we have been, actually, in the reinsurance business, at Berkshire Hathaway, for 30 years.

So it's a business, obviously, that we've paid a lot of attention to. And we've gotten some scars from it at times. But overall, we've done extremely well.

And the reason we've done extremely well is because we've had an absolutely sensational manager in Ajit Jain, who I wrote about, running that business.

But Ajit is a good example of what somebody with brains and energy and discipline and the right temperament and some capital behind him can do in a business.

It's not the world's most efficient business. And it never will be the world's most efficient business, because it's not strictly actuarial. It —

All excess returns will not be competed away. There will be people that will earn very subnormal returns in the business. There will be people who get killed in the business. And that means there will be quite a deviation from the mean in terms of the results of individual insurers.

And we think that both at National Indemnity, under Ajit, and at General Re, that we have advantages, so that our returns will be significantly better than average.

But both of our businesses are subject to getting killed in any single year, will get killed in specific years, but also, in our view, will do better than average and more than satisfactory, in terms of Berkshire Hathaway's results.

You know, I can't prove that to you now. I can show you what's happened over the past years.

I don't think the situation in reinsurance is way different than some years back. There's always dumb competitors. There's always a lot of capital in the business.

In the '85, 1985, 1986 period, people felt very poor. But it wasn't really a lack of financial capital. It was psychological capital that disappeared. People were just plain scared. And that was the best of times to be writing business, obviously. You know we like to —

Prices are somewhat better now. But there are always people that misevaluate risk. And when they misevaluate risk, it's our job to let them have the business.

That's easier to do with Ajit's business in National Indemnity than it is with General Re, because General Re has long-term relationships with many accounts.

And the question of what you do when your competitor offers a price that's a little too low, with somebody you've been doing business with for 50 years, is a very tough decision to make.

And so sometimes, they probably do some business that might be labeled as "necessarily evil." And Charlie always says that he doesn't mind an occasional transaction like that, as long as you underline evil and not necessary.

The nature of people in the business, usually, particularly the frontline guy, who was calling on the account, is to underline necessary. And as owners, our tendency is to underline evil.

GenRe has done a terrific job, over the years, of balancing the necessity of continuing a relationship so long with the discipline of making sure they get paid enough.

That was not done perfectly last year. And the conditions were very difficult for doing it perfectly, I might add, too.

But I think that, both at Ajit's operation and at General Re, we have two businesses that will do very well, in terms of what we get out of them and very well compared to their competition, but occasionally will have a very bad year.

I mean, we could have something happen tomorrow, you know, a Tokyo earthquake. Or, I can name a bunch of them that would result in a very bad year. And that's what we're getting paid for.

And if we price with discipline, our 20-year results can't be bad, no matter what any one year produces. And if we don't price with discipline, we'll get killed over time.

Charlie?

CHARLIE MUNGER: Yeah. I don't think the reinsurance business is quite as much of a commodity business as might first appear. It's not like an execution transaction when you sell government bonds or something, where one broker is roughly just as good as another.

There's such a huge time lag between the time the premium is paid and the time the performance is given that you're making a — the customer is making a big prediction about the insurer's, A, willingness to pay what it really owes and, B, its ability to pay what it really owes.

I think we have a huge edge in reputation and actuality, with reference to both those two factors.

WARREN BUFFETT: Yeah, we have a reputational advantage. And I think that, in actuality, it's even stronger than the reputational advantage. I mean, I can't think of a case where there's been any problem with having Berkshire or General Re write a check very promptly for anything it owed.

I mean, we've, you know, we have never been subject to people suing us and getting money later on or anything like that after fighting us out in courts. It just — it's not the nature, it's not the attitude we bring toward the reinsurance transaction.

And we have a reputational advantage. But like I said, I don't think it's quite as wide as it should be in some cases, even.

And then we have a huge attitudinal advantage in that we have no need, none, to write more business, or the same amount of business, or even something close to the amount of business, next year that we wrote this year.

We — there is no — there are no volume goals at Berkshire Hathaway at all. And that is not true at most insurance organizations.

We report the results as they come in and as we see them, which also, I think, gives us an advantage in being realistic about all aspects of our business.

We have huge amounts of capital behind us. So we can take large pieces of attractive business and keep them all for our own accounts.

So we have a lot of advantages in the business. And they will translate into something better than the rest of the world gets.

I don't know how much better. And I don't know how much the rest of the world will get. But it's not insignificant, the advantages we have in the business.

Morning Session - 2001 Meeting

1. Formal business meeting

(Video recording begins with meeting already in progress)

WARREN BUFFETT: And — (laughter) — Andy [Heyward], if you're here, you could stand up, I think the crowd would like to say thanks. (Applause)

We have one other guest, too. After doing an incredible job for all Berkshire shareholders and particularly for Charlie and me, Ralph Schey retired this year. But Ralph and Luci, I believe, are here. And [if] Ralph and Luci would stand up, the shareholders and I would like to say thanks. (Applause)

Scott Fetzer was one of the best acquisitions we ever made, but the reason it was among the very best was Ralph. And a great many of the other companies that we own now, our ownership was made possible because of the profit that Ralph delivered over the years. So, thanks very much, Ralph.

Now we will come to order. I will go through this fast. I'm Warren Buffett, chairman of the board of directors of the company, and I welcome you to this 2001 annual meeting of shareholders.

I will first introduce the Berkshire Hathaway directors that are present in addition to myself.

First of all, of course, is Charlie, on my left. And if you'll — the directors will stand when I give your name.

Howard Buffett, Susan Buffett — she was the voice on the songs, the ones that were sang — sung well — Malcolm G. Chace, Ronald L. Olson, and Walter Scott Jr.

Also with us today are partners in the firm of Deloitte and Touche, our auditors. They are available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire, and he will make a written record of the proceedings. Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg. We will conduct the business of the meeting, and then adjourn the formal meeting. After that, we will entertain questions that you might have.

Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting, that was sent by First-Class Mail to all shareholders of record, on March 2, 2001, being the record date for this meeting, there were 1,343,041 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting and 5,505,791 shares of Class B Berkshire Hathaway common stock outstanding, with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 1,116,384 Class A shares, and 4,507,896 Class B shares are represented at this meeting by proxies returned through Thursday evening, April 26.

WARREN BUFFETT: Thank you. That number represents a quorum, and we will therefore directly proceed with the meeting.

First of order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott Jr. who will place a motion before the meeting.

WALTER SCOTT JR.: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with.

WARREN BUFFETT: Do I hear a second?

VOICES: Aye.

WARREN BUFFETT: The motion has been moved and seconded. Are there any comments or questions? We will vote on this motion by voice vote. All those in favor, say, "Aye."

VOICES: Aye.

WARREN BUFFETT: Opposed, say, "Bye, I'm leaving." (Laughter)

The motion is carried. The first item of business of this meeting is to elect directors. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholder that is present has not turned in a proxy, and desires a ballot in order to vote in person, you may do so. If you wish to do this, please identify yourself to meeting officials in the aisles, who will furnish a ballot to you. Would those persons desiring ballots please identify themselves, so that we may distribute them?

I now recognize Mr. Walter Scott Jr. to place a motion before the meeting with respect to election of directors.

WALTER SCOTT JR.: I move that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. be elected as directors.

VOICE: I second the motion.

WARREN BUFFETT: It has been moved and seconded that Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. be elected as directors. Are there any other nominations? Is there any discussion?

The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of election.

Would the proxy holders please also submit to the inspector of elections a ballot on the election of directors, voting the proxies in accordance with the instructions they have received?

Miss Amick, when you are ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders, in response to the proxies that were received through last Thursday evening, cast not less 1,126,480 votes for each nominee.

That number far exceeds a majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders, in response to proxies delivered at this meeting, as well as those cast in person at this meeting, if any, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. have been elected as directors.

The next item of business was scheduled to be a proposal put forth by Berkshire shareholder Bartlett Naylor. On April 20th, 2001, Mr. Naylor advised us he was withdrawing his proposal. Accordingly, we will not have the proposal presented at this meeting.

At the adjournment of the business meeting, I will respond to questions you may have that relate to the business of Berkshire, but do not call for any action at this meeting.

Does anyone have any further business to come before this meeting, before we adjourn? If not, I recognize Mr. Walter Scott Jr. to place a motion for the meeting.

WALTER SCOTT JR.: I move this meeting be adjourned.

WARREN BUFFETT: Motion to adjourn has made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say, "Aye."

VOICES: Aye.

WARREN BUFFETT: Opposed say, "No." Meeting's adjourned. (Applause)

I ask you, am I getting slower in my old age? No, I'm — (Laughter)

Now, the first — we're going to go —

We have eight microphones strategically placed. We have the first two on my right. Far back, three and four, and over to this back area, over here, and then up front for the seven and eight.

And if you have a question, just go to the microphone, and queue up at the microphone, and we'll keep rotating, like I say, until noon. Then we'll have a break, and then we'll start again around 12:30, or thereabouts, and go until 3:30.

2. Four-year-old and Buffett look ahead to Berkshire's future

WARREN BUFFETT: Now, first question in area 1, we have a special guest.

I received a letter from Mark Perkins on April 5th, telling me about his daughter, who has been a shareholder since she was 6 months old.

And she's going to be 4 in November, and she would like — Marietta would like to ask the first question.

And frankly, I take all the questions from 4-year-olds, and Charlie handles them from anybody — (laughter) — that's been around a little longer.

So Marietta, if you've got the microphone there, would you ask your question, please?

VOICE: Ask him. (Inaudible)

MARIETTA: (Inaudible)

VOICE: I'm Marietta.

MARIETTA: Marietta.

VOICE: I'm three. Speak up.

MARIETTA: I’m three.

VOICE: Berkshire Hathaway fistful of dollars.

MARIETTA: (Inaudible) dollars. (Laughter)

VOICE: Her — actually, her question was, she said she was three, and she says, “Berkshire Hathaway fistful of dollars,” and she says, “What should we invest in now” so that she’ll be ready when she goes to college?

WARREN BUFFETT: What should she invest in, or what should Berkshire invest in?

MOTHER: What should Berkshire invest in?

WARREN BUFFETT: Well, Berkshire would like very much to buy businesses of the same quality, and with managements of the same quality, and at prices consistent with the eight businesses that we’ve bought over the last 16 or 18 months.

Our first preference is, and has been for many decades — although I would say most observers didn’t seem to realize it — but our first preference has always to been — to be buying outstanding operating businesses. And we’ve had a little more luck in that respect lately.

We also own lots of marketable securities. We’ve bought many of those, for example, in the mid-’70s, that did very well for us. But the climate has not been as friendly toward making money out of marketable securities.

And we, frankly, prefer — we prefer the activities associated with owning and operating businesses over time.

So what we hope to do, Marietta, is by the time you’re ready to go to college, I would hope that

well, first of all, I’d hope I’m still around. (Laughter)

But beyond that, I would hope that we would have — you’ll be ready in about 14 years or so. I would hope that we would have another, maybe, 40 businesses or so that would be added. And I would hope that we would have every business that we have now.

And I would hope we would not have more shares outstanding, or any — at least any appreciable number of more shares outstanding.

If we can get all that done, I think you’ll probably be able to afford college.

Charlie, do you have anything to add?

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: And there's some things in life, Marietta, you can really count on. (Laughter)

3. Tech sector not comparable to pharmaceuticals

WARREN BUFFETT: OK, let's go to microphone number 2.

AUDIENCE MEMBER: Good morning, Mr. Buffett, Mr. Munger.

VOICE: (Inaudible)

AUDIENCE MEMBER: Oh, sorry. OK.

If you want to trade a share of Berkshire A for 30 shares of Berkshire B, as you had mentioned before, a personal stock split, or vice versa, is this considered a wash sale for tax purposes?

Also, I'd like to ask you a question which you've heard before, but in a slightly different context. A few years ago, you said you had made a mistake by not buying shares of the major pharmaceutical companies around 1993.

You cited their value to society, as well as their terrific growth, high profit margins, and great potential. You said that while you didn't know which companies would do the best, you could've made some kind of sector play, because the entire sector had been decimated.

These exact same words, including those about not knowing which businesses will dominate over time, can also be used to describe another industry, which has recently been decimated.

This is industry is, of course, technology. How do you see these two investment ideas, pharmaceuticals in '93 and technology now, and what difference in the two situations makes the first a good opportunity for Berkshire, and the second not one?

WARREN BUFFETT: Well, Charlie answers all the questions about mistakes, so I will turn the second question over to him. (Laughter)

CHARLIE MUNGER: Personally, I think that the future of the pharmaceutical industry was easier to predict than the future of the high-technology sector.

In the pharmaceutical sector, almost everybody did well, and some companies did extremely well. In the other sector, why, there are many permanent casualties in the high-tech sector.

WARREN BUFFETT: Yeah, I would say that there's certainly nothing obvious to us about the fact that the tech sector — as a group — viewed in aggregate — would be a good buy or be undervalued.

Whereas we should have had enough sense to recognize that the pharmaceutical industry, as a group, was undervalued.

But the pharmaceutical industry has a far, far better record of returns on large amounts of equity over time, and with a high percentage of the participants having those returns, than the tech industry. I wouldn't regard those two as comparable at all.

4. Tax implications for exchanging Berkshire share classes

WARREN BUFFETT: Your first question about exchanging and whether you have a wash sale, and I think you indicated exchanging from B into A.

If you actually, physically, have a share of A, and turn it in for 30 shares of B, that is not a taxable transaction, so there is no sale under such a circumstance. If you —

There would be no reason, unless the B was at a significant discount, to actually sell the A and buy the B, but I — and I'm not giving tax advice on this — but I would think that they — I think the tax code refers to "substantially identical" securities when they talk about wash sales.

And I would think that you — that the IRS would be entitled to, at least, raise the question if you had an A share you were selling at a loss, and replacing it with 30 shares of B.

You'd have a better argument than if you bought a share of A back the next day, if you were establishing a loss. If you were establishing a gain, you'd have no reason — you know, they're not worried about wash sales in that respect.

You can't go from B to A by exchange, but you could go by selling 30 shares of B in the market, and buying a share of A.

Again, if that were being done at a loss, I think the IRS could well argue that they were substantially identical, but you could argue otherwise.

Charlie?

CHARLIE MUNGER: No, no, I think the IRS would win.

WARREN BUFFETT: Yeah. (Laughter)

Charlie might even go state's evidence, you know, if there was a (inaudible).

5. Berkshire isn't hindered by state insurance regulators

WARREN BUFFETT: OK, let's go to zone 3.

AUDIENCE MEMBER: I'm Dan Blum (PH) from Seattle, Washington.

As an insurance holding company, Berkshire Hathaway is subject to regulation by insurance departments in every state in which GEICO or your other insurance subsidiaries do business.

Has that handicapped or affected your operations in any way? And do you have any trenchant or wise observations to make about governmental regulation in that context?

WARREN BUFFETT: Yeah, we've really not been impeded in any way by the fact that — Berkshire Hathaway itself is not an insurance company, but it owns various insurance companies. Of course, it owns a lot of other companies, too.

But being the holding company of insurance companies, which indeed are regulated by the states in which they're admitted, it really has not slowed down any acquisition.

They are not — whereas with the Public Utility Holding Company Act, under that statute, the authorities are directed to be concerned with the activities of the holding company. And in the banking business, to some extent, they are.

In the insurance business, there's relatively little in the way of regulation or oversight that extends up to the holding company. So, it has not slowed us down in that business, but it's been reported recently in the electric utility business.

There's a statute from 1935, the Public Utility Holding Company Act, the acronym is that euphonious term, PUHCA. (Laughter)

The Public Utility Holding Company Act has a lot of rules about what the parent company could do. And that act was put on the books because the holding companies of the '20s, most particularly ones held by — formed by — Sam Insull, but there were others.

There were many abuses, and a good many of those abuses involved what took place at the holding company. So it was quite understandable that that act was passed in the '30s. And it achieved a pro-social purpose at the time.

I don't think there's anything, frankly, pro-social about limiting Berkshire's ability to buy into other utilities. We can buy up to five percent of the stock. But we might well, in the last year or two, have bought an entire utility business if it were not — if that statute weren't present.

So we're handicapped by the utility holding company statute, we are not handicapped, in my view, by any state insurance statutes.

Charlie?

CHARLIE MUNGER: Nothing to add. (Laughter)

6. "Pain today, gain tomorrow" insurance transactions

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Good morning.

WARREN BUFFETT: Good morning.

AUDIENCE MEMBER: Steve Bloomberg, from Chicago. I have two questions regarding the insurance operations.

With regard to the reinsurance contracts, which were written at what some consider and call "good losses," you've discussed those insurance contracts in your report, indicating that it's generated 482 million of losses in the year 2000.

Do we need an annual schedule disclosing the aggregate amortized charges of all current and past such deals, to make our adjustments, to reflect economic reality?

WARREN BUFFETT: Well, there are two unusual-type deals, and you referred to one type, what I call the "pain today, gain tomorrow," or good losses-type deals.

And under the deals you're describing, we record a usually quite significant loss in the current year, and then we have the use of float for many years to come, and there are no subsequent charges against that.

