I — and Charlie may have a different view on this. I don't think that the quantity or sustainability of moats in American business has changed that dramatically in 30 or 40 years.

Now, you can say that Sears and General Motors and people like that thought there were some very wide moats around their businesses, and it turned out otherwise when, in the case of Sears, Walmart, for example, came along.

But, I think — the businesses we think about, I think the moats that I see now seem as sustainable to me as the moats that I saw 30 years ago.

But I think there are many businesses — industries where it's very hard to evaluate moats. There — those are the businesses of rapid change.

And are there fewer businesses around where change is going to be relatively slow than previously? I don't think so, but maybe Charlie does.

Charlie?

CHARLIE MUNGER: No, I would argue that the old moats, some of them are getting filled in. And the new moats are harder to predict than some of the old moats. No, I would say it's getting harder.

WARREN BUFFETT: Well, there you have it. (Laughter)

Unanimity at Berkshire. OK.

I think it's a very good question. And I really don't — you know, Charlie may be right, I may be right. I think it's a very tough one to figure.

But regardless of whether there are fewer or that — harder to find, that's still what we're trying to do at Berkshire. I mean, that is what it's all about.

Our instructions to our managers — we don't have budgets and we don't have all kinds of reporting systems or anything else. But we do tell them to try and not only protect, but enlarge, the moat. And if you enlarge the moat, everything else follows.

14. How derivatives become "potential dynamite"

WARREN BUFFETT: Area 5?

AUDIENCE MEMBER: Bill Graham (PH) from Los Angeles.

Warren, you've made it possible for outside shareholders to understand Berkshire's financial businesses.

But there is one that seems, to me, anyway, hard to understand, which is the financial products business, which I guess, involves trading of derivatives.

And for the same — given the same kind of concerns that you and Charlie voiced in relation to financial businesses, can you help us out on that and why you're comfortable with it?

WARREN BUFFETT: Well, I think you put your finger on it, Bill.

It is a hard business to understand. And it's a hard business to understand if you own it, let alone read about it in somebody else's annual report.

And I would guess that most people who own complicated or extensive derivatives businesses, I would say that most of the CEOs probably don't understand it. And how many of them stay awake at nights over that, I don't know.

Actually, in financial products, what you see on that one line of income on that, and also what you see in the balance sheet items, is a combination of several things. It's General Re Securities, which used to be GRFP, General Re Financial Products. It's — and it's a couple of other operations.

It actually had our — it has our — structured settlement business in it, which is quite predictable and a very easy business to understand.

And it actually has some trading business that I do that falls in there. It's not our normal investment business, but it may involve, what I think are — it tends to be fixed-income related.

It might involve arbitrage or semi-arbitrage of various types of fixed-income securities. It wouldn't involve any equity arbitrage. That would not be in there.

But I would say that it would be a fair criticism to say that neither Charlie nor I know fully, or even in large part, what goes on in the derivatives business.

Now, we have a fellow who is both smart and trustworthy running that in Mark Byrne. So we feel very good about the individual.

We do not feel the instinctive understanding of everything that's going on that we do, probably, in most of the businesses that we're in. I think we've probably got 17,000 outstanding tickets at General Re Securities. And those interplay in all kinds of ways.

And I don't think that Charlie or I have my mind — our minds — around that book of products. That means we want to be very comfortable with the fellow whose job it is to have his mind around those products. And I will tell you that, you know, there's nobody that I'd feel more comfortable with than Mark Byrne.

But it is — it's not a natural-type business for us.

The other things in that area, and we made a fair amount of money in some things that aren't related to the derivative business last year. And those are under my direct control. So I feel OK about that.

The structured settlement business is a minor profit area. But it's made us some money. And right now, it's not attractive. But it could be again in the future.

And there could be other financial-type things we would stick in there. But if we stuck in anything, it would be something that I would be running.

Charlie?

CHARLIE MUNGER: Yeah, that mix includes what I would call oddball pastimes of Warren Buffett — (laughter) — outside —

WARREN BUFFETT: The ones that are publishable. (Laughter)

CHARLIE MUNGER: — outside the common stock field. That I'm quite comfortable with, although I'm sure the results will be irregular.

The rest of it — and I think we also have what might be called oddball personal ideas of Mark Byrne, and I'm quite comfortable with those.

As you get away from that, into what might be called more standardized derivative trading businesses, I think it's fair to say I like them less than most of the people do who are in them.

WARREN BUFFETT: Quite a bit less. (Laughter)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: Yeah, we regard that area as potentially being dynamite because if you get a group — a large group — of people that, in many cases in that business — although we've tried to go away from it ourselves — but in many cases in that business are getting paid based on front-ending potential profits, you can get — I mean, that's a dangerous situation to place a hundred people in. You're going to find people who will crack under that, in terms of what they will do.

You know, they had — we had a case of it, actually, in the electric utility industry a year or two ago, when Edison in California, through a subsidiary, compensated people based on projecting the profitability of the business they were putting on the books that day.

That's Wall Street practice and it was brought to the utility industry. And it produced I'd say predictable results.

So it's dangerous to pay people to make deals where you won't know the outcome for 15 or 20 years and give them a lot of money upfront for doing it.

And that's fairly standard practice in the business. I mean, it was standard practice at Salomon when I was there. And as I say, people occasionally crack under that.

It isn't exactly analogous, but it's worth reading Roger Lowenstein's book entitled "When Genius Failed," because it touches on some of the problems we've described that Charlie and I are apprehensive about.

CHARLIE MUNGER: Yeah, the derivatives business has the very significant problem that the accounting profession sold out. The accounting is improper. It front-ends way too much income.

It's irrationally optimistic because that's the way the denizens of the field want it because it creates bigger compensation. This is intrinsically an irresponsible system. And it's another case where the accounting profession has failed the wider civilization.

WARREN BUFFETT: We found — Charlie was on the audit committee at Salomon — and we found positons — single positions — mismarked by close to $20 million, for example, didn't we, Charlie?

CHARLIE MUNGER: Oh, yeah. But deliberate mismarkings was not the main problem. The main problem is the whole system of accounting is wrong. The whole system of accounting is too optimistic. It would be like going into the taxi cab business with a 30-year depreciation rate.

WARREN BUFFETT: Yeah. Or it'd be like writing long, very long-tail insurance, and paying a big commission upfront based on the expected profit of that insurance over a 10-year period or something, with that prepared by the guy who wrote the policy.

There are certain activities that are really just dangerous in the financial world. And when you get close to that kind of situation, you just have to be very careful.

Now you — actually, Mark has been implementing a system that compensates — that accounts for this — significantly differently than occurs at many institutions. So, you know, you can try to attack it. But it's also hard to get too far away from industry norms and still do business. I mean —

CHARLIE MUNGER: Yeah. Our accounting is way more conservative than the standard derivative accounting of the country, thank God.

15. GEICO's Lou Simpson manages "autonomously"

WARREN BUFFETT: OK. Area 6.

AUDIENCE MEMBER: My name is Scott Tilson (PH). I'm from Owings Mills, Maryland.

Gentlemen, you have stated many times that Lou Simpson manages the GEICO investment portfolio on an independent and autonomous basis.

What unique or superior qualities does Mr. Simpson possess as an investor that has earned him this tremendous vote of confidence?

Secondly, Berkshire invests in privately-held businesses as well as publicly-traded securities. While the skillset required to value public and private businesses may be the same, does Mr. Simpson also have the additional experience and skills necessary to negotiate a private transaction, if called upon to do so?

WARREN BUFFETT: Yeah, I think he could. But I hope he doesn't get called on to very soon. (Laughter)

Lou is smart, and careful, and high-grade, and experienced.

So he does manage a couple billion dollars autonomously. He will buy things. I won't know about them until I either look at a monthly sheet or sometimes read it in the paper. And that's fine, you know? He doesn't know what I'm doing. I don't know what he's doing.

Every now and then, we're in the same security, so we try and coordinate if we're buying or selling under those circumstances.

And incidentally, you will occasionally read a headline, not a very big headline, but in the financial press that says, "Buffett buying X, Y, Z." Well, sometimes it should say, "Simpson buying X, Y, Z."

They — the reports we file would not necessarily tell the reader which one of us made the decision, because even if the reports show that something was bought in GEICO, that could be bought in — by me and placed in GEICO for various reasons.

Or conceivably, Lou can buy something and place it in National Indemnity or some other Berkshire company also for perfectly good reasons. But some of what gets reported as done by Berkshire is done by Lou entirely independent of me.

And most of it, in terms of dollars, is done by me. But Lou's record is just as good as mine, so.

And Lou would know how to evaluate businesses, whether private negotiations or public securities, and — but I'm in no hurry to turn it over. (Laughs)

16. Berkshire's investment in Finova

WARREN BUFFETT: Seven.

AUDIENCE MEMBER: Good afternoon. My name is Scott Croy (PH). I'm from Chicago, Illinois.

Mr. Buffett, could you please describe the situation — the extent, if any, of Berkshire Hathaway's investment in Finova Group earlier this year? Finova's back appears to be against the wall.

WARREN BUFFETT: Yeah. It's worse than against the wall. They're in Chapter 11. (Laughter)

But that was all contemplated, obviously.

Finova is the old Greyhound leasing company, and grew to about 13 or $14 billion in assets. And then just about a year ago, now, ran into funding difficulties.

And when you run a highly leveraged finance business and you run into funding difficulties, they compound on you very quickly.

You know, confidence is a real coward. I mean, it runs when it sees trouble.

And in a finance business, you're constantly faced with refinancing old obligations, and you have commercial paper out and all of that. So there's no honeymoon period when you get in trouble in the finance business.

And we've even seen big ones in the past, like Chrysler Financial and all of that. I mean, it can strike anywhere when confidence disappears.

And so that hit Finova about a year ago. And it became clear not that many months later that Finova would have to either be sold or reorganized.

And I think there were attempts made to sell the company to other finance companies, and even a couple of little portions of the portfolio were sold. But they didn't make a sale.

And when the bonds started selling down to prices that I thought were very attractive, in the fall or whenever it was of last year — and by attractive, I mean, I thought that if they went into bankruptcy that the assets were considerably greater in relationship to the liabilities than indicated by the market — we started buying bonds.

And we bought — we publicly announced it. We bought $1,428,000,000 face amount of bonds or bank debt. So we, out of 11 billion of aggregate debt at Finova, we own $1,428,000,000 face value. And we bought those at prices that looked attractive then and look attractive now.

And it became clear — it was somewhat — it was clear all along that they were either going to sell or go into bankruptcy. And it became clearer that they weren't finding a buyer as time went by. And so it became very likely that they would declare bankruptcy sometime earlier this year.

One of the reasons being is they didn't want to use the available cash to pay out the creditors whose money was coming due tomorrow, and thereby shortchange creditors whose claims were due at later dates.

We thought, perhaps, somebody would come in with a plan of reorganization. And it got very close to where they —in our view — they were going to default. And so we jointly, with Leucadia, in a joint venture called Berkadia, put forth our own plan and made a — and arranged a transaction.

But they are now in Chapter 11, and there will be plans presented to the — a plan or plans — presented to the court in short order. And then the court will determine —

I'm not — Charlie may know more about exactly how bankruptcy works than I do, although I don't think he's had any personal experience — that a plan gets submitted to creditors for approval.

And we will have a plan, which will be — which has been outlined in the press, and will be submitted to the court, almost certainly within a week, and when you can read about it at that time.

And then we will see whether anything else happens. I mean, it may be that somebody else comes in with a plan. It may be that our plan is approved.

And if our plan is approved, it involves a significant additional investment so that an initial payment can be made to the present debt holders. And then we'll see what happens.

We feel very good about Berkadia. I — we think Berkadia — well, we think the Leucadia part of Berkadia brings a lot to the party, in terms of efficiently managing the assets that are there. It makes it — when an entity gets in bankruptcy, it makes a lot of difference how it's handled.

I mean it, you can — there can be a lot of wastage of assets in bankruptcy. Or there could be a reasonably efficient way of handling it.

We think that the Berkadia arrangement will maximize the value of the assets. And we think that's important. But we'll see what happens. I think our position is going to work out fine.

Charlie?

CHARLIE MUNGER: Yeah. I think it's —

WARREN BUFFETT: Microphone.

CHARLIE MUNGER: — a very interesting transaction. And you would hope there would be more of it.

WARREN BUFFETT: There will be. (Laughter)

CHARLIE MUNGER: No, I mean, not more bankruptcy, but more cures of bankruptcy following this model. I think it's a very intelligent model and a very clean, simple, prompt way of cleaning up a corporate mess.

And I hope the rest of the world feels about it the way I do, and that the judge and other people concerned will say, "Thank God," and we want this one to go through and we want more like it to happen.

WARREN BUFFETT: That's what we tried to do in Salomon, incidentally. I mean, we tried to behave in a somewhat different way, in terms of a corporate crisis, than typical.

And we hoped that if that got a good result, that that might become a model that people might gravitate toward in future problems, because there will be future problems.

We are the largest creditor of Finova now. So we have more money on the line than anybody else, and we don't have an interest —

You know, our interest is not primarily in getting fees or extending the bankruptcy or, you know, any of that sort of thing. We want to get the greatest realization of assets as possible. And the swing in that between doing it right and doing it wrong, you know, could be measured in the billions.

17. GEICO's Lou Simpson bought Berkshire's Gap shares

WARREN BUFFETT: Area 8.

AUDIENCE MEMBER: Good afternoon. I'm Claudia Fenner (PH) from Long Island, New York and I have two questions.

The first is, as a big fan of the Gap, I'd like to know why at this time you feel that the Gap is undervalued.

And the second question, if you could direct your answer to my husband, as a shareholder, would you agree that buying a large present at Borsheims this afternoon is like taking money out of one pocket and putting it back in another? (Laughter and applause)

WARREN BUFFETT: I'll let Charlie handle the second one. (Laughter)

He's our expert on consumption at Berkshire.

The Gap is a good illustration of what I talked about earlier, because I think the world assumes that I made a decision to buy Gap at Berkshire. And actually, that's totally, 100 percent a Lou Simpson portfolio investment.

I don't think I've read the annual report of the — I know — I haven't read the annual report of the Gap ever. And I don't know anything about it. I mean, you probably know a lot more about it than I do, and I hope Lou knows a lot more about it than I do. (Laughter)

It's not a company I've ever looked at.

And Lou operates — and he has people that help him — Lou operates in somewhat — he can look at smaller securities, in terms of aggregate market caps, than I can, because I'm investing $2 billion. He can work with $200 million positions or even $100 million positions sometimes.

And I will do that occasionally, just because I happen to bump into them, in effect. But I'm really looking for things that we can put a billion or 2 billion or more in. And Lou's universe of possible candidates for purchase is a bigger universe than mine.

And that may be a good thing, I mean, having two of us in there. Because he just is going to see things that I'm not going to see. So you'll have to ask Lou about the Gap.

18. Buffett's never regretted buying jewelry

WARREN BUFFETT: But, well, Charlie, give her a little advice on Borsheim's. (Laughter)

CHARLIE MUNGER: Well, I think when you're buying jewelry for the lady you love, it probably shouldn't get too much financial calculation into it. (Laughter and applause)

WARREN BUFFETT: I will say this. And this is true. And you're talking to a guy who does not normally go down this path, but I would say this:

I've never bought a piece of jewelry that I've regretted, in terms of what has happened subsequently, so it — (Laughter)

Well, if that isn't a sales pitch, I don't know what is. (Laughter)

19. Why GEICO can't give everyone a better deal

WARREN BUFFETT: Zone 1.

AUDIENCE MEMBER: You're a tough act to follow.

I'm Matt Richards. I'm from Parkton, Maryland.

Last year at this meeting, a gentleman stood up and implored you, Mr. Buffett, to invest in some technology stocks to juice our returns. I would like to this year thank you for having not done that. (Applause)

My question is regarding GEICO. I've been a USAA preferred risk customer for something like 15 years now.

WARREN BUFFETT: Yeah. You'll do very well with USAA. They're a perfect —

AUDIENCE MEMBER: Yes, well —

WARREN BUFFETT: — company.

AUDIENCE MEMBER: — I'd prefer to be a customer of the company that I own part of. Unfortunately, due to an accident and two speeding tickets in the last five years, they will not accept me as a preferred risk.

And I wonder if this isn't an untapped group of people who are preferred risks with their own company.

Couldn't GEICO possibly take their current preferred risk status into account when determining whether to accept them as a customer?

WARREN BUFFETT: Yeah, I would — USAA, incidentally, is a terrific company.

And Leo Goodwin, who started GEICO, which was then called Government Employees Insurance Company in 1936 — Leo actually was a key employee of USAA, as was his wife, Lillian. They both came from USAA.

And, they felt that — I mean, USAA as you know, limits its clientele — at that time, they limited their clientele to the officers in the armed services. And Leo wanted to extend — and that was a preferred class, and history has shown it to be a preferred class.

Leo wanted to extend that to other classes that he felt also had similar characteristics that USAA was not interested in. And that's the reason he formed Government Employees Insurance.

He felt that the preferred characteristic that could be determined by employment in that area as to their propensity for accidents would extend beyond the officer ranks of the armed services. And he was right. It's a fascinating story.

And there's a good book about USAA that came out about two or three years ago, tells the whole story.

It's hard for us to take away the preferred customers of USAA. It's hard for them to take away our preferred customers, too.

But USAA has some of the same qualities that we have talked about in terms of State Farm. It has, as I remember, maybe a $6 billion, maybe larger now, surplus.

It's slightly different than State Farm. It's not a true mutual. It's a reciprocal, as I remember. But, it's tantamount to a mutual.

So the 6 billion that has been accumulated over the years is working for present policy holders, which is a terrific asset for them.

And the fact that they keep you as a preferred risk probably means you are a preferred risk. I mean, their underwriting judgment is very good.

You know, we have various categories that relate to speeding tickets or accidents and all of that sort of thing. And in aggregate, they are a good predictor of future accident potential. But it's only in aggregate.

I mean, it's like saying, you know, "Because I'm 70, that I have X percent chance of dying," but it doesn't say what's going to happen to me specifically. But it does mean if you're insuring 100,000 70-year-olds, you'd better get this sort of price.

We have these predictors, too. And past driving history is an important predictor. But you've got this long history with USAA. And they, probably for very good reason on that total history, keep you in the preferred class.

And we, based on criteria that are developed from looking at 5 million policy holders, we can't make the determination — we can't come out and actually observe you driving, or anything of the sort.

We have to look at the information that comes to us, which if it says speeding tickets or accident, it does result in various scores being applied. So I really can't offer you a better deal. I'd like to. I have a feeling you'd be a good client. If USAA ever gets mad at you, come over and see us.

20. "We regard volatility as a measure of risk to be nuts"

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: I'm Bob Kline (PH) from Los Angeles.

Wall Street often evaluates the riskiness of a particular security by the volatility of its quarterly or annual results. And likewise, evaluates money managers by their volatility — measures their risk by volatility, I should say.

And I know you guys don't agree with that approach. I wonder if you could give us some detail about how you come at the concept of risk, how you measure it, and just in general how you approach risk.

WARREN BUFFETT: Yeah, we regard volatility as a measure of risk to be nuts.

And the reason it's used is because the people that are teaching want to talk about risk. And the truth is, they don't know how to measure it in business.

I mean, that would be part of our course on how to value a business. It would also be, how risky is the business? And we think about that in terms of every business we buy. And risk with us relates to —

Well, it relates to several possibilities. One is the risk of permanent capital loss. And then the other risk is just an inadequate return on the kind of capital we put in. It does not relate to volatility at all.

Our See's Candy business will lose money — and it depends on when Easter falls — but it'll lose money in two quarters of the four quarters of the year. So it has a huge volatility of earnings within the year.

It's one of the least risky businesses I know.

You can find all kinds of, you know, wonderful businesses that have great volatility and results. But it does not make them bad businesses. And you can find some very — you can find some terrible businesses that are very smooth.

I mean, you could have a business that did nothing, you know? And its results would not vary from quarter to quarter, right? So it just doesn't make any sense to translate — (laughter) — volatility into risk.

And Charlie, you want to add anything on that?

CHARLIE MUNGER: Well, it raises an interesting question, which is how can a professoriate that is so smart come up with such silly ideas and spread them all over the country? (Laughter)

It is a — it's a very interesting question. If all of us felt that — (Laughter)

WARREN BUFFETT: Charlie, your Dilly Bar's arrived.

CHARLIE MUNGER: Oh, good.

WARREN BUFFETT: Yeah. You've heard of getting a second wind.

CHARLIE MUNGER: Oh, fine.

WARREN BUFFETT: Thank you. (Laughter and applause)

You tip him. (Laughter)

I didn't think our cracks were that funny. (Laughter)

CHARLIE MUNGER: Right, right. But I've been waiting for this craziness to pass for several decades now. I do think it's getting dented some. But it's not passing.

WARREN BUFFETT: If somebody starts talking to you about beta, you know, zip up your pocketbook. (Laughter)

21. Zen Buddhism and the value of low expectations

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: Brian Zen (PH) from China.

As a Coke addict myself, I'm excited to report to you — (laughter) — our worldwide promoter-in-chief, that the Cokes in Beijing taste just as wonderful as in Omaha.

As a ex-Zen monk, today I feel like visiting the Buddha of the financial world. (Laughter)

We have an investment club, but with a name that ends in .com, believe it or not, which tells you that the frenzy — .com frenzy — even seduced Zen monks when we tried to follow you.

We find that Mrs. Susan Buffett used to send Zen Buddhism books to her sorority sisters. That's probably why she always has a peaceful smile due to her low expectation of life which, according to Buddha, is full of sufferings.

But Mr. Munger would tell me that Susan's smile is because you, as the husband, exceeded her low expectations.

CHARLIE MUNGER: That's right. (Laughter)

WARREN BUFFETT: Yeah. And her father's even lower expectations. (Laughter)

CHARLIE MUNGER: Right, right.

AUDIENCE MEMBER: Anyway, my question is, did Susan also send those Zen books to your office or your bedroom?

And if you have read those books, what are the key ideas that contributed to your investment tao, which even made sense to secluded, narrow-minded Zen monks like me? Thanks for the financial enlightenments you've given us today.

WARREN BUFFETT: Thank you. I sent those books on to Charlie so I'll let him answer. (Applause)

CHARLIE MUNGER: Actually, I tend to be a follower of Confucius. (Laughter)

And I think this room is full of Confucian values, you know? If the first law of Confucianism is filial piety, particularly toward elderly males, you can see why I like that system. (Laughter)

22. Capital and opportunity costs

WARREN BUFFETT: Area 4. (Laughter)

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. My name is Kevin Truitt (PH) from Chicago. I have three questions for you.

Mr. Munger, at last year's shareholder meeting, you stated that you didn't feel that the concept of the cost of capital made true economic sense. Would you explain why you felt this way and what you would do to replace it with anything?

My second question is to Mr. Buffett. You've stated the importance of an occasional big idea. How were you able to, in fact, tell when you had a big idea?