So in respect to those contracts, the important thing is that we tell you — and we should tell you — really, every quarter if they're significant, and certainly yearly, any significant items that fall in that category.

And as you mentioned, you know, we had over 400 million last year. We had a significant amount the year before.

We have not had a significant amount this year. I think, in the first quarter, there may have been a 12 million charge for one of those.

If they're significant, we're going to tell you about them.

It's a one-time adjustment in your mind that, in effect, should — you should regard as different than any other type of underwriting loss that we experience, because we willingly enter into these.

We take the hit the first year, and accounting calls for that. And over the life of the contract, we expect to make money. And our experience would be that we do make money.

But we'll tell you about any significant item of that sort, so that you will be able to make an adjusted cost to float. I reported our cost to float last year at 6 percent, which is high. It's not unbearable, but it's high, very high.

And included in that 6 percent cost was — about a quarter of it came from these transactions that distorted the current year figure. And therefore, our cost of float, if we hadn't willingly engaged in those transactions, would've been about 4 1/2 percent.

I should mention to you that I expect that our cost of float — I said in the annual report — that absent a mega-catastrophe — and I might define a mega-catastrophe as insured losses, we'll say, of 20 billion or more, or something on that order — absent a mega-catastrophe, we expected our cost of float to come down this year, and I said perhaps substantially.

In the first quarter, our cost of float will probably run just a touch under 3 percent, and — on an annualized basis.

And I think that — I think the trend is in that direction, absent a mega-catastrophe. I would expect the cost of float, actually, to come down substantially this year.

But if we were to take on some of these "pain today, gain tomorrow" transactions — and we don't have any in the works at the moment — but if we were to take those on, then it would be reflected in our cost of float, and we would lay out the impact of that sort of transaction.

Charlie?

CHARLIE MUNGER: Yeah, I think almost all good businesses have occasions where they're making today look a little worse than today would otherwise be, to help tomorrow. So I regard these transactions as very much the friends of the shareholders.

WARREN BUFFETT: We have a second type of transaction, just to complete, which we also described in the report, which also creates a large amount of float, but where accounting rules spread the cost of that transaction over the life of the float.

And those do not distort the current-year figures, but they do create an annual charge that exists throughout the life of float. And that charge with us is running something over $300 million a year.

But there again, it's a transaction that we willingly and enthusiastically engaged in. And that has this annual cost attached to it.

So when you see our cost to float at 3 percent, annualized, in the first quarter, it includes, probably, a $80 million charge or so, relative to those retroactive insurance contracts, which were the second kind described in the report.

I recognize this accounting is, you know — and even the transactions — are somewhat Greek to some of you. But they are important, in respect to Berkshire, so we do want to lay them out in the annual report for those who want to do their own calculations of intrinsic value.

7. "What really costs … are the blown opportunities"

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Good morning, gentlemen, my name is Jay Parker. I'm from Washington State. And this question regards mistakes. So that being the case, it should probably be directed to Mr. Munger.

Mr. Munger, I know you're fond of evoking humility to promote rational thought. So my question is, what's the most recent business mistake that you've made, Mr. Munger, and why did it occur? (Laughter)

WARREN BUFFETT: I'm going to take notes on this one. (Laughter)

CHARLIE MUNGER: The mistakes that have been most extreme in Berkshire's history are mistakes of omission. They don't show up in our figures. They show up in opportunity costs.

In other words, we have opportunities, we almost do it. In retrospect, we can tell that we were very much mistaken not to do it.

In terms of the shareholders, those are the ones in our history that it really cost the most. And very few managements do much thinking or talking about opportunity costs. But Warren, we have blown —

WARREN BUFFETT: Billions and billions and billions. I might as well say it. (Laughter)

CHARLIE MUNGER: Right, right. And we keep doing it. (Laughter)

WARREN BUFFETT: Some might say we're getting better at it. (Laughter)

CHARLIE MUNGER: I don't like mentioning the specific companies, because the — you know, we may, in due course, want to buy them again and have an opportunity to do so at our price.

But practically everywhere in life, and in corporate life, too, what really costs, in comparison with what easily might have been, are the blown opportunities. I mean, it just — it's an awesome amount of money.

When I was somewhat younger, I was offered 300 shares of Belridge Oil. Any idiot could've told there was no possibility of losing money, and a large possibility of making money. I bought it.

The guy called me back three days later, and offered me 1,500 more shares. But this time, I had to sell something to buy the damn Belridge Oil. That mistake, if you traced it through, has cost me $200 million.

And I — it was all because I had to go to a slight inconvenience and sell something. Berkshire does that kind of thing, too. We never get over it. (Laughter)

WARREN BUFFETT: Yeah. I might add that when we speak of errors of omission, of which we've had plenty, and some very big ones, we don't mean not buying some stock where we — a friend runs it, or we know the name and it went from one to 100. That doesn't mean anything. It's only —

We only regard errors as being things that are within our circle of competence. So if somebody knows how to make money in cocoa beans, or they know how to make money in a software company or anything, and we miss that, that is not an error, as far as we're concerned.

What's an error is when it's something we understand, and we stand there and stare at it, and we don't do anything. Or worse yet, what really gets me is when we do something very small with it. We do an eyedropper's worth of it, when we could do it very big.

Charlie refers to that elegantly when I do that sort of thing as when I'm sucking my thumb. (Laughter)

And there really — I mean, we have been thumbsuckers at times with businesses that we understood well. And it may have been because we started buying, and the price moved up a little, and we waited around hoping we would get more at the price we originally started — there could be a lot of things.

But those are huge mistakes. Conventional accounting, of course, does not pick those up at all. But they're in our scorebook.

8. Not worried "at all" about product liability involving sugar

WARREN BUFFETT: Zone 6, please.

AUDIENCE MEMBER: My name is Joseph Lapray. I'm from Minneapolis, Minnesota.

In recent years, tobacco companies have been compelled to pay large damages for marketing their unhealthy, but discretionary, products. My question has two parts.

First, does the potential for similar damage liabilities reduce the intrinsic value of Coca-Cola, See's Candies, Dairy Queen, or any other business, which sells discretionary products of questionable healthfulness? Not that I don't like these products.

And second, are either of you concerned that a possible erosion in the principle of caveat emptor is undermining the legal basis of contracts, in general? Thank you for taking my question.

WARREN BUFFETT: Well, the products you described, I've been living on for 70 years, so — (laughter) — they'll probably haul me in as a witness if I — that they don't do much damage.

No, I think, if — you know, if you're opposed to sugar and the — I think the average human being eats something like 550 pounds dry weight of food a year. And I think 125 pounds, or thereabouts — I'd have to look at it — it consists of sugar in one form or another.

I mean, it's in practically every product that you have, and happens to be in Coca-Cola, it happens to be in See's Candy, but it's in practically everything you're — I mean, it's over 20 percent of what Americans are consuming, one way or another.

And, you know, the average lifespan of Americans keeps going up. So, I would not be worried at all about product liability in connection with those companies.

But product liability, generally, is an area that is a fertile field for the plaintiff's bar. And it's — we are conscious in buying into businesses, and we have passed up some businesses, because we were worried about the product liability potential.

Unless there is some legislative solution, I think you will see more and more of the GDP going into liability awards. And whether there will be any change by legislation, I don't know. But, you know, it's a big field.

And the lottery ticket aspect of it is so attractive. Because if an attorney can gamble a modest amount of time, or even a reasonable amount of time, and have a potential payoff of 10, or 20, or maybe, in some cases, hundreds of millions of dollars, you know, that's a decent lottery ticket. Who knows what 12 people, you know, are going to be on the jury?

As one of my friends who's a lawyer said, you know, he said, "Lincoln said, 'You can fool all of the people some of the time, and all of the — some of the people all of the time, and all of the people some of the time, but not all of them all the time.'" He says, "I'm just looking for 12 that you can fool all of the time." You know, and — (Laughter)

You know, and all you have to do is get an award. And the odds are fairly favorable in a nation where lots of zeros have sort of lost meaning to people. So it's a very real concern in any business we get into, in terms of trying to evaluate product liability.

Charlie?

CHARLIE MUNGER: What's particularly pernicious is the increasing political power of the plaintiff's contingency, the bar.

If you're on a state Supreme Court, for — in most places, you're on for life. If you — at least, you're on for life if you want to stay for life.

And the one thing that could get you off the court would be to really irritate some important group. And I think that greatly helps a lot of abusive conduct in the courts.

I think the judges of the country haven't been nearly as tough as they should be on junk science, junk economic testimony, trashy lawyers. And I don't see — (applause) — and I don't see many signs that it's getting better.

In Texas, they actually improved the Supreme Court of Texas, which really needed it. So, there are occasional glimmers of life.

WARREN BUFFETT: We make our decisions in insurance and in buying businesses with a very pessimistic attitude toward the chances of that particular ill that Charlie described being even moderated.

I mean, we think if — we would project out that the trend would accelerate, but that's just our natural way of building in a margin of safety in decisions.

Don't worry about eating the See's candy, or the Dairy Queen, or the Coke.

You know, if you read the papers long — I use a lot of salt, and, you know, I was always being warned about that. And then, you know, few years ago they started saying, "You know, you can't get enough salt" and all that. I don't know what the answer is, but I feel terrific. (Laughter)

9. We don't "have cash around just to have cash"

WARREN BUFFETT: Zone 7. (Applause)

AUDIENCE MEMBER: Good morning. I'm Murray Cass from Markham, Ontario.

The financial community relies heavily on the P/E ratio when evaluating prospective investments.

When you buy a company, you must certainly consider not just the future stream of earnings but also the company's financial condition, among other things. By financial condition, I'm speaking mainly of cash and debt.

But the P/E doesn't take into consideration either cash or debt. Occasionally, you see a company with consistently positive free cash flow trading just over cash value, effectively giving away the future earnings. In cases like this, the P/E looks terribly overstated unless adjusted for cash and debt.

I've always preferred companies with oodles of cash to those burdened with lots of debt. And then I read Phil Fisher's book, "Conservative Investors Sleep Well."

Well, I haven't slept well since. He really confused me when he commented that "hoarding cash was evil." He wrote that instead, "Companies should either put the cash to good use or distribute it to shareholders." Can I get your thoughts on this?

WARREN BUFFETT: Well, there are times when we're awash in cash. And there have been plenty of times when we didn't have enough cash.

Charlie and I, I remember in the late '60s, we were — when bank credit was very difficult — we were looking for money over in the Middle East. You remember that, Charlie?

CHARLIE MUNGER: Yes, I do.

WARREN BUFFETT: Yeah, and —

CHARLIE MUNGER: They wanted us to repay it in dinars.

WARREN BUFFETT: Yes, and the guy that wanted us to repaint it — repay him — in dinars — or "deeners," or whatever the hell they call them — (laughter) — was also the guy that determined the value of those things.

So, we — (laughter) — were not terribly excited about meeting up with him on payday and having him decide the exchange rate on that date. (Laughter)

But we, obviously, are looking every day for ways to deploy cash.

And we would never have cash around just to have cash. I mean, we would never think that we should have a cash position of X percent. And I — frankly, I think these asset allocation things that tacticians in Wall Street put out, you know, about 60 percent stocks and 30 — we think that's total nonsense.

So, we want to have all our money — (applause) — working in decent businesses. But sometimes we can't find them, or sometimes cash comes in (un)expectedly, or sometimes we sell something, and we have more cash around than we would like.

And more cash around than we would like means that we have 10 or 15 cents around. Because we want money employed, but we'll never employ it just to employ it. And in recent years, we've tended to be cash heavy, but not because we wanted cash per se.

In the mid-'70s, you know, we were scraping around for every dime we could find to buy things. We don't like lots of leverage, and we never will. We'll never borrow lots of money at Berkshire. It's just not our style.

But you will find us quite unhappy over time if cash just keeps building up. And I think, one way or another, we'll find ways to use it.

Charlie?

CHARLIE MUNGER: I can't add anything to that.

10. Costs vary by type of business

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: Good morning. My name is Mark Dickson (PH) from Sarasota, Florida. And I'd like to thank you for providing this forum for all of us. It's wonderful.

In past years, you've been very specific about some of the numbers related to Coca-Cola, Wells Fargo, Rockwood — specifically like with Coca-Cola — cost of aluminum, and sugar, and all that. It goes into the bottom line of Coca-Cola.

Can you provide some of the specific numbers that go into some of your more recent purchases over the last couple years?

WARREN BUFFETT: Well, they have such different characteristics. That's very difficult. I mean, we have service businesses such as FlightSafety, and Executive Jet is a service business.

And, you know, in many of those companies, the big cost is personnel. I mean, we need people with — at a FlightSafety, we've got a lot of money invested in simulators. We'll put over $200 million into simulators this year, just as we did last year.

So we have a big capital cost in that business, and then we have a big people cost because we are training pilots. And that's very person-on-person intensive. NetJets, part of Executive Jet, very people-intensive. I mean, we are absolutely no better than the people that interact with our clientele.

You get into something like the carpet business, and maybe only 15 percent of your revenues will be accounted for by employment costs. And you're a very heavy raw material buyer. I mean, you're buying lots of fiber.

So it varies enormously by the kind of business you're in.

I mean, when we're in the insurance business, you know, we're in the business of paying future claims. And that's our big cost. And that's — obviously, involves estimates because sometimes we're going to pay the claim five, 10, or 20 years later. We're not going to know about it sometimes till 20 years later.

So, it's very hard to generalize among the businesses.

If you're in the retail business, which we are in the furniture and jewelry in a significant way, purchased goods are very — obviously — very important. We don't manufacture our own goods to any extent in those businesses.

And then, the second cost, of course, is labor in a business like that.

But we don't have any notions as to what we want to buy based on how their costs are segmented. What we really are looking for is an enduring competitive advantage. I mean, that's what's going through our mind all the time.

And then we want, obviously, top-notch people running the place, because we're not going to run them ourselves. So those are the two factors we look at.

We want to understand the cost structure, but Charlie and I can understand the cost structure of many companies — there's many we can't — but we can understand a good many companies.

And we don't really care whether we're buying into a people-intensive business, a raw material-intensive business, a rent-intensive business. We do want to understand it and understand why it's got an edge against its competitors.

Charlie?

CHARLIE MUNGER: Yeah, basically, to some extent we're like the hedgehog that knows one big thing. If you generate float at 3 percent per annum and buy businesses that earn 13 percent per annum with the proceeds of the float, we have actually figured out that that's a pretty good position to be in. (Laughter)

WARREN BUFFETT: It took us a long time. (Laughter)

Incidentally, I would hope that we would — and actually expect that — absent a mega-catastrophe — that 3 percent figure will come down over the next, well, in the near future.

But a mega-catastrophe could change all of that. I mean, if you had a $50 billion insured catastrophe — Tokyo earthquake, California earthquake, Florida hurricane — I mean, those — we're in the business of taking those risks.

We're the largest insurer, as you may know, of the California Earthquake Authority. I have a sister here who is from Carmel, and she used to call me when the dogs and cats start running in circles. (Laughter)

So we're exposed to some things that could change.

But absent a mega-catastrophe, experience is going in the right way at both — at really at all of our insurance companies. And I would expect that to continue for a while. And then at some point I'd expect it to reverse itself. Isn't that helpful? (Laughter)

11. Airlines must keep costs in line with competitors

WARREN BUFFETT: Area 1, please.

AUDIENCE MEMBER: Good morning. I'm Martin Wiegand from Chevy Chase, Maryland.

WARREN BUFFETT: Good to have you here, Martin. (Laughs)

AUDIENCE MEMBER: Thank you. Thank you for the wonderful shareholder weekend, and thank you for the leadership and education you give your shareholders and the general public.

My question. Large airlines are in the news negotiating labor contracts. They claim they can't pass along rising labor costs to their customers.

In the annual report, you say Executive Jet is growing fast and doing great. Executive Jet seems to be able to pass along its rising labor cost to its customers.

Is this because Executive Jet has a rational compensation plan that keeps employee salaries in line with billable services? If not, why does Executive Jet do well while the airlines experience troubles?

WARREN BUFFETT: Well, the big problem with the airlines is not so much what their aggregate payments will be. The real problem is when you're in the airline business and your wage rates are out of line with your competitors.

When you get right down to it, the figure to look at with an airline — among a lot of other things — but you start with the cost per available seat mile. And then you work that through based on the capacity utilization to get to the revenue per — or the cost per — occupied seat mile.

And the — you could have labor costs or any other costs. You certainly have fuel costs up dramatically for the airlines from a couple of years ago.

As long as you're more efficient than your competitor, and your costs are not higher than your competitor, people will continue to fly.

It's when you get your costs out of line with your competitor, which was the situation that — where Charlie and I were directors of USAir a few years back — and our costs per seat mile were far higher than competitors.

And that was fine where we didn't have competitors on some — many of the short routes in the East. But as the Southwest Airlines would move into our territory — and they had costs, we'll say, of — and this is from memory — but they might have had costs below eight cents a seat mile. And our cost might have been 12 cents a seat mile.

You know, that is a — you're going to get killed, eventually. They may not get to this route this year, but they'll get there next year or the year after.

So if you're running a big airline at Delta or United or whatever, if your costs are on parity or less — labor costs — than your other major competitors, that is much more important to you than the absolute level.

And the NetJets service is not really designed to be competitive with United Airlines or an American or something of that sort. It has a different group of competitors.

And I think we have a absolutely terrific pilot force there. And we want them to be happy. But there's a lot of other ways. I mean, you want to pay them fairly. But with our pilots for example, it's extremely important to them, in many cases, to be able to live where they want to and to work the kind of shifts that we can offer. So we attract them in many other ways than bidding against United Airlines or American Airlines.

Big thing in — you just can't take labor costs that are materially higher than your competitor in a business that has commodity-like characteristics such as airline seats. You just can't do it over time.

And you can get away with it for a while. But sooner or later, the nature of a capitalist society is that the guy with the lower cost comes in and kills you.

Charlie?

CHARLIE MUNGER: The airline unions are really tough. And it's interesting to see a group of people that are paid as well as airline pilots with such a brutally tough union structure. That really makes it hard in a commodity-style business.

And no individual airline can take a long shutdown without having considerable effects on habit patterns and future prospects. It's just a very tough business by its nature.

Passenger rail travel, even in a previous era, was a pretty tough way to make a buck. And nothing is all that different with the airline travel.

We hope that our services are preferred by customers more than one airline seat is preferred compared to another.

WARREN BUFFETT: Yes, fractional ownership is not a commodity business. I mean, the people care enormously about service and the assurance of safety. And I don't think that, you know, I don't think if you were buying a parachute you'd want to take the — necessarily take the low bid, and —

CHARLIE MUNGER: Yeah. (Laughter)

WARREN BUFFETT: Now with the big commercial airlines with millions and millions of passengers, people, I think probably correctly assume, that there's quite a similarity in both service and safety.

But if you're in a business that cannot take a long strike, you're basically playing a game of chicken, you know, with your labor unions. Because they're going to lose their jobs, too, if you close down. So you're playing a game of chicken periodically.

And it has a lot — there's a lot of game theory that gets involved.

To some extent, you know, the weaker you are, the better your bargaining position is. Because if you're extremely weak, even a very short strike will put you out of business. And the people who are on the other side of the negotiating table understand that. Whereas, if you have a fair amount of strength, they can push you harder.

But it is of — it is no fun being in a business where you cannot take a strike. We faced that one time back in the early '80s when there were — we were in kind of a death struggle in Buffalo with The Courier-Express.

And when I bought The Buffalo News — actually Charlie did. He was stranded there during a snowstorm, and he got bored. So, he called me and said, "What should I do?" I said, "Well, you might as well buy the paper." (Laughter)

And so we were in this struggle. And — but when we bought the Buffalo News, we had two questions of the management, and one of them I can't tell you.

But the second one was, we wanted to meet with the key union leaders, and we wanted to tell them, "Lookit, if you ever strike us for any length of — significant length of time — we're out of business.

"You know, you can make our investment valueless. So we really want to look you in the eye and see what kind of people you are before we write this check." And we felt quite good about the people, and they were good people.

And we had one situation in 1981, or thereabouts, where a very, very small union, I think, less than 2 percent of our employees, struck over an issue that the other 10 or 11 unions really didn't agree with them that much on.

But they struck, and the other unions observed the picket line, which you would expect them to do in a strongly pro-union town, such as Buffalo.

And I think, as I remember, they struck on a Monday. And I remember leaders of some of the other unions actually with tears in their eyes over this, because they could see it was going to put us out of business.

And frankly, I just took the position then, I said, "Lookit, if you come back in a day, I know we're competitive. If you come back in a year, I know we will not be competitive.

"And if you're smart enough to figure out where exactly the point is that you can push us to and still come back and we have a business and you have jobs, I said, you're smarter than I am. So, you know, go home and figure it out."

And they came back in on Thursday, and we became very competitive again. But they could've — I mean, it was out of my hands. I couldn't make them work, and if they decided they were going to stay out long enough, we were not going to have a newspaper.

And that's the kind of situation, occasionally, you find yourself in. And I would say the airline industry is a good example of people — where people find themselves in that position periodically.

Charlie, anything you want —

CHARLIE MUNGER: Well. The shareholders may be interested to know, vis-à-vis competitive advantages in our NetJets program, that the day that other charter plane crashed in Aspen, NetJets refused to fly into Aspen at all. People remember that kind of thing.

WARREN BUFFETT: Yeah.

12. Berkshire's advantages, and one big disadvantage

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: Good morning, gentlemen. David Winters from Mountain Lakes, New Jersey. Thank you for hosting "Woodstock for Capitalists." (Laughter)

Berkshire seems to have an enormous long-term advantage in spite of its large size and high equity prices.

The structure of the company's activities, non-callable capital, substantial free cash flow, and improving insurance fundamentals, permit Berkshire to capitalize on potential asset price declines and dislocations in financial markets, while most investors would not either have the money or the cool minds to buy.

Am I on the right track here?

WARREN BUFFETT: Well I think, in certain ways, you are. But we do have disadvantages, too.

But we have some significant advantages in buying businesses over time. We would be the preferred purchaser, I think, for a reasonable number of private companies and public companies as well.

And we — our checks clear. So we — (laughter) — we will always have the money. People know that when we make a deal, it will get done, and it will get done as fast as anybody can do it. It won't be subject to any kind of second thoughts or financing difficulties.

And we bought, as you know, we bought Johns Manville because the other group had financing difficulties.

People know they will get to run their businesses as they've run them before, if they care about that, and a lot of people do. Others don't.

We have an ownership structure that is probably more stable than any company our size, or anywhere near our size, in the country. And that's attractive to people, so —

And we are under no pressure to do anything dumb. You know, if we do things dumb, it's because we do things dumb. And it's not — but it's not because anybody's making us do it.

So those are significant advantages. And the disadvantage, the biggest disadvantage we have is size.

I mean, it is harder to double the market value of a hundred billion dollar company than a $1 billion company, using our — what we have in our arsenal.

And that isn't — I hope it isn't going to go away. I mean, I hope we don't become a billion dollar company and enjoy all the benefits of those. (Laughter)

And I hope, in fact, we have the agony of becoming, you know, a much larger company.

So, you are on the right track. Whether we can deliver or not is another question. But we go into combat every day armed with those advantages.

Charlie?

CHARLIE MUNGER: Yeah. This is not a hog heaven period for Berkshire. The investment game is getting more and more competitive. And I see no sign that that is going to change.

WARREN BUFFETT: But people will do stupid things in the future. Even — there's no question. I mean, I will guarantee you sometime in the next 20 years that people will do some exceptionally stupid things in equity markets.

And then the question is, you know, are we in a position to do something about that when that happens?

But we do — we continue to prefer to buy businesses, though. That's what we really enjoy.

When Charlie mentioned hog heaven, I thought we ought to open the peanut brittle here, which I recommend heartily. (Laughter)

13. "There is no such thing as growth stocks or value stocks"

WARREN BUFFETT: Zone 3.

AUDIENCE MEMBER: Good morning. Mo Spence (PH) from Waterloo, Nebraska.

You've often stated that value and growth are opposite sides of the same coin.

Would you care to elaborate on that? And do you prefer a growth company that is selling cheap or a value company with moderate or better growth prospects?

WARREN BUFFETT: Well, actually I think you're — you may be misquoting me. But I really said that growth and value, they're indistinguishable. They're part of the same equation. Or really, growth is part of the value equation.

So, our position is that there is no such thing as growth stocks or value stocks, the way Wall Street generally portrays them as being contrasting asset classes.

Growth, usually, is a chance to — growth, usually, is a positive for value, but only when it means that by adding capital now, you add more cash availability later on, at a rate that's considerably higher than the current rate of interest.

So, there is no — we don't — we calculate into any business we buy what we expect to have happen, in terms of the cash that's going to come out of it, or the cash that's going to go into it.

As I mentioned at FlightSafety, we're going to buy $200 million worth of simulators this year. Our depreciation will probably be in the area of $70 million or thereabouts. So we're putting $130 million above depreciation into that business.

Now that can be good or bad. I mean, it's growth. There's no question about it. We'll have a lot more simulators at the end of the year. But whether that's good or bad depends on what we earn on that incremental $130 million over time.

So if you tell me that you own a business that's going to grow to the sky, and isn't that wonderful, I don't know whether it's wonderful or not until I know what the economics are of that growth. How much you have to put in today, and how much you will reap from putting that in today, later on.

And the classic case, again, is the airline business. The airline business has been a growth business ever since, well, you know, Orville [Wright] took off. But the growth has been the worst thing that happened to it.

It's been great for the American public. But growth has been a curse in the airline business because more and more capital has been put into the business at inadequate returns.

Now, growth is wonderful at See's Candy, because it requires relatively little incremental investment to sell more pounds of candy.

So, its — growth, and I've discussed this in some of the annual reports — growth is part of the equation, but anybody that tells you, "You ought to have your money in growth stocks or value stocks," really does not understand investing. Other than that, they're terrific people. (Laughter)

Charlie?

CHARLIE MUNGER: Well, I think it's fair to say that Berkshire, with a very limited headquarters staff — and that staff pretty old — (laughter) — we are especially partial to laying out large sums of money under circumstances where we won't have to be smart again.

In other words, if we buy good businesses run by good people at reasonable prices, there's a good chance that you people will prosper us for many decades without more intelligence at headquarters. And you can say, in a sense, that's growth stock investing.

WARREN BUFFETT: Yeah, if you had asked Wall Street to classify Berkshire since 1965, year-by-year, is this a growth business or a value business — a growth stock or value stock — you know, who knows what they would have said.

But, you know, the real point is that we're trying to put out capital now to get more capital — or money — we're trying to put out cash now to get more cash back later on. And if you do that, the business grows, obviously. And you can call that value or you can call it growth. But they're not two different categories.

And I just cringe when I hear people talk about, "Now it's time to move from growth stocks to value stocks," or something like that, because it just doesn't make any sense.

14. Advice to young people: Invest in yourself

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Hi. My name is Steven Kampf (PH) from Irvine, California. I'm 10 years old and this is my fourth consecutive year here.

WARREN BUFFETT: Terrific.

AUDIENCE MEMBER: How I got —

WARREN BUFFETT: We're glad to have you here.

AUDIENCE MEMBER: Thanks. This is my fourth consecutive year here, and how I got to owning stock is my dad taught me to start my own business. And I bought Berkshire Hathaway stock with my profits.

In school, they don't teach you how to make and save money, not in high school or college. So my question is, how would you propose to educate kids in this area?

WARREN BUFFETT: Well, that's a good question. Sounds to me like — (Applause)

Sounds to me like you could do a good job yourself, too. And, you know, at 10, you're way ahead of me. Unfortunately, I didn't buy my first stock until I was 11, so I got a very slow start. And — (Laughter)

It's, you know, what it takes really is — and you find it in some classrooms and you don't in others — but it takes teachers who can explain the subject. Charlie would say Ben Franklin was the best teacher of all in that respect.

But, you know, it looks like you either got it from your parents — an education on that — and parents can do more education, really, in that respect, even, than teachers.

But it's, you know, I get a chance to talk to students from time to time. And, you know, one of the things I tell them is, you know, what a valuable asset they have themselves.

I mean, I would pay any bright student probably $50,000 for 10 percent of his future earnings the rest of his life. So he's a $500,000 asset just standing there. And what you do with that $500,000 asset, in terms of developing your mind and your talents, is hugely important.

The best investment you can make, at an early age, is in yourself. And it sounds to me like you're doing very well in that respect. I congratulate you on it.

I don't have any great sweeping program for doing it throughout the schools though. We have — here in Nebraska — we have an annual get-together of students from all the high schools throughout the state. And it’s a day or two of economic education. I think it’s a very good program.

But I think if you just keep doing what you’re doing, you may be an example to other students.

Charlie?

CHARLIE MUNGER: Well, I’d like to interject a word of caution. You sound like somebody who’s likely to succeed at what you’re trying to do. And that’s not always a good idea.

If all you succeed in doing in your life is to get early rich from passive holding of little bits of paper, and you get better and better at only that for all your life, it’s a failed life.

Life is more — (applause) — than being shrewd at passive wealth accumulation. (Applause)

WARREN BUFFETT: I think he’s going to do well in both.

15. Internet “was a chance for people to monetize the hopes of others”

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Good morning. My name is Thomas Kamay (PH). I am 11 years old and from Kentfield, California. This is my fourth annual meeting.

Last year, I asked how the internet might affect some of your holdings. Since a lot of the internet companies have gone out of business, how are — has your view of internet changed?

WARREN BUFFETT: Well, that’s a good question. I think that the internet probably looks to most retailers like less of a competitive threat than it did a couple of years ago.

For example, if you look at the jewelers who have been on the internet and, in many cases — in several cases, at least, had very large valuations a couple of years ago, so the world was betting that they would be very effective competitors against brick and mortar jewelry retailers.

I think that that threat has diminished substantially. I think that’s been true in the furniture business. In both of those industries, very prominent dot-coms that had aggregate valuations in the hundreds of millions have vanished in short order.

So I would say that we think the internet is huge opportunity for certain of our businesses. I mean, GEICO continues to grow in a — at a significant rate in internet business.

See’s Candies’ internet business is up 40 percent this year. Last year it was up a much larger percent from the year before, and it grows and it will continue to grow.

So the internet's an opportunity, but I think the idea that you could take almost any business idea and turn it into wealth on the internet — many were turned into wealth by promoting them to the public. But very few have been turned into wealth by actually producing cash results over time.

So I think there's been a significant change in the degree to which I perceive the internet as a possible threat to our retail businesses. There's been no change in the degree to which I regard it as an opportunity for other of our businesses.

Charlie?

CHARLIE MUNGER: Well, Warren, you and I were once engaged in the credit and delivery grocery business. And it was a terrible business. It barely supported one family for a hundred years with all of them working 90 hours a week.

And somebody actually got the idea that was the wave of the future and turned it into a great internet idea. That can only be described as mania. And it sucked in a lot of intelligent people.

WARREN BUFFETT: Yes, Charlie is talking about the infamous Buffett & Son Grocery Store, which did barely support the family for a hundred years. And, only then did we support the family by hiring guys like Charlie for slave wages. (Laughter)

But I used to go out on those delivery trucks, and it was pretty damned inefficient. You know, people would phone their orders in. And now it's true we took them down with a pencil and an order pad instead of punching them into a computer.

But when we started driving around the trucks and hauling the stuff off and everything, you know, we ran into the same costs that Webvan is running into now.

What the internet offered was a chance for people to monetize the hopes of others, in effect. I mean, you are able to capture the greed and dreams of millions of people and turn that into instant cash, in effect, through venture capital and the markets.

And there was a lot of money transferred in the process, from the gullible to the promoters. But there's been very little money created by pure internet businesses so far. It's been a huge trap for the public.

Charlie?

CHARLIE MUNGER: Nothing more.

16. "We don't have a master plan"

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: Thank you for taking my question. My name is Frank Gurvich (PH). I'm from London, Ontario. It's great to see all the young people asking questions. I even have my own 11-year-old here, Matthew, this year.

I first want to start by passing on a message from my wife to you, Mr. Buffett. And that is, "Thank you, Mr. Buffett for your autograph that Frank brought back last year. However, quite frankly, the ring in the Borsheims box you autographed was far more precious."

WARREN BUFFETT: You can repeat that if you'd like. (Laughter)

AUDIENCE MEMBER: My question relates to the future of Berkshire. Back in 1994, there was a PBS video interview of you at the Flagler Business School. And I believe you said Berkshire was not an insurance company.

It appears that's not quite the case as much anymore, and I suppose insurance acquisitions will provide the financial fuel and the stability the Johns Mansvilles and MidAmerica types of acquisitions will need for their future growth.

But I'm hoping that you and Charlie can describe for us an anticipated future look at, say, 20 years out, of how Berkshire might be different and — from how it is today — and perhaps a couple of the not so obvious problems that Berkshire will need to contend with.

And thank you for all the apparently wonderful acquisitions you've made on our behalf in the last year.

WARREN BUFFETT: Well, thank you. I think you ought to take your wife another ring, too. (Laughter) But thank you.

We actually, as long ago as — I don't remember whether it was in the 1980 annual report, but at least 20 years ago, we did say that we thought insurance would be our most significant business over time.

We had no idea that it would get to be as significant as it is. But we've always felt that that was — we would be in many businesses — but that insurance was likely to be our largest business.

Right now, it's not our largest business in terms of employment. It's our largest business in terms of revenue. And we would hope it gets a lot bigger over time. We don't have anything in the works that would make that happen, although we will have natural growth in what we already own.

But we will just keep acquiring things. And sometimes — some years we'll, you know, we'll make a big acquisition. Some years we'll make a few small acquisitions.

We'll do whatever comes down the pike. I mean, if there's a phone call waiting when this meeting is over and it's an interesting acquisition, it'll get done.

We don't have a master plan. We don't — Charlie and I do not sit around and strategize or talk about the future of various industries or do anything of that sort. It just doesn't happen. We don't have any reports. We don't have any staff. We don't have any of that.