And my third question, Mr. Buffett, you have talked about the importance of the franchise and sustainable competitive advantage.

Companies like Kellogg and Campbell's Soup are companies that most people would have said had those qualities. However, over time, those qualities were lost as a result of a change in consumer taste.

What gives you confidence that the same things won't happen to Coke or Gillette?

WARREN BUFFETT: Charlie?

CHARLIE MUNGER: Well —

WARREN BUFFETT: Cost of capital.

CHARLIE MUNGER: Cost of capital, first.

Obviously, considerations of cost are important in business. And obviously, opportunity costs, which is a doctrine of economics, really a doctrine of lifesmanship, are also very important. And we've always had that kind of basic thinking.

Of course, capital isn't free. And, of course, you could figure cost of capital when you're borrowing money. Or at least you can figure cost of loans. But the theorists had to develop some theory for what equity cost. And there, they just went bonkers.

They said if you earned a hundred percent on capital because you had some marvelous business, your cost of capital was a hundred percent. And therefore, you shouldn't look at any opportunity that delivered a lousy 80 percent.

That is the kind of thinking, which came out of the capital assets pricing models and so forth, that I've always considered inanity.

What is Berkshire's cost of capital? We have this damn capital. It just keeps multiplying and multiplying. What is its cost? You have perfectly good, old-fashioned doctrines like opportunity cost, you know?

At any given time when we consider an investment, we have to compare it to the best alternative investment we have at that time. We have perfectly good, old-fashioned ideas that are very basic to use, but they weren't good enough for these modern theorists.

So they invented all this ridiculous mathematics, which concluded that the companies that made the most money had the highest costs of capital.

Well, all I can say is, it's not for us.

Now, the other half of that question I leave for Mr. Buffett.

WARREN BUFFETT: Yeah, what you find, of course, is that the cost of capital is about a quarter percent below the return promised by any deal that the CEO wants to do. It's — (laughter) — very simple.

You know, we have three questions on capital — with capital, throughout — leaving aside whether we want to borrow money, which we generally don't want to do.

And one is, does it make more sense to pay it out to the shareholders than to keep it within the company? A sub-question on that is if we pay it out, is it better off to do it via repurchases or via dividend?

The test for whether we pay it out in dividends is, can we create more than a dollar of value within the company with that dollar than paying it out? And you never know the answer to that. But so far, the answer as judged by results is yes, we can.

And we think that prospectively, we can. But, that's a — you know, that's a hope on our part. And it's justified to some extent by past history, but it's not a certainty.

Once we've crossed that threshold, then do we repurchase stock? Well, obviously, if you can buy your stock at a significant discount from conservatively calculated intrinsic value, and you could buy it in reasonable quantity, that's a use for capital.

Beyond that, then the question becomes, if you have the capital, you think you can create more than a dollar, how do you create the most with the least risk? And that gets to business risk. It doesn't get to any calculation of the volatility.

I don't know the risk in See's Candy as measured by its stock volatility because the stock hasn't been outstanding since 1972. Does that mean I can't determine how risky a business See's is, because we don't have a daily quote on it?

No. I can determine it by looking at the business, and the competitive environment in which it operates, and so on.

So once we cross the threshold of deciding that we can deploy capital so as to create more than a dollar of present value for every dollar retained, then it's just a question of doing the most intelligent thing that you can find. And, you know, that is —

The cost of every deal we do is measured by the second best deal that's around at a given time, including more — doing more of some of the things we're already in.

And I have listened to cost of capital discussions at all kinds of corporate board meetings and everything else. And, you know, I've never found anything that made very much sense in it except for the fact that it's what they learned in business school and that's what the consultants talked about.

And most of the board members would nod their head without knowing what the hell was going on. And that's been my history with the cost of capital.

23. How Buffett knows when he's had a "big idea"

WARREN BUFFETT: Now, moving onto the big ideas, you know when you've got a big idea. And I can't tell you, you know, exactly what happens within your nervous system or brain at that time.

But we've had relatively few big ideas, good ideas, over the years. I don't know how many you think we've had in aggregate, probably, career, maybe 25 each or something?

CHARLIE MUNGER: If you took the top 15 out of Berkshire Hathaway, most of you people wouldn't be here. (Laughter)

So, roughly one every two years.

WARREN BUFFETT: Yeah, one every year or two. And sometimes there'll be a bunch of them, like in 1973 and -4. But the problem is, for us is that big, now, really means big. I mean, it has to be billions of dollars to move the needle very much at Berkshire.

But I would say that when I would turn those pages, 50 years ago in the Moody's Manuals, I would know when I hit a big idea. I've got half a dozen of them that I keep the Xeroxes from those reports around from 50 years ago just because it was so obvious that they just — they were incredible. And that happens every now and then.

When I met Lorimer Davidson, you know, in end of January, 1951, and he spent four hours or five hours with me explaining GEICO, I knew it was a big idea.

Eight months later, no, probably 10 months later, I wrote an article for The Commercial and Financial Chronicle on "The Security I Like Best." It was a big idea.

When I found Western Insurance Securities, I knew it was a big idea.

I couldn't put billion — millions — of dollars into it, but I didn't have millions so it didn't make any difference.

And I — we've seen things subsequently. And we'll see, you know. If we have a normal lifespan, we'll see a few more before we get done, but I can't tell you that —exactly how —

I can't tell you exactly what transpires in my mind that says, you know, flashes a neon sign up that says, "This is a big idea."

What happens with you, Charlie?

(Laughter)

Actually, one of my — I've have a real system. (Laughter)

My idea of a truly big idea is, one I get it and I call Charlie and he only says no, rather than, "That's the worst idea I've ever heard of." But if he just says no, it's a hell of an idea.

CHARLIE MUNGER: You know, the game in our kind of life is being able to recognize a good idea when you rarely get it, and — or when it rarely is presented to you. And I think that's something you have to prepare for over a long period.

What is the old saying? That opportunity comes to the prepared mind? And I don't think you can teach people in two minutes how to have a prepared mind. But that's the game.

WARREN BUFFETT: Things we learned 40 years ago, though, will help and recognize the next big idea.

CHARLIE MUNGER: And on opportunity costs, going back to that, the current freshman economics text, which is sweeping the country, has right in practically the first page. And it says, "All intelligent people should think primarily in terms of opportunity cost." And that's obviously correct.

But it's very hard to teach business based on opportunity cost. It's much easier to teach the capital assets pricing model where you could just punch in numbers and out come numbers. And therefore, people teach what is easy to teach, instead of what is correct to teach.

It reminds me of Einstein's famous saying. He says, "Everything should be made as simple as possible, but no more simple."

WARREN BUFFETT: Write that down. (Laughter)

24. Big retailers are attacking big brand-name moats

You asked an interesting question about franchises, too, and mentioned Campbell's Soup and Kellogg.

And, you know, I'm no expert on that but I would say that, just based on my general observation over the years, is that the problems there came from two different things.

I think that the problems with cereal — ready-to-eat cereal — were not so much changes in taste or consumption patterns. But I think they maybe just pushed their pricing too far to the point that they lost market share without getting — without having — the moat that they thought they had, as opposed to the General Mills cereals, and the General Food cereals, and all of that sort of thing.

I mean, if you're pricing really gets out of whack and people regard Wheaties or Grape-Nuts in the same category as they regard Kellogg's Corn Flakes, you know, you're going to lose share. And once you start losing share, it's hard to get back.

The problems with soup I think relate more to lifestyle. I think it's become — it's a little less — it fits in a little less well with current lifestyles, maybe, than 40 years ago.

Soft drinks, — the consumption of soft drinks — I don't have the figures here, but I would wager that in 110 years, the per capita of soft drinks has gone up virtually every year throughout that history.

I mean, it's now 30 — close to 30 percent — of U.S. consumption of liquids. So, if the average American has about 64 ounces of liquids a day, you're talking about, say, 18 ounces of that being soft drinks and 43 percent of that 18, or almost 8 ounces a day, of being Coca-Cola products.

In other words, 1/8th of all the liquid man, woman and child in the United States take in comes from Coca-Cola products. But that has gone up, virtually — well, throughout the world it's gone up on a per capita basis, you know, almost since soft drinks were discovered.

I would say that that trend is almost impossible to reverse on a worldwide basis. I mean, there's so much potential in countries where per capita consumption is like — well, I think it's, you know, maybe 8 per capita, which is — 8-ounce servings they talk in terms — 64 ounces a year.

So you have 1/50th of the consumption, per capita, on Coke products in many — in some important countries — that you have here. I don't — I just don't see it as being —

Now, you can push pricing too far. I mean, there comes a point — it depends on the country in which you're doing it, but that depends even on areas within the country in which you do it.

But if you establish too wide a differential between Coke and a private label product, you will change consumption patterns somewhat. Not huge, but enough so that you don't want to do it. But I don't think you'll see —

It's interesting. Coffee's gone down every year. People talk about Starbucks and all that, but if you look at coffee consumption in this country, if you look at milk consumption in this country, you know, per capita, it just goes down, down, down, down, year, after year, after year, after year.

And I think it's pretty clear what people like to drink once they get used to it, and with the price right.

Interesting thing about Coca-Cola is, when I was born in 1930, a 6 1/2-ounce Coke cost a nickel and you put a two cent deposit on the bottle. But forget about that, just take the nickel.

Now you buy a 12-ounce can or a larger product, and you're paying, if you buy it on the weekends in the supermarket special or something, you're paying maybe a little more than twice per ounce what you were paying in 1930, 70 years ago.

And compare that to the price behavior of almost any product, you know, that you can find except raw commodities. But compare it to cars, housing, anything. And there's been very, very little price inflation in it.

And I think that's a contributor, of course, to the growth in per capitas over time.

Charlie, how about cereals and soup?

CHARLIE MUNGER: Well, I think those are examples where the moats got less hostile for the competitors.

Part of the trouble was the buying power got more concentrated and tougher.

I mean, the big grocery chains now have a lot of clout. And then you add the Walmarts and the Costcos and the Sam's and the — it's a different world faced by the Kelloggs than the one they had 30 or 40 years ago.

WARREN BUFFETT: Yeah, there will be a battle, always, between brands and retailers, because the retailer would like his name to be the brand.

And, to the extent that people trust Costco or Walmart more than they — or as much as — they trust the brand, then the value of having the brand moves over to the retailer from the product itself.

And that's gone on for a long, long time. You know, the first — I would — cases I know about in any real quantity were back with A&P in the '30s. And A&P, I believe, was the largest food retailer in this country. And they were also a big promoter of private labels. Ann Page I think was a big private label with them, for example.

And they felt they could convince the consumer in the '30s that their brand meant more than having Del Monte on it or Campbell's or whatever it might be in the different categories. And people thought they were going to win that war for a while.

And who knows? I mean, I don't know all the variables that went into A&P's decline, but it was dramatic. I mean, it was one of — it was a great American success story for a while, and then it was a great American failure.

Charlie, you —?

CHARLIE MUNGER: The muscle power of the Sam's Clubs and the Costcos has gotten very extreme. A little earlier this morning, when I was autographing books, a very good looking woman came up to me and said she wanted to thank me.

And I said, "For what?" And she said, "You told me to buy this pantyhose I'm wearing from Costco."

And I'd evidently made some previous comment about how amazing it was that Costco could get Hanes, of all people, to allow a co-branded pantyhose, Hanes-dash-Kirkland, in the Costco stores. That wouldn't have happened 20 years ago.

WARREN BUFFETT: She must've been pretty desperate if she was consulting with you on where to buy pantyhose, Charlie. (Laughter)

25. Selling short is "tempting" but "very painful"

WARREN BUFFETT: OK, let's move to area 5.

CHARLIE MUNGER: Yeah, right.

AUDIENCE MEMBER: Hi, I'm Dave Staples from Hanover, New Hampshire and I've got two questions for you.

First, I'd like to hear your thoughts on selling securities short and what your experience has been recently and over the course of your career.

The second question I'd like to ask is how you go about building a position in a security you've identified.

Using USG as a recent example, I believe you bought most of your shares at between 14 and $15 a share. But certainly, you must've thought it was a reasonable investment at 18 or 19.

Why was 14 and 15 the magic number? And now that it's dropped to around 12, do you continue to build your position? How do you decide what your ultimate position is going to be?

WARREN BUFFETT: Well, we can't talk about any specific security, so — our buying techniques depend very much on the kind of security we're dealing in. Sometimes, it's a security that might take many, many months to acquire. And other times, you can do it very quickly. And sometimes, it may pay to pay up. And other times, it doesn't.

And the truth is, you never know exactly what the right technique is to use as you're doing it, but you just use your best judgment based on past purchases. But we can't discuss any specific one.

Short selling, it's an interesting item to study because it's, I mean, it's ruined a lot of people. It is the sort of thing that you can go broke doing.

Bob Wilson, there're famous stories about him and Resorts International. He didn't go broke doing it. In fact, he's done very well subsequently.

But being short something where your loss is unlimited is quite different than being long something that you've already paid for.

And it's tempting. You see way more stocks that are dramatically overvalued in your career than you will see stocks that are dramatically undervalued.

I mean there — it's the nature of securities markets to occasionally promote various things to the sky, so that securities will frequently sell for five or 10 times what they're worth, and they will very, very seldom sell for 20 percent or 10 percent of what they're worth.

So, therefore, you see these much greater discrepancies between price and value on the overvaluation side. So you might think it's easier to make money on short selling. And all I can say is, it hasn't been for me. I don't think it's been for Charlie.

It is a very, very tough business because of the fact that you face unlimited losses, and because of the fact that people that have overvalued stocks — very overvalued stocks — are frequently on some scale between promoter and crook. And that's why they get there. And once there —

And they also know how to use that very valuation to bootstrap value into the business, because if you have a stock that's selling at 100 that's worth 10, obviously it's to your interest to go out and issue a whole lot of shares. And if you do that, when you get all through, the value can be 50.

In fact, there's a lot of chain letter-type stock promotions that are sort of based on the implicit assumption that the management will keep doing that.

And if they do it once and build it to 50 by issuing a lot of shares at 100 when it's worth 10, now the value is 50 and people say, "Well, these guys are so good at that. Let's pay 200 for it or 300," and then they could do it again and so on.

It’s not usually that — quite that clear in their minds. But that’s the basic principle underlying a lot of stock promotions. And if you get caught up in one of those that is successful, you know, you can run out of money before the promoter runs out of ideas.

In the end, they almost always work. I mean, I would say that, of the things that we have felt like shorting over the years, the batting average is very high in terms of eventual — that they would work out very well eventually if you held them through.

But it is very painful and it’s — in my experience, it was a whole lot easier to make money on the long side.

I had one situation, actually, an arbitrage situation when I was in — well, it was when I moved to New York in 1954, so it would’ve been about June or July of 1954 — that involved a surefire-type transaction, an arbitrage transaction that had to work.

But there was a technical wrinkle in it and I was short something. And I felt like a — for a short period of time — I felt like Finova was feeling last fall. I mean, it was very unpleasant.

It — you can’t make — in my view, you can’t make really big money doing it because you can’t expose yourself to the loss that would be there if you did do it on a big scale.

And Charlie, how about you?

CHARLIE MUNGER: Well, Ben Franklin said, “If you want to be miserable, you know, during Easter or something like that,” he says, “borrow a lot of money to be repaid at Lent,” or something to that effect.

And similarly, being short something, which keeps going up because somebody is promoting it in a half-crooked way, and you keep losing, and they call on you for more margin — it just isn’t worth it to have that much irritation in your life.

It isn’t that hard to make money somewhere else with less irritation.

WARREN BUFFETT: It would never work on a Berkshire scale anyway. I mean, you could never do it for the kind of money that would be necessary to do it with in order to have a real effect on Berkshire’s overall value. So it’s not something we think about.

It’s interesting though. I mean, I’ve got a copy of The New York Times from the day of the Northern Pacific Corner. And that was a case where two opposing business titans each owned over 50 percent of the Northern Pacific Company —the Northern Pacific Railroad.

And when two people each own over 50 percent of something, you know, it’s going to be interesting. And — (laughter) — Northern Pacific, on that day, went from 170 to a thousand.

And it was selling for cash, because you had to actually have the certificates that day, rather than the normal settlement date.

And on the front page of The New York Times — which, incidentally, sold for a penny in those days. It's had a little more inflation than Coca-Cola — front page of The New York Times, right next to the story about it, it told about a brewer in Newark, New Jersey who had gotten a margin call that day because of this.

And he jumped into a vat of hot beer and died. And that's really never appealed to me as, you know, the ending — (laughter) — of a financial career.

And who knows? You know, when they had a corner in Piggly Wiggly, they had a corner in Auburn Motors in the 1920s. I mean, there were corners. That was part of the game back when it was played in kind of a footloose manner. And it did not pay to be short.

Actually, during that period — you might find it interesting — in the current issue of The New Yorker, maybe one issue ago, the one that has the interesting story about Ted Turner, there's also a story about Hetty Green.

And Hetty Green was one of the original incorporators of Hathaway Manufacturing, half of our Berkshire Hathaway operation, back in the 1880s. And Hetty Green was just piling up money. She was the richest woman in the — maybe in the world. Certainly in the United States. Maybe some queen was richer abroad.

But Hetty Green just made it by the slow, old-fashioned way. I doubt if Hetty was ever short anything.

So as a spiritual descendent of Hetty Green, we're going to stay away from shorts at Berkshire.

OK, area 6.

Hetty, incidentally — this story, it's a very interesting story. As I read the story, it's almost conclusively clear to me that she forged a will to try and collect some significant money from, I believe, her aunt.

And it was a very, very famous trial back in whenever it was, 1860 or '70. And they found against Hetty when it got all through, but she still managed to become the richest woman in the country.

26. The value of Berkshire's "loyalty effect"

WARREN BUFFETT: Area 6.

AUDIENCE MEMBER: Yeah, hi. I'm James Halperin from Dallas, Texas. And I've been a shareholder since 1995. And I feel great about it, so thank you.

This question has to do with Berkshire's so-called permanent holdings and whether, when making investment decisions, you somehow mathematically calculate a value to Berkshire's reputation for loyalty to its public investees.

Let's say you are confident enough that Pepsi or Procter and Gamble would grow cash flow faster than Coke or Gillette would. And that the replacement value of the stock was less expensive enough to more than make up for the taxes.

Would you then sell Coke, for example, to buy Pepsi? And if not, why not? And how do you value this reputation for loyalty aspect in those decisions?

WARREN BUFFETT: Well, I think that's a very good question.

I don't think we would ever — I think it's very unlikely we would come to the conclusion that we were that certain that — you mentioned P&G and Pepsi versus the ones — but that some major consumer products company would do better than the ones we're in.

We might very well decide that some other one is going to do quite well and buy that additionally.

As a practical matter, if I'm on the board of a company, or Charlie were to be, representing Berkshire, it's very difficult — I would say it's almost impossible for us to trade in their securities.

It just — it creates too many problems. People would think we knew something we didn't. Or, you know, particularly if we were selling it, you know, we would have people questioning very much whether we had detected something within the company that was not available to the rest of the world.

So we really give up an enormous amount of investment mobility when we go on a board.

And so I don't even think about doing what you're suggesting, although I might very well if I were just a money manager running the business.

We certainly, and we've laid it out in the ground rules in the back of the — in our Owner's Manual back in the annual report — we've certainly said, in terms of businesses we buy control of, that they just aren't for sale. And a fancy price will not tempt us.

And that we lay out that exception relating to businesses where we think there's a permanent loss of cash for as far as the eye can see, or businesses where we have labor troubles, which we — I described earlier in the day, we might've had at The Buffalo News at that one period.

But otherwise, simply because we can use the money better someplace else, we're not interested in it.

You know, I can't really dig into my psyche and tell you how much of that is because I think that will help us buy businesses in the future if we behave that way, or how much is just my natural inclination that when I make a deal with somebody and I'm happy with how they behave with me, that I want to stick with them. It's probably both, you know?

And I wouldn't want to try and weight the two. I'm happy, you know, with the results of the first and I'm happy with the way I feel, essentially, about the second.

I just think it's crazy — I know if I owned all of Berkshire myself, I wouldn't dream of trading around businesses with people that have trusted in me and that I like and have been more than fair with me.

I wouldn't dream of trading around businesses so that my estate was 105 percent of some very large number instead of 100 percent of some large number. I just would regard that as a crazy way to live.

And I don't want the fact I run a public company to cause me to behave in a way that I would be uncomfortable behaving if we were a private company.

But I also feel that you, as shareholders, are entitled to know that that's an idiosyncrasy of mine. And therefore, I lay it out, and have laid it out for 20 years, as something that you should understand, as an investor or before you become an investor.

I'm sure it helps us in acquisitions over time. But whether that in any way compensations the opportunity costs that Charlie talks about of making an occasional advantageous disposal, I don't know and it's something I'll never calculate.

Charlie?

CHARLIE MUNGER: Well, I do tend to calculate it, at least roughly. And so far, I think that the loyalty effect is a plus in our life.

WARREN BUFFETT: Would you regard that as true though in both public — I mean, both marketable securities and owned businesses?

CHARLIE MUNGER: Oh, no. I don't think the loyalty effect in lots of public companies is nearly as important as it is with the private companies.

WARREN BUFFETT: You can say it's a mistake for us to be directors of companies, because we give up huge amount of flexibility in investment because we are directors. I — and there's no question that we do.

It's — if you're thinking solely of making money, you do not want to be a director of any company. So there's just no question about that.

27. Confidence that Berkshire's culture will endure

WARREN BUFFETT: Area 7.

AUDIENCE MEMBER: Tom Harrison (PH) from Claremore, Oklahoma. Good afternoon, gentlemen. And thanks for a wonderful weekend.

This question's for Mr. Buffett. Being somewhat pessimistic by nature, I have a recurrent nightmare of a Wall Street Journal headline proclaiming, "Buffett kicks bucket."

WARREN BUFFETT: They may phrase it a little more elegantly than that — (laughter) — but someday, the headline will be there. (Laughter)

AUDIENCE MEMBER: And, of course, Charlie's no spring chicken either. (Laughter)

In light of these concerns, could you please go into a little more detail than that presented in your annual report regarding the succession issue? And my apologies for the morbid nature of the question.

WARREN BUFFETT: Oh, there's no reason to apologize. I mean, it's a question I ask our managers, incidentally, every couple of years.

I — about every two years, I send them a letter and I say, you know, "If you die tonight, what will you — what will I wish you had told me tomorrow morning?" You know, because I have to make that same decision and I'm not conversing with them every night.

So I want them to put in writing to me, once every couple of years, what they think about the subject, who they think should succeed them, or whether there are several candidates, or what the strengths and weaknesses are. And I have that information available.

And, you know, you're entitled to the same sort of answer about succession. It's a part of buying into this business.

And it — I can tell you that no one has more of an interest in it than I do. And Charlie has a similar interest, because, we have a very high percentage of our net worth in the business.

Plus, we've got a lifetime of effort in the business. And we want it to succeed for both, in our cases probably, at least my case, the ultimate reward, the foundation I have.

But also because we just want — we like what's happened so far and we want to prove that it can — it's not dependent upon a couple of guys like us, but that it can be institutionalized, in effect.

And we have, and Charlie and I, we know who will succeed me in what are likely to be two jobs, one marketable securities and one business operations.

We want to be very sure that the culture is maintained. And I think it's so strong that I think it'd be very hard to change it.

But in addition, the stock ownership situation with me is such that it can — if there were any inclination to change it, it can be prevented from happening. I don't think it would, anyway.

Now, in terms of who succeeds me, that depends when I die. I — and there's no sense telling you who it would be today. There'd be no plus to that, and it might not be the same 20 years from now.

I mean, 20 years ago, it would've been Charlie, obviously. But it won't be Charlie now because of his age. And it'll be somebody else.

But 20 years from now or 15 years from now it might be some third party. But we've got —we feel very good about the succession situation.

We feel very good about the stability of the organization, in terms of the stock ownership situation, because that is insured for a very, very long time to come. We couldn't feel better about the managers we have in place and the culture we have in place. And, you know, the individual will be named.

I think I've mentioned, though, that when they open that envelope — all of the contents of that envelope are already known to the key people — but when they open that envelope, the first instruction is, you know, take my pulse again. (Laughter)

But if I flunk that test, there will be somebody very good in place.

Charlie?

CHARLIE MUNGER: The main defense, of course, is to have assets that will do well, more or less, automatically. And we have a lot of those.

And to the extent you improve that further by having very good managers in place and very good individualized systems for bringing new managers into the places, there's a lot of momentum here that would go on very nicely with the present management gone.

And now, I don't think our successors are going to be as good as Warren at actually — (applause) — allocating the money. (Louder applause and laughter)

WARREN BUFFETT: No, we ran a little test case 10 years ago because for nine months and four days, I took another job at Salomon. And things went fine at Berkshire.

We've got — the managers don't need me. We have to allocate capital. We have to make sure they're treated fairly. And —

But we are not making decisions around the place, except in the allocation of capital. And that will be important. But some of that is semiautomatic. And others, you know, it does require, you know, some imagination sometime or something of the sort.

But for nine months and four days in 1991, you know, Salomon was primarily on my mind and Berkshire wasn't. And everything went on just as before. And we are far, far, far stronger now than we were 10 years ago.

So I'm very comfortable with 99 percent of my estate being in Berkshire shares. And I think it's an intelligent holding, eventually, for the foundation. And knowing that, you know, I won't be around at some point before the foundation gets it.

28. "We don't want to talk about silver"

WARREN BUFFETT: OK, area 8.

AUDIENCE MEMBER: Hello, Mr. Buffett, Mr. Munger. My name's Matt Ahner (PH). I'm from Tucson, Arizona. It's a tremendous pleasure to be here today.

This question probably falls into Charlie Munger's realm of oddball investment activities.

But considering Berkshire's previous experience in silver, what are your thoughts on the silver market today? How do you analyze this market? Have you determined an equilibrium price for silver? And if so, would you share that price, or explain to us how you determined it?

CHARLIE MUNGER: The short answer is we don't want to talk about silver. (Laughter)

WARREN BUFFETT: Yeah. We're not going to comment, you know, on oil or the prices of anything in terms of making any forecasts about it.

The equilibrium price though I can tell you is whatever it's selling for today. But there will be a different equilibrium price a year from now or five years from now. But we can't tell you what it'll be.

29. Electricity deregulation led to damaging shortages

WARREN BUFFETT: Area 1.

AUDIENCE MEMBER: Hello, Mr. Buffett, Mr. Munger. My name's Bob Odem (PH) from Seattle, Washington.

Considering the political climate, and what seems to be a more regulated environment than not in the electric utilities market, and politicians that seem to be pacifying their constituents rather than the common sense of price and quantity —

Is it not a risky venture to participate in these markets more than what has already been done with MidAmerican, considering that, even with a possible repeal of the PUHCA laws, that they may be reinstated some years later, with the addition or subtraction of any other legislation that a politician may dream up, and then put the investment at risk?

WARREN BUFFETT: Charlie, you're a resident of California. (Laughs)

CHARLIE MUNGER: Well, the production of electricity, of course, is an enormous business. And it's not going away.

And the thought that there might be something additional that we might do in that field is not at all inconceivable. It's a very fundamental business.

Now, you're certainly right in that we have an unholy mess, in California, in terms of electricity.

And again, it reflects, I would say, a fundamental flaw in the education system of the country, that is many smart people of all kinds, utility executives, governors, legislators, journalistic leaders, they have difficulty recognizing that the most important thing with a power system is to have a surplus of capacity.

Is that a very difficult concept? (Laughter)

You know, everybody understands that if you're building a bridge, you don't want a bridge that will handle exactly 20,000 pounds and no more.

You want a bridge that'll handle a lot more than the maximum likely load. And that margin of safety is enormously important in bridge building.

Well, a power system is a similar thing. Now, why do all these intelligent people, you know, ignore the single most obvious and important factor and just screw it up to a fare-thee-well?

So I'm giving you a response which is, of course, another question. As the — my old professor used to say, "Let me know what your problem is and I'll try and make it more difficult for you." (Laughter)

WARREN BUFFETT: Well, to me, the interesting thing is that you had a system — I mean, Charlie's obviously right in that you've got about three goals in terms of — from a societal standpoint — you've got perhaps three goals in what you would like your electric utility business to be.

One is you would like it to be reasonably efficiently operated.

Secondly, since it does tend to have, in many situations, monopoly characteristics, you would want something that produced a fair return, but not a great return for capital. But enough to attract capital.

And then third, you'd want this margin of safety, this ample supply.

Now, when you've got a long lead time to creation of supply, which is the nature of putting on generation capacity, you have to have a system that rewards people for fulfilling that obligation to have extra capacity around.

A regulated system does that. If you give people a return on the capital employed, if they keep a little too much capital employed so that they have this margin of safety on generation, and they get paid for it, they stay ahead of the curve. They always have 15 or 20 percent more generating capacity than needed.

And one of the disadvantages of that regulation and the monopoly nature is that it doesn't have the spur to efficiency. They try to build it in various ways, but it's difficult to have a spur to great efficiency if somebody can get a return on any capital they spend.

So utility regulators have always been worried about somebody just building any damn thing and getting whatever the state-allowed return is.

But I would say that the problems that would arise from, say, a little bit of sloppy management are nothing compared to the problems that arise from inadequate generation.

So here you have in California — my view as an outsider — you had a situation under regulation where the utilities had the incentive to have a little extra generating capacity because they got allowed to earn a decent return on it, a return that would attract capital.

Then you had, I think, the forced sell-off of half of their generating capacity or something like that. And they sold it at multiples of book value to a bunch of people who were now just generators who were deregulated.

They've got — they don't have an interest in having too much supply. They've got an interest in having too little supply.

So you've totally changed the equation because the fellow that now has the deregulated asset, for which he paid three times book, now has to earn a return on a three times book what the fellow was formally earning under the regulated environment at one times book.

And so, he is not going to build extra generating capacity. That — all that does is it brings down the price of electricity. You know, he hopes things are tight.

So you've created, in my view, a situation where the interests of the companies in the business have diverged in a significant way from the interests of society. And I — it just doesn't make any sense to me. And I really think that the old system made more societal sense.

Let people earn a good return, not a great return, but a return that attracts capital, on an investment that has built into it the incentives to keep ahead of the game on capacity because you can't fine tune it that carefully. And you do have this long lead time, so.

Now, what you do with the scrambled eggs now, you know, is something. And with all the political forces back and forth, I think that you'd better have a system that encourages building extra capacity.

Because you don't know how much rainfall there will be in the Pacific Northwest and, therefore, how much hydro will be available. And you don't know what natural gas prices will do. And therefore, you know, whether it's advantageous for a gas-fired turbine to be operating.

And it — the old system really strikes me as somewhat better than this semi-deregulated environment that we've more or less stumbled into.

But Charlie, what do you think on that?

CHARLIE MUNGER: Of course, even the old system got in some troubles in that since everybody had the NIMBY syndrome — "Not In My Back Yard" — everybody wanted any new power plant to be anyplace not near me.

And if everybody feels that way, and if the political system means that the obstructionists are always going to rule, which is true in some places in terms of zoning and other matters, you get in deep trouble.

If you let the unreasonable, self-centered people make all the decisions of that kind, you may well get so you just run out of power. That was a mistake.

And we may make that mistake with oil refineries. It is — you know, we haven't had many new, big oil refineries in the last, well, period. So you may get to do this all over again.

WARREN BUFFETT: All of that being said, there will be need for more generation capacity. I mean, the electric utility industry will be — will grow. It will need lots of capital.

And there should be ways to participate in that where we get reasonable returns on capital. We would not expect to get great returns on capital. But we would, you know, we would be happy to do that. We generate a lot of capital and we would be comfortable in that business.

We would not feel the risks were undue, as long as we didn't go around paying incredible prices for somebody else's capacity and then have people get very upset at what that meant in terms of their electric rates. You can't go out and —

If you've got a utility plant in this country that was put in place at X and then you go out and encourage entrepreneurs to buy in at 3X, you cannot expect utility prices — electricity prices — to fall. And that was, in my view, a very basic mistake. I may not understand it fully.

30. Can a good business make up for bad management?

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: Good afternoon. My name is Pavel Begun. I am from Minsk, Belarus. And I have two questions.

And before I'll have questions for you, I'd like to say thank you for recommending to read "Intelligent Investor." It's a terrific book and it reshaped me tremendously, literally, overnight. So I'd like to thank you for that.

And now the question. Say I'm an owner of the business. And the business has a durable competitive advantage and superior business model and is run by able people.

And then, you know, I start noticing that, basically, management starts doing things which are far from intelligent.

So what should I do as an owner, as an investor? Should I try to tell them how they should run the business? Or should I just sit back and do nothing because superior business model should overcome poor management? That's the first question.

And the second question is, how important is nominal experience in the business of investing? And by saying nominal, I mean the number of — the actual time you've been in the business, as opposed to real experience that also includes experience you acquire from, say, Ben Graham, or you, or Peter Lynch, when you read books? So those are the questions.

WARREN BUFFETT: On your first question, did you assume that you had control of the business, or you just owned a marketable security?

AUDIENCE MEMBER: Yes, if I own, say, 20 percent of marketable securities.

WARREN BUFFETT: All right. Well, the situation you described is not hypothetical, in the first case. (Laughter)

And I would say that the history that Charlie and I have had of persuading decent, intelligent people, who we thought were doing unintelligent things, to change their course of action has been poor.

Would you agree with that, Charlie, or no?

CHARLIE MUNGER: Worse than poor.

WARREN BUFFETT: Yeah. (Laughter)

So I would say that if you really think you're in with people that have got a good business, but they're going to keep doing dumb things with your money, you'll probably do better to get out and get in with people who've got a good business and you think they're going to do sensible things with it. I mean, you've got that option.

Now, you also have the option of trying to persuade them to change their mind. But it's just very, very difficult. I mean it is, you know, that's been something we've faced for 50 years.

And initially, we faced it from a position where nobody even knew who the hell we were, or anything of the sort.

So we've acquired a certain stature over time, perhaps in talking on the subject. And we've written on the subject. And we still don't get very far. I mean, when people want to do something, they want to do something.

And they didn't rise to become the CEO of a company to have some shareholder tell them that their most recent idea is dumb. I mean, that is just not the type that gets to the top.

So I would say that, as a matter of investment technique, and maybe as a matter of, you know, avoiding stress in your life and all of that sort of thing, that it's — and dealing with smaller quantities of stock so it's easier to sell and buy and all that sort of thing — I would say that it's better to be in with a management you're simpatico with, than simply to be in a great business with a management that's bent on doing things that don't make much sense to you.

Charlie?

CHARLIE MUNGER: Well, I certainly agree with that.

31. Having "your head screwed on right in the first place"

WARREN BUFFETT: Second question — (laughs) — I gather is, sort of, how much does our actual business experience versus book experience help us?

AUDIENCE MEMBER: Well, it's, you know, if you look at a person who has just made two years of being in the business of investing, versus a person who has been for 10 years in the business of investing.

And say the person who has been for two years, you know, has read a lot about, you know, Ben Graham's techniques, and your techniques, and, say, Peter Lynch's techniques. So would you say that the person who has only two years of experience may do much better than the second person?

WARREN BUFFETT: Well, if everything else is equal, I mean, everything else is equal, except the amount of experience you have, I think the experience is probably useful. But it isn't going to be equal. And I don't think that — I don't think that the —

I think it's way more important what you've thought about for two years than what you've practiced for 10 years. If you're — if the direction — if there's a divergence in techniques applied, I would rather be with the one that I'm philosophically in sync with.

If I'm philosophically in sync with both and one's had 10 years of experience, the chances are they will know a little bit more about more businesses if they've been around for 10 years, looking at them, than if they've been around for two years.

But the biggest thing is that, you know, basically they've got their head screwed on right in the first place, in terms of how they value businesses and how they look at stocks.

Whether they look at them as pieces of businesses or whether they look at them as little things that move around, and that you can tell a lot by looking at charts or listening to strategists on or something of the sort.

We have — Charlie and I have learned a lot about a lot of businesses over 40 or 50 years. But I would say that, in terms of the new things that would come to us, at the end of the second year, we were probably about as good judges of them as we would be today.

But I think there's a little plus to having seen — more in terms of human behavior and that sort of thing — than knowing about the specifics of a given business model.

Charlie?

CHARLIE MUNGER: Yeah, I think that — I've watched Warren for a long time now, and I would say he's actually getting better as he gets older. Not at golf or — (Buffett laughs) — many other activities, but —

WARREN BUFFETT: Stay with generalities.

CHARLIE MUNGER: — as an investor, he's better — (laughter) — which I think's remarkable. It shows that scale of experience matters.

WARREN BUFFETT: Yeah, it helps somewhat to have seen a lot of business situation — I mean, Charlie talks about models and you construct your models as you go along based on observation.

And your models will — if you're paying attention, your models will be somewhat better the more years you've spent really observing and not just trying to make everything fit into what you saw the first few years.

32. Berkshire stock recommendations would be "big mistake"

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: Hi, my name is Richard Marvel (PH) from Washington, D.C. And my question has to do with the intrinsic value of Berkshire Hathaway.

You've stated several times that you would prefer the stock to be neither overvalued nor undervalued so that the time people spend owning the security represents a gain from what the security — the results during that period of time.

However, it's a very difficult security to value because of the disparate pieces.

And, as we saw last year, when you provide a little bit of guidance — in last year's annual report you said that when the stock price hit $45,000 a share, you considered buying, but thought it was unfair until the annual report came out so everyone had the same information.

And while I also realize that you don't feel there is a particular quote-unquote "correct" number, would you ever consider giving any guidance in this direction?

WARREN BUFFETT: Yeah. The answer is we really wouldn't. I mean, to the extent that we were going to repurchase shares, you could certainly interpret that as indicating that we thought it was attractive from the standpoint of remaining shareholders to do so.

And we certainly wouldn't be paying over intrinsic value, at least in our judgment, and benefiting the exiting shareholders to the disadvantage of the continuing shareholders. So you might draw that conclusion at that point.

But other than that, we've — you know, we would prefer Berkshire's shares to fluctuate far less than they do. Because we would like the — ideally — we would like the experience of every investor during the time they held the shares to be exactly proportionate to the progress, or lack thereof, of the business.

And I think we've come, over the years, reasonably close to that, compared to most companies. But the nature of markets is such that reasonably close is as, you know, probably as good as it's going to get.

We don't know the exact intrinsic value of Berkshire, obviously. And if you looked at the figures, we — if we had written down secret figures over the — ever since 1965 — they would — some of them would look silly now, in terms of what has actually transpired.

But we try to give you — I think Berkshire is easier to value than most businesses, actually, because we give you all the information that, at least, is important to us in valuing it.

And then the biggest judgment you have to make is how well capital will be deployed in the future.

Because it's easy — it's relatively easy — to figure out the present value of most of our businesses, but the question becomes, "What do we do with the money, as it comes in?"

And that will have a huge impact on the value 10 years from now. And that will depend a lot on the environment in which we operate over the next 10 years. There'll be a lot of luck in it.

I think — you know, I think there's a reasonable chance of good luck. But who knows?

It would be a mistake for us to do anything — I mean, a big mistake — to ever recommend buying or selling the stock. I mean, how would you tell everybody to do it at once? You know, you would negate your own advice.

You're certainly not going to tell one person, you know, to the advantage or the disadvantage of somebody else.

So there's really no way for us to ever talk about whether we think the stock — whether we think it's a buy or a sale, except to the extent, like I say, on repurchases where there's obviously an implicit judgment being given the shareholders.

Charlie?

CHARLIE MUNGER: Yeah. I rather like the way it's worked out.

If you average out the period that we've been through, we've come within hailing distance of the objective of having our stock track its intrinsic value. It gets a little ahead sometimes and a little behind other times, but averaged out, it's worked pretty well.

33. Would Benjamin Graham's "cigar butt" strategy work now?

WARREN BUFFETT: Area 4.

AUDIENCE MEMBER: Good afternoon. My name is Martin O'Leary (PH) and I'm from Houston, Texas. My question to you is this.

In your annual report this year, in the letter to the shareholders, you indicated that it was 50 years ago that you met Benjamin Graham, and that he had a major impact in your life, especially in your investment success.

Moreover, you've stated in the past that "The Intelligent Investor" is, by far, the greatest book ever written on investing.

One of the central tenants in the book was that if you bought a group of stocks, say, 10 or 20, that traded at two-thirds or less than net current assets, that you would be assured of a margin of safety, coupled with a satisfactory rate of return.

Today, if you were to find 10 or 20 stocks that trade at two-thirds of net current assets, would you be inclined to purchase those stocks for your own personal portfolio, not for Berkshire Hathaway?

And the second question, since I've mentioned the book, I was wondering which books that you and Mr. Munger have been reading lately and would recommend. Thank you.

WARREN BUFFETT: Yeah, in respect to your first question, you could probably — if you found a group like that — and you won't, I don't think — you'd probably do all right buying the group.

But not because the businesses themselves worked out that well over time, but because there would probably be a reasonable amount of corporate activity in a group like that, either in terms of the managements taking them private, or takeovers, or that sort of thing.

But those sub-working capital stocks are just almost impossible to find now. And if you got into a market where a lot of them existed, you'd probably find wonderful businesses selling a lot cheaper, too. And our inclination would be to go with a cheap, wonderful business.

I don't think you'll get — in a high market or something close to it — I don't think you'll get a lot of sub- working capital stocks anymore. There's just too much money around to promote deals before they really get to that point.

But that was a technique. It was 50 years ago.

And is Walter Schloss here still? Walter, are you here? Stand up if you're here.

I met Walter 50 years ago when I met Ben Graham. I know Walter's — came out this year, but he already knows everything I've been talking about, so he may have left.

But Walter, actually, has practiced in securities, much closer to the original — he's run a partnership now for 46 years, I guess it is. And he's done it much more with the type of stocks that Ben was talking about in those days.

And he has a record that is absolutely sensational, that is far better than people who get promoted and go on television shows and do all of that sort of thing.

And he's done it in, you know, what I tend to call cigar butt companies. You know, you get one free puff and that's about it, but they don't cost anything.

And that's — that was the sub-working capital type situations. Walter's had to extend that somewhat, but it's been a great, great record over a considerable — I mean, 46 years — a very considerable period of time.

So I think, if you found that kind of a group and did it as a group operation, and Ben always emphasized a group operation because when you're dealing with lousy companies but you expect a certain number to be taken over and all that, you'd better have a group of them.

Whereas if you deal with wonderful companies, you only need a couple. But I think, if you see that period again, we'll be very active. But it won't be in those kind of securities.

Charlie?

CHARLIE MUNGER: Yeah. And there's another change. In the old days, if the business stopped working, you could take the working capital and stick it in the shareholders' pockets.

And nowadays, as you can tell from all the restructuring charges, when things really go to hell in a bucket, somebody else owns a lot of the working capital. The whole culture has changed.

If you have a little business in France and you get tired of it, as Marks & Spencer has, the French say, "What the hell do you mean trying to take your capital back from France? There're French workers in this business."

And they don't care. They don't say, "It's your working capital. Take it back," when the business no longer works for you. They say, "It's our working capital." The whole culture has changed on that one.

Not completely, but a lot from Ben Graham's day. There're a lot of reasons why the investment idiosyncrasies of one era don't translate that perfectly into another.

WARREN BUFFETT: That list that was published, I forget whether it was published in the 1951 edition of "Security Analysis" or the '49 edition of "Intelligent Investor," but there were a list of companies.

There was Saco-Lowell, there was Marshall-Wells, there was Cleveland Worsted Mills, there was Foster Wheeler, and all those companies were sub-working capital companies selling at three or four times earnings.

And there was a — if you bought a group of stocks like that, you were going to do well. But, you know, I — you certainly don't see that in companies of any size today.

And I've seen a few lists of tech companies selling below cash. But they're determined to use that cash. And it may not be there in a year or two.

It was a different breed of animal, to some extent, in Ben's list at that time.

34. Book recommendations

WARREN BUFFETT: Did you ask a second question?

CHARLIE MUNGER: Books you've read.

WARREN BUFFETT: Oh, books I've read.

Well, tell him what books you've read, Charlie. (Laughter)

CHARLIE MUNGER: Well, I mentioned that one book "Genome." I have a hell of a time putting the accent on the first syllable. But that is a marvelous book.

And some shareholder sent me a book that not many of you will like, by Herb Simon I think, "Models of My Life." And it's a very interesting book for a certain academic type.

But that "Genome," you know, which is the history of a species in 23 chapters, and it's a perfectly amazing book, and very interesting.

WARREN BUFFETT: I may have recommended it before, but if you haven't read "Personal History" by Katharine Graham, I think you'd find that it's a fascinating story. And more amazing yet, it's an honest story.

You know, if I ever write my autobiography, I'm going to look like Arnold Schwarzenegger, but — (Laughter)

But she is compulsively honest about what's happened. And it's really quite a saga.

CHARLIE MUNGER: It is a good book.

That Janet Lowe book about me I find has had a very interesting sub-chapter, so to speak, in its distribution.

I notice a considerable number of people buying that book and sending one copy to each descendant.

They believe that if they just do that, the descendants will behave more like the parents. It'll be interesting to see if that works. If it does, it's going to outsell the Bible. (Laughter)

WARREN BUFFETT: Hold your breath — (Laughter)

35. Congress should loosen capital restrictions for utilities

WARREN BUFFETT: Area 5.

AUDIENCE MEMBER: Good afternoon. I'm Laura Rittenhouse (PH) from New York City. And I want to say it's a great pleasure to be here. You talked earlier about companies that monetize greed. And it's great to be with people and with leaders who monetize values.