We try to look at what comes in — we try to survey the whole financial field. We try to look at what comes in and look for things we understand, where we think they have a durable, competitive advantage, where we like the management, and where the price is sensible.

And, you know, we had no idea two or three years ago, you know, that we would be the 87 percent owner of the largest carpet company — broadloom carpet company — in the world.

You know, we just don't — we don't plan these things. But I would tell you in a general way that 20 or so years from now, we will own a lot more businesses.

I would still think it likely — I mean, I think it's certain that insurance will be a bigger business for us in 20 years than it is now. Probably much bigger. But I think it's — and I think it's also likely it will be our biggest business still. But that could change.

I mean, we could get a deal offered to us tomorrow that, you know, was a 15- or $20 billion deal, and then we've got a lot of money in that industry at that point.

So it's — we have no more master plan now than we had back in 1965 when we bought the textile mill, really.

I mean, we had a lousy business. I didn't realize it was as lousy as it was when I got into it. And we had to, you know, we just had to start trying to deploy capital in an intelligent way.

But we've been deploying capital, you know, since I was 11. And I mean, that's our business and we enjoy it. And we get opportunities to do it. But the bigger you are, the fewer the opportunities you're likely to get.

Charlie?

CHARLIE MUNGER: Well, I think it's almost a sure thing that 20 years from now there'll be way more strength and value behind each Berkshire share. I also think it is an absolutely sure thing that the annual percentage rate of progress will go way down from what it has been in the past.

WARREN BUFFETT: No question about it.

17. Buffett's cholesterol level

WARREN BUFFETT: On that happy note, we move to zone 7. (Laughter)

AUDIENCE MEMBER: Good morning, Mr. Buffett, Mr. Munger. My name is Gary Radstrom (PH) from right here in River City [Omaha]. I've been a shareholder since '93, and have loved every minute of it.

Recently, there's been medication available to reduce cholesterol. My doctor even gave it to me since mine is kind of high.

Every time I hear what you like to eat, Warren, it makes me wonder what your cholesterol level is — (Laughter) — or if you even worry about it. I think everyone here wants you to be with us for a long time, so have you considered taking this new medication to reduce your cholesterol level? (Laughter)

WARREN BUFFETT: I do know the number, and I don't remember it. My doctor tells me, "It's a little high," but if he says it's a little high, it means it isn't that high, or he would — because he always tries to push me into making a few changes in my life.

But he — I've got a wonderful doctor. And I was lucky last year, because I hadn't been in to see him for about five years. And — (laughter) — due to — those guys cost a lot of money, I mean. (Laughter)

And due to purely an accident, a reaction to some other medicine I was given when I was out of the city, he got a hold of me, and then he shamed me into having a physical. And it was extremely lucky, because I had a polyp in the colon that would have probably caused trouble, you know, within a couple of years.

I would say that if you ask my doctor, he would want me to make a few changes, but he would also say that my life expectancy is probably a lot better than the average person of 70.

You know, I have no stress whatsoever. Zero. You know, I mean, I get to do what I love to do every day. You know, and I'm surrounded by people that are terrific. So that problem in life just doesn't exist for me. You know, and I don't smoke or drink or, well, we'll end it right there. (Laughter)

And so, you know, if you were an underwriter for a life company, you would rate me considerably better than the average. You'd rate Charlie better than average, too.

And I'm sure that, you know, I could change it slightly, perhaps, on the probabilities, you know, if I change my diet dramatically or something. But it's very unlikely to happen.

Actually, when my mother got to be 80 — you know, the most important thing in life, in terms of how long you live, is how long your parents live. So I got her an exercise bike when she got to be 80. (Laughter)

She put 40,000 miles on it. And I told her to watch her diet and do all these things. And I mean, she lived to be 92, so you know, she did her share, and I helped her do it by giving her the exercise bicycle. So, I think that improved my odds at that point.

Charlie?

CHARLIE MUNGER: Yeah. I have a book recommendation which will be very helpful to all shareholders that worry about Warren's health and longevity.

And that's this book called "Genome" by Matt Ridley, who was, for years, the science editor of The Economist magazine. And if Ridley is right, Warren has a very long life expectancy.

There are very interesting correlations between people who cause stress to others instead of suffering it themselves. (Laughter and applause)

And Warren has been in that position ever since I've known him. (Laughter)

And the figures that Ridley quotes are awesomely interesting. It is a fabulous book.

Of course, I'm recommending a bestseller, but they're selling it in the airport. It's called "Genome," and you'll feel very good about Warren's future if you agree with the science of the book.

18. Unrealistic investment expectations for pension funds

WARREN BUFFETT: Zone 8.

AUDIENCE MEMBER: My name is Charlie Sink (PH). I'm from North Carolina.

Mr. Buffett, your article last year in Fortune Magazine was excellent.

I'm thinking — well, I'm wondering what your thoughts are on American business profit margins and return on equity in the future. I also would like your thoughts about the — some businesses today with their huge inventory write-offs, what your thoughts about those are.

WARREN BUFFETT: Yeah, well, in that article I talked about the unlikelihood of corporate profits in the United States getting much larger than 6 percent of GDP. And historically, the band has been between 4 and 6 percent. And we've been up at 6 percent recently.

So, unless you think that profits, as a part of the whole country's economic output, are going to become a bigger slice of the pie — and bear in mind, they can only become a bigger slice of the pie if other slices get diminished to some extent, and you're talking about personal income and items like that.

So, I think it's perfectly rational and reasonable that in a capitalistic society the corporate profits are something like 6 percent of GDP.

That does not strike me as outlandish in either direction. It attracts massive amounts of capital, because returns on equity will be very good if you earn that sort of money.

And on the other hand, I think it would be very difficult in the society to get where they'd be 10 percent or 12 percent, or something of the sort because it just — it would look like an unfair division of the pie to the populace.

So, I don't see any reason for corporate profits — they're going to be down in the near future as a percentage of GDP from recently, but then they'll go back up at some point. So I think 10 years from now, you'll be looking at a very similar picture.

Now, if that's your assumption and you're already capitalizing those profits at a pretty good multiple, then you have to say that you have to come to the conclusion that the value of American business will grow at a relationship that's not much greater than the growth in GDP.

And most of you would estimate that probably to be, you know, maybe 5 percent a year, if you expect a couple percent a year of inflation.

So, I wouldn't change my thoughts about the profitability of American business over time. And I wouldn't change my thoughts much about the relationship of stock prices over time to those profits. So, I — you know, I would come down very similarly.

Now, interestingly enough, some of those same relationships prevailed decades ago, but you were buying stocks that were yielding you perhaps 5 percent or something like that, so that you were getting 5 percent in your pocket, plus that growth as you went along.

And of course, now if you buy stocks you get 1 1/2 percent, if you're the American public, before the frictional cost. So that the same rate of growth produces a way smaller aggregate return. And some —

You know, I think stocks are a perfectly decent way to make 6 or 7 percent a year over the next 15 or 20 years. But I think anybody that expects to make 15 percent per year, or expects their broker or investment advisor to make that kind of money, is living in a dream world.

And it's particularly interesting to me that back when the prospects for stocks were far better — I even wrote something about this in the late '70s — pension funds were using investment rate assumptions that were often in the 6 percent or thereabout range.

And now when the prospects are way poorer, most pension funds are using — building into their calculations — returns of 9 percent or better on investments. I don't know how they're going to get 9 percent or better on investments.

But I also know that they change the investment assumption down, it will change the charge to earnings substantially. And they don't want to do that.

So, they continue to use investment assumptions which I think are quite unrealistic. And with companies with a big pension component in their financial situation, and therefore in their income statement, that can be quite significant.

It will be interesting to me to see whether in the next couple years where pension funds are experiencing significant shortfalls from their assumptions, how quickly they change the assumptions.

And the consulting firms are not pushing them to do that at all. It's very interesting. The consulting firms are telling them what they want to hear, which is hardly news to any of us. But it's what's taking place.

The second question about inventory write-offs. You know, that gets into the category entirely of big-bath charges, which are the tendencies of management, when some bad news is coming along, to try and put all the bad news that's happened into a single quarter or a single year — and even to put the bad news that they are worried about happening in the future into that year.

And it's — it leads to real deception in accounting. The SEC has tried to get quite tough on that, but my experience has been that managements that want to do it usually can find some ways to do it.

And managements, frequently, are more conscious of what numbers they want to report than they are of what has actually transpired in a given quarter or a given year.

Charlie?

CHARLIE MUNGER: Yeah, pension fund accounting is drifting into scandal by making these unreasonable investment assumptions. It's — evidently, it's part of the human condition that people extrapolate the recent past.

And so, since returns from common stocks have been high for quite a long period, they extrapolate that they will continue to be very high into the future. And that creates a lot of reported earnings, in terms of pension benefits, that aren't available in cash and are likely not to be available at all.

And this is not a good idea, and it's interesting how few corporate managements have just responded like Sam Goldwyn: "Include me out."

You'd think more people would just say, "This is a scummy way to keep the books, and I will not participate." Instead, everybody just drifts along with the tide, assisted by all these wonderful consultants.

WARREN BUFFETT: Yeah, I don't think — I don't know of any case in the United States right now, and I'm sure there are some, but except for the pension funds that we take over, I don't know of any case where people are reducing their assumed investment return.

Now you'd think if interest rates drifted down several percentage points that that might affect what you would think would be earned with money. It certainly is to bond holders or to us with float or something of the sort.

But most major corporations, I believe, are using an investment return assumption of 9 percent or higher. And that's with long-term governments below 6 percent, you know, and maybe high-grade corporates at 7.

They don't know how to get it in the bond market. They don't know how to get it in the mortgage market. I don't think they know how to get it in the stock market. But it would cause their earnings to go down if they change their investment assumption.

And, like I say, I don't know of a major company that's thinking about it. And I don't know of a major actuarial consultant that's suggesting it to the managements. It just — they'd rather not think about it.

CHARLIE MUNGER: The way they're doing things would be like living right on an earthquake fault that was building up stress every year and projecting that the longer it's been without an earthquake the less likely an earthquake is to occur.

That is a dumb way to write earthquake insurance. (Laughter)

And the current practice is a dumb way to do pension fund planning and accounting.

WARREN BUFFETT: If you talk —

CHARLIE MUNGER: Dumb and improper.

WARREN BUFFETT: If you talk to a management or board of directors about that, you get absolutely no place.

CHARLIE MUNGER: No, they — their eyes would glaze over before the hostility came. (Laughter)

19. Executive Jet won't be a "mature" business "for decades"

WARREN BUFFETT: Area 1.

AUDIENCE MEMBER: Good morning, gentlemen. Marc Rabinov from Melbourne, Australia. I had a question on two of our key operating businesses.

Firstly, Executive Jet. Once this becomes a mature business, would it be fair to say that its net margin should be about 5 percent?

And secondly, would it be fair to say that our current insurance businesses are likely to grow aggregate float at about 10 percent over time?

WARREN BUFFETT: Well, it's really anybody's guess. I mean, I don't expect Executive Jet to become a mature business for decades. I mean, it — there's a whole world out there on that one.

And we have something over 2,000 customers in the United States at the current time. We have a little over a hundred, but in Europe.

But there are tens and tens and tens of thousands, and perhaps hundreds of thousands, of people or businesses where it does make sense over time. So it's going to be long time.

I mean, there are only 700, roughly, jets a year being produced. And of course, up until a few years ago that was limited to people who wanted to buy single planes.

But you won't change that output much in the next five years. But — so, you couldn't really take on —

We can take on about 600 customers a year, just in terms of the delivery schedule that we have built into our business. And we couldn't change that — we couldn't double that — because the planes simply aren't available in the next year or two, although we have orders further out.

But I would say it will be a long time until Executive Jet is a mature business, and I would say that — a long, long time.

I mean, we're going to, when we get Europe — as we make progress in Europe, we'll move to Asia. We'll move to Latin America over time. And so we're going to be, I think, growing that business significantly for a very long time.

When it becomes mature, or close to it, you know, if you're talking 5 percent after-tax margins, I'd say that that's probably a reasonable figure. But we're so far away from even thinking about that, that, you know, it's pure speculation.

20. "There's an unlimited market for dumb insurance policies"

WARREN BUFFETT: In our insurance business, we've grown our float and then we've purchased businesses to add to the float.

This year, I would certainly expect, unless one — a big transaction would fall through or something — I would certainly expect our float to grow at least 2 1/2 billion. And that is close to 10 percent of the beginning of the year float.

That's a rational expectation. But whether it can grow 10 percent a year, you know, how far you can do that — I would say the total float of the property-casualty industry in the United States is — I'm pulling this out from making some other calculations in my head as I talk — but it wouldn't be much more than 300 billion.

So, we are close to 10 percent of the entire U.S. float now, and I don't think the U.S. float — the aggregate float — you know, is going to grow at a 10 percent rate.

So when you're as big a part of the pie as we are, it may be difficult to sustain a 10 percent rate. But we're doing everything possible that makes sense to grow float. I mean, that is a major, major objective. But the even bigger objective is to keep it low-cost.

I don't think you can see — unless the world changes in some way — I don't think you can see 10 percent growth over 25 years. But we'll do our darnedest to get it, you know, at the rate you suggest for at least the near future.

Charlie?

CHARLIE MUNGER: Well, I certainly agree that long term, it's not going to happen. Good, but not that good. (Buffett laughs)

WARREN BUFFETT: But we've been surprised at what's happened. I mean, there's no — I mean, when we bought Jack Ringwalt's company in 1967, you know, my memory is Jack had a float of, you know, less than 15 million.

And would we have ever guessed that we might hit something close to 30 billion this year? We never dreamt of it. But we just kept doing things, and we'll keep doing things.

But it can't be at huge rates for a long period of time, because we're too big a part of the pie now. We were nothing initially, and we kept grabbing a little more of the pie as we've gone along. And we like that, but it can't go on forever.

CHARLIE MUNGER: Yeah. That's what I call really low-cost float. If it ever should be advantageous for us to go into what I would call higher-cost float, that might change the figures upward, in terms of growth of float.

WARREN BUFFETT: Yeah. Although, that won't be — I mean, it could happen that we could take on incrementally some higher-cost float under very special circumstances if we saw unusually good ways to use it, but that — we don't even like to think about that.

We certainly don't want the people running our businesses to think about that. Because keeping it low- cost, you know, that is the big end of the game.

Anybody can generate float. I mean, if we gave our managers a goal of generating 5 billion of float next year, they could do it in a minute, you know, and we would be paying the price for decades to come.

You can write dumb insurance policies, you know. There's an unlimited market for dumb insurance policies. And they're very pleasant, because the first day the premium comes in and that's the last time you see any new money. From then on, it's all going out. And that's not our aim in life.

21. GEICO focusing on U.S. instead of global expansion

WARREN BUFFETT: Zone 2?

AUDIENCE MEMBER: My name is Kjell Hagan (PH). I'm a Norwegian working in Tokyo in Japan.

I'm very satisfied to have more than 95 percent of our family's savings in Berkshire. I have two questions.

In my work, I've seen a lot of insurance companies in Europe and Japan. And I think that GEICO's business model is quite superior to most primary insurance companies in Europe and Japan.

And I think that GEICO would be very successful in Europe and Asia. So I'd like to hear what are the views and plans for GEICO doing business in Europe and Asia.

Second, regarding Coca-Cola — living in Japan, I notice that Coke has a relatively low presence in advertising, although they are the largest player with 30 percent market share versus 15 for the number two. I think Coke is being too cheap on advertising, thus hurting the long-term position.

I wonder if advertising strategy internationally is a high enough priority of Coke's management, and if aggressiveness is sufficient. I'd like to hear if you have any comments on this.

Also I'd just like to thank you very much for this experience and for the wonderful company you have created.

WARREN BUFFETT: Well, thank you very much.

Clearly when you've got a business model that works as well as GEICO has in this country and it continues to work well, and has that fundamental advantage of being a low-cost operator, we think about every possible way that we can take that idea and extend it.

It's been remarkably hard to do it. I mean, the management has tried various things, ever since Leo Goodwin started the company in 1936, to take it into other areas, and those efforts have been modestly successful at certain things like life insurance, but then they got out of it, and various other things.

But it's an idea still. We have — you know, we have 4 percent or so of the market in the United States. This market is so huge. And as we look at the drain on human resources involved in extending it into other countries, and we've looked at it a lot, and it may be something we'll do at some time.

But we've never felt that the possible gain, considering the rigidities of these other — both in Europe and in Asia — of breaking in — it's not easy to get into those markets. And the cost, the time, we just felt that it would be better to concentrate those same resources in this country.

It's not a question of capital at all. I mean, we'd put the money in in a second. And we're doing it in something like NetJets in Europe. I mean, we — there's a human cost to it, there's a financial cost to it.

Financial cost bothers us not at all. Human cost is a real question, because it gets back to Charlie's opportunity cost.

We have talented managers, but we have a finite number of them. And I would rather have Tony Nicely and Bill Roberts and their crew focusing on how to gain additional market share in this country at the right rates than I would starting in a project in Europe or Asia now.