You — a couple years ago, you spoke very passionately about campaign finance reform, and I wondered if you could comment on your views of this, given recent developments related to another question in Washington.

What's your expectation for the passage of the repeal of PUHCA? I know there was some recent activity in a Senate sub-committee.

And lastly, a question for Charlie. How would you, or do you, apply the principles of intrinsic investing to real estate?

WARREN BUFFETT: OK. In respect to PUHCA, it's hard for me to — you know, I have no great record of handicapping legislative action.

But I would say that the awareness of the public problems in the electric utility industry under current circumstances, you know, has mushroomed. I mean, it's ballooned.

And so I think that — I think it's likely that Congress is more receptive to the idea that they need to do something that ensures that the power supply is adequate.

And I think that there's probably a number of them that would think that PUHCA is a barrier to capital entering the industry from a lot of sources where capital is available. And that it's going to take capital to solve this problem.

Now, they don't have to solve it by letting Berkshire do more things. But it's not a crazy approach to say that if Berkshire has billions of dollars to invest, that it might be a net plus for the availability of electricity down the road.

So I think that certainly the chances of repeal or major change are far higher now than they were a couple of years ago. And, I mean, politicians do not like to face major brownouts.

I mean, they can try and blame it on someone else and they may well be accurate in blaming it on someone else.

But the public is going to at least partially blame political leaders if this country runs out of electricity, because it hasn't run out of the ability to build generators.

You know, we could create all the generators we needed to have plenty of electricity. And we could create the transmission lines and all of that.

But you do need a flow of capital to the industry. And PUHCA restricts that flow to quite a degree, I would say.

36. More regulation needed for campaign contributions

WARREN BUFFETT: Campaign finance reform, you've read about it as much as I have. You know, I happen to admire enormously what McCain and Feingold have done.

I don't think it's a panacea. I mean, money is going to find its way into trying to buy political influence one way or another.

But the present situation, in my view, has gotten totally out of control and, incidentally, totally out of sync with what the American Congress, even, as well as the public, intended, because in 1907, Congress said, and it's never been changed, that corporations shall not contribute money to federal elections.

And in 1947, they said the same thing about labor unions. And then they enacted campaign legislation in the early '70s which, when later interpreted by the Federal Election Commission, enabled corporations and unions to do on an unlimited scale, what Congress had said they shouldn't do at all.

And politicians did not really understand the potential in that, initially. I remember the first guy that called me, Senate candidate, called me for a soft money contribution probably in 1985, or so.

And he was kind of embarrassed about it and sort of danced around the subject about how this money was going to find its way into his campaign and everything. And he was asking me for an amount of money that was illegal under the law, except if I did it via soft money.

And that has developed to the point where I have literally had people, where I have firsthand knowledge, of requesting million dollar contributions or larger, which would never be reported. We'd never be required to report it. And I regard that as a perversion of the system.

But I think we're going to get some significant improvement. I think it was only possible because of the credibility that McCain built up with the public and the fact that he just wouldn't let go of this issue.

So I'm — but I'm not hopeful about it changing the whole course of American democracy or anything of the sort.

But I am hopeful that the system of government where access is sold to the highest bidder, and where the bidding starts at a higher level, by a material amount, in every election cycle, will at least be checked for a while.

Charlie, she had a question for you.

CHARLIE MUNGER: Well, my trouble with campaign finance reform is that I fear career politicians just staying on and on just about as much as I fear special interests protecting themselves with money. And I never know exactly how the reform is going to work.

When I came to California, we had sort of a semi-corrupt, part-time legislature dominated by race tracks and saloons and liquor distributors, and so on.

And people went up and entertained the legislators with prostitutes and what have you. And I really sort of prefer that government, in retrospect — (laughter) — to the full-time legislators I have now.

So I just am more skeptical about my ability to predict which reform I'm going to like the results of and which I would like to trade back in for my former evils.

37. Munger has moved on from real estate investing

WARREN BUFFETT: Laura, you had one more, did you on —? Was it for Charlie?

AUDIENCE MEMBER: It was a question about the principles of intrinsic value investing applied to real estate.

CHARLIE MUNGER: Oh, that period of my life involved the remote past. And I much prefer business investment to real estate investment.

38. Q&A concludes

WARREN BUFFETT: OK. It’s 3:30. We’re going to have a directors meeting here, we do that once a year, following this meeting. And so I’ll ask the directors to stick around.

Morning Session - 2002 Meeting

1. Formal business meeting begins

(Video recording begins after meeting has started)

WARREN BUFFETT: … second or anybody would like to speak to that motion, might now work their way over to the microphone in zone 1. Could we have a spotlight on where that is? In that way, when we get to that point of the program —

If anybody that would like to speak to the motion that was in the proxy statement, if you'll work your way over to the microphone there then we'll be ready at the time — you can be ready at the time when it will be appropriate to talk about it.

And so we'll get there in just a minute and if you'll all wander over there that are interested.

Also with us today are partners in the firm of Deloitte & Touche, our auditors. They're available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter, the secretary of Berkshire. He will make a written record of the proceedings.

Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for the meeting are Walter Scott Jr. and Marc D. Hamburg.

We will conduct the business of the meeting and then adjourn the formal meeting. After that, we will entertain questions that you might have.

2. Berkshire's shares outstanding

WARREN BUFFETT: Does the secretary have a report of the number of Berkshire shares outstanding entitled to vote and represented at the meeting?

FORREST KRUTTER: Yes, I do.

As indicated in the proxy statement that accompanied the notice of this meeting that was sent by first class mail to all shareholders of record on March 6, 2002, being the record date for this meeting, there were 1,323,707 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting and 6,290,415 shares of Class B Berkshire Hathaway common stock outstanding, with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 1,103,455 Class A shares and 5,260,231 Class B shares are represented at this meeting by proxies returned through Thursday evening, May 2nd.

WARREN BUFFETT: Thank you. That number represents a quorum and we will therefore directly proceed with the meeting.

3. Previous meeting's minutes approved

WARREN BUFFETT: First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second? The motion has been moved and seconded.

Are there any comments or questions? Three second pause. We will vote on this motion by voice vote.

All those in favor say aye. Opposed? The motion's carried.

4. Susie Buffett "leads the ticket"

WARREN BUFFETT: The first item of business of this meeting is to elect directors. The shareholders present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors here, he or she may do so.

Also, if any shareholder that is present and has not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you.

Would those persons desiring ballots please identify themselves so that we may distribute these?

I now recognize Mr. Walter Scott to place a motion before the meeting with respect to election of directors.

WALTER SCOTT: I move that Warren E. Buffett, Charles T. Munger, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Ronald L. Olson and Walter Scott Jr. be elected as directors.

WARREN BUFFETT: Is there a second?

It has been moved and seconded that Warren E. Buffett, Charles T. Munger, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Ronald L. Olson and Walter Scott Jr be elected as directors. Sounds like a hell of a slate to me.

Are there any other nominations? Is there any discussion?

Nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections.

The proxy holders please all submit to the inspector of elections a ballot on the election of directors, voting the proxies in accordance with the instructions they have received.

I will have to say at this point, deviating from my script, that — in the spirt of disclosure which now permeates the corporate world — I have a tally here from yesterday as to the number of votes each director has received.

And the — I won't give the affirmative votes, but the total — basically negative vote is a withhold vote — Charlie and I and Howie came in last, by a significant margin.

Susie did the best. She only had 1,000 votes against her, but Charlie and I had 16,000-some votes against us.

So, I really suspect that Susie voted against us so that she could lead the ticket, but who knows? (Laughter)

Miss Amick, when you're ready you may give your report.

BECKI AMICK: My report is ready.

The ballot of the proxy holders in response to proxies that were received through last Thursday evening has not less than 1,139,672 votes for each nomine.

That number far exceeds a majority of the number of the total vote related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the vote, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as any cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick.

Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr. have been elected as directors.

Next — (Applause)

5. Shareholder proposal on charitable contributions, abortion, and overpopulation

The next item of business is the proposal put forth by a Berkshire shareholder, Gloria Jay Patrick, the owner of two Class B shares.

Miss Patrick's motion is set forth in the proxy statement and provides that the shareholders request the company to refrain from making charitable contributions.

The directors have recommended that the shareholders vote against this proposal.

We will now open the floor to recognize Miss Patrick or her designee to present her proposal.

And I believe we have Mr. Mosher at the microphone in area one to speak to — to make the proposal and speak to it. Would you go ahead please, sir?

STEVEN MOSHER: Thank you, Chairman Buffett. I apologize if this is a little loud. I was told I would have to really project but I think you can hear me up there on the stage and I hope you can hear me up in the rafters.

My name is Steven Mosher. I'm the chairman of the Population Research Institute, a nonprofit organization dedicated to making the case for people as the ultimate resource, the one resource that we, as investors, cannot do without, and to debunking the hype about overpopulation, what the New York Times has called, and I quote, "One of the myths of the 20th century." Of course, we're now living in the 21st century.

I've written about the coming depopulation — that's right, I said depopulation — in the Wall Street Journal and other publications.

I say all this to explain why Gloria Patrick, a Berkshire Hathaway shareholder, has asked me to present her action at this meeting, the following proposal.

And I do have one other qualification: I have nine children.

Now when people gasp at this, I remind them that my children will be paying their Social Security one day. Of course, if you invest in Berkshire Hathaway stock, you won't need Social Security.

I will present the proposal and then, with the chairman's indulgence, spend a couple of minutes explaining why it's necessary.

Here is the resolution:

Whereas, charitable contributions should serve to enhance shareholder value.

Whereas, the company has given money to groups involved in controversial activities like population control and abortion.

Whereas, our company is dependent on people to buy the products and services of the various companies we own.

Whereas, our company is being boycotted by Life Decisions International and investment-related groups like Pro Vita Advisors because of these contributions.

Resolved: The shareholders request the company to refrain from making charitable contributions.

Let me take these very quickly, point by point.

You all know shareholder money is entrusted to the board of directors to be invested in a prudent manner for the shareholders.

I think you will all agree, as the resolution states, that charitable contributions should serve to enhance shareholder value.

Indeed, this is already Berkshire Hathaway policy with regard to its operating subsidiaries.

As Chairman Buffett explained in his Chairman's Letter of last year, quote, "We trust our managers to make gifts in a manner that delivers commensurate tangible or intangible benefits to the operations they manage. We did not invest money in this company so it could be given to someone else's favorite charity."

I think you will also likewise agree that activities like population control and abortion are controversial.

In fact, some of the charitable money has been given to Planned Parenthood, a group that is responsible for almost 200,000 abortions a year in the United States — (applause) — and in countless more through its population control programs worldwide.

Now, we believe abortion is the taking of a human life, but even if you disagree on this fundamental point, you must concur that these ongoing boycotts of Berkshire Hathaway company products are not a good thing.

Next, it should be self-evident that Berkshire Hathaway, like the economy as a whole, is dependent upon people. It is people who produce the products and services of the various companies we own, and it is people who buy them.

Now, you may think that there is the superabundance of people in the world and that we will never run short, but this is not true.

Half of the countries of the world, including countries in Latin America, Africa, and Asia, now have birthrates below replacement.

Europe and Japan are literally dying, filling more coffins than cradles each year.

Dying populations may shrink the economic pie. We already see this happening in Japan and some European countries.

How much of Japan's continuing economic malaise can be directly traced to a lack of young people to power the economy?

Dying populations may also make economic development nearly impossible. Russia is having trouble finding its feet economically. Why? Because of its ongoing demographic collapse, losing a million people a year.

These problems will spread to many more countries in the near future.

Charitable contributions to simple-minded population control programs, in which governments impose restrictions on childbearing, are not in Berkshire Hathaway's interest.

Such programs are not investing in humanity's future, they are compromising humanity's future and putting a roadblock in the way of future economic growth.

There is no global share buyback in store for those who fund population control programs, because such programs will rob the world of future consumers and producers and threaten to shrink the economic pie.

Let me give you a concrete example of what I mean. Berkshire Hathaway owns Dairy Queen.

Now, there are 103 Dairy Queens in Thailand. But Thailand, due to a massive population control campaign, now has a birthrate that is below replacement and falling.

This means that its cohorts of young children are shrinking. There will be fewer and fewer families in the years to come and its population will eventually fall.

Now, you may think Thailand has too many children. But is it possible for there to be too many children for Dairy Queen?

According to Dairy Queen, the Dairy Queen concept especially appeals to, quote, "young families." But there will be fewer young families in Thailand's future and Dairy Queen's future because of population control.

So I urge you to vote yes on this resolution: let it be resolved that this company refrain from making charitable contributions.

One final point. Should you, on the other hand, both continue the current practice of making charitable contributions based on shareholder designations, I would urge you all to designate 501(c)(3)s, like the Population Research Institute, which are attempting to help the poor become the agents of their own development and not simply try to reduce their number through population control.

Thank you, Mr. Chairman for this opportunity to speak. (Applause)

WARREN BUFFETT: Thank you.

Do we have a — do we have a second to the motion?

Ok, we have.

And is there are any further discussion? Is there anyone there at the microphone that would like to talk?

OK. If there's no further discussion, we'll have Miss Amick report on the votes cast on that.

If anybody wishes to cast a vote in person, they can raise their hand and submit that, but we'll have a preliminary report from Miss Amick.

BECKI AMICK: My report is ready.

The ballot of the proxy holders in response to the proxies that were received through last Thursday evening cast 28,452 votes for the motion, and 1,014,353 votes against the motion. (Applause)

As the number of votes against the motion exceeds a majority of the number of votes related to all Class A and Class B shares outstanding, the motion has failed.

The certification required by Delaware law of the precise count of the vote will be given to the secretary and placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Ms. Amick. The proposal failed.

6. Formal meeting adjourned

WARREN BUFFETT: After adjournment of the business meeting, I will respond to questions that you may have that relate to the businesses of Berkshire but do not call for any action at this meeting.

Does anyone have any further business to come before this meeting before we adjourn?

If not, I recognize Mr. Walter Scott to place a motion before the meeting.

WALTER SCOTT: I move that this meeting be adjourned.

WARREN BUFFETT: Is there a second?

Motion to adjourn has been made and seconded. We will vote by voice.

Is there any discussion? If not, all in favor say aye. All say no? The meeting's adjourned. Thank you. (Applause)

7. Mickey Newman introduced

WARREN BUFFETT: Now, before we get on to the questions, and when we get to the questions we will move through various zones sequentially, there are just a few special guests that I would like to recognize, and because of the crowd, I've not had an opportunity to make sure all of these special guests are here, but we will find out here shortly.

The first guest, and I hope very much he's here. He was planning to be here. It was — let's see — 40 — 48 years ago this July or so — well about June — I got a letter from Ben Graham who I had been pestering for a job for about three years and getting no place, and then said the next time you're in New York, come in and talk to me.

So, I was there about ten hours later. I didn't have a NetJets plane, so it took a little longer.

And I went in to see Ben and he offered me a job and I took it on the spot. I didn't ask what the salary was, or anything else, and a month or two later the family joined me.

I had — my daughter was already born and Susie was pregnant with Howie. And we moved back there and I went to work for Graham-Newman Corp.

And, one of my three bosses — I had three bosses that — Ben Graham, Jerry Newman, and Mickey Newman. And Mickey was exactly ten years older than I was at that time and he's exactly ten years older now.

And Mickey was a major factor in a hugely successful — he ran the place — company that was not quite that successful yet in 1954 when I went back there: the Philadelphia and Reading Coal and Iron Company, as it was called then.

And after I'd been there maybe a year — Mickey was in charge of Philadelphia and Reading — and a fellow named Jack Goldfarb came into the office, and I really didn't know what was going on.

I had a good bit of my net worth in Philadelphia and Reading, so I was interested, but Jack Goldfarb and Mickey were behind closed doors, largely.

But when they emerged, the Philadelphia and Reading Company, which was controlled by Graham-Newman, had bought Union Underwear, which was the manufacturer of Fruit of the Loom product under a license at that time.

And, as I told in the annual report, was a very, very attractive buy, and Mickey made a number of good buys.

And when — Mickey and I have talked and seen each other over the years, some, not a lot, but we would see each other.

And when Fruit of the Loom entered bankruptcy a few years ago, Mickey called me and sort of said, what are you going to do about it? You should do something.

And he was very helpful, particularly helpful, in introducing me to John Holland, who runs Fruit of the Loom, and who is a tremendous asset to the company. And, Mickey gave me lots of insights on that.

And when I got discouraged with the bankruptcy procedure — and it is discouraging to try and buy a company out of bankruptcy — Mickey would gently prod me along.

And so I believe, today, we have with us Mickey Newman and his son, who I last saw when he was a little red-headed kid, Bill.

Mickey and Bill, if you're here, if you'd stand up, it'd be great. Now, let's see if they made it.

There they are. Let's have a spotlight on them. (Applause)

I can't see very well from here whether Bill is still redheaded.

But Mickey is 81, believe it or not. You won't believe it if you meet him.

And he's been a tremendous help and a great friend over the years.

And he accomplished much for us in the past year. We — I don't think we would have Fruit of the Loom if it hadn't been for Mickey, particularly nudging me along as we went through the process.

8. Scott and Fetzer's Ralph Schey introduced

WARREN BUFFETT: I also hope we have today with us, and again, I didn't get a chance to see them before the meeting, but are Ralph and Luci Schey here? Ralph and Luci? Did they — were they able to make it or not?

Yeah, there they are. (Applause)

Ralph is in the Berkshire Hathaway Hall of Fame. I mean, this is like being at Cooperstown, you know, and introducing Bob Gibson or Sandy Koufax.

Ralph, for a great many years, added tremendous value to Berkshire at Scott and Fetzer.

We wouldn't be able to buy some of the things, like Fruit of the Loom, if it hadn't been for the profits developed under Ralph's management at Scott Fetzer.

So I'm delighted that he and Luci can join us. (Applause)

9. Larry and Dolores Brandon introduced

WARREN BUFFETT: I believe, and I hope we have Larry and Dolores Brandon. Are they here?

Show your — there they are. Let's have a spotlight on them. (Applause)

Delores is also known as "Dutchy" but we call her "Saint Dutchy" at Berkshire headquarters because she gave birth some years ago to Joe Brandon, and Joe has been doing a fabulous job for us at General Re. He took over early in September.

It's really going to be our number one asset. There're been a lot happened since those days in September when Joe took over. I think you're going to see some terrific results throughout our insurance business, but particularly at General Re.

I wrote Dutchy a letter and I said, you know, it's terrific what you've done for us, but — you know, I was a little like the farmer that went into the henhouse, and I, you know, pulled out an ostrich egg, and said to the hens, you know, I don't like to complain, but this is just a sample of what the competition's doing. (Laughter)

Well, I berated her a little bit for not having twins, because if she just had a twin for Joe, we'd own the world.

But she tells me that — and she wrote me back and said — she really had done her best. I mean, she'd had seven children, five of whom are in the insurance business, and she has 19 grandchildren.

So, we have people out on the road trying to sign up these grandchildren now and — (Laughter)

If you get a chance, you know, tell her her productive years are not over. (Laughter)

10. Andy Heyward introduced

WARREN BUFFETT: And finally, we have with us today the fellow who put together that terrific cartoon.

Anybody that can — even takes on the job of making me look like James Bond is a very brave person.

And, Andy Heyward has a company called DiC Entertainment, which is a leading producer of children's programming. When you turn on the television on Saturday morning, you will be seeing his output.

And Andy puts this product together. He sends people to Omaha. He does it all.

It's his script, it's his production. He does it on his own time, on his own nickel, he just — it's his contribution to the Berkshire meeting. And it, I mean, it's absolutely fabulous.

And I have to tell you that this fall, Andy is going to have a series of 40 episodes that are called — I think it's called "Liberty's Kids."

It will be on public broadcasting at 4:30, five days a week. And it's really the story of America.

It's told — Charlie will like this — Charlie doesn't know about this — it will be told through the eyes of three young apprentices in Ben Franklin's print shop.

And it will view the evolving of the American democracy and the Constitution, and all with Andy's creative characters, but it will use the voices of various other people.

And I'm flattered. I get to be James Madison in this. And we have Sylvester Stallone, we have Billy Crystal, we have Whoopi Goldberg.

And Charlie will be crushed to find — I think its Walter Cronkite is going to be Ben Franklin.

I mean, I think Charlie held out for too much money or something. (Laughter)

But, it's going to be a fabulous series. I mean, I am looking forward to this. It will run all this year, starting in the fall, and then it will run again in the following year. And it will be a great, great, piece for American children and American adults.

I plan on watching it myself. And it will just be the story of how this country came about, through the eyes of these three young apprentices of Ben Franklin.

So, Andy is here with his son Michael, and if Andy and Michael would stand up, I'd like to give them a hand myself. Andy, where are you? (Applause)

They're here someplace. (Applause continues)

11. Berkshire managers praised

WARREN BUFFETT: We've got a lot of other special guests, but they're up here in our managers' section. You saw them up on the screen. They're the people who make this place work.

We have a larger and better cast this year than we've had even in the past, and it will grow in the future.

This is a company of managers. And, you know, we confess to how little we do around headquarters, as you saw in the movie.

And we now have, I think — I'm not sure of the exact number, whether we have 130,000 now, or something like that — people working all over the world in all kinds of occupations.

And, I think they get a sense when they come here that they're working for real people on this side, too.

I mean, they get to see people who are actual owners. We have some institution holders, but we have 350,000 individual owners now, and I think — I believe — it's correct to say that our stock turns over — less turnover — in the shares of Berkshire than in any other company of major size in the country.

Which means, in effect, we have more what I would call real owners, people who want to be in partnership with the kind of managers we have. And Charlie and I are very proud of them.

12. Q1 insurance update

WARREN BUFFETT: Now we're going to get to the questions in just one second.

I thought I would give you a little update on, particularly, the insurance aspects of the first quarter, because insurance cost us a lot of money last year.

It's our main business. It's always going to be our main business. It's a very, very big business, and it's going to get bigger.

And, there were some special events of last year, and there were some mistakes of our own that made it a bad year for insurance last year.

Our float last year cost us almost 13 percent, and that's a lot to pay for money.

It's not our record. We had a period in the '80s when we ran into even more difficulties.

But I think there's been — well, I know there's been — there's been a change in the market. There's been a change, to a degree, in the culture at a very important unit.

And, I think that, barring some really mega-catastrophe, and we'll talk about those later — possibility — that we are — I think we're doing pretty well.

And if we could have the first chart that I — yeah — the first chart, which I can't see myself here, but I think it will be the insurance underwriting results for the first quarter.

And you will see that two good things happened in the first quarter.

One is our float increased by $1.8 billion. That's a lot of money to take in, net. I don't think there's any company, probably in the world, that had a gain in float that was even close to that.

And we actually achieved that with a small underwriting profit. So the float not only cost of nothing in the first quarter, but we had a gain of a billion-eight in it. And all units contributed to that. (Applause)

Our goal is to obtain more and more float at minimal or no cost. And there have been a number of years in the past when we've run an underwriting profit, which means that the use of that money is essentially free, or even better than free.