But that's — it's a very good question. It's something I can guarantee you we think about all the time and will continue to think about.

We've tried to extend geography. Coke has been the most successful company in the world in extending geography.

We've tried to do it with See's Candy, and it's had limited — very limited — success. I mean, we've tried 50 different ways, because the trials are relatively cheap to do.

And we think it should work, we just haven't been able to make it work. But that — it's a very good question.

22. Coca-Cola advertising in Japan

WARREN BUFFETT: The question about Coke's advertising in Japan. As you know, Coke has a terrific presence in Japan.

Japan's an interesting market, because the percentage of soft drinks sold through vending machines is just far, far higher than any place in the world. And the United States is a very distant second. And then, the rest of the world, there's very little done in the way of vending machines.

I don't know the specifics of the advertising in Japan, but of course, Doug Daft who now is the CEO of Coke, comes with a huge background in Asia. I mean, that was his territory for much of his career.

And Doug — we have a new major — very major — advertising campaign coming up. And you probably read that Coke is going to spend 300 million-plus additional on marketing beyond the normal spend, which is huge.

And I can't tell you the specific markets in which that will be, but I would be surprised if Japan isn't a big part of it, because Japan is an enormous market for Coca-Cola.

Charlie?

CHARLIE MUNGER: I have nothing to add.

23. Berkshire's asbestos exposure

WARREN BUFFETT: Zone 3, please.

AUDIENCE MEMBER: Hi. My name is Steve Rosenberg (PH). I'm from Ann Arbor, Michigan.

First, I just want to thank both of you for being two phenomenal role models. I've really looked up to you both for a long time.

My first question is about reinsurance. I believe that you're willing to write larger policies in reinsurance than anyone else, but that you still insist on the amount of your liability being capped.

I'm wondering, with your investments in companies with — that have exposure to asbestos, have you somehow capped that? Or is that unlimited, especially given joint and several liability?

My second question involves auto insurance. And I was wondering, does State Farm's structure as a mutual insurance company compensate it — or help it compensate — for having a higher cost structure because, over the long term, it need only remain solvent and not provide an adequate return on capital to its investors?

WARREN BUFFETT: The first question, on asbestos. We have not put any significant money, to our knowledge, in any company that has any asbestos exposure now.

You know, we have a small amount of money in USG, where the subsidiary, United States Gypsum, has a major asbestos exposure. But that's a very, very minor investment. The — and that would be the only one that I can think of.

We've walked away from several deals that were quite attractive in every respect except asbestos. But that's like saying to a 120-year-old, you know, "You're in good health except for the fact that you're dead." (Laughter)

So we don't go near asbestos.

Now, in terms of our retroactive insurance policies, we are taking over the liabilities of companies that have lots of asbestos exposure. And in that case, we assume that those exposure — that those contracts — will be paid in full.

I mean, we make no assumption of any reduction in asbestos costs, but we do cap them.

There's a couple things you can't cap in insurance. You can't cap workers' compensation losses. I mean, they —you can as a reinsurer, but I mean, the primary insurer can't do that.

I believe in auto, for example, in the U.K., that it's uncapped. And I think that nobody thought that was very serious until they had a recent accident that caused — I think it involved a car doing something that — an auto doing something to a train that was unbelievable.

So they — there are a few areas where insurance is written on an uncapped basis. And in our case, we write some auto insurance in the U.K. and we write some workers' compensation, primarily in California.

But generally, in the reinsurance business, you are capping the liabilities you take on.

I mean, obviously, when we bought General Re, they had asbestos liabilities from reinsurance contracts they had written. But the reinsurance companies are pretty careful about writing unlimited policies.

We write huge limits. We're the biggest — you know, if somebody wants to write a huge limit, or an unusual limit, they should call us. Because there's no one else in the world that will act as big or as promptly as we will. But we don't write things that are unlimited.

Now, the interesting thing is that the biggest exposures, in our view, are the people that write a lot of primary business and don't have the catastrophe cover they need.

I mean, if you write 10 percent of all the business in homeowners on — or 15 percent — on Long Island or in Florida, I mean, you are writing a catastrophe cover that would blow your mind.

If you're Freddie Mac or Fannie Mae and you're guaranteeing mortgages, you know, for millions of people in areas like that, and they don't have insurance — earthquake in California or property insurance in Florida — they'd be less likely to have earthquakes someplace — you are taking on enormous risks.

I mean, huge risks, far beyond what we would ever take on. They just — but you don't get paid for them, unfortunately.

I mean, just take the New Madrid section of Missouri, down in the corner. That was the area of three of the greatest quakes, that are sort of related in time, in the — certainly in the recorded history, they were the three greatest quakes in the United States.

You know, how much homeowners' business, how much commercial property business, does somebody have in that huge territory, which you know, supposedly caused church bells to ring in Boston when it happened back in whenever it was — 1807, or '9, or something like that?

So, there are all kinds of risks that can aggregate in huge ways that companies are not thinking about at all.

I mean, I don't know whether Freddie Mac or Fannie Mae, for example, is demanding that all of the homes they insure in the, you know, 300-miles radius of New Madrid, have earthquake insurance.

But, you know, it — that sort of thing never comes to mind until the unthinkable happens. But in insurance, the unthinkable always happens.

24. Praise for State Farm

WARREN BUFFETT: State Farm, as a competitor, is a mutual company, and it has a huge amount of net worth.

You referred to them as a higher-cost — a high-cost operator or higher cost — but they're really a relatively low-cost operator. But they're not anywhere near as low-cost as GEICO. But they're a low-cost operator compared to many people in the insurance business.

And it's certainly true that they do not have the demands for profitability, partly because they've done such a great job in the past and built up so much surplus.

I have nothing but basically good things to say about what State Farm has done over the years.

They do not need — they can subsidize, to some extent, current auto policy holders with the profits that were derived from auto policy holders of the past. But that's always true when a stock company competes with a mutual company. And, you know, we know that when we go in the business.

And that's true of — there are a lot of other mutual companies out there that operate without the demands of earning a high return on capital. But if I were State Farm, I'd, you know, I'd probably be doing what they're doing. I don't criticize them at all.

Charlie?

CHARLIE MUNGER: Well, I don't criticize State Farm, either. State Farm is one of the most interesting business stories in the United States.

The idea that it could get as big as it is and has as good a distribution system as it does, it's a thoroughly admirable company. In fact, Berkshire has bought insurance from State Farm. Not auto insurance. (Laughter)

WARREN BUFFETT: GEICO still has a lower cost structure. I mean, it is a great business operation. And we have invested significantly to build that, because it is so attractive.

And, as I pointed out in the annual report, the incremental investment we made last year did not produce the same results as incremental investments in previous years.

So we are finding it hard to grow the business under current circumstances on a basis that we would like to.

But it's a wonderful business, and it has, you know, it has a business model that I wouldn't, you know, I wouldn't trade for anything.

25. "Nobody's going to catch" NetJets

WARREN BUFFETT: Zone 4?

AUDIENCE MEMBER: Hi, Mr. Buffett, Mr. Munger. My name's Dan Sheehan from Oakville, Canada.

Following up on your discussion about GEICO, you've often talked about their advantages as a direct seller and investor of float.

My question is, how do you control claim costs versus your competitors, other than through good underwriting?

Some may have advantages in terms of economies of scale or cutting corners you won't do. And this might allow them to eliminate some of the advantages you've gained on the other side of the combined ratio.

And my second question is, you've said, "It's hard to be smarter than your dumbest competitor." And along that line, what are your thoughts about a recent Wall Street Journal article about a major airline getting into the fractional jet business? Thank you.

WARREN BUFFETT: I don't worry about the dumbest competitor in a business that's service. The customer will figure that out over time.

And we have a huge advantage in the fractional ownership business. I mean, we have 265 planes flying around now, and you can get one on four hours' notice at any one of 5,500 airports. We have planes in Europe for our American customers. We have planes here for our European customers. And nobody's going to catch us, in my view, in fractional ownership.

And we've had some dumb competitors in the past in that business. And, you know, they bleed. And to the extent, you know, we've got more blood than they have.

26. Buffett on the "trick" of good underwriting

WARREN BUFFETT: In the question of GEICO and underwriting, you know, that — it's a fascinating business because there are — in this audience — there are people with hugely different propensities to have an accident. And of course, most people figure they're better than average.

Now, part of the propensity to have an accident will depend on how many miles you drive. Obviously, somebody who never takes the car out of the garage is — no matter what their driving skills might be — is not going to have an accident.

They drive 10 miles a year, you know, you're pretty safe with almost anybody. But — so there's a relationship to miles driven. But there's a relationship to all kinds of other things.

And the trick, in insurance, is being able to figure out the variables and not have them too many, because you still have to get people to fill out a form, and you don't want something that has practically no significance.

But the trick is to find out what questions you need to ask to determine in which category to place people as to their propensity to have an accident.

Now, in the life insurance business, you know, even Charlie and I figured out that the older you get, the more likely you are to die in a given year.

Now that's not the only factor, but everybody understands that. That the older you are, the mortality risks go up. And they've learned a few other things. They've learned that females live longer than males.

Now that doesn't get into a judgment as to why or anything else. You just know it. So, you build that in if you're pricing the product. And then you know a whole bunch of other things.

You may even know that cholesterol's bad — you know, that makes a difference in terms of predicting mortality.

But in the auto insurance business, there are lots of variables that correlate with the frequency with which a person will have an accident per mile driven.

And the more experience you have with a large body of people whom you've asked a lot of questions about and can draw conclusions there from, the better off you are.

State Farm has got a wonderful body of information. I mean, their actuarial judgments should be better than anybody else's, because they've got more experience with more cars and drivers.

But our experience with close to five million policy holders enables us, I think, to underwrite quite intelligently. But every day, you know, we're looking for some variable that will tell us more.

People with a good credit history are better drivers by a significant margin than people with a lousy credit history.

Why? We don't care too much why, because it wouldn't help. What we really need to know is that the two factors correlate. And we're looking for correlations all the time, and we're trying to avoid spurious correlations, which you can have.

And it's, you know, it's a moving target. You keep working on it all the time. But we're better at it than we were five years ago and we'll be better at it five years from now than we are now.

When we go into a new state, we will have a very small body of policy holders. And some of the factors, obviously, prevail over all states, but there's certain things that you learn, actually, only if you're in a given state for a while.

You know, you're more likely to have an accident if you're a — everything else being equal — if you're an urban driver — city driver in a big city — than if you're driving in an area that's very rural where the density of other cars is very low.

If you're the only guy in the county with a car, you know, you're not going to have a lot of two-car accidents.

So, the underwriting question is all important. And fast, fair settlement of claims is very important, because people who really weren't injured start feeling worse and worse as they talk to more and more lawyers.

So, you know, the claims delivery is a vital part of running a good property-casualty operation. And all I can tell you is, at GEICO, that we think very hard about those things, but we'll be thinking about them tomorrow as well as today.

Charlie?

27. Challenges for United's fractional jet venture

CHARLIE MUNGER: Well, vis-à-vis the fractional jet ownership program, which has been announced for United Airlines, I find that very interesting.

A senior United Airlines pilot now makes about $300,000 a year plus fancy fringes, including pension. And what he does is work a very limited hour — number of hours a month. And about half of that he spends sleeping in a comfortable bunk on long ocean flights.

That is not a culture that will work well in fractional jet ownership. Maybe they think they'll get some advantage in recruiting new pilots or something. I don't know why they're doing it. I would not have done it.

WARREN BUFFETT: Well, they haven't done it yet, either, but the — many of the airlines have organized second companies to take care of commuter flights and all of that.

And, you know, that does produce problems when the pilots of the subsidiaries start comparing their benefits to the pilots, you know, of the parent, and all that. I mean, they try to get lower cost structures by doing that.

But I would guess that if you were wanting to set up a fractional ownership company, that — and you were — you would probably not think about trying to align yourself with somebody that has extremely high costs in other areas.

And the advertising campaign will be kind of interesting, too. You know, "Give up first class travel. Start traveling right," you know, or something. It'll be interesting.

But I would tell you that we have competitors in the fractional ownership business, the two largest being companies that are part of plane manufacturers. And you can understand why they went into it, but it is not an easy business. And we've got the best hand, frankly.

28. Calling it a "hedge fund" doesn't make you any smarter

WARREN BUFFETT: Zone 5?

AUDIENCE MEMBER: Michael Wong (PH), San Diego, California. First of all, I would like to thank both of you.

My question is, when you started your business, why you started an investment partnership instead of a mutual fund?

And also, can you recommend a good book, or books, regarding how to start an investment partnership fund and how to service clients, et cetera?

WARREN BUFFETT: Yeah, I don't know of any books on starting partnerships or hedge funds. Do you know, Charlie?

CHARLIE MUNGER: No, but people seem to manage to create them without the books. (Laughter)

The incentives are awesome.

WARREN BUFFETT: Yes. And the one thing, I mean, it's always interesting to both of us how you get certain things that are fashionable. And people think that by naming something a given name, that somehow that makes everybody smarter or able to make money in it.

I mean, there is no magic to private equity funds, international investing, hedge funds — all of the baloney that gets promoted in Wall Street.

What happens is that certain things become very promotable, usually because there's been recent successes by other people, and that the new entrants extrapolate the successes of a few people in the past to promote new money from people currently.

So, they adopt titles that, you know, that they think will attract money and they — but it doesn't make anybody any smarter if they hang out a shingle in front of their house that says, "hedge fund" or they have a shingle that says "asset allocation firm" or something of the sort. The form doesn't create talent.

I backed into the business. I mean, I'd worked for a mutual fund — closed-end investment company. In fact, there's a fellow here today who's a friend of mine that — the two of us worked there, and we were 40 percent of the whole company because there were three other people, all of whom outranked us considerably. And that firm was Graham-Newman Corp, from 1954 to 1956.

And it was a regulated investment company. It was about $6 million in assets, which seemed like a big deal at the time. And Ben Graham was one of the best known investors in the world, and he had $6 million in his fund.

There was a sister partnership called Newman and Graham, which operated in what would, today, be called "hedge fund style," as far as a partnership split of the profits and so on.

And when I left there in ’56 and I came back here, we had seven people, a couple of whom are here in the room, who said, “Do you want to manage money?” And I said, “Well, here’s what I learned at Graham-Newman,” that Newman and Graham is a better way to do it than Graham-Newman.

So I formed a little partnership, and then I met Charlie a few years later. And he figured, if I was making money doing it, he’d make a lot more. So — (laughter) — he formed one. And that was the carefully calculated strategy of how we both became involved in the partnership business.

Charlie? (Laughs)

CHARLIE MUNGER: Yeah, it is amazing how big the hedge fund industry has become. They have conventions on the subject now. And in the late ’20s, you could take a course on how to run a crooked security pool.

And these things come in great waves. I’m not suggesting the hedge funds are crooked, but I am suggesting that you get these waves of fashion that go to great extremes. The amount of money, what is it now, Warren, in hedge funds?

WARREN BUFFETT: It’s very big, although it’s a little less in a few quarters than it used to be. (Laughs)

But I would be willing to put a lot of money up that if you take the aggregate experience of all the hedge funds — as starting right today and going for the next 15 years — I would bet a lot of money it will not hit 10 percent, in terms of return to partners. And I would, if you push me, I would bet at a lower figure than that.

CHARLIE MUNGER: Then you have Bernie Cornfeld’s idea, the Fund of Funds. There are people who want to get paid for selecting hedge funds for other people. And that didn’t work very well for Bernie Cornfeld.

WARREN BUFFETT: Well, it worked pretty well for Bernie for a while, but it didn’t work so well for his investors, actually. (Laughter)

Yeah. That result was probably something Bernie had in mind at the start maybe.

29. Investing small amounts allows bigger opportunities

WARREN BUFFETT: Zone 6.

AUDIENCE MEMBER: I’m Michael Zenga from Danvers, Massachusetts. That’s a town whose band Mr. Buffett so generously sent to the Rose Bowl parade last year, so you’re a very popular guy in my town.

Good morning, Mr. Buffett and Mr. Munger.

Mr. Buffett, I wanted to ask you this question last week when I ran into you after Gillette's annual meeting, but I choked. So now that there's no pressure, here goes. (Laughter)

In the years from — from my reading — in the years from 1956 through '69, you achieved the best results of your career quantitatively. Twenty-nine percent annually against only 7 percent for the Dow.

Your approach then was different than now. You looked for lots of undervalued stocks with less attention to competitive advantage or favorable economics and sold them rather quickly.

As your capital base grew, you switched your approach to buying undervalued excellent companies with favorable long-term economics.

My question is, if you were investing a small sum today, which approach would you use?

WARREN BUFFETT: Well, I would use the approach that I think I'm using now of trying to search out businesses that — where I think they're selling at the lowest price relative to the discounted cash they would produce in the future.

But if I were working with a small amount of money, the universe would be huge compared to the universe of possible ideas I work with now.

You mentioned that '56 to '69 was the best period. Actually, my best period was before that. It was from right after I met Ben Graham in 19 — early 1951 — but from the end of 1950 through the next 10 years, actually, returns averaged about 50 percent a year. And I think they were 37 points better than the Dow per year, something like that. But that — I was working with a tiny, tiny, tiny amount of money.