And we've had one very bad year, and a couple of so-so years before that.

But I think our cost of float over the next few years, unless we get into an extraordinary catastrophe, I think it should be pretty satisfactory.

Now, you'll notice there's a note down at the bottom that's slightly technical, but it's an important enough item in Berkshire, and in understanding our cost of float, that I thought I'd just devote a minute to it.

If you find this uninteresting, you can live a happy life without understanding what I'm about to explain next. You may even lead a happier life if you don't understand it. (Laughter)

As I look at the people that understand it and don't understand it, I'm not sure which group is happier. (Laughter)

When we write — we write a good bit — and have written a good bit, I should say — of retroactive insurance.

Now, in retroactive insurance, a company may come to us that's merging with another company, and they want to put a cap on their liabilities, or define them better, from past incidents.

So they may come to us and say, we want you to pick up all the losses that are going to be paid from things that happened prior to, say, 1990.

And we think that we owe $1 billion — have yet to be paid in losses from that period — but we want to protect ourselves up to, say, $2 billion, or some number like that.

So they write us a check and we take over — this is called retroactive insurance — we take over their losses from the past for a specific period and for a specific amount.

And, when we do that, the accounting — it's not accounting you run into every day — we've explained it in the past — but it creates a charge which will occur over time in the future.

And, as you can see, in the first quarter, the 20 million of underwriting profit we made was after a total of 112 million for the amortization of this charge that is set up.

So, if a company comes in and says, for example, we want you to protect us up to a billion-and-a-half for losses that occurred in the past, and we'll give you a billion dollars for it, we will debit cash for a billion dollars and we'll debit this deferred charge for half a billion and we'll set up a liability for a billion-and-a-half.

And that 500 million we set up as a deferred charge, we amortize over a period of time as we expect to pay the claims.

Now, there would be a lot of room for judgement — there is a lot of room for judgement — in terms of how fast we amortize that.

We try to be conservative. We make an estimate of when we will pay those claims and how much we will pay, and we try to amortize it over a reasonable period.

I've got another slide that shows how those amortization charges will work over time.

And we're going to put these slides on the internet, because we feel that our shareholders should understand the impact of these charges that will come against underwriting profits.

In the year 2002, we will have a 400 million-plus charge for this. It's built into the figures now.

And if we do 20 billion of premium volume, that's about a 2 percent charge.

So, to have our float be cost free, we have to make 400-plus million on underwriting elsewhere, in order to offset that.

And as you can see, we did that the first quarter and we'll find out whether we do it for the full year.

It's a — not many companies do this kind of business and it's a big item with us, so I really want all the shareholders to understand it, and for that reason, we'll put it on the internet.

I should emphasize that in all of these contracts, we cap our liability. So a lot of these contracts apply to liabilities that primarily — or not primarily — but in a significant way, and often primarily, arise from asbestos.

But when you read about asbestos claims accelerating and all of that, the numbers are capped in our case, in all of these contracts. So really don't care whether we pay it on an asbestos claim or whether we pay it on an old auto liability claim, or whatever.

The question is whether we've been correct in estimating the speed at which we will pay. And in some cases, we may pay even less than our maximum amount.

So, anyway, that's available for those of you who have previously were unhappy not understanding this and now are thrilled to know how it all works. (Laughter)

13. GEICO growth resumes

WARREN BUFFETT: Now the final item, which is a little easier to understand, is — we talked in the annual report about how we expected growth to resume at GEICO.

And I put up — again I can't see what's up there — but I assume that we have the GEICO policies in force figure and the increase by — Charlie hasn't seen these, as a factor of fact, so I'll give him the slide.

And as you can see, growth, not at the rates of a couple of years ago, but quite a turnaround from last year. Growth has resumed at GEICO in a reasonable way.

We figure each policyholder of a preferred nature is worth $1000 to us, at least, and so if we had 40,000 policyholders in a month, we've created, in our view, $40 million of value.

And, of course, we have the earnings in the float, and so on, that goes with it.

You'll notice on the first slide, GEICO operated at a significant underwriting profit in the first quarter, so all of its float was free and its float has continued to grow.

We are — you saw one of our little squirrel ads there which I like — we are getting — we are not getting a whole lot more inquiries than a year ago, but we're closing a significantly higher percentage of those that call. So our growth has been — has been picking up because our closure rate has increased quite substantially, and our retention rate of old policyholders, also, is increasing month by month.

So we've got two trends that are quite favorable, in terms of adding business.

And the third one of adding more inquiries is something that we are working on, and we're delighted to spend a lot of money on it, if we can figure out the way to spend it intelligently.

But, the increase in the retention ratio, the increase in the closure ratio, is resulting in very decent growth at GEICO.

And it's growth in all of our categories, in the preferred class, and the standard class, and the nonstandard class of business, whereas last year, the latter two fell.

Well, that's enough about the formal presentation.

14. How Buffett decides when to sell stocks

WARREN BUFFETT: Now, we're going to go in the various zones.

I promised a young shareholder in zone one that he would get to ask the first question and we're ready for zone 1.

AUDIENCE MEMBER: Hello Mr. Buffett and Mr. Munger. My name is David Klein-Rodick from Lincolnshire, Illinois. Thank you for letting me ask the first question.

I wanted to say I am sorry for the loss of your friend Mrs. Graham last year.

My question is: you have said that your favorite time to own a stock is forever.

Yet, you sold McDonald's and Disney after not owning them for long.

How do you do decide when to hold forever and when to sell?

And also, are you and Mr. Munger wearing Fruit of the Loom? (Laughter and applause)

WARREN BUFFETT: Charlie? (Laughter)

I think I better answer the question. I can answer unequivocally. I am wearing Fruit of the Loom.

I'm not sure whether Charlie wears underwear. Do you? (Laughter)

CHARLIE MUNGER: I haven't bought any new underwear in a long time and therefore I'm inappropriately attired. (Laughter)

WARREN BUFFETT: He's waiting for a discount, don't let him kid you. (Laughter)

Well, the answer — it's a very good question about selling. I mean, we — it's not our natural inclination to sell.

And on the other hand — and we have held the Washington Post stock since 1973. I've never sold a share of Berkshire, having bought the first shares in 1962.

And we've held Coke stock since 1988. We've held Gillette stock since 1989. Held American Express stock since 1991.

We had actually previously been in American Express in the '60s and Disney.

So, there are companies we are familiar with.

We generally sell by — we would sell if we needed money for something else — but that has not been the problem the last 10 or 15 years.

Forty years ago my sales were all because I found something that I liked even better. I hated to sell what I sold, but I also didn't want to borrow money, so I would reluctantly sell something that I thought was terribly cheap to buy something that was even cheaper.

Those were the times when I had more ideas than money. Now I've got more money than ideas, and that's a different equation.

So now we sell — really when we think that we've — when we're reevaluating the economic characteristics of the business.

In other words, if you take the — don't want to name names — but take a stock we've sold, of some sort.

We probably had one view of the long-term competitive advantage of the company at the time we bought it, and we may have modified that.

That doesn't mean we think that the company is going into some disastrous period or anything remotely like that. We think McDonald's has a fine future. We think Disney has a fine future. And there are others.

But we probably don't think that their competitive advantage is as strong as we might have thought — as we thought it was — when we initially made the decision.

That may mean that we were wrong when we made the decision originally. It may mean that we're wrong now, and that their strengths are every bit as what they were before.

But, for one reason or another, we think that the strengths may have been eroded to some degree.

A classic case on that would be the newspaper industry, generally, for example.

I mean, in 1970, Charlie and I were looking at the newspaper business. We felt it was about as impregnable a franchise as could be found.

We still think it's quite a business, but we do not think the franchise in 2002 is the same as it was in 1970.

We do not think the franchise of a network television station in 2002 is the same as it was in 1965.

And those beliefs change quite gradually. And who knows whether they're precise — you know, whether they're right, even.

But that is the reason, in general, that we sell now.

If we got into some terribly cheap market, we might sell some things that we thought were cheap to buy something even cheaper, after we'd bought lots and lots of equities. But that's not the occasion right now.

Charlie?

CHARLIE MUNGER: Nothing to add.

WARREN BUFFETT: He's been practicing for weeks. (Laughter)

15. Cost of float is more important than its size

WARREN BUFFETT: OK, let's go to zone 2.

AUDIENCE MEMBER: I'm John Bailey from Boston, Massachusetts and I hope I'm not asking you to repeat your insurance presentation, but I have a question about the growth of our float.

There's an increasingly popular piece of analysis out there where people project the growth of float for a large number of years into the future in order to determine the value of our business here.

But I wanted to ask more fundamentally, the existing float that we have runs off annually at a pretty considerable rate.

In order to maintain that, we have to replace it through our operations.

And then going the next step, to achieve the growth, we have more than replace it.

And so I wanted to ask you to address the characteristics of the — maybe the non-GEICO insurance businesses — that should give us the confidence to expect large amounts of replacement and growth float, at reasonable costs, going forward?

WARREN BUFFETT: Yeah, in a sense, float is somewhat similar to being in the oil business. I mean, you know, every day, some goes out as you pay claims, and the question is, did you find more oil than you produced that day? And it's very relevant.

It's a good question to, you know, what is the permanence of the float? What is the cost of the float? What's the likelihood of it growing? Could it actually run off?

As you saw up on the slide, we have $37 billion-plus of float. I think we have more float in our property-casualty business. A little bit of that float is in General Re's life and health business, but very small.

So, basically you're looking at property-casualty float when you look at that 37 billion.

I believe that's more than any company has in the United States and it's possible — I haven't checked Swiss Re and Munich — but it's even possible it's larger than anybody in the world.

Now, if you go to 30th and Harney Street, here in Omaha, you'll see National Indemnity building. It's the same building that was there when we bought the company in 1967 from Jack Ringwalt, when it had, maybe, 12 million of float.

And I had no idea that that 12 million, or whatever the number was, would turn into 37 billion. I mean, sometimes I can't really quite figure out how it happened.

But in any event, it did, and it's — we don't want people focusing on growth in our insurance business. I mean, we want them focusing on intelligent growth when we can do it at a GEICO or whatever it may be.

But I think it's suicide, from a business standpoint, to tell a bunch of insurance managers to go out and grow a lot.

So, you can say, well, with that lack of push from the home office, you know, how is that 37 1/2 billion going to grow? And I would say, just as I would have said to you for the last, you know, 30-odd years, I don't know.

But I think that — well, I can tell you this, that our float would have less natural runoff than the float from just about any company in the world.

I mean, we have a longer duration to our float because it arises from these retroactive contracts and from reinsurance, long-tail reinsurance, and that sort of thing.

So, our float has less natural erosion than any — just about any — that I know of in the world, but it erodes. It is a long-lived oil field, but it — we're pumping it every day.

You know, if I had to bet my life on whether the float would be higher or lower three years from now, or five years from now, I would certainly bet it would be higher.

And it's turned out, over the decades, that it's grown at a very significant rate. But I don't want to push anybody to do it. It grew at $1,800,000,000 the first quarter.

Now, there are a few special transactions in that, but we seem to attract special transactions.

There's nothing more important to Berkshire than to — to have that float, at least, be maintained, but I would say grow. And it will grow, I think. And to have it be obtained at low cost.

That float did us no good last year at all. That float was — lost us a lot of money in the year 2001, because it cost us, I think, 12.8 percent. And we didn't have a way to make money with 12.8 percent money.

We will make a lot of money if we can obtain a float at no cost, as we did in the first quarter.

The answer to your question is that without knowing any specifics that — without being able to promise you any specifics — you know, I think the float is more likely to grow than to erode.

I said last year at this meeting that there — you know, that the float of the American property-casualty business was 300-and-some billion, and I thought we were sneaking up on 10 percent of it.

I was corrected later on. Ferguson pointed out to me that — he sent me the figures. The float of the American property-casualty business is well over 400 billion.

But even at that, you know, we are 8 or 9 percent, or some figure like that, of the float of the whole country.

And, obviously, we can't grow at the same percentage rate starting from that kind of a base as we could when we started back in 1967.

But I still think we can grow it.

Charlie?

CHARLIE MUNGER: Yeah, I think the questioner realizes that growing float at a good clip, with very low costs, is extremely difficult.

It is. It's almost impossible. But we intend to do it anyway. (Laughter)

WARREN BUFFETT: See, of the two variables, though, that the most important thing to do is to focus at getting it at a very low cost. If we get $37 billion at no cost, or very low cost, you know, then if we don't do — if we don't make money with that, shame on us.

I mean, the troops have delivered and then it's up to Charlie and me to figure out ways to use that money.

So the important thing is the cost of the float and not the size of the float, although, obviously, we would like it to grow and we will do what we can to make sure that happens.

16. Asbestos liability risks and opportunities

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: Good morning, gentlemen. My name is Hugh Stephenson. I'm a shareholder from Atlanta.

My question is on asbestos liability tort cases. It seems like this is growing to be a bigger and bigger problem, including more and more companies, including a number of companies in the Dow Jones 30 industrials.

What do you see for Berkshire as the risks and opportunities in the operating and insurance businesses?

And, if you two were in charge of writing or structuring a settlement for the whole problem, how would you do it?

WARREN BUFFETT: OK, I'm going to let Charlie tackle most of that, because he's — we've both done a lot of thinking on it. I think Charlie's thinking is — I know — it's better, and it may even be more extensive.

Asbestos, as I mentioned in some of these retroactive contracts, is a big part of the liability, but it really doesn't make any difference, unless — it's much more dependent on the speed of payments than the amount of payment.

We are capped on all those types of contracts.

So, there's a figure in the annual report about aggregate asbestos and environmental liability. And that number may look quite big compared to some other insurance companies — but most of that, there's a limit on.

And, it's a good thing, because asbestos continues to explode. It's just — we talked about it last year at this meeting, and I said no matter how bad you thought it was, it was going to be worse. And it has been worse. And it will be worse.

And you make a very good point when you bring up the fact that many companies that are thought to be, or have been thought to have been, insulated from the asbestos litigation have now been dragged in one way or another. And that won't stop, either.

Ironically, it's not impossible that that asbestos litigation actually produces some opportunities for Berkshire, in terms of buying companies out of bankruptcy, free of their asbestos liabilities.

We did that — although it occurred much earlier in the — but we bought Johns Manville, which was the, in my memory, was the first major company, really big company, to go into bankruptcy and be forced there by asbestos liability. That happened back in the early '80s.

And that subsequently, they were cleansed of their liability by, in effect, giving a very high percentage of the company and its debt to the plaintiffs. And their lawyers, I might add.

And when we came along a year ago, I mean, that was all past history. But we probably wouldn't own the Johns Manville company if it hadn't been for some asbestos litigation that started 20 years ago or more.

We may see, actually, more companies that end up in Berkshire that have been forced into bankruptcy through asbestos.

But it is a — it's really a cancer on the American corporate world. And it's one that growing. And I think I'll let Charlie talk about it.

CHARLIE MUNGER: Well, the asbestos liability situation in the country is morphed into a very disadvantageous situation where there's an enormous amount of fraud.

And the wrong people are getting money, and there are vast profits for people who are arranging the fraud. And so it isn't a good situation.

There's also real liability to people who have serious injuries, and some of those people are being deprived because the meritless claims are taking so much of the money that there isn't adequate money for the people who had the worst injuries.

The Supreme Court has practically invited Congress to please step in and create a solution, but, deterred by the plaintiffs contingency fee bar, Congress has refused to do anything.

This is not a good situation, and if you can do anything about it, why, I would encourage you to do so.

WARREN BUFFETT: What do you think it will look like in five years, Charlie?

CHARLIE MUNGER: I would be surprised if there were a constructive solution. I think we'll have more of the mess we have now.

WARREN BUFFETT: It's huge, too. I mean, you — there are companies that some of you may own stock in that had huge potential liabilities.

They didn't think they had those liabilities, even, maybe, a few years ago. But, they're finding ways to drag in almost anyone.

And, you know, it's a concern when we buy businesses, because we are a deep pocket. And a tiny — a smaller — company may not have been worth people investing lots of hours on a speculative idea that they could create some kind of a connection with, you know, the ABC Company and hundreds of thousands of people that are claimed to be sick.

But, it gets more interesting if Berkshire — it could get more interesting — if Berkshire's involved.

So, it's a real problem for corporate America and they have not been able, in effect, to come up with a solution.

There was a solution, as I remember, and the Supreme Court didn't allow it. Isn't that right, Charlie?

CHARLIE MUNGER: That's right.

WARREN BUFFETT: Yep.

We will be very careful, both in our insurance operations, but just as importantly, in our acquisitions and all of that, in terms of avoiding unnecessary exposure to asbestos liability.

I'm not terrified at all about our insurance operation, in terms of what's there from the past.

I'm not saying that I know with any precision what the amounts will be, but I — that is not at the top of my list.

But, essentially you will have a plaintiffs bar that, going beyond asbestos, will try to turn any kind of human adversity into a claim against somebody that's got a lot of money.

And that's going on with mold. I mean, you may have seen Ed McMahon is suing his insurer for $20 million for the mold in his house. I just wish I could get some of that mold. I mean — (laughs) —

CHARLIE MUNGER: You probably have it.

WARREN BUFFETT: Yeah. (Laughter)

I hope you're referring to the house. (Laughter)

17. How to pick a stock index fund

WARREN BUFFETT: OK. Area 4.

AUDIENCE MEMBER: Good morning. My name is Tedd Friedman. I'm from Cincinnati, Ohio.

You said in the 1996 annual report that most investors will find that the best way to own common stocks is in an index fund that charges minimal fees.

Two questions. First: there are a lot of different index funds that hold different baskets of stocks. What criteria would you use, or recommend, to select an appropriate index fund?

Second: The price-to-earnings ratio of the S&P 500 is significantly higher than its historical average. What benchmark should an investor use in purchasing this index?

WARREN BUFFETT: Yeah, I would say that in terms of the index fund, I would just take a very broad index. I would take the S&P 500, as long as I wasn't putting all my money in at one time.

If I were going to put money into an index fund in relatively equal amounts over a 20 or 30-year period, I would pick a fund — and I know Vanguard has very low costs. I'm sure there are a whole bunch of others that do. I just haven't looked at the field.

But I would be very careful about the costs involved, because all they're doing for you is buying that index. I think that the people who buy those index funds, on average, will get better results than the people that buy funds that have higher costs attached to them, because it's just a matter of math.

If you have a very high percentage of funds being institutionally managed, and a great many institutions charge a lot of money for doing it and others charge a little, they're going to get very similar growth results but different net results.

And I recommend to all of you reading — John Bogle's written a couple of books in the last five years, and I can't give you the titles but they're very good books, and anybody investing in funds should read those books before investing, or if you've already invested, you still should read the books. And it's all you need to know, really, about fund investing.

So I would pick a broad index, but I wouldn't toss a chunk in at any one time. I would do it over a period of time, because the very nature of index funds is that you are saying, I think America's business is going to do well over a — reasonably well — over a long period of time, but I don't know enough to pick the winners and I don't know enough to pick the winning times.

There's nothing wrong with that. I don't know enough to pick the winning times. Occasionally, I think I know enough to pick a winner, but not very often.

And I certainly can't pick winners by going down through the whole list and saying, this is a winner and this isn't and so on.

So, the important thing to do, if you have an overall feeling that business is a reasonable place to have your money over a long period of time, is to invest over a long period of time, and not make any bet, implicitly, by putting a big chunk in at a given time.

As to the criteria as to when you should or shouldn't, I don't think there are great criteria on that.

I don't think price-earnings ratios, you know, determine things. I don't think price-book ratios, price-sales ratios — I don't think any — there's no single metric I can give you, or that anybody else can give you, in my view, that will tell you this is a great time to buy stocks or not to buy stocks or anything of the sort.

It just isn't that easy. That's why you go to an index fund, and that's why you buy over a period of time. It isn't that easy.

You can't get it by reading a magazine. You can't get it by, you know, watching television. You can't — you'd love to have something that said, you know, if P/Es are 12 or below or some number, you buy, and if they're 25 or above, you sell.

It doesn't work that way. It's a more complex business than that. It couldn't be that easy when you think about it.

So, if you are buying an index fund, you are protecting yourself against the fact that you don't know the answers to those questions but that you think you can do well over time without knowing the answers to those questions, as long as you consciously recognize that fact.

And, you know, I would — if you're a young person and you intend to save a portion of your income over time, I'd just say, just pick out a very broad index — I would probably use the S&P 500.

But I think if you start getting beyond that — starting to think you should be in small caps this time and large caps that time, or this foreign stock — and as soon as you do that, you know, you're in a game you don't know — you know, you're not equipped to play, in all candor.

That would be my recommendation.

Charlie?

CHARLIE MUNGER: I think his second worry is that common stocks could become so high-priced that if you bought index funds, you wouldn't expect to do very well.

I didn't think I'd live long enough to think that was likely to happen, but now I think that may happen.

WARREN BUFFETT: But, probably what you're saying there is they could get to a level and be at — they'd have to be at a sustained level like that for a long time.

CHARLIE MUNGER: They could be there and stay there for a long time.

WARREN BUFFETT: In which case, you might make 3 or 4 percent.

But would there be any way better than that around, under those circumstances, anyway? And pass the peanut brittle, please. (Laughs)

CHARLIE MUNGER: Well, in Japan, where something like this happened, the returns from owning a nice index over the last 13 years or so is negative.

Can something as horrible as that happen here? I mean, is it conceivable? I think the answer is yes.

WARREN BUFFETT: But the option in Japan, of course, is to have deposits in a bank, or own Japanese bonds, at somewhere between 0 and 1 or 1 1/2 percent.

So, if rates on everything get very low, which means stocks sell very high, you know, then it just means that you live in a different world than existed 20 or 30 years ago when, generally, capital got paid better.

CHARLIE MUNGER: I must say that we have very good packaging.

WARREN BUFFETT: Yeah. (Laughs)

Normally he does this in a less formal manner, but he's on his good behavior today.

CHARLIE MUNGER: We're protecting the integrity of the peanut brittle.

WARREN BUFFETT: That is true. The package — the nature of anything with butter in it, you know, is that it starts going downhill from the moment you make it. And therefore, the packing has to be extraordinary in order to meet the quality standards that Charlie and I insist on. (Laughter)

18. Effect of 9/11 on insurance underwriting

WARREN BUFFETT: OK, we'll go to zone 5.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, my name is Thomas May (PH). I am 12 years old. I live in Kentfield, California. This is my fifth annual meeting.

I know you lost a lot of money as a result of 9/11. But I would like to know how 9/11 changed your life and your investment strategy?

WARREN BUFFETT: Well, I think it, in a sense, is changing — good question.

And, it made everybody, I think, in the country aware, I mean, we've gone through world wars and all of that, and essentially felt quite protected within these borders.

And I have been quite worried about — Charlie can attest to — you know, the possibility, particularly of some kind of nuclear device in this country, by — probably more likely by terrorists than by some, at least, declared act of war by another state.

And 9/11 made everybody realize that as humans have not progressed, particularly, in terms of how they behave with each other over the years, they have progressed enormously in their ability to inflict damage on those they hate for one reason or another.

And that has increased, you know, for a long time. In the world, if you didn't like somebody, the most you could do was throw a rock at them.

And that went on for millennia, and then it moved into what you might characterize, ironically, as more advanced states. And in the last 50 years, it's increased exponentially.

And so now people who are megalomaniacs, or psychotics, or religious fanatics, or whatever, and who hate others in some unreasonable way, now have means at their disposal to inflict a whole lot more damage, incredibly more damage, than they had not too many decades ago.

And 9/11 brought that home to everybody, something they probably understood subconsciously and didn't think about very often, to something they thought about much more intensely and it's become much more real to them.

It hasn't really changed my view about — I mean, in the sense that I — you know, there are millions and millions and millions of people in the world that hate us. And most of them can't do anything about it.

But, a few have always tried to do something about it, and now the instruments they can use, in the most extreme, in a sense, being the human bombs that have appeared in the Middle East, but there's more ability to — incredibly more ability — for the deranged who want to inflict harm to do harm. And that's the reality.

In terms of the business aspects of it, in your question, obviously the area at Berkshire that it effects most significantly, by miles, is insurance.

And prior to 9/11, even though we recognized that there could be huge monetary damages that flowed from the activities of what I would call deranged people, we hadn't really written the contracts in such a way as to either get paid for taking that risk or to exclude the risk. In other words, we were throwing it in for nothing.

We had excluded risk for war. I mean, we knew that we'd seen what had happened in England in the 40s, and so we had taken account of something that some of us had seen with our own eyes, but we didn't take account of something that we knew is possible, but we just hadn't seen. And that's, you know, that's the human condition, to some degree.

Since September 11th, everybody in the insurance business recognizes that they had exposures that they weren't charging for, and they either had to exclude those exposure or they had to charge for them.

We have written — first thing we had to do, of course, is we had lots of policies on the books that left us exposed to this, and most of those policies ran for a year, starting at different points. Those have run off to a great degree, but they're not entirely run off.

The other thing we did was on new policies. We have sold a fair amount, quite a large amount, of terrorism insurance that excludes what we call NCB, nuclear, chemical, and biological, as well as fire following nuclear.

And, we can take a fair amount of exposure to that sort of terrorism, because it doesn't — it won't aggregate. It aggregated at the Twin Towers in a way that — World Trade Center — in a way that just about was as extreme as you could get for non-NCB-type activities.

I mean, that was a huge amount of damage done without nuclear, chemical, or biological.

But we can have tens of billions of dollars with NCB excluded throughout a greater New York area, or something, but we can't have hundreds of billions of exposure that would be exposed, say, to, nuclear activities, because there an act or two, or three, coordinated, could cause damage that would destroy the insurance industry.

And if we had coverage on that, it would destroy us as well. So, we write very little — we do write a little, because we can take —we can lose a billion or two billion dollars, and if we got paid appropriately for taking the risk, you know, that's a business we're in.

But we can't lose 50 or 100 billion dollars. And, so we take a little bit — we take a few risks that involve nuclear, chemical, or biological, but, generally speaking, the terrorism insurance that we're writing, and we've written a fair amount of it, excludes those particular risks.

You can say, you know, take biological. How could that be something significant from an insurance standpoint?

Well, many people don't realize it, but the World Trade Center loss was, by a huge margin, the largest workers' compensation loss in history.

We think of it as property damage, but, in the end, close to 3000 people had died who were working at the time they died, and therefore, covered by workers' compensation.

If the same thing had happened at Yankee Stadium while they were all watching a baseball game, or some other place, they wouldn't have been covered by workers' compensation. So it was happenstance, to some degree.

But that was — became the largest workers' compensation loss in history by a huge margin.

Now, if you were trying to cause huge damage in this country, and you could figure out something in the way of a biological agent — and there are people working on this — that could be injected into the ventilation systems, or whatever, of large plants, large office buildings, you could create workers' compensation losses that, you know, would just totally boggle your mind.

And anybody that was working on such a thing, you have to expect they would — if they thought they had perfected it — would try to do something close to simultaneously in areas where there would be thousands and thousands of people working. And it could make the World Trade Center loss look like nothing.

So, we have to be, basically, vigilant, in how much risk we let aggregate in something of that sort.

People have always been vigilant about how many houses they'll insure along a shoreline, or, in terms of physical risk, you know, they don't want too many homes or factories on the San Andreas Fault, or something of the sort, because they recognize that as having aggregation possibilities.

But now you have to think about things that man may plan in the way of catastrophes that will have aggregation possibilities, and that is something that's pretty much been introduced into the insurance world's thinking since September 11.

And I can tell you, you know, we think a lot about it. But — I mean, the social consequences are far worse than insurance, but we have to think about how we'd pay our claims, because if we ever do anything really foolish and endanger — take an aggregation — that would cause us to lose the net worth of Berkshire, we would not only not be able to pay the claims of the people in that disaster, but there are other people that suffered injuries 15 years ago, paraplegics and all that, that we're making payments to for the rest of their lifetime. And we wouldn't be able to make those payments. And we're not going to run our business that way.

Charlie?

CHARLIE MUNGER: Yeah. To the extent that September 11th has caused us to be less weak, foolish, and sloppy, as we plainly were in facing some plain reality, it's a plus.

We regret, of course, what happened, but we should not regret at all that we now face reality with more intelligence.

This inconvenience that we all have, this tightening of immigration procedures, etc., should have been done years ago.

WARREN BUFFETT: The most important thing in investments is not having a high IQ, thank God.

I mean, the important thing is realism and discipline. And you don't need to be extraordinarily bright to do well in investments, if you are realistic and disciplined.

And the same thing applies in insurance underwriting. It is not some arcane science that, you know, the ability to which to do successfully is given only to a few, or which requires the ability to do — mathematics have very little to do with it.

There's an understanding of probabilities and all that, a kind of gut understanding, that's important. But it does not require the ability to manipulate figures — does not — you know, you can do it without calculus, you can do it — you can really do it with a good understanding of arithmetic and an inherent sense of probabilities.

As Charlie says, to the extent that — I think we've always, from the investment standpoint, you know, if we've had any distinguishing characteristics, it would be that, in terms of realism and discipline.

And generally that means finding what you don't know.

In insurance underwriting, it's the same thing. You have to have — you have to be realistic about what you can understand and what you can't understand, and therefore, what you can insure and what you can't insure.

And you have to be disciplined about turning down all kinds of offerings where you're not getting paid appropriately.

And September 11th drove home those lessons and probably redefined getting paid appropriately in certain cases.

19. All banks aren't the same

WARREN BUFFETT: Area 6?

AUDIENCE MEMBER: Hello. My name is Everett Puri (PH). I'm from Atlanta.

I wanted to ask you to comment on the relative P/E multiples of bank stocks versus the S&P.

They seem to be at 30, 35 to 50-year year relative lows to the S&P, and I was wondering if that's the result of the market — a change in the market's perception of the forward growth rates of banks or if the market has perceived that there's a change in risk there.

WARREN BUFFETT: You're asking about the performance of what group compared to the S&P?

AUDIENCE MEMBER: Banks.

WARREN BUFFETT: Banks? Well, and what was your assertion about the performance, historically?

AUDIENCE MEMBER: Well —the relative multiple of bank stocks versus the S&P.

Back in the '40s — '40s, '50s, '60s, they commonly traded at, say, one times the S&P multiple and now they're maybe half that level.

WARREN BUFFETT: Yeah. Harry Keith (PH) used to have a lot of figures on this.

I don't really think about them. I mean, the appropriate multiple for a business, relative to the S&P, will depend on what you expect that business to achieve in terms of returns on equity, and incremental returns on incremental equity, versus that S&P.

I mean, if you've got two types of businesses, and we'll say the S&P earns X on equity, and can deploy an additional amount of capital at Y, and then you compare that with any other business, and that's how you determine which one is cheaper.

I would not characterize all banks as the same. I mean, we have in this room John Forlines, who runs the Bank of Granite — Granite, North Carolina — and they've earned 2 percent on assets without taking any real risks for decades. It's a tremendous record.

And then you have other banks that have been run by people that took them right into the ground.

I mean, whether it was First Pennsylvania, going back 30 years ago, I think it was John Bunting, and they — they're not a homogeneous group.

We own a couple of — stock — in a couple of banks. We own stock in M&T, that has an exhibit downstairs today. We own stock in Wells Fargo. And we think those institutions are somewhat different than other businesses.

So, I don't think there's — it goes back to that earlier question.

People always want a formula. You know, they — I mean, they go to the Intelligent Investor and they think, you know, somewhere they're going to give me a little formula and then I can plug this in and I know I'll make lots of money. And it really doesn't work that way.

What you're trying to do is look at all the cash a business will produce between now and judgment day, and discount it back at a rate that's appropriate, and then buy it a lot cheaper than that.

And, whether the money comes from a bank, whether it comes from an internet company, or whether it comes from a brick company, the money all spends the same.

Now the question is, what are the economic characteristics of the internet company or the bank or the brick company that tell you how much cash they're going to generate over long periods in the future.

And I would come to a very different answers, you know, on M&T Bank versus some other bank.

So, I wouldn't want to have a single yardstick, or a, you know, relative P/E that I went by.

I think that banks have sold — a good many banks have sold — at very reasonable prices.

We bought all of a bank in 1969. We bought a bank in Rockford, Illinois.

Charlie and I went and looked — we must have looked at a half a dozen banks at that — you know, in a two or three-year period.

CHARLIE MUNGER: Absolutely.

WARREN BUFFETT: Yeah. We trudged around and we found some very oddball banks that we liked.

And they were characterized by very little risk on the asset side and very cheap money on the deposit side. And even Charlie and I can understand that. And low prices, incidentally, too.

And then they passed the Bank Holding Company Act in 1969, and they killed off our chances to do anything further in buying all of banks.

So, we look at banks. We will own bank stocks from time to time in the future. We'll probably buy stocks in other banks.

We've also seen all kinds of banks ruined. I think it was, what was the fellow? M.A. Schapiro, who came up with the statement, he said, "There are more banks than bankers."

And if you think about that a bit, you'll see what I mean. (Laughter)

There have been — you know, there have been a lot of people that have run banks in a very injudicious manner, but that's made for opportunities for other people.

A lot of banks have disappeared over time. I mean, up in Buffalo, where Bob Wilmers runs M&T, there were some other very prestigious institutions that went right down the tubes. And a lot of that happened in the early '90s or late '80s.

I wouldn't look for a single metric like relative P/Es to determine what — how — to invest money.

You really want to look for things you understand, and where you think you can see out for a good many years, in a general way, as to the cash that can be generated from the business.

And then, if you can buy it at a cheap enough price compared to that cash, it doesn't make any difference what the name attached to the cash is.

Charlie?

CHARLIE MUNGER: Yeah, I think the questioner is, maybe, even asking the wrong people that question.

I would argue that Warren and I have failed to properly diagnose banking. I think we underestimated the general good results that would happen because we were so afraid of what non-bankers might do when they were in charge of banks.

WARREN BUFFETT: There are a number of banks, that over the last five or six years, on tangible net worth, the number net of goodwill, but on tangible net worth have earned over 20 percent on equity.

You would think that would be difficult for an industry to do dealing in a commodity like money, and, of course, the banks will argue it's not a commodity — but it's got a lot of commodity-like characteristics —and you would think those kind of returns in a world of 6 percent long-term interest rates and much lower, you would think that would be very hard — well, you would have though it wouldn't have occurred, you'd think it would be hard to sustain.

We been wrong in the sense that banks have earned a lot more money on tangible equity than Charlie and I would have thought possible.

Now, I think, to some extent, they've done because they stretched out equity much further than was the case 20 or 30 years ago.

I mean, they operate with more dollars working per dollar of equity than people thought was prudent 30 or 40 years ago.

But, however they've done it, they've earned — a number of banks have earned — very high returns on equity in recent years.

And, if you earn high enough returns on equity and you can keep employing more of that equity at the same rate — that's also difficult to do — you know, the world compounds very fast.

You know, banking as a whole has earned at rates that are well beyond, on tangible equity, you know, well beyond, I think, what much more glamorous businesses have earned in recent years.

Charlie, you have any further thoughts on that?

CHARLIE MUNGER: No, I say again, we didn't diagnose it as it actually turned out and, even worse than that, we haven't changed. (Laughter)

WARREN BUFFETT: And even worse than that, we won't. (Laughter)

20. Detecting fraud and the evils of EBITDA

WARREN BUFFETT: Area 7.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. My name is Andrew Sole, and I'm a shareholder from New York City.

I have two questions. The first one, I'd like to direct to Mr. Munger.

Pertaining to cash flow analysis, given the practices of numerous corporations of deliberately fabricating cash flow numbers, which occurred in some of the telcos, where they characterized like-kind exchanges as product sales.

How do you ferret out this type of fraud? What do you recommend a shareholder, an individual investor, to do, short of obtaining a degree in forensic accounting to uncover this type of fraud?

And the second question is, on a lighter note, what books would either of you gentlemen recommend to shareholders that you read this year that you liked?

CHARLIE MUNGER: Yeah. I think you're asking for a lot if you want some simple way of not being taken in by the frauds of the world.

If you stop to think about it, enormously talented people deliberately go into fraud, drift gradually into it because the culture carries them there, and the frauds get very sophisticated and they're very slickly done.

I think it's part of the business of getting wisdom in life that you avoid getting taken by the frauds.

And so I think you're asking a very good question, but I don't think there is any short answer.

I think there are whole fields that you can just quit playing because it looks like there's too much fraud in it.

And I think we do a lot of that, don't we, Warren?

WARREN BUFFETT: Yeah. How many times have we been defrauded in the last 20 years?

CHARLIE MUNGER: Well, damn little that we can — it's amazing how little.

WARREN BUFFETT: Yep.

CHARLIE MUNGER: And I've always said that the guy who takes us is going to have a modest little office and a modest demeanor and —

WARREN BUFFETT: He'll carry around Ben Franklin's autobiography, I can —

CHARLIE MUNGER: The kind of people who defraud us are not going to be the kind of people who are defrauding everybody else.

WARREN BUFFETT: Yeah. I mean, it's a very good question. It's tough to answer.

But I will tell you that we haven't, and we won't get defrauded often. Now, that may mean we pass up a whole lot of other opportunities, too.

But, for example, you raised the question about cash flow. I would say the number of times we're going to buy into a company, whether it's through stocks or through the entire company, where people are talking about EBITDA, is going to be about zero.

I mean, we start out with — if somebody's talking about EBITDA, you know — if we take all the people in the world that talk about EBITDA and all the people in the world who haven't talked about EBITDA, there are more frauds in the first group, percentage-wise, by a substantial margin. Very substantial. I mean, it is, you know, it's just a start.

Now, that isn't — you know, that — it's very interesting to me. If you look at some enormously successful companies, Walmart, General Electric, Microsoft, I don't think that term has ever appeared in their annual reports.

I mean, they just — so when people start talking about that sort of thing, either they're trying to con you in some way, or they've conned themselves, to a great degree. I mean —

CHARLIE MUNGER: Or both.

WARREN BUFFETT: Yeah. Well, that often happens. I mean, if you set out to con somebody, after a while you con yourself, which is why some of the people in the internet stocks, you know, stayed with them.

It's — if somebody is — if they think you're focusing on EBITDA, they may arrange things so that that number looks bigger than it really is.

It's bigger than it really is, anyway. I mean, the implication of that number is it has great meaning.

You take telecoms, they're spending every dime that comes in, I mean, in many cases.

There isn't — it isn't cash flow. I mean, the cash is flowing out. But it — you know, you can look at the statement and there's billions of dollars, supposedly, in depreciation and so on. But there — you know, interest is an expense.

Actually, taxes are going to be an expense. Anybody that tells us that making a lot of money before taxes, in terms of EBITDA, is meaningful — you know, you get depreciation by laying out money ahead of time. It's the worst kind of expense.

We look for float, where we get the money and then pay out later on. But depreciation occurs because you buy an asset first and then you get the deduction later on. It's the worst kind of expense there is.

And you start paying taxes when you actually make money, and when the depreciation runs out at some point.

So these — it just amazes me how widespread the usage of EBITDA has become, and I would say there have been people who have tried to dress up financial statements in a way to appeal to people who are impressed by such a number.

Charlie and I have found, actually, that — at least to us — many of the crooks look like crooks.

Now, we have spotted — we haven't shorted them — but we have spotted a lot of frauds over the years in public companies. And years before, you know, that the roof fell in.

And they usually are people that tell you things that are too good to be true, for one thing.

I mean, they, you know, they tell you very mediocre businesses are wonderful businesses for one reason or another. Or they — they just have a smell about them, you know, in effect.

Wouldn't you say that's true, Charlie?

CHARLIE MUNGER: Well, sometimes it's amazingly obvious. Maxwell, of England, his nickname was the "bouncing Czech."

And three weeks before he went under, Salomon —

WARREN BUFFETT: (Inaudible)

CHARLIE MUNGER: — Salomon was aggressively seeking more business from him, with both Warren and I on the board. It shows how much influence outside directors often have.

WARREN BUFFETT: Yeah. Wall Street is —

CHARLIE MUNGER: Imagine extending credit to a guy whose nickname is the "bouncing Czech." You'd think it — if you wrote it as satire, people would say it was too extreme to be funny. (Laughter)

WARREN BUFFETT: We have read — I mean, Charlie and I have — it's a hobby keeping track of the Maxwells of the world, and the —

They get — there's a syndrome. I mean, they give off a lot of the same messages.

I mean, Maxwell was a classic case, but there — time after time — Wall Street has no filter against them. Wall Street loves them, as long as, you know, as long as they're pushing out securities and the commissions are there.

Charlie and I could not have stopped Salomon from making a deal with Maxwell, you know, right to the last 30 seconds before he sunk, you know, under the ocean.

CHARLIE MUNGER: We didn't stop First Normandy with Lou Simpson and Warren Buffett and Charlie Munger on the board.

WARREN BUFFETT: Yeah. First Normandy was a case of some guy that manufactured a record out in California that he claimed was from owning a bunch of securities, including Berkshire Hathaway.

And, he was going to go public and Salomon was courting him. And this — the record was, you know, it was total baloney.

And I think they actually went public for a day or so and then the SEC pulled it back.

CHARLIE MUNGER: Absolutely. They had the offering and then they canceled it before the money changed hands.

But it was a very embarrassing episode. And we remonstrated against this obvious insanity, they told us the underwriting committee had approved it.

WARREN BUFFETT: I don't think they changed underwriting committees, either. (Laughs)

21. Quick decision to buy Larson-Juhl

WARREN BUFFETT: OK. Zone 8.

WARREN BUFFETT: We're a cheery group up here, aren't we, on the human condition?

AUDIENCE MEMBER: Good evening from Germany. My name is Norman Reinzhoff (PH). I'm a shareholder for about 10 years. And I want to thank you gentlemen for your long-term performance.

I brought you two of my favorite German chocolates. One for you, Mr. Buffett. One for you, Mr. Munger. And I will give them to you tomorrow at the steak house.

WARREN BUFFETT: How much do they sell for a pound? I'm just curious. (Laughter)

AUDIENCE MEMBER: Well, by the way, this is not the chocolate company you wrote to two years ago.

WARREN BUFFETT: Oh.

AUDIENCE MEMBER: They were sold about a week ago for a very low price.

WARREN BUFFETT: Is that —

AUDIENCE MEMBER: This can still be fixed. (Laughter)

My question is concerning that what you were just describing as smelling.

And, I mean, you told us in former shareholder meetings that if management loves money, do not invest.

If they love what they do, preferably if they come tap dancing to the office every day, and all other things are right, then invest.

That resonated to me very good with the biblical truth that not money itself, but love for money, is the root of all evil.

As a principal that once made once made Prussia the largest of all kingdoms, namely the ethos of doing a job for its own sake.

You tell us in this year's report that you buy a company after talking to the owners for no more than 90 minutes.

I'm wondering what kind of — is it the wisdom of experience, just like you described it, or do you do more background work before talking to the owners for 90 minutes?

What's the process like? Do you do background checks or do you talk to competitors?

Do the other people in headquarters do that work for you? How does this whole thing work?

WARREN BUFFETT: Well, it's a very good question. And all of the things you suggest might well make sense. I mean, talking to competitors, talking to ex-employees, talking to current employees, talking to customers, talking to suppliers, all of those things Phil Fisher laid out in a book over 40 years ago, and we have done a fair amount of that over the years.

But, Charlie would have behaved exactly the same way I did on the company you're referring to.

I got a call from Craig Ponzio in December, on a Monday. It was about a company that made custom picture frames.

I'd never heard of the company before. I'd never heard of Craig before.

I didn't talk to him on the phone much more than 15 minutes. He's a very — he'd be here today but his wife became seriously ill, at least we hope it's not serious, but at least there was a problem last night — but Craig talked to me, maybe 20 minutes. And, you can tell when — I mean, it's just all the difference in the world.

And he laid out what the custom frame — how the — custom frame picture business works, and it's not complicated.

I hadn't thought about it for 10 seconds in my whole life up till then, you know. I'd had some pictures framed — you know, I get around (laughs)

But it's not hard — I mean, if you think about it for 30 seconds, you — the economics of the industry will sort of make themselves manifest to you.

There are 18,000 or so framers in the country. It's a small business. So you're dealing with thousands of people.

Now, what's important to those thousands of people that you're dealing to? They're doing 250 thousand, or 300, or 400 thousand dollars of business a year, and they have customers who come in periodically — like I come in once every three months, or every six months, and say, here, I'd like a frame, and they may ask me about what kind of frame I want or I may leave it up to them.

It's a service operation to a very great degree. And Craig built something starting with, in 1980 or so, with 3 million of sales, he built an organization that became enormously responsive to these 18,000 or so framers.

They call on those people five or six times a year. They get 85 percent of the frames to those people the next day when they order them. That's what counts in that kind of a business.

You know, you're not supplying the Big Three with auto parts. You're not — there's all kinds of things that give it a distinctive economic character.

So Craig told me about that, like I say, in not more than 20 minutes. And he told me the price and he told me the capital that was employed and he gave me some — a few figures.

I knew in talking to him that he had a deal that made sense, you know, and I said, when can you come in? That was on a Monday. He said, I'll be there Wednesday morning. And he came with Steve McKenzie, who is here today, and who I encourage you to meet, and I think they got there at nine and they left at 10:30, and we'd shaken hands.

I was hoping to see Craig at the — today — or tomorrow — but I won't because of this illness.

But, I haven't seen Craig since, you know. I mean, we made — he got this money, he knew he was making a deal, he had a reason why he wanted — he wanted to sell it to somebody that would be sure to close, that would be a good owner, where the people who worked there wouldn't be worried because he was leaving.