And so, I would pour through volumes of businesses and I would find one or two that I could put $10,000 into or $15,000 into that just were — they were ridiculously cheap. And obviously, as the money increased, the universe of possible ideas started shrinking dramatically.

The times were also better for doing it in that time.

But I think that, if you're working with a small amount of money, with exactly the same background that Charlie and I have, and same ideas, same whatever ability we have — you know, I think you can make very significant sums.

But you — but as soon as you start getting the money up into the millions — many millions — the curve on expectable results falls off just dramatically. But that's the nature of it.

You've got to — you know, when you get up to things you could put millions of dollars into, you've got a lot of competition looking at that. And they're not looking as I did when I started. When I started, I went through the pages of the manuals page by page.

I mean, I probably went through 20,000 pages in the Moody's industrial, transportation, banks and finance manuals. And I did it twice. And I actually, you know, looked at every business. I didn't look very hard at some.

Well, that's not a practical way to invest tens or hundreds of millions of dollars. So I would say, if you're working with a small sum of money and you're really interested in the business and willing to do the work, you can — you will find something.

There's no question about it in my mind. You will find some things that promise very large returns compared to what we will be able to deliver with large sums of money.

Charlie?

CHARLIE MUNGER: Well, yeah, I think that's right. A brilliant man who can't get any money from other people, and is working with a very small sum, probably should work in very obscure stocks searching out unusual mispriced opportunities.

But, you know, you could — it's such a small world. It may be a way for one person to come up, but it's a long slog.

30. Promotion, not performance, is Wall Street's biggest money maker

WARREN BUFFETT: Yeah, most smart people, unfortunately, in Wall Street figure that they can make a lot more money a lot easier just by, one way or another, you know, getting an override on other people's money or delivering services in some way that people —

And the monetization of hope and greed, you know, is a way to make a huge amount of money. And right now, it's very — just take hedge funds.

I mean, it's — I've had calls from a couple of friends in the last month that don't know anything about investing money. They've been unsuccessful and everything else. And, you know, one of them called me the other day and said, "Well, I'm forming a small hedge fund." A hundred and twenty-five million he was talking about.

Like, the thought that since it was only 125 million, maybe we ought to put in 10 million or something of the sort.

I mean, if you looked at this fellow's Schedule D on his 1040 for the last 20 years, you know, you'd think he ought to be mowing lawns. (Laughter)

But he may get his 125 million. I mean, you know, it's just astounding to me how willing people are, during a bull market, just to toss money around, because, you know, they think it's easy.

And of course, that's what they felt about internet stocks a few years ago. They'll think it about something else next year, too.

But the biggest money made, you know, in Wall Street in recent years, has not been made by great performance, but it's been made by great promotion, basically.

Charlie, do you have anything?

CHARLIE MUNGER: Well, I would state it even more strongly. I think the current scene is obscene. I think there's too much mania. There's too much chasing after easy money. There's too much misleading sales material about investments. There's too much on the television emphasizing speculation in stocks.

31. Powerful forces don't want to expense stock options

WARREN BUFFETT: Zone 7.

AUDIENCE MEMBER: Robert Piton from Chicago. The Honorable Warren Buffett and the Honorable Charlie Munger, I felt it would be appropriate to address you both in a manner that reflects the tremendous amount of value that the two of you have been instrumental in unleashing for your shareholders, your employees, and the good of society. (Applause)

The area that I'd like to inquire about is stock options. As you are aware and have written about in the past reports, companies have been taking advantage of, and contributing to, FASB's inadequate rules regarding stock options.

In particular, the lack of having to expense them on the income statement and the lack of having to report them as a liability on the balance sheet.

My question is, are either one of you doing anything to help FASB's current stance on the issue?

If not, have either one of you ever considered establishing a, quote, "real," end quote, independent body of accountants that would actually try to make companies produce accounting statements that reflect economic reality?

WARREN BUFFETT: Charlie, I'll let you. You have the history on it.

CHARLIE MUNGER: Well, we don't like the accounting, which we've called "corrupt," or at least I have. And I don't think that's too strong a word. I think it's corrupt to have false accounting because you like a certain outcome better than another.

All that said, I don't think either of us spends a lot of time fighting with FASB or trying to create a better one.

It's like splitting your lance against stone or something. You can get a lot of back pressure from the butt of the lance. And we can't be expected to cure all the ills of the world.

WARREN BUFFETT: We've written about it and talked about it. Obviously, you've picked up on it. And when it was an active issue whenever it was, about, I don't know, four years ago or so, Senator [Carl] Levin of Michigan was one of those who felt as we did. And, of course, FASB felt as we did.

But the pressure was incredible that American business brought on, on Congress. They weren't getting — they tried to put pressure on FASB and they weren't getting a result, so they just said, "Well, we're not going to let FASB set the accounting rules, we'll have Congress set the accounting rules."

And I thought that was a bad idea, per se, but I thought in this — and, but they got plenty of supporters. Got a huge number of supporters. I mean, they —

And at the time, I compared it, I think — there was a bill introduced in the Indiana legislature in the 1890s, I believe. And the bill was to change the value of the mathematical term "pi" to three even, instead of 3.1415... (Laughter)

And the legislator who introduced it said that it was too difficult for the school children of Indiana to work with this terribly long, unending term. And it would be so much easier if pi was just three. And he thought they ought to enact that.

Well, I thought that was quite rational compared to, you know, what the Congress of the United States was going to do in telling people that, since it — one of the arguments was that, "It makes it very tough for startup companies if they have to expense this."

Well, it makes tough if they have to pay their electricity bill, too. But, I mean, but those were the kind of arguments you got.

And my memory is, Charlie is better on this than I am probably, but I think the accounting firms 40 years ago or 50 years ago were in accord with our position.

But every client would put pressure on, you know, and they don't want to report expenses. They particularly don't want to report expenses that are paid to them, and that could be huge, and that might prove obnoxious if recorded by conventional accounting. But if it's sort of lost in a table in the proxy statement, people don't pay much attention.

So, the only way it will get changed — we wrote about it and I even talked to a few senators at the time — the only way it will get changed is — and this is the only way corporate governance problems generally will get changed — if 15 or 20 large institutional investors would band together in some way on this.

But some of them have the same problem because they're getting paid extraordinary sums for doing something that, you know, is really not adding that much value.

So, they're not really inclined to call attention, in many cases, to what Charlie would refer to as "obscenities" in other people's compensation.

So, I think it's going to go on. I mean, it's a fascinating subject. But the institutional investors seem to focus very much on matters of form and not substance.

I mean, you get a lot of — they, you know, they cluck a lot about little things that don't have anything to do with their economic return over time, whereas on stock options they're something that's terribly important. They're the ones that are paying the costs, and the costs are there whether they get recorded or not.

But American management will not change its position on that voluntarily. Consultants will never change their position. They're getting paid to encourage people to look at other companies, and it just keeps ratcheting up. So, I don't think you're going to see change unless institutional investors do it.

As I say, I get these questionnaires, you know, about the composition of the board or a nominating committee. None of that makes any difference in terms of how a business performs.

I got one form that said they wanted a list of directors broken down by sex. And I said, "None that I know of." (Laughter)

But it just is not germane.

Charlie?

CHARLIE MUNGER: Well, I can't top that one. (Laughter)

32. No company should predict 15 percent annual growth

WARREN BUFFETT: Zone 8, please.

AUDIENCE MEMBER: Steve Casbell (PH) from Atlanta.

My question concerns Gillette. Do you think their goal of trying to grow earnings at 15-plus percent kind of got them into their current inventory problems at the trade?

And as well, the Duracell acquisition. I know at the time, neither one of you were the biggest fans of the deal. I just want to know how you feel about it now.

WARREN BUFFETT: Well, I would say it's a mistake. And I've said it. I think it's a mistake for any company to predict 15 percent a year growth. But plenty of them do.

For one thing, you know, unless the U.S. economy grows at 15 percent a year, eventually any 15 percent number catches up with you. It just, it doesn't make sense.

Very, very few large companies can compound their earnings at 15 percent. It isn't going to happen.

You can look at the Fortune 500, and if you want to pick 10 names on there that will compound their growth from — other than some extraordinarily depressed year, I mean, if they had a year where they just broke even so the number's practically zero.

But if you pick any company on there that currently has record earnings, and you want to pick out 10 of them that over the next 20 years will average 15 percent or greater, I will, you know, I will bet you that more than half of your list will not make it.

So, I think it's a mistake, and as I've said in the annual report, I think it leads people to stretch on accounting. I think it tends to make them change trade practices.

And you know, I'm not singling out Gillette in the least, but I can tell you that if you look at the companies that have done it, you will find plenty of examples of people who have made those sort of mistakes.

And I think that, in connection with Duracell — I mean, obviously, Duracell has not turned out the way that the management of Gillette, at the time, hoped that it was going to do. And the investment bankers who came in and made the presentations, those presentations would look pretty silly now.

Charlie?

CHARLIE MUNGER: I think that kind of stuff happens all the time. It will continue to happen. It's just built into the system.

I see more predictions of future earnings growth at a high rate, not less. I mean, a few people have sort of taken an abstinence pledge, but it's very few. It's what the analysts want to hear.

WARREN BUFFETT: It's what the investor relations departments want the managements to say. It makes their life easier, you know. But they don't have to be there five years from now or 10 years from now doing the same thing. It's —

If we predicted 15 percent from Berkshire, you know, 15 percent means that — assuming the same multiples — I mean, that means in five years, 200 billion. In 10 years, 400 billion. You know, 15 years, 800 billion. A trillion-six in 20 years. And the values get to be crazy.

And you know, if you have a business with a market value of 4- or 500 billion — and you had a few of those not so long ago — just think of what it takes to deliver, in the way of future cash, at a 15 percent discount rate to justify that.

If you've got a business that's delivering you no cash today and it's selling for $500 billion, you know, to give you 15 percent on your money, it would have to be giving you 75 billion this year.

But if it doesn't give you 75 billion this year, you know, it has to be giving you 86 and a quarter billion next year. And if it doesn't do it next year, it has to be giving you almost a hundred billion in the third year.

It just — those numbers are staggering. I mean, the implications involved in certain market valuations really, you know, belong in "Gulliver's Travels" or something. But people take them very seriously.

I mean, people were valuing businesses at $500 billion a year, a year-and-a-half ago, and there's just no mathematical — almost no mathematical calculation you could make that would — if you demanded something like 15 percent on your money — there's almost no mathematical calculation you could make that would — could possibly lead you to justify those valuations.

Charlie, have any more?

CHARLIE MUNGER: You know, I said on another occasion that, to some extent, stocks sell like Rembrandts. They don't sell based on the value that people are going to get from looking at the picture.

They sell based on the fact that Rembrandts have gone up in value in the past. And when you get that kind of valuation in the stocks, some crazy things can happen.

Bonds are way more rational, because nobody can believe that a bond paying a fixed rate of modest interest can go to the sky, but with stocks they behave partly like Rembrandts.

And I said, suppose you filled every pension fund in America with nothing but Rembrandts? Of course, Rembrandts would keep going up and up as people bought more and more Rembrandts, or pieces of Rembrandts, at higher and higher prices.

I said, "Wouldn't that create a hell of a mess after 20 years of buying Rembrandts?" And to the extent that stock prices generally become sort of irrational, isn't it sort of like filling half the pension funds with Rembrandts? I think those are good questions.

WARREN BUFFETT: Once it gets going, though, people have an enormous interest in pushing Rembrandts. I mean, it creates its own constituency.

33. "It's stupid the way people are extrapolating the past"

WARREN BUFFETT: Zone 1?

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, my name is Joe Schulman (PH). I'm a shareholder from Oxford, Maryland. Thank you for a wonderful meeting.

In order for Berkshire to have an opportunity to hopefully grow its earnings by about 15 percent per year, if we can do that, at least for the next few years, it's obvious that because of the redeployment of earnings and float, the existing businesses do not need to grow at 15 percent.

At what rate would you expect the existing businesses to grow to achieve an aggregate rate close to what I'm describing? And what do you think the probability is of achieving that?

WARREN BUFFETT: Yes. Well, I think the probability of us achieving 15 percent growth in earnings over an extended period of years is so close to zero, it's not worth calculating.

I mean, we'll do our best, and we have a lot of fun doing it. So it is not something where we have to come down and do things that are boring to us or anything of the sort.

I mean, our inclination is to — very much — to do everything we can, legitimately, to add to Berkshire's earnings in things we can understand. But it can't happen, over time. You know, we will have years when we do it, but —

And you're quite correct in pointing out we don't need to do it from the present businesses — we will add things all the time — any more than we needed to do it from the current business back in 1965 with the textile business.

I mean, we have to improvise as we go along. And we will. And the businesses we have are good businesses, in aggregate. They will do well.

They won't do anything like 15 percent growth per annum, but we will take a good rate of progress from those businesses, and we will superimpose upon that acquisitions which will add to that.

But we can't do 15 over a period of time, and — nor, incidentally, do we think any large company in the United States is likely to do.

There will be a couple that do it for a long period of time, but to predict which of the Fortune 500 will end up being the one or two or three, would be very hard to do.

And it won't be more than a couple out of 500, if you take large companies not working from a deflated base year.

I think our method is a pretty good one. I mean, I think the idea of having a group of good businesses to throw off cash in aggregate, in a big way, that themselves grow, that are run by terrific people, and then adding onto those, sometimes at a slow rate, but every now and then at a good clip, more businesses of the same kind, and not increasing the outstanding shares, I think that's about as good a business model as you can have for a company our size. But what it produces, we'll have to see.

Charlie?

CHARLIE MUNGER: I certainly agree that the chances of this 15 percent per annum progress extrapolated way forward is virtually impossible. I think, generally, the shareholding class in America should reduce its expectations a lot.

WARREN BUFFETT: Including the pension funds.

CHARLIE MUNGER: Yeah, including the pension funds, you bet.

It's stupid the way people are extrapolating the past. Not slightly stupid, massively stupid. (Laughter)

WARREN BUFFETT: And this is a message, incidentally, if you think about it. I mean, nobody has any interest in saying this — a financial interest in saying it — whereas people have all kinds of financial interest in saying just the opposite.

I mean, so you do not get an information flow — if you listen to the financial world or read the financial press — you do not get an information flow that is balanced in any way, in terms of looking at the problem, because the money is in believing something different.

And money is what, you know, it's what causes people to become prominent, or it flows from becoming prominent in the investment world in terms of whether you go on television shows, or whether you manage money, or are trying to attract it through funds, or whatever it may be.

I don't think if you were an actuarial consultant and you insisted that the companies that you gave your actuarial report to use a 6 percent investment rate, I don't think you'd have a client.

So, it's almost impossible for the advisors, in effect, in my view, to be intellectually honest on it. Don't you think so, Charlie?

CHARLIE MUNGER: Yeah. There was a very smart — there is a very smart investment advisor in my town, and he said that, "Years ago, some risk arbitrage firm would tell his clients, 'We know how to make 15 percent per annum year in and year out.'"

And he said, “Years ago, everybody said, ‘That’s impossible.’” He says, “Now in this climate, they say, ‘So what?’” You know, who’s interested in a lousy 15 percent?

WARREN BUFFETT: And it was easier in the earlier climate, obviously, because the money hadn’t been attracted into it.

CHARLIE MUNGER: Generally speaking, there’s more felicity to be gained by — from reducing expectations than in any other way. It is simply crazy for this group to have very high expectations. Moderate expectations will do fine for all of us.

34. No comment on USG investment

WARREN BUFFETT: OK. We’ll take one more before we go — we break for lunch. We’ll go to number 2.

AUDIENCE MEMBER: Good morning. My name is Ken Goldberg from Sharon, Massachusetts.

A few questions ago, you mentioned the company’s investment in USG. I was wondering how the company — how you got comfortable with that as an investment, in light of the asbestos exposure?

Do you view the company — the stock — as cheap enough and the asbestos exposure as manageable enough over time, so that the investment is justified?

Or do you view it as, in a worst-case scenario, if the subsidiary with asbestos exposure blows up, the rest of the solid businesses are insulated from that and are alone worth the price of the investment?

CHARLIE MUNGER: Let me answer that. I don’t think we want to comment. (Buffett laughs)

WARREN BUFFETT: Yeah. It’s one-tenth of one percent of Berkshire, roughly. I mean, but as Charlie says, that gets too close to giving stock advice.

But I will tell you their asbestos problems are serious, and they would be the first to tell you that.

Afternoon Session - 2001 Meeting

1. "Insurance float has been a huge asset to Berkshire"

WARREN BUFFETT: OK.

I hope you've all had a cholesterol free lunch. And — (laughter) — we will move on. And when we stopped, we were about to go to zone 3.

AUDIENCE MEMBER: Hi, my name is Jason Tank from Traverse City, Michigan.

I've got one kind of quick question that I'm sure you can answer relatively quickly, if you're not interested.