He was leaving with a lot of money, and, you know, people — he wanted to be sure — a lot of people leave with a lot of money and they leave the employees behind and they don't care what happens. But this guy cared. And I could tell that, and that's a big plus with me.

So, you know, I have not been to their headquarters yet. I plan to be at their headquarters. Steve, I apologize.

But I understand what the business is about. And you can — most good businesses, you can understand what they're about in a very few minutes, unless they're a kind of business that you can never understand what they're about.

I mean, there are other businesses, if you spent years on them you still wouldn't understand what the hell is going on.

I don't know which one of — which American auto company is going to the best 10 years from now. And if I spent all year talking to dealers for Ford and Chrysler and General Motors, and I talked to suppliers, and I talked to people who are driving their cars, I still wouldn't know anything about what it's going to look like five or 10 years from now.

But I know that you can't crack our custom picture frame business. I mean, you cannot figure out a way to call on those 18,000 people that are in that business and figure out a way to divert their business to you when you can't offer a frame as good as ours and you can't offer service remotely like ours. So it's a good business.

And Craig was 100 percent up — I mean, he told me exactly what he wanted to receive for the business. He wanted cash. You know, that fits us.

And there's nothing complicated about it. I mean, you can drag it out for a long time. But what would be the sense of it? I mean, if you're going to make a deal, you're going to make a deal.

Charlie?

CHARLIE MUNGER: Yeah. If you stop to think about it, the ordinary result when a big publicly-held corporation buys another corporation is that, maybe two-thirds of the time, it's a terrible deal for the buying corporation and yet the people have taken an enormous time doing it.

And we've bought all these businesses taking practically no time in doing it, and on average they've worked out wonderfully.

Why is that? That's a good question. The answer is we wait for the no-brainers. We're not trying to do the difficult things.

WARREN BUFFETT: We're for those.

CHARLIE MUNGER: Yeah. And we have the patience to wait. And then we're so peculiar that there actually are a good number of businesses in America where they prefer selling to us than to other people. That's very helpful.

WARREN BUFFETT: I just saw a review of a major company. Made 10 acquisitions in a recent five-year period.

Every one of those 10 acquisitions was preceded by due diligence and all the baloney they go through, and they probably had an investment banker's book and everything.

Not one of the 10 in 2001 lived up — or was even close — to the expectations of the presentation that was made at the time of purchase.

In aggregate, the 10 earned one-quarter of what they were projected to earn in 2001. In other words, the projections were for four times the actual earnings.

And these were companies with strategic — this is a company with a strategic, you know, acquisition department with loads of people to go over the due diligence with investment bankers, quote, "helping them," end quote, all along the way.

And, you know, and 10 out of 10 failed miserably. And, you know, you have to ask yourself, how can you produce that? Because the world didn't go to hell during that period, either. I mean, that was not a time when we went into a great depression or anything of the sort.

It's — they were getting — they were buying what was getting sold to them, and it was fulfilling some things that the management — myths — that the management had about itself. And managements have many myths about themselves.

And it isn't that complicated if you just wait for the fat pitch. And the fat pitch doesn't have to be somebody else doing something dumb or anything like that, because people don't do that.

People come to us, come for a good reason. I mean, they usually want a transaction that a) they want one they're sure to close. They want —if a deal is made — and they want one that will leave the people happy, that are at the business.

When it was announced at Johns Manville, I believe, that Berkshire was the buyer, I understand there was a standing ovation. And I've seen it at, you know, whether it's Jordan's or Star Furniture.

People are concerned. If you've been working at a company for 20 years and you know that the owning family is getting older and has some problems to take care of, believe me, they talk in the hallways about that.

What's going to happen when, you know, the family sells the place? And people worry about that.

And to have an answer for them, so that they all sleep the night that it's announced that the business has changed hands, means some —a lot — to some owners. And it doesn't mean anything to other owners.

I don't think we've ever bought a business from a financial operator. Can you think of any, Charlie?

CHARLIE MUNGER: I can't think of one.

The — you know, somebody once defined hell, in a legal system, as a place with endless due process and no justice. And we're getting close.

And similarly, in the corporate world, if you have endless due diligence and no horse sense, you've just described a corporate hell, at least for the people who own the business.

22. Buffett shows little interest in cryonic suspension

WARREN BUFFETT: Go back to zone 1.

Oh, I'm sorry. Excuse me one second. We have — we have — Mark, do we have a number of people in the music hall that —

Pardon me?

VOICE: Yes.

WARREN BUFFETT: Do we have somebody at zone nine?

VOICE: Yes.

WARREN BUFFETT: OK.

AUDIENCE MEMBER: Mr. Buffett, my name is Luke Nosek from Palo Alto in California.

The first thing I'd like is just to thank you for saving my shirt from the internet stocks for the last few years.

And, actually, it's not quite true. I lost my shirt but you did save my underpants. I bought the stock in late 2000.

And, it’s actually not just been about the stock. It’s about — been about — learning from you and your investment philosophy and your character.

It’s been very inspiring at the beginning of my professional life to have a mentor like that.

And I would love to — (Applause)

I think it’s been very inspiring for all of us for, I guess, it’s been almost 50 years of your investment professional life that’s been continuing to go over the top.

I’d love that — for that — to continue for a long time. I’d love to see the next 50 years.

And, I don’t know if that’s possible, given current medical technology, but I have some friends in biotech who have been involved in companies that do something called cryonic suspension.

And I’m curious if you’ve heard of it. It’s the process of — or looked into it — the process of freezing people as they’re dying, and —

WARREN BUFFETT: Just don’t do it too early with me. (Laughter)

AUDIENCE MEMBER: It’s, actually, legally, after pass away.

But even if the risks are — even if the chances of it working are very small and the discount rate is huge over a long period of time, I wonder if you’d looked into it?

What — if you would consider or think about that possibility?

And again, thank you for your service and all the lessons for the last 50 years (inaudible)?

WARREN BUFFETT: Well, I appreciate the suggestion and there probably isn’t much downside to it. (Laughter)

CHARLIE MUNGER: It takes a lot of electricity to keep you frozen for all eternity. (Laughter)

WARREN BUFFETT: That’s all right. We get our electricity wholesale at MidAmerican. (Laughter)

We’re for anything that extends our productive years.

I must say, at 71, I can’t recall ever having any more fun than I’m having now. And I think Charlie seems to be in pretty good spirits too, so it —

We are lucky to be in the business we’re in. I mean, just imagine, you know, if we’d been in — been halfway athletic, or anything like that, where you’re, you know, you — essentially you’re limited by age.

But, there's really no — there are no problems in this business. I mean, as long as I can kind of lift the phone up (laughs) and hear Craig on the other end, or if I can't hear him, I get him to tell to Charlie and he can relay it on to me.

It's a very easy business to conduct throughout your life. And we're fortunate that way.

23. Fruit of the Loom: good management for good company

WARREN BUFFETT: Zone 10, do we have anybody?

AUDIENCE MEMBER: Good morning. My name is Pamela Harrington and I live here in Omaha, Nebraska.

And my question concerns your investment in Fruit of the Loom.

Could you tell us about how that investment fits in with your philosophy about turnaround situations and your preference for businesses that have barriers to entrance? Thank you.

WARREN BUFFETT: Yeah. Well, Fruit of the Loom got in trouble for two reasons.

One is they borrowed too much money. They borrowed about a billion, 200-million, and actually it went something beyond that because they were engaged in some other transactions that were off balance sheet and so on.

So, it was a company that, in a financial sense, was out of control. Simultaneously with that, they had a lot of operating problems, too.

But we were not going to inherit the capital structure and we were not going to inherit the management that had caused the operating problems.

But, much to our pleasure, we were going to inherit a management that had done an incredible job in running the business for a long time prior to the sins of the recent period.

And, we made a condition — I don't think there'd probably ever been a condition made to a bankruptcy court proposal — where we said our offer is not contingent on financing, it's not contingent on, you know, if war breaks out, our offer is still good and everything else.

But John — but we did make it contingent on John Holland being available to run the business, because John had done a sensational job of running the business before the difficulties of the excess leverage and operating insanities. And he was willing to come back, which was very important to us.

And Fruit of the Loom has, I don't know, between 40 and 45 percent of the men's and boy's market. It's a product that has a deserved quality image.

It’s accepted in a big way by very important retailers who were disturbed by things that took place prior to, and early in, the bankruptcy, but who loved the idea of having a product like Fruit of the Loom in their stores.

And it’s a very low-cost producer of a very basic product.

So, it fits us very well. And now the management can simply worry about building the brand and running plants as efficiently as possible.

And there’s been some rearrangement of plants, as has happened throughout to many things connected with textiles.

But it’s an absolutely first-class business. And, you know, we’d like to get a little more share in the women’s market. We’d like to get a little more share in the men’s and boy’s market, too.

But it’s made to order for us. But it’s only made to order with the present management.

If we had to take on the management that was there for a few years, you know, we wouldn’t have bought it for a dollar. It would have been a disaster. And it was a disaster for a while.

But fortunately, it’s a little like GEICO in the mid ’70s. I mean, GEICO was a marvelous company that got mismanaged in a big way for a while.

But its fundamental advantages were there throughout the period, and what you had to do was get rid of the mismanagement and get back to the basics.

Charlie?

24. Three book recommendations

CHARLIE MUNGER: Yeah, I don’t have anything on that subject, but I neglected to answer the question about what books would we recommend.

The two books that I recommend this year were both sent to me by Berkshire shareholders who thought I might like them, and boy were they right.

The first is called “Ice Age,” which is a description of the past history of glaciation in the last few hundred-thousand years and how they figured out what had happened and why it had happened.

And I think it’s the best book of scientific explanation I have ever read. It’s been published in England and it’s going to be published in the United States this fall. And the airport has like 20 copies — PD Waterhouse — which they did by scrounging all of Canada.

And so, I recommend that book to you, but a lot of you are going to have to wait for the fall, I think.

The other book was "How the Scots Have Helped Create the Modern World." That's a subject that's always interested me, how a tiny, poor, little population of Celtic people had such a huge favorable impact on the world, starting from poverty.

And, of course, it's related to the Irish, who were a similar ethnic strain with a different religion.

And, it was marvelous book. And I forget the author's name, but I recommend both of those books to all of you.

WARREN BUFFETT: Yeah. I'll recommend a book which may sound a little self-serving, but it nevertheless — I think — I think this group, many of you would enjoy reading about the Berkshire managers.

And Bob Miles has brought out a book and it tells about the people who are handling your capital. And, I don't think you could have a — well, I know you couldn't have a better group.

And so therefore, if you feel like reading about them, I would — Bob has done a good job of interviewing — and I would encourage you to read about them.

And I think you'll like your investment better after you read about the managers than if you just read what Charlie and I write.

25. How to make the "right" friends

WARREN BUFFETT: Let's go back to zone 1.

We're going to break at noon, incidentally, and we'll probably break for 30 minutes or thereabouts and then we'll come back. Go ahead.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. My name is Jesse Spong (PH) and I am 12 years old, from California.

This is my second consecutive year in attendance. My parents brought me here to learn from you.

My question is not about money. It's about friendship.

How do you remain friends and business partners for so long? And what advice do you have for young people like me in selecting true friends and future business partners? Thank you. (Applause)

WARREN BUFFETT: Well, when Charlie and I met in 1959 we were introduced by the Davis family, and they predicted that within 30 minutes we would either not be able to stand each other or we would get along terrifically.

And that was a fairly insightful analysis, actually, by the Davises, because you had two personalities that both had some tendencies toward dominance in certain situations.

But we hit it off. We have disagreed, but we have never had an argument that I can remember at all in 43 years.

And yet we both have strong opinions and they aren't the same strong opinions at times.

But the truth is we've had an enormous amount of fun together, we continue to have an enormous amount of fun, and nothing will change that, basically.

It may have worked better because he's in California and I'm in Omaha, I don't know. (Laughs)

I'll let Charlie comment on it.

CHARLIE MUNGER: Well, that's a wonderful question you've asked, because Warren and I both know some very successful businessmen who have not one true friend on earth. And rightly so. (Laughter)

WARREN BUFFETT: That's true.

CHARLIE MUNGER: And that is no way to live a life. And if by asking that question, you're asking how do I get the right friends, you are really onto the right question.

And when you get with the right friends, if you've worked hard at becoming the right sort of fellow, I think you'll recognize what you have and then all you have to do is hang on.

WARREN BUFFETT: The real question — what is — the question is what do you like in other people? I mean, what do you want from a friend?

And if you'll think about it, there are certain qualities that you admire in other people, that you find likeable, and that cause you to want to be around certain people.

And then look at those qualities and say to yourself, "Which of these is it physically or mentally impossible for me to have?" And the answer will be none, you know.

I mean, you — it's only reasonable that if certain things that attract you to other people that, if you possess those, they will attract other people to you.

And secondarily, if you find certain things repulsive in other people, whether they brag or they're dishonest or whatever it may be, if that turns you off, it's going to turn other people off if you possess those qualities. And those are choices.

You know, very few of those things, you know, are in your DNA. They are choices.

And they are also habits. I mean, if you have habits that attract people early on, you'll have them later on.

And if you have habits that repel people, you're not going to cure it when you're 60 or 70.

So it's not a complicated equation. And, as I remember, Ben Franklin did something like that one time. Didn't he list the qualities he admired, and then just set out to acquire them?

CHARLIE MUNGER: Absolutely. He went at it the way you've gone after acquiring money. (Laughter)

WARREN BUFFETT: They're not mutually exclusive.

CHARLIE MUNGER: No.

26. One thing you don't need for investing

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. My name is Kevin Hewitt (PH) and I'm a shareholder from Chicago, Illinois. This question is for you, Mr. Buffett, and Mr. Munger.

Mr. Buffett, I've followed your career since I first read about you in the first edition of the Forbes 400 that came out in '82.

Reading your profile also led me to Ben Graham's book, The Intelligent Investor.

Since that time, I've followed the careers of — I've also followed the careers of other successful investors, such as Walter Schloss, Bill Ruane, Richard Rainwater, Robert Bass, and Edward Lampert.

In following your career, and the careers of these other highly successful investors, it's my observation and my firm belief that despite their obvious high level of intelligence and some of them having gone to some of the best schools in the country, none of these people, including yourself, were born great investors.

Every one of these, including yourself, learned to be a great investor. Graham learned from his experience. You, Bill Ruane, Walter Schloss, learned from Graham.

Richard Rainwater learned from you, Bill Fisher, and Charlie Allen, and from reading Graham.

Robert Bass and Ed Lampert learned from Richard Rainwater and, most likely, from reading Graham and Fisher as well.

These observations lead me to the conclusion that despite intellectual brilliance, although that probably helps, I've come to the conclusion that great investors are made, not born.

Do you and Mr. Munger agree with this conclusion? If so, why? If not, why not?

And if you do agree, what things would you recommend that someone do if they wanted to become a great investor?

Also, what mental attributes do you think a person should have if they want to try to become a great investor? Thank you very much.

WARREN BUFFETT: Yeah, I'd largely agree with what you said.

I would say that there — I don't know to what extent — an ability to detach yourself from the crowd, for example — I don't know to what extent that's innate or to what extent that's learned — but that's a quality you need.

I would agree totally with you that a great IQ is not needed. I mean, you do not have to be terrifically smart to do well as an investor, at all.

I would say you're 100 percent right that I learned from Graham first in a very, very big way, and I learned something additionally from Bill Fisher, and I learned a lot from Charlie.

And the proof is in my record, actually. From 11 to 19, I was reading Garfield Drew, and Edwards and Magee, and all kinds of — I mean, I read every book — Gerald M. Loeb — I mean, I read every book there was on investments, and I didn't do well at all.

And I had no real investment philosophy. I had a lot of things I tried. I was having a lot of fun. I wasn't making any money.

And I read Ben's book in 1949 when I was at University of Nebraska, and that actually just changed my whole view of investing. And it really did, basically, told me to think about a stock as a part of a business.

Now, that seems so obvious. You can say, you know, that why should you regard that as the Rosetta Stone? But it is a Rosetta Stone, in a sense.

Once you crank into your mental apparatus that you're not looking at things that wiggle up and down on charts, or that people send you little missives on, you know, saying buy this because it’s going up next week, or it’s going to split, or the dividend’s going to get increased, or whatever, but instead you’re buying a business.

You’ve now set a foundation for going on and thinking rationally about investing. And there’s no reason why you need a high IQ to do that. There’s no reason why you have to be born in some way.

I do think there’s certain matters of temperament that may be innate, they may be learned, they may be intensified by experience as you go on, partially innate, but then reinforced in various ways by your experience as you go through life, but that’s enormously important.

I mean, you have to be realistic. You have to just define your circle of competence accurately. You have to know what you don’t know and not get enticed by it.

You can’t be — you’ve got to have an interest in money, I think, or you won’t be good in investing. But I think if you’re very greedy, it’ll be a disaster, because that will overcome rationality.

But I think the same books I read had really molded what I — how I — thought about businesses and investing. I think that they’re just as valid now.

I mean, I haven’t seen anything in the last 25 years, and I read — I glance through — most of the books. I’ve seen nothing to improve on Graham and Fisher in terms of the basic approach of going about investing, which is to think about stocks as businesses, and then think about what makes a good business.

And really, that’s all there is to investing, and having a margin of safety, which Ben talks about, and so on.

It’s not a complicated process, but it definitely requires a discipline.

It requires insulating yourself from popular opinion. You just simply cannot — you can’t pay any attention to it. It doesn’t mean anything.

So you can’t — the idea of listening to lots of people tell you things, it’s just a waste of time, you know. You’d be better off just sitting and thinking a little bit.

I mean, there were no analyst reports on custom frame makers, you know. It just doesn’t — and they wouldn’t have been any good anyway.

You just have to think, but you have to think about them in terms of their business characteristics and what they can earn on capital employed, and that sort of thing.

I would just read the, you know, I would read the Graham and the Phil Fisher books. And then read lots of annual reports, think about businesses, and try and think about which businesses you understand and which you don't understand.

And you don't have to understand them all. Just forget about the ones that you don't understand.

Charlie?

CHARLIE MUNGER: Yeah, I have a deeper level of generality.

If you have a passionate interest in knowing why things are happening, you always are trying to figure out the world in terms of why is this happening or why is this not happening, that cast of mind, kept over long periods, gradually improves your ability to cope with reality.

And if you don't have that cast of mind, I think you're destined, probably, for failure, even if you've got a pretty high IQ.

WARREN BUFFETT: I would say we've seen relatively little correlation between investment results and IQ.

I mean, not that there are a whole bunch of people out there with 80 IQs that are knocking, you know, the cover off the ball, but there are all kinds of people with high IQs that get no place.

And, yet, it's probably, in a sense, it's more interesting to look at why people with high IQs don't succeed, and then sort of cast out those factors, see if you can cast them out in yourself, and leave a residual that will work.

Because it's like Charlie always says, "All I want to know is where I'm going to die, so I'll never go there." (Laughter)

If you study the people who die financially, you know, with high IQs and say why do they die, you know, you'll see certain overwhelming characteristics that are present in most of the cases.

And you've just got to make sure that either you don't possess them, or if you do possess them, that you can get rid of them or control them in some manner.

27. Coca-Cola's domestic marketing

WARREN BUFFETT: Area 3?

AUDIENCE MEMBER: Yes. Steve Pattice (PH), shareholder from Los Angeles. Good morning, Warren and Charlie.

I'd like to address the domestic Coke business.

It seems to me that Coke has been pulling back from what former great CEO Roberto Goizueta often said, and I paraphrase, we can't control what soft drinks people buy at retail. But in public venues, including food service, we can control that.

We've all heard about the marquee lawsuits that Coca-Cola has had, such as the NFL, United Airlines, and emerging restaurant brands like Baja Fresh Mexican Grill.

But they're also losing contracts with major — or minor — league baseball, college, and high school vendors.

Furthermore, it's my understanding that our competitor PepsiCo has been the fastest-growing domestic beverage company for three consecutive years.

My question is has Coke's vision changed, and is my perception that the domestic fountain division has lost their way correct?

WARREN BUFFETT: No, I would not say that's correct, but I understand the reason for the question. Because there is the question, always, of the marquee-type accounts.

I mean, the truth is, either of the two major colas that are going to be sold and associated with, say, the Olympics or Disney World, or whatever it is, is going to lose a lot of money, if only directly thought of in terms of those contracts.

But there is that association over years. I mean, Coke wants to be where people are happy, and they want that in people's minds.

And that tends to be, you know, sporting events, it's the Disneylands, Disney Worlds, of the world.

But, in the end, can you have a determination to be at every one of them at any price? And the answer, obviously, is no.

It was sort of interesting, about five years ago, or thereabouts, Coke took Venezuela, essentially, away from Pepsi.

Pepsi — Venezuela was one of the few countries in the world in which Pepsi was the leader, and that was because the Cisneros family had developed the business down there very early.

So, Pepsi had 70 percent or 80 percent of the business. And in sort of a midnight raid, Coke bought the Cisneros operation, converted it all to Coke overnight, flew 747s in because they didn't want to have — they wanted it to be a surprise, and they just reversed the whole situation in Venezuela.

And, it actually — whether that is going to turn out to be smart or not is another question, because they paid a lot of money to do it.

But in any event, Pepsi was very upset.

And so, the University of Nebraska pouring rights came up, very shortly thereafter. And the universities, as you know, bid out these things to give sort of an exclusive to a given university.

And Pepsi came in and bid about twice as much for the Nebraska pouring — the University of Nebraska — pouring rights, as was the sort of the standard, in terms of per-student at universities throughout the country, at Penn State or something.

And I like to think that they were trying to stick it in the eye of Coke by doing that in Nebraska. And I feel that the University of Nebraska really should give me credit for about 5 million a year of contribution to the university, because I don't think Pepsi would have done it if it hadn't been Nebraska.

Now, the question is, people at Coke called me, and they said, you know, "Do you want us to go up against this?" And I said, you know, no.

I mean, it's nice to have everybody at University of Nebraska drinking Coke, but if we've got everybody at Penn State drinking Coke, I mean, it's probably worth as much, as potential Coke customers.

So, there is this bit where one organization or the other, particularly if they've lost one in the immediate past, may overbid a little for the next one.

And you know, for United Airlines, the question is how far do you let United, or whomever it is, drive you, in terms of making that specific deal.

I would say that in something like the Olympics, you know, I think Eastman Kodak made a huge mistake when they let Fuji take away the Los Angeles Olympics 20 years ago or so, because it allowed Fuji to get put on a mental parity, to a degree, with Kodak, whereas Kodak had always owned that.

And now Fuji was there with Coca-Cola and IBM and a few premier companies. And it was a mistake.

So, in the end you end up overpaying, in any kind of an objective quantitative sense, for most of these marquee properties. But you can't — it'd be foolish to think that you had to have them all.

Coca-Cola, actually Pepsi-Cola — colas have generally declined, somewhat, as a percentage of per capita consumption in the United States. And Pepsi-Cola has lost considerably more than Coke.