I know that Walter Scott's on the board of directors and he's also on the board of directors of a company called Level 3 Communications that is in an industry that's — well, there's been a lot of change happening and stock prices have been plummeting. I wonder if you've ever —

You've probably spoken to him at great length about the economics of that business. And have you ever expressed any interest that business, especially at the prices today?

That's the first question. The second question is — if you look at Berkshire Hathaway as a portfolio, you've got wholly owned subsidiaries as operating businesses, marketable securities, common stocks and bonds. If you strip out — and if my premise is wrong, just please tell me.

If you strip out the leverage effect of the cost of the float being, you know, nearly zero or negative throughout the years — if you look at the portfolio minus that leverage piece, how fast do you think your book value would've grown over the last 30-plus years? Are we talking about 5 percent or 6 percent due to just the leverage piece on the insurance float?

WARREN BUFFETT: I don't think it would run as much as 5 or 6 percentage points, but the float has been very useful to us. And actually, I've never made the calculation.

So you could well be correct that if it was 5 or 6 points, that would be a quarter of our book value gain over the years being attributable to insurance float.

And I think that's probably maybe on the high side but — and you can't make it —

We don't look at insurance float 100 percent the same as we would look at equity, but we've looked at it a good bit, you know. It's largely tantamount to equity because we've had so much equity, we could afford to do it that way. So I — you'll have to make that calculation yourself.

We think insurance float has been a huge asset to Berkshire. We think it'll continue to be a huge asset. And we look for every way possible to increase the amount of low-cost float.

On a small scale, we added US Liability last year, an excess surplus lines carrier based in Philadelphia. And so far, that's working out extremely well. Got a terrific guy running it. And, you know, in a small way, we add float there. I just looked at the first quarter on it, and we had a significant underwriting profit and we had float added. And, you know, that's the best of all worlds.

So we'll keep working on it, and it will add — it's a big asset that Berkshire has that a great many companies — I mean, virtually no other company has it to the degree that we have that also invests in other businesses and uses it as a source of money to invest in other businesses.

The question about Level 3, I obviously can't answer. I just — I can tell you that you have two enormously smart and high-grade guys in Walter Scott and Jim Crowe in that business. But it's not a business I know a lot about. And if I did, I wouldn't talk about it.

Charlie?

CHARLIE MUNGER: I cannot talk just as well as you can. (Laughter)

WARREN BUFFETT: Not always. (Laughter)

2. Accounting "shenanigans" and "gamesmanship"

WARREN BUFFETT: OK. Section 4.

AUDIENCE MEMBER: John Golob from Kansas City.

I have a follow-up question to your comments about how financial statements can be distorted by making over-optimistic assumptions about returns for the pension portfolio.

If you believe accounting statements, as published in annual reports, returns on equity for U.S. businesses are amazingly high — higher than in Europe, higher than they've been historically, higher than Japan.

Are these highs, do you think, completely attributable to accounting shenanigans? Or are there any fundamental reasons in addition that might make returns in the U.S. higher than in Europe or higher than they've been historically?

WARREN BUFFETT: Well, I would say that they certainly — to the extent that American returns have been higher than those around the world, at least in developed countries, I would say that they are not solely due at all to accounting shenanigans.

I think that the absence of honest accounting for option costs and — has been a factor. But American business has done very well, excluding — very well — excluding any accounting activities that Charlie and I might differ with.

You know, I'm no expert on exactly what returns have been around the world in developed countries, but my impression definitely is that American business is well above averaged — average — for the developed world, in terms of profitability.

And, you know, I don't have the answers as to why that's occurred. I think that American business, and I think the whole American system, has reflected more of a meritocracy than exists in many countries.

And I think that a meritocracy works best. I think — and I think that mobility between classes, which is the flip side of a meritocracy, you know, does tend to get the Jack Welches into positions of — whether they run a General Electric or an Andy Grove or an Intel or, you know, go with Sam Walton at Walmart.

I think if you'd taken those same individuals and dropped them down in most countries, they would've done very well. But I don't think they would've done quite as well as here. And I think that what they have done well has spilled over, in a big way, to benefit the American economy.

So I would not lay it all on the accounting shenanigans.

And the pension funds accounting, that applies very heavily at some companies. And, of course, most newer companies don't have pensions.

Companies that have started in the last 20 or 30 years are much more inclined to have various kinds of profit sharing or 401(k)s.

The older industries that took on pensions spurred, to a great degree, I think, by World War II, when you got excess profits taxes that ran to 90 percent. And there was a huge incentive to start pension plans and fund them heavily because the government, in effect, was funding 90 percent of your pension obligation.

So there was a great boon — boom period in the inauguration of pension funds. And, of course, that meant steel and auto and all of those big industries of that time.

Charlie?

CHARLIE MUNGER: Yeah. It isn't so much accounting shenanigans as it is deliberate financial practice. Take General Electric.

There's been a deliberate increase in financial leverage, which was made possible by the wonderful and deserved reputation. There's been a deliberate increase in repurchase of stock, which General Electric has done even when they're paying huge multiples of book value.

That sort of thing does wonders for returns on equity as reported, as does the process of writing off everything in sight and various extraordinary charges, removing the burden of past costs from future earnings.

You put all those things together, and American returns on equity are higher partly because the management has deliberately set out to paint the company as unusually efficient in its use of capital, meaning that it earns a high return on shareholders' equity.

Think of how high we could drive our return on equity at Berkshire. I mean, we could make it almost any number you want if we just used enough leverage.

WARREN BUFFETT: Yeah, we could run it with no (inaudible).

CHARLIE MUNGER: We could run Berkshire with no equity. And then people could say, "Gosh, these guys have finally learned how to manage the damn thing." (Laughter)

It's not been an objective around here to reduce the equity to zero. But at other places, in order to make the reported return on equity good, they deliberately pound on the net worth as much as they can.

WARREN BUFFETT: Yeah. The questioner may have seen — if you look at the S&P figures of the last 15 years, they report them both before special charges and after special charges. And there's been a very significant difference between those two figures.

American business likes to frequently write off things and say that doesn't count. And, of course, that takes the equity down. And it actually frequently benefits future earnings because you remove costs that would otherwise hit the income statement in future years.

CHARLIE MUNGER: The truth of the matter is you have — part of this is shrewd and correct management of the companies' financial structure and operations. And part of it can drift into gamesmanship.

3. Save money in your teen years and be very curious

WARREN BUFFETT: Region 5.

AUDIENCE MEMBER: Hi, Mr. Buffett. My name is Mallory Marshall (PH). I am 11 years old and I am from Kearney, Nebraska. I have 2 questions.

First, my dad would like to know if you have any grandsons my age. (Laughter)

WARREN BUFFETT: Any what her age?

CHARLIE MUNGER: She wants to know if you have any grandsons her age.

WARREN BUFFETT: How many shares of stock do you have? And I'll tell you. (Laughter)

AUDIENCE MEMBER: Also, what investment advice do you have for young people of my generation?

WARREN BUFFETT: Yeah. Well, I've got a grandson fairly close to your age and he probably would go for a younger woman anyway, so — (laughter) — I will mention him to you. Mention you to him.

The — well, if you're interested in financial matters, A, you've got to have something to work with. I mean, I was fortunate in that respect because my dad paid for my education. If he hadn't, I probably wouldn't have become educated if I had to pay for it myself, but —

So I was able to save $10,000 by the time I was 21. And, you know, that was a huge, huge head start. If I hadn't have been able to do that and, you know, my first child came along when I was 22.

So it's much easier to save in those teenage years if you're lucky enough to be in a family where you don't have — where your parents are taking care of your financial obligations. Every dollar then is, you know, worth making $10 or $20 later on.

And, so if you are interested in financial matters, getting a stake early is very useful, and getting knowledge early is very useful.

So, you know, I would say you're well on the way if, at 11, you're even interested in coming to a meeting like this.

And I would — if that interest is maintained, you know, I would read financial publications. I would read whatever was of interest to me. I'd be curious about how the businesses around the town of Kearney operated.

I would — to the extent that you can get people to talk to you — and people usually like to talk, you know — learn about who's got good businesses in Kearney and why they're good businesses. And learn about the businesses that went out of business and why they went out of business.

And just keep accumulating knowledge. That's one of the beauties of the business that Charlie and I are in, is that everything is cumulative. The stuff I learned when I was 20 is useful today. Not in necessarily the same way and not necessarily every day. But it's useful.

So you're building a database in your mind that is going to pay off over time. But you have to have a little money to work with. So there's nothing like getting a few dollars ahead. Stay away from credit cards. And you can have a lot of fun, if your mind goes along that track as you get older.

Charlie?

CHARLIE MUNGER: Well, I'm glad to see somebody that has, so early, shown an interest in getting ahead. There's nothing wrong with getting ahead. (Laughter)

WARREN BUFFETT: And actually, she may have the best idea about getting ahead by learning the name of my grandson, too. (Laughter)

CHARLIE MUNGER: Well, there, I can give the young lady some advice. Before your feelings totally take over, you should look carefully at both parents and all four grandparents. (Laughter)

WARREN BUFFETT: Write Charlie and let us know how it works out. (Laughter)

4. GEICO policy retention rates

WARREN BUFFETT: Area 6.

AUDIENCE MEMBER: I'm Jack Hurst (PH), Philadelphia, Pennsylvania. Three notes of thanks. First, for American Express for the terrific job they've done the last three times in scheduling reservations for me.

The second is thanks for the care you take with your annual report. There is nothing more accessible than the statistics in that report, and the text is just absolutely marvelous.

The third one is the care and feeding you give to troubled businesses like World Book, which I'm glad has survived, and Dexter Shoes.

They're closing the plant in Milo, Maine, which is advantageous for the shareholders. But they gave the people enough time that, because of the additional — Jackson Labs expanded, they're hiring, and Fidelity brought 6,000 jobs into the area. So those people will have better chance for jobs than they had to — if they were kicked out right away.

The second point is a question about GEICO. You have a wonderful table in your annual report showing the number of policies issued and the policies in force at the end of each year, for the last seven or eight years.

In general, at the end of one year, the policies in force are equal to 95 percent of the policies in force at the beginning of the year, plus 60 percent of those that have been issued in the year.

And that's been constant, up until this last year, when the amount in force at the end of 2000 is 24 percent of the policies issued in 2000 and 95 percent of those that were in force at the end of 1999.

I'm curious if Mr. Nicely has asked, first, "Why is there such a large difference in lapse between the first year policies and the renewal policies?" and, "Why is there such a discontinuity in the year 2000?"

WARREN BUFFETT: The — I'll answer the last one first, about GEICO. The retention rate is affected overwhelmingly by two factors.

One is the mix between the below-standard business, the standard business, and the better business, in terms of risk. In other words, we have — just making a calculation here — we have 75 percent or so of our business, plus, in the preferred category.

But we have grown faster up till the last year or so — in the last three or four years before that — up till the last year in the standard and the non-standard business. Those latter two categories have far greater lapse — or non-retention ratios — or lapse ratios — than the preferred business.

They're two different businesses almost. So any change in the mix between preferred and the other two categories will change the aggregate retention ratio very substantially.

The second thing is that the first year has a much higher retention — lapse ratio — than the second year of a policy. And, in turn, than the third, and so on.

In other words, if you get to preferred business that's been with you five or more years, you have a very, very high retention ratio.

In the last few years, we've added more new business than we were adding in the years before that. So we have had a higher percentage of new business and we've had a higher percentage of non-preferred business, both of which would make the aggregate lapse ratio look higher, even though the lapse ratio, when categorized by class of business and age of business, really hadn't changed very much.

Now, it's true, however, our retention ratio in the preferred business has fallen by a point or so.

But that's the big difference. And now, unfortunately, you know, our new business is not as strong. So you'll actually see, and — but, our preferred business is running stronger than our standard and non-standard.

So you are seeing the mix go back in the other direction, right now. I mean, currently, that's going on.

Through right to date this year, our preferred business is up in aggregate policy holders. And our standard and non-standard is down.

So what you've deduced from those figures reflects changes in mix and age of business far more than it does retention ratio, although there was a minor change in the retention ratio. And that will be true. And maybe I should explain that better in the annual reports in the future.

I touched on it once a year ago, but we can make that clearer in future reports.

What you said about the American Express people, I echo. I mean, they have just done a fabulous job with people.

We sort of turned the problem over to them of how people get here and where they stay and all of that. And we've had wonderful help from the local American Express office.

And frankly, they've been so good, we don't even think about it. We just refer people on to American Express. And I congratulate them for the job they've done. Thank you. (Applause)

5. "True synergy" between General Re and Berkshire's reinsurance operations

WARREN BUFFETT: Area 7, please.

AUDIENCE MEMBER: I'm Chip Mann (PH) from Minneapolis, Minnesota. Thanks again for this open format and your direct answers to our questions.

You've talked a bit about the super-cat class level of risk that you write. Could you share your thoughts about expanding the competitive advantage and the scale advantages at General Re, referring more to their traditional or historical franchise and the type of contracts they would write?

WARREN BUFFETT: Yeah. General Re was a — is a — and General Re and Cologne are a very different operation than the historical reinsurance business of National Indemnity.

National Indemnity had nothing like their distribution system. And they have a — and a knowledge base for a whole different form of reinsurance than we could ever accumulate at National Indemnity.

General Re did not — nor Cologne — did not take —retain — as much risk as we're quite willing to retain because their financial profile was different before they joined Berkshire.

So it's an opportunity for us, for two reasons, to make more money in that respect than General Re might've made on its own.

One is we can retain much bigger portions of what they would write in the first place, and which they've been writing over the years, but which they've laid off with other companies in what has the fancy name of retrocessionals.

And a second point is that they have a distribution capacity that may well have the ability to deliver to us a lot of big risks that we might not otherwise see. And that, in the past, they might not otherwise have had a good outlet for.

So there is — there's really true — I hate the word — but there's really true synergy in General Re Cologne being married to Berkshire Hathaway. And you've put your finger on, really, one point that has two aspects to it.

And we haven't fully exploited that. We probably won't fully exploit it, you know, 10 years from now.

But it's very much in my mind and the minds of the managers at General Re and Cologne that we have expanded opportunities, simply because Berkshire is willing to take on more risk than just about anybody in the world knowingly takes on.

Although we think some other people take on a lot more risk, unknowingly.

But in terms of writing a specific contract, we are both bigger and faster, I think, than anybody in the world. In effect, we have some of the abilities that used to be associated with going to a Lloyd's of London.

I mean we can — now, I don't know how true all that was over the years, because I wasn't around there then. But we really can give an answer on something in an hour that other companies wouldn't know what to do with in a month. And that should be a plus for us in the world.

Charlie?

CHARLIE MUNGER: Nothing to add.

6. Why Buffett doesn't like to buy a new car

WARREN BUFFETT: OK. Zone 8.

AUDIENCE MEMBER: My name is Ethan Berg. I'm from Cambridge, Massachusetts and I'd like to thank you for the education you've provided, particularly with the annual reports. I've got three brief questions.

Years ago, you wrote to your friend Jerry Orans that you were applying to Columbia's Business School because they had a pretty good finance department and a couple of hot shots in Graham and Dodd.

If you were considering graduate or business school today, with which individuals or professors would you want to study?

The second question is, a friend who wants to know your thoughts on the concrete, cement and aggregates business.

And the third question is from my wife. You mentioned earlier if someone were buying a parachute, they wouldn't buy based on lowest bid. We saw you tooling around in a car this week that, were it to be bought today, could probably be bought at a relatively low bid.

As someone interested in your health, she's wondering whether you've considered a newer automobile, possibly one with lots of airbags. (Laughter)

WARREN BUFFETT: Actually, I picked out the car I have based on the fact that it had airbags on both sides. So that was a factor. It may be the first car of its type ever made with airbags.

But I think my car actually — it's both heavy and has airbags, and those are two primary factors in safety. I don't think any — I don't think a safer car is necessarily being made. It might be safer to drive around in a big, heavy duty truck or something but I'm not ready for that.

Incidentally, on a car, I look at that like anything else. It would take me, probably, a half a day to go through, you know, the exercise of buying a car and reading the owner's manual and all that. And that's just a half a day I don't want to give up in my life for no benefit.

You know, if I could write a check in 30 seconds and be in the same position I'm in now with a newer car, I'd be glad to do it this afternoon. But I don't like to trade away when there's really no benefit to me at all. I'm totally happy with the car.

I just don't want to trade away the amount of time I'd have to spend fooling around to get familiar with and get title to and do all the rest of the things, pick one out, so a new car. But if there's a safer car made, you know, I'll be driving in it.

7. Concrete, cement, and aggregates are understandable

WARREN BUFFETT: The aggregates business, concrete, all of that, those are businesses that — and Charlie probably knows more about them than I do. We've looked at businesses like that.

In fact, we've even owned a few shares at one time or another, because it's an understandable business. And it's a business that — particularly if you get into concrete, cement, I mean, you know, there have been periods of substantial overcapacity, particularly on a regional basis.

But those are fundamental businesses. And at a price, you know, for low-cost capacity and advantageously located raw materials and so on, you know, we would do it. In fact, Charlie and I talked about one probably 10 or 15 years ago —

CHARLIE MUNGER: Yes.

WARREN BUFFETT: — quite a bit. And he's had a fair amount of familiarity with it. And what was the other one? I jotted it down here. Let's see.

8. Business schools are "pathetic" at teaching how to invest

CHARLIE MUNGER: He wanted to know what business school a young man should —

WARREN BUFFETT: Oh, business schools.

CHARLIE MUNGER: — go to.

WARREN BUFFETT: Yeah. Well, I would say this, that I think Bruce Greenwald's class at Columbia is very good. He gets in a lot of people that are practitioners. So there's a lot of practicality to the course.

And I think Bruce is good. He's got a new book coming out probably within the next six months or so that will deal with that.

And then there also has been endowed, at the University of Florida, certain courses relating to value investing. And I think there's been one at the University of Missouri.

So I would suggest you at least check out the curriculum at the University of Missouri and Columbia and Florida. And do a little comparison and maybe check with a few graduates — recent graduates — as to what kind of experience they had.

If you can find them, I think that's the best system for evaluating a place. But those three, at least, have courses that, based on the catalogue, sound like they might be of interest to you.

Charlie?

CHARLIE MUNGER: Yeah. A huge majority of the business school teaching on the field of investment of (inaudible) portfolios of securities is not what we believe and not what Warren was taught years ago by Ben Graham. There're just little pockets of our attitude left. There's one at Stanford. Jack McDonald?

WARREN BUFFETT: Yeah, sure. Yeah, that's graduate school. But yeah.

CHARLIE MUNGER: It's graduate school. And what's interesting about that is I think it's the most popular course in the whole Stanford Business School. They've got some kind of a bidding system. And yet, I asked Jack how he felt and he said he felt lonely.

He's got the most popular course, but in the whole professoriate, dealing with investment matters, the Jack McDonalds are a little clan of their own in a side pocket, so to speak.

Now, they're right. And they can take whatever consolation they get from that. But mostly, if you go to business school you will learn a lot of things we don't believe. (Laughter)

WARREN BUFFETT: Jack — Bob Kirby comes in and works with Jack sometimes, too. And Bob has got a terrific mind, in terms of investment. I mean, there's no question about that.

You know, it's not the easiest school in the world to get into and it is at the graduate level. But there are these occasional little anomalies, as they would say, in the teaching world.

I mean, what you really want a course on investing to be is how to value a business. That's what the game is about. I mean, if you don't know how to value a business, you don't know how to value a stock.

And if you look at what is being taught, I think you'll see very little of how to value a business.

And the rest of it is playing around, maybe, with numbers or, you know, Greek symbols or something of the sort. But it doesn't do you any good. I mean, in the end, you have to decide, you know, whether you're going to value a business at $400 million or $600 million or $800 million.

And then you compare that with the price. And that's what investing is. And I don't know any other kind of investing, you know, basically to do.

And there — that just isn't taught. And the reason it isn't taught is because there aren't teachers around, you know, who know how to teach it.

I mean, they don't know themselves. And since they don't know themselves, they teach something that says, "Nobody knows anything," which is the efficiency market theory. (Laughter)

And if I didn't know how to do it — and if I ever teach physics, I'm going to come up with a theory that nobody knows anything, because it's the only way I can get through the day, you know? But — (Laughter)

It's fascinating to me how, you know, the really great universities operate in this respect.

If you get a sacred writ, I mean, you get in the finance department because you sign on, you know, to whatever the present group thinks. And if they think the world is flat, you'd better think the world is flat too, you know? And your students better answer that the world's flat when they get it on exams.

I would say investment — finance — teaching in this country, in general, is kind of pathetic.

CHARLIE MUNGER: Well, I think the business schools do a pretty good job when it comes to accounting —

WARREN BUFFETT: Oh, accounting, sure, sure.

CHARLIE MUNGER: — or personnel management, or — there're a whole lot of subjects I think they do quite well with. But they miss one enormous opportunity.

If you learn to think intelligently about how to invest successfully in businesses, you'll become a much better business manager than you will if you aren't good at understanding what's required for successful investment.

So they're missing a huge opportunity to improve the management profession by doing such a lousy job in teaching investment.

WARREN BUFFETT: Yeah, see, Charlie and I see CEOs all the time who, in a sense, don't know how to think about the value of businesses they're acquiring. And then, you know, so they go out and hire investment bankers.

And guess what? The investment banker tells them what to do, tells them to do it because they get 20X if they do it and X if they don't do it. And guess how the advice comes out.

So it's a — when a manager of a business feels helpless, which he won't say out loud, but inwardly feels helpless in the question of asset allocation, you know, you've got a real problem.

And there aren't — they have not gone to business schools that have given them any real help, I think, in terms of learning how to think about valuation in businesses. And, you know, that's one of the reasons that we write and talk about it some, because there's a gap there.

9. Credit card advice: "It's crazy to get in debt

WARREN BUFFETT: OK. Number 1.

AUDIENCE MEMBER: My name is Martin Mitchell (PH). I'm from Bakersfield, California.

My question, a two-part question, is concerning debt. We know that individual debt can be devastating.

Do you — are you concerned that the American consumer is so far in debt, as a whole, as to be a problem?

And part two is, do you feel that our trade deficit with other countries is of concern to you?

WARREN BUFFETT: Well, the first question about debt, I think it's very hard to answer about the consumer as a whole. I get letters every day from people who have problems in life. And they revolve — I mean, they're either health or debt. And usually — frequently — the debt is connected with health, you know?

But they — it's been very easy for them to borrow money, and they're in over their heads, and it's all over then.

And there's no question that the American consumer is somewhat more indebted, in aggregate.

But it's a very hard thing, I think, to come into conclusions about whether it poses a serious problem. You know, most people have had assets, directly or indirectly, that have gained in value enormously, particularly in real estate and some in securities.

So there's a greater capacity to carry debt as earning power increases and assets held increases. I don't — I can't give you a useful answer, in terms of the world as a whole.

But I constantly give advice to young people, and those are the only people I talk to, aside from our shareholder group: just don't start out behind the eight ball.

I mean, it's crazy to get in debt because it's so hard to get out of debt. And, I mean, the idea of having credit card debt — and we issue credit cards in all our businesses and, you know, so does every other retailer.

But the idea of trying to borrow money at 18 percent, you know, and thinking you're going to get ahead in life, it isn't going to work.

And I urge people — they can use their credit card, but I urge them to pay it off before it starts revolving because it's just — it's too expensive.

Charlie and I can't make money with 18 percent money. I mean, we're looking around for float because we don't want to pay 5 percent for money.

And, so I'm very sympathetic to people get in debt. But once you get in it, it is hell to get out.

I mean, Charlie will have a few Ben Franklinisms to quote on that subject.

In fact, you want to give a few from Ben now? (Laughter)

CHARLIE MUNGER: Oh, no.

WARREN BUFFETT: He'd love to, but I led him into it the wrong way.

10. Long-term trade deficit is "a significant minus for the country"

WARREN BUFFETT: And the second question about the trade deficit, that's a very interesting thing. Because when you run a trade deficit, what you're doing is you're trading assets of one sort or another for goods, beyond what you're sending abroad.

So in effect, you are selling off a tiny bit of the farm so that the country can consume more than it's producing. If you run a net trade deficit, the country, in aggregate, is consuming less than — or consuming more — than it's producing.

And if you're a very rich country, you can't even see it because if you run a trade deficit of a few hundred billion dollars, you know, compared to an economy that's maybe worth, what, 40 trillion or something like that, you don't see it.

But you're trading off a tiny bit of the farm every year to live a little bit better than if you just lived off the produce of the farm that year.

And you can do it with IOUs if you've got a good record. You can't do it with IOUs if you're a country that's got a terrible record.

So they have to denominate their debt in dollars. And, of course, they don't have the ability to denominate a lot of dollars, and people don't want to accept a weak currency. So a weak country can't get away with doing that, unless it's getting special-type loans from agencies set up to do that.

We can do almost anything we want in this country, because we don't confiscate property and we don't — we haven't destroyed a currency that the people have accepted, in terms of payment for their goods, over the years.

But I basically think a significant trade deficit over a long enough time is a significant minus for the country. You won't see it though, day-by-day, or week-by-week, or month-by-month.

But eventually, if you trade for trinkets or whatever you're getting beyond what you're sending, and you trade away your assets —

Fortunately, some of the assets we traded not that many years ago, like movie studios and some of those things, the other people got the short end of the bargain on.

But by and large, it's not a good policy for the country to run large trade deficits year after year.

Charlie?

CHARLIE MUNGER: Well, it's — that's certainly true if what you're trading for is trinkets, or consumer goods, or something. But, of course, a developing country that ran a trade deficit to put in power plants and what have, that might be a very smart thing to do. In fact, the United States once did that.

WARREN BUFFETT: Yeah, we did it with railroads in a huge way, you know, and —

CHARLIE MUNGER: But under modern conditions, do we look like a twosome that would love a big trade deficit? (Laughter)

WARREN BUFFETT: No. It's one thing to build railroads with the process, but it's another thing, you know, to buy radios and television sets. I mean, it depends what you're getting.

But by and large, we run a trade deficit on consumption goods. And that's not a big plus over time.

11. Satisfied sellers are a "recruiting force"

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: Good afternoon. I'm Jim Hays (PH) from Alexandria, Virginia. I'd like to thank you and Mr. Justin for bringing his masterpiece into the Berkshire family.

But the question arises, will you soon run out of privately-held firms that meet the criteria for acquisitions of sufficient size to continue the returns to Berkshire?

WARREN BUFFETT: Well, that's a good question because people who sell to us have the option of —private business — selling elsewhere or going public.

There seem to be enough people that have built businesses lovingly over 50 or 100 years, and their parents before them and grandparents, that really do care about the eventual disposition of them in some way beyond getting the last dollar that day, that we have a supply from time to time of those businesses. And I think we'll continue to see them.

You do raise an interesting question. How many businesses like that are worth, you know, a billion dollars or more in the whole economy? There seem to be — you know, I wish there were more, but there are enough. So I think we will probably buy, on average, maybe two a year, something of that sort.

The really big ones — I mean, what we'd love to make is a 10- or $15 billion acquisition. And there would be very few private companies that would be in that category.

And then, from the ones that are in that category, you have to find somebody that is not going to conduct an auction.

We don't — we just are not interested in auctions. If somebody wants to auction their business, we're not that excited about getting in with them because we need people to run it after we buy it.

And, if that's the way they look at their business, we may get more unpleasant surprises than we've tended to get in the past with the kind of criteria we've used.

Charlie?

CHARLIE MUNGER: Yeah. There're two aspects of that situation. One is, are there going to be enough businesses? And two, how much competition are we going to get from other buyers?

One thing we do have going for us is that if you are the kind of a business owner that likes the culture that's in this room today, there isn't anybody else like us. Everybody else is off on a different path with a different culture. (Applause)

So — and look at all you. I mean, this culture is popular, at least with a certain group. And surely, there'll be other people who like this culture in the future, as in the past, and will feel right about joining it with their companies.

WARREN BUFFETT: We haven't had any luck internationally so far, but we would hope that that could change.

I was over in Europe about a month ago and I got asked the question a lot of times about whether we would be a prospect for businesses in Europe, for example.

The answer is yes. And then they say, "Well, you know, why haven't you bought anything?" And I said, "The phone's never rung." I don't know whether they thought that was a brilliant answer or not, but they — (Laughter)

But I left my phone number a lot of places, you know? Every time I got a chance, I gave that answer. And maybe the phone will ring.

I've got to believe that, if we were on the radar screen the same way in Europe over the last five years that we have been in the United States, we would've bought a couple of companies.

It's just, they don't think of us. And a lot of people don't think of us in the United States, either, but more do now than did five or 10 years ago.

And we have, actually — a reasonable percentage of our acquisitions come, directly or indirectly, because we've made another acquisition in the past where the seller was happy. It's very hard to find anybody that's been unhappy dealing with us.

And they're friends with other people in their industry, or whatever it may be. So, we hear about things now more often, because we actually have what you might call a recruiting force out there of people that have already done business.

It's very much like NetJets that way. I mean, we spend a lot of money advertising at Executive Jet, the NetJet service. But still, 70 percent or so of our business comes from owners who are with us. They're, by far, the best salespeople we have.

And incidentally, that's the way I was introduced to the business. Frank Rooney, who's in this room today, told me about his good experience with NetJets back in January or so of 1995. And that's when I joined in. And if Frank hadn't told me, I might — six years later, I might not have ever looked into it. I mean, you know, I might've just turned the pages past the ads and —

But when Frank said, "You ought to look into this," I did. Well, that's what we hope we have going for us on the acquisition front. And I think we do, to some degree. But we'd like it to be greater, and we would like it to be more widespread, geographically, than it is.

CHARLIE MUNGER: When I was a lawyer, I used to say, "The best business getter any lawyer has is the work that's already on his desk."

And similarly, probably the best business getter that Berkshire Hathaway has is the business practice that's already on our desk. That's what's driving the new businesses in, right, Warren?

WARREN BUFFETT: Sure. Sure.

CHARLIE MUNGER: So it's a very old-fashioned idea. You just do well with what you already have and more of the same comes in.

12. Why Berkshire sold its Freddie Mac and Fannie Mae stakes

WARREN BUFFETT: Zone 3, please.

AUDIENCE MEMBER: My name is Steve Sondheimer. I live in Chicago and I'm 14 years old. I'm a third generation shareholder and my question is, I noticed that you sold our position in Freddie Mac. What risks do you see in that industry?

WARREN BUFFETT: Are you Joe's granddaughter?

AUDIENCE MEMBER: Yeah.

WARREN BUFFETT: Oh, good. We have an amazing number of second and third and even fourth generation shareholders, which I'm delighted with. I mean, I don't think lots of companies — big companies on the stock exchange — are in that position.

It is true, we sold the Freddie Mac stock last year. And there were certain aspects of the business that we felt less comfortable with as they unfolded — and Fannie Mae, too.

And the consequences of what we saw may not hurt the companies, I mean, at all. But they made us less comfortable than we were earlier, when, actually, those practices or activities didn't exist.

We did not — I would stress — we did not sell because we were worried about more government regulation of Freddie and Fannie. If anything, just the opposite, so —

It was not — it was not — Wall Street occasionally will react negatively to the prospect of more government regulation and the stocks will react sometimes short-term for that reason. But that was not our reason. We were — we felt the risk profile had changed somewhat.

Charlie?

CHARLIE MUNGER: Yeah, but that may be a peculiarity of ours. We are especially prone to get uncomfortable around financial institutions.

WARREN BUFFETT: We're quite sensitive to —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — risk in — whether it's in banks, insurance companies or in what they call GSEs here, in the case of Freddie and Fannie.

We feel there's so much about a financial institution that you don't know by looking at just figures, that if anything bothers us a little bit, we're never sure whether it's an iceberg situation or not.

And that doesn't mean it is an iceberg situation, in the least, at banks or insurance companies that we pass.

But we have seen enough of what happens with financial institutions that push one way or another, that if we get some feeling that that's going on, we just figure we'll never see it until it's too late anyway.

So we bid adieu without — and wish them the best — without any implication that they're doing anything wrong. It's just that we can't be 100 percent sure of the fact they're doing things that we like.

And when we get to that situation, it's different than buying into a company with a product or something, or a retail operation. You could spot troubles usually fairly early in those businesses. You spot troubles in financial institutions late. It's just the nature of the beast.

Charlie?

CHARLIE MUNGER: Yeah. Financial institutions tend to make us nervous when they're trying to do well. (Laughter)

That sounds paradoxical, but that's the way it is.

WARREN BUFFETT: Financial institutions don't get in trouble by running out of cash in most cases. Other businesses, you can spot that way.

But a financial institution can go beyond the point — and we had banks 10 years ago that did that, en masse — but they can go beyond the point of solvency even while they still have plenty of money around.

13. Debating whether it's good moats are harder to find

WARREN BUFFETT: Area 4, please.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett, Mr. Munger. My name is George Brumley from Durham, North Carolina.

We often consider evaluating companies in the context of Michael Porter's model of position relative to competitors, customers, suppliers, substitute products. You state that much more simply when you say you seek for companies with the protection of wide and deep moats.

To complete the valuation of a company, we all seek to choose the appropriate future cash flow coupons. A qualitative assessment of the protected competitive position is required to precisely forecast those future coupons.

In your opinion, are the dynamic changes in the nature of competition, distribution systems, technology, and even changes in customers, making it more difficult to accurately forecast those future cash flow coupons?

Are good, protected businesses going to be more rare going forward in — than they have been in the past? And if so, does that make the few that do exist more valuable?

WARREN BUFFETT: Well, you've really described the investment process well. I can't see from here, but which George are you? Are you the — are you Fred's brother-in-law or are you one generation down?

AUDIENCE MEMBER: George III. My father is here as well.

WARREN BUFFETT: OK, good. The questions you ask are right on the mark. And we do think, to the extent I understand what — or have read what Porter has written, we think alike, basically, in terms of businesses.

And we do call it a moat. And he makes it all into a book, but that's the difference between the businesses we're in. (Laughter)