What has kept Pepsi doing well, basically, is Mountain Dew. Mountain Dew has been a very successful product for Pepsi, and that has gained share in carbonated soft drinks.

Carbonated soft drinks — the average person in this room drinks 64 ounces of liquid a year. Carbonated soft drinks are just under 30 percent of that. And beer and milk are each about 11 or 12 percent. They're both down from 10 years ago. Carbonated soft drinks are up substantially.

Bottled water is up somewhat, but the only two categories that are really up are carbonated soft drinks, from ten years ago, and bottled water.

Coffee is down significantly. You think Starbucks has done a lot, but coffee just keeps going down and down and down.

If you look at Coke, of the almost 30 percent of the liquids consumed in the United States, they have about 43 percent of the 30, in their arenas.

So you're talking 13 percent of all liquids, you know, tap water, everything else that the American water — the American people — drink, is a Coca-Cola product.

And it's off a couple tenths of 1 percent from the high, but it's higher than five years ago, it's higher than 10 years ago. And, actually, in the first quarter, it did quite well, too.

So, I think there's been no — I mean, I'm sure there's been no loss of marketing vigor.

Doug Daft is a marketer at heart. He's a, you know, he comes from the same — he's put together the same way as — along the same lines — as Don Keough. There'll never be another Don Keough.

But Doug is the same type of guy. He's in tune with the product.

And I would — if I had to bet, I would bet the market share of Coke, in terms of both carbonated soft drinks and in terms — actually in terms of water.

I mean, the Dasani — the gains in Dasani last year were like 95 percent, in the first quarter they were about 60 percent. Those were huge gains. And Pepsi got an earlier start with Aquafina. But Coke has almost closed that gap.

Coke is a very, very powerful marketing organization. So 18, I think, point-seven billion cases, there's nothing like it in the world.

And I do not think they've lost their focus or drive in any way whatsoever.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

WARREN BUFFETT: You might try Vanilla Coke, too. It'll be out next month.

28. How long does it take to dig a moat?

WARREN BUFFETT: Area 4.

AUDIENCE MEMBER: Good morning, Mr. Buffett, Mr. Munger. My name is Jerry McLaughlin. I'm from San Mateo, California.

First, I just want to thank you for all the effort you put into the annual reports, the letters, and these conversations.

I've learned a lot, and they're terrific, which is why I'm here from half a country away. (Applause)

You know, you've said that great companies are those that have an economic moat, and I understand that phrase to mean a sustainable competitive advantage.

Do businesses begin their lives with sustainable competitive advantages, or must that be developed over a very long time?

And then, what are the fundamental bases upon which you've seen companies successfully develop sustainable competitive advantages?

Of those, which do you think is the most enduring and which is the least?

WARREN BUFFETT: Well, sometimes they can develop it very quickly.

I mean, I would say that Microsoft, in terms of the operating system, you know, that was a relatively quick development. But that was an industry that was exploding, and things were changing very fast.

On the other hand, if you go back to See's Candy, which started in 1921, you know, there was no way you could build a sustainable competitive advantage, at least that would be recognizable, in times measured shorter than decades.

I mean, you opened up one shop at a time, and nobody'd heard of you originally, and then a few people did.

And boxed chocolates were something that, you know, people may have bought once or twice a year for a holiday occasion or whatever.

So, you weren't going to embed yourself in the minds of Californians in one or two or five years just because you were turning out, you know, outstanding box of chocolates.

So it depends on the way the industry itself is developing.

Walmart has done a fabulous job in a — an incredible job — in quite a short period of time. But even they, you know, they took it in the small towns, and they progressed along, and refined their techniques as they went.

But I would say that there could be things in new industries.

I would say with NetJets, we have a sustainable competitive advantage. And that's an industry that was only originated in 1986 when Rich Santulli got the idea, and it was in its infancy — I mean total infancy — for a good many years after that.

But what he has built, and is building and fortifying, is that sustainable competitive advantage.

But it depends very much on the industry you're in.

And I mean, Coca-Cola, 1886, Jacobs Pharmacy, Atlanta, Georgia, you know, John Pemberton came up with a product. And did he have a sustainable competitive advantage that day? If he did, he blew it because he sold the place for 2,000 bucks to Asa Candler.

He did — and it took decades, thousands of competitors over that time, and — you know, but they were painting one barn at a time and designing one Saturday Evening Post ad at a time, and all of that.

And — and pebbles — you know, around the world in World War II, General Eisenhower went to Mr. Woodruff and he said, "I want a Coke within the arm's length of every American serviceman." He said, "I want something to remind them of home."

And so he built a lot of bottling plants for Coke around the world. And that was a huge impetus.

But that was, what, 60 years or so after the product was invented. So it takes — it takes a long time in certain kinds of products, but I could see certain areas of the world where a huge competitive advantage is built in a very short period of time.

I would say that probably, in terms of animated feature-length films, for example, Walt Disney did that.

And after "Snow White" and a few more, it took him a while until he could cash in on it, but he — it became Disney and nobody else in that field for quite a while, and fairly quickly.

Charlie?

CHARLIE MUNGER: Yeah, there are a lot of different models that create a sustainable competitive advantage. And there are also some models of where you can lose it very fast.

Just ask Arthur Andersen. That was a very good name in America not very long ago.

And I think it would be harder to lose the good name of Wrigley's gum than the good name of Arthur Andersen.

I think there's some perfectly remarkable competitive advantages that people have gotten over time.

And the great trouble with the investment process is that they're so damned obvious that the stocks sell at very high prices.

WARREN BUFFETT: Snickers has been the number one candy bar for probably 30 or 40 years now.

CHARLIE MUNGER: Yeah, and —

WARREN BUFFETT: Well —

CHARLIE MUNGER: — in Russia, it turns out that everybody likes Snickers.

WARREN BUFFETT: What — how do you really knock it off?

You know, I mean, we make candy, we would love to displace Snickers, but it's hard to think of ways to knock them from the number one spot.

I mean, my guess is that they'll be number one in, you know, 10 years from now in candy bars, and the list doesn't change much in that field because — if you think about the nature of how you make that choice as to what candy bar —

If you were chewing Spearmint chewing gum five years ago, and you buy a pack of some chewing gum today, it's likely to be Spearmint.

I mean, there's just things that you experiment a lot with, and there're things that you don't fool around with once you're happy.

And, you know, you can understand that if you observe your own habits and people's habits around you.

But there's other — usually if something can gain competitive advantage very quickly, you have to worry about them losing it quickly, too.

I mean, when an industry is in flux, there are a lot of people that think they're the survivors, or the ones that are going to prosper, where it turns out otherwise.

29. Bullish on Coca-Cola & Gillette

WARREN BUFFETT: Area 5.

AUDIENCE MEMBER: Mr. Buffett, my name is Pete Danner (PH) from Boulder, Colorado. And I would also like to thank you two for what you bring to the game.

I heard your response to the Coke — to the question regarding Coca-Cola.

In the annual report a few years back, you described Coca-Cola and Gillette as the two "invincibles."

With Pepsi as a strong competitor today, do you still continue to view Coca-Cola as the "invincible?"

Additionally, with respect to American Express Company, with last year's financial results at American Express, how do you now view American Express?

WARREN BUFFETT: Yeah, I think the term I used was "inevitables," actually, but it's very close to the same thing.

And I would — and I think when I made that statement, I said Coca-Cola in soft drinks or Gillette in blades and razors. I mean, I did not extend them to the entire corporate portfolio, particularly in the case of Gillette, but to the blade and razor business.

Gillette now has 71 percent, by value, of the blade and razor business in the world. Just think of that. I mean, 71 percent.

Here's a product that everybody knows what it does, they know how to — you know, they know where it's sold, they know that it's a high-margin business. I mean, it isn't like the world — the capitalist world — is unaware of the money that could be made if they could knock off Gillette.

But they can't knock off Gillette, and it's 71 percent. And that's a little higher percentage than when I wrote about it.

Actually, Coca-Cola's worldwide market share is a little higher now than it was when I wrote that five years ago.

And I would say that five or 10 years from now I would be amazed if Gillette or Coca-Cola has lost market share in their respective fields.

Coca-Cola sells half, roughly, of the soft drinks in the world, and soft drink consumption per capita goes up, basically, every year, and the per capitas go up — I mean the capitas — go up every year, also.

So you get these gains, maybe they're 3 percent or 5 percent in units, or 4 percent, 5 percent in the first quarter, but it was poorer than that. I think it was 3 percent last year.

But when you have half the world, and the world's population is growing at a little under 2 percent and you're getting 3 percent or 4 percent from something as pervasive as soft drinks, you know, you are doing all right.

And it was crazy, in my view, for people to think that earnings can grow 15 or 18 percent a year in a business where units — we had half the world's business, and units are going to grow fine — but they're not going to grow anything like 15 or 12 percent or 10 percent.

The Coca-Cola business has done fine. People went crazy, in terms of valuing some of these businesses a few years back, and I think we had some cautionary language in there, generally, about the valuations at which the businesses sold.

But the businesses — at 71 percent in blades and razors, that is a — there's some countries where it's 90. In the U.S., it's also about 70 percent.

Those are huge market shares of something people use every day. In this country, you know, it's a little over eight ounces per day, more like — well ,actually more like 9 1/2 ounces per day — for every man, woman, and child in the United States, out of the 64 ounces they drink.

Well, you're not going to have galloping percentage increases from that arena. But the company's made, basically, good progress.

People got carried away from the stock — with the stock — and I would argue that they may have gotten encouraged a little bit too much by, not only Wall Street, but even by company pronouncements, in terms of attainable — possibly attainable — gains.

There aren't large companies —you know, there may be one someplace, somehow, very large now that will grow at 15 or 18 percent a year — but it just isn't in the cards in the world.

And we don't want anybody to think Berkshire can do that either, because we can't do it from a very large base. The world doesn't allow that.

But it does allow making reasonable progress, and certainly Coke and Gillette, in those areas where I said they were inevitable, have done very well.

They haven't — Gillette has not done as well with acquisitions, which is clear.

I mean, the Duracell — the Gillette acquisition of Duracell — resulted in giving 20-odd percent of the business for another business, and that business has not done nearly as well as either the management or the investment bankers thought it was going to do at the time the deal was made.

Charlie?

CHARLIE MUNGER: Well, I would say, regarding that last instance, that that's the normal result.

When you try and — you've got a wonderful business and you issue shares in it to buy another business, I'd say at least two times out of three, it's a terrible idea.

WARREN BUFFETT: Well, GEICO is a great example. GEICO is a wonderful business. Absolutely wonderful, gets more wonderful by the day, has the world's best manager, Tony Nicely, running it.

GEICO, in the last 20 years, went into three — at least three — other insurance businesses I can think of.

They went into Resolute Insurance, which was a reinsurance operation started in the mid-80s. It was a disaster.

They went into two others, Southern something or other, and another one that started with an M.

I don't know why in the hell they would go into them. I mean, they had a great, great insurance business, and there aren't that many great insurance businesses. And neither one of those amounted to anything. I think, you know, they sold them off at some point.

But why would you have an absolutely wonderful business and start one and buy two others that are obviously mediocre, where you bring nothing to the party?

But managements — it's very human to want to do that. It's no great sin that the GEICO management did it, because we see it happen time after time after time.

I can tell you this: Charlie and I have no urges like that. I mean, we want to buy easy things. We do not have to prove our manhood by doing something terribly difficult.

And I think a lot of managements feel that necessity. They've got a wonderful business —

The cigarette companies did that. Cigarette companies had these great businesses, and, you know — it irritated them that they — they liked to think they're business geniuses, so they would go out and buy other things and those other businesses, generally, did not do that well.

I'm not saying they should've been in the cigarette business in the first place, but they were not business geniuses because they made a lot of money selling an addictive, you know, product.

That did not make them business geniuses, and so they wanted to prove it other ways, and they bought businesses and fell on their face, in many cases.

Charlie, do you have any more to add on cigarette companies?

CHARLIE MUNGER: No, but I think a lot of people rise to the top in publicly-held corporations, who come up in sales or, you know, engineering, or drug development, or what have you.

It's natural to assume once you're sitting in the top chair that now you know pretty much everything.

Or at least, how to get wisdom out of this wonderful staff and all these outside advisors that are now available to you.

And so I think it's very natural that perfectly terrible acquisition decisions get made, I'd say, more often than not.

30. Staying rational and avoiding confirmation bias

WARREN BUFFETT: Area 6.

We have a break in about five minutes. In fact, we'll do this question and then we'll break.

AUDIENCE MEMBER: OK. My name's Paul Tomasik from Illinois.

I'd like to talk about your thinking, if you don't mind.

In the "Fortune" magazine article that you sent to all the shareholders, you referenced a practice by Darwin that when he found something that was contrary to his established conclusions, he quickly wrote it down because the mind would've pushed it out.

And if you read "The Origin of Species," Darwin's very careful to avoid fooling himself. He very carefully asks and answers the hard questions.

It's a feedback mechanism, and you've picked up on one of his feedback mechanisms to avoid fooling yourself.

So the two questions are this:

If you look — model — how you think, Charlie thinks, how physicists think, how mathematicians think, you see the same pattern.

You want to use logic. You're dedicated to logic. But logic's not enough. You have to avoid fooling yourself, so you build feedback mechanisms.

So the first question is, do you see it that way? That you're thinking just like mathematicians, physicists, and some of the other exceptional businessmen, by being logical and being careful to have feedback mechanisms?

And the second question is about other feedback mechanisms.

Your partnership — sitting next to you is a great feedback mechanism. Hard to fool yourself when you partner with Charlie Munger.

WARREN BUFFETT: Right.

AUDIENCE MEMBER: This meeting's a feedback —

WARREN BUFFETT: Hard to fool him, too. (Laughter)

AUDIENCE MEMBER: But that's not an accident.

The meeting is one level of feedback mechanism, the way you attack the annual report letter is a feedback mechanism.

So you could comment, both of you, on other feedback mechanisms you developed? Thank you.

WARREN BUFFETT: Well, you've come up with two very good ones. I mean, there's no question that Charlie will not accept anything I say because I say it, whereas a lot of other people will.

You know, I mean, it's just the way the world works.

And it's terrific to have a partner who will say, you know, you're not thinking straight.

CHARLIE MUNGER: It doesn't happen very often.

WARREN BUFFETT: There's no question, the human mind — what the human being is best at doing is interpreting all new information so that their prior conclusions remain intact. I mean, that is a talent everyone seems to have mastered.

And how do we guard ourselves against it? Well, we don't achieve it perfectly.

I mean, Charlie and I have made big mistakes because, in effect, we have been unwilling to look afresh at something.

You know, that happens.

But we do have — I think the annual report is a good feedback mechanism. I think that reporting on yourself, and giving the report honestly, whether you do it through an annual report or do it through some other mechanism, is very useful.

But there — I would say a partner, who is not subservient, and who himself is extremely logical, you know, is probably the best mechanism you can have.

I would say that on the contrary, to get back to looking things you have to be sure you don't fall into, I would say the typical corporate organization is designed so that the CEO opinions and biases and previous beliefs are reinforced in every possible way.

I mean, having staff surround you that know what you want to do, you are not going to get a lot of — you're not going to get a lot of contrary thinking.

I mean, most staffs, if they know you want to buy a company, you're going to get a recommendation.

Whatever your hurdle rate, if it's 15 percent internal rate of return, which very few deals ever work out at, you know, or 12 or — they're going to come back, and they're going to come back with whatever they feel that you want.

And if you arrange your organization so that you basically have a bunch of, you know, sycophants who are cloaked in other, you know, titles, you're not going to get — you are going to leave your prior conclusions intact, and you're going to get whatever you go in with your biases wanting.

And the board is not going to be much of a check on that. I've seen very, very few boards that can stand up to the CEO on something that's important to the CEO and just say, you know, "You're not going to get it."

You've hit on a terribly important point. All of us in this room want to read new information and have it confirm our cherished beliefs. I mean, it is just built into the human system.

And that can be very expensive in the investment and business world.

And, like I say, I think we've got a pretty good system. And I think that most of the systems aren't very good, that exist in corporate America, to avoid falling into the trap you're talking about.

Charlie?

CHARLIE MUNGER: Yeah, I think it also helps to be willing to reverse course even when it's quite painful.

As we sit here, I think Berkshire is the only big corporation in America that is running off a derivative book.

And we originally made the decision to allow the General Re derivative book to continue, and it's a very unpleasant thing to do to reverse that decision, yet we're perfectly willing to do it.

Nobody else is doing it, and yet it's perfectly obvious, at least to me, that to say that derivative accounting in America is a sewer is an insult to sewage. (Laughter)

WARREN BUFFETT: I would second that. I might not have chosen those exact words, and we may not even use those words in describing why we got out of it, but —

Yeah. And in the first quarter of this year, we'll show quite a bit of income — and anything we say here, we ought to put on the internet, Marc — but I think we'll show, what, 100 and, I don't know, 60 million or something like that of financial — maybe it's 140, I'll take a look here.

Well, you'll have 160-odd million of income in that funny little line we have from financials income.

But that will be after an $88 million loss, in terms of getting — the first steps — of getting out of the General Re — what used to be called General Re Financial Products — derivative book.

You know, those losses were there. I mean, some of that is a shutdown loss, 30-odd, 30 million or thereabouts is severance pay and that sort of thing.

But the truth is that derivative accounting is absolutely terrible in this country, and there are a lot of companies that will not want to face up to what would be involved if they actually got out.

Now you're seeing derivative accounting unwound at Enron, in a very major way. And believe me, it's not being unwound at a profit, except to the extent that the bankruptcy court lets them disaffirm certain contracts.

I mean, it is — there was no place where there was as much potential for phonying numbers at a place like Enron than the derivative kind of data.

They were marking-to-model, they were doing all these things.

You give a whole bunch of traders the ability to create income by putting little numbers down on a piece of paper that nobody can really check, and it, you know, it can get out of control. It will get out of control.

And so we decided, finally, to bite the bullet on it, and we'd get out of it.

And it would — incidentally, we would not have reported $88 million of loss if we'd stayed in it. Might have reported a tiny profit or something, but, in the end, you know, the loss was there.

And there will be — it could well be — some more to come in that, because once you get into derivatives — I think our longest contract may run 40 years or something like that.

The guy who put the 40-year contract on the book probably got paid, you know, that week for putting it on, virtually. And, you know, we've got a bunch of assumptions as to how it's all going to work out over 40 years. You couldn't devise a worse system.

And, in the end, you know, we didn't want to be in the business when we got in it, and we are now in the process of getting out.

But you don't get out of fast — out fast — in something like this.

I mean, it's, you know, it's a little like hell. It's easy to get into, and it's hard — very hard — to get out of. (Laughs)

Afternoon Session - 2002 Meeting

1. Blue Chip Stamps plunges under Buffett and Munger

WARREN BUFFETT: You've heard us talk here about the importance of our managers. However, occasionally, Charlie and I get involved in management ourselves. And we would normally be too modest to claim any great accomplishments.

But we have had one rather incredible performance which, since Charlie participated in it as well I do — I think if we put up the slide on the company that Charlie and I have managed personally, you'll see that this entity — you can't — Charlie, here it is, right here.

It's one where we took over 30-odd years ago. And as you can see, the 46,000 became — what?

VOICE: That's the wrong slide.

WARREN BUFFETT: Oh. Excuse me. Are you sure? Oh.

VOICE: Oh, yeah.

WARREN BUFFETT: OK. Well, I guess we better put up the next slide.

We — (laughter) — they got that first one — they got it reversed. We were doing 120 million when we took over, and we're now doing $46,000 a year. But we may get a bounce one of these years. (Laughter)

That was a company that also had a lot of float — (laughs) that we were attracted to. And the interesting thing is, you know, this was Blue Chip Stamps.

Although Blue Chip was a copy, of a sort, of Sperry & Hutchinson, which really was the main inventor of trading stamps on any large scale in the country, and they go back to the 19th century.

But if you think about it, S&H Stamps — Green Stamps — or Blue Chip Stamps, had many similarities to frequent flyer miles. You know, the only difference being that, you know, you got them a lot at, like, grocery stores and all of that and then you had to lick them and put them in a book. Whereas now, it's all done electronically.

But the basic underlying business was very similar to frequent flyer miles, which have this incredible hold on the American public. But somehow, we were not able to make the transfer.

We haven't yet made the transformation, let's put it that way, from the lick-it stamp to something that the public will accept.

But we've still got $47,000 of revenue annually from the entire state of California, so we're building a base. (Laughter)

Charlie and I continue to spend most of our time working on this one.

2. Shareholders share the wealth through philanthropy

WARREN BUFFETT: Let's go to area 7. I think we stopped in area 6 last time, and we'll go from there.

AUDIENCE MEMBER: Yes, my name is Mort November. I'm from Cleveland, Ohio. I'm here with my wife, Iris, who in 1986 founded the Statue of Liberty Collectors' Club.

I wanted to tell you personally what Berkshire Hathaway has meant for me. By owning it, we have become philanthropists in Cleveland. And the way it happened is we sold all our other stock. It was never any fun owning it, and I could never understand that my stock went down and the CEO's bonuses went up.

So, I got rid of that, and we took all of that money and we're doing things for children in Cleveland. On May 16th, we're sending a group — (applause) — thank you.

On May 16th, for the tenth year in a row, we're sending a group of children from Cleveland Municipal Schools, who win the trip by doing good work in their class and good work in the community, to Dearborn, Michigan, Henry Ford Museum, Greenfield Village. It's a lot of fun for them and it's really a lot of fun for us.

We invested in a building in the Cuyahoga National Park for campers, and hopefully we'll be able to help put up an addition to a library in East Cleveland, Ohio, which really needs all the help it can get.

So, my wish for you gentlemen is that you have many, many more years of good health and that we have the opportunity to see you on this stage, or any stage, for as many years as you want. I salute you both.

WARREN BUFFETT: Thank you. (Applause)

It's terrific what a number — a large number — of Berkshire shareholders, particularly the ones, perhaps — well maybe not particularly — but in the Omaha area, because they go way back to the partnership, and a number of them are in their mid-seventies or thereabouts.

But there have been a lot of things that have come out of the stock. In fact, there's been a suggestion that somebody may do a book on some of the things that have flowed from various Berkshire shareholders.

And I'm sure many of you know about the case of Don and Mid Othmer. Don went to Central High, here in Omaha. Mid Othmer's mother, Mattie Topp, was a wonderful woman, who was a customer when I started selling securities when I was 20 or 21, and she ran a dress shop.

And they, you know, they left about $750 million to a group of mainly 4 or 5 charities, one of which was the University of Nebraska.

But there have been all kinds of things. And there may actually be something done on that at some point, but I'm glad to hear what you're doing in Cleveland.

3. Hard to pick pharmaceutical winners

WARREN BUFFETT: Let's hear from area 8, please.

AUDIENCE MEMBER: Hi, my name is Jennifer Pearlman from Toronto, Canada.

Mr. Buffett, in 1998, you were asked to comment on the pharmaceutical industry, and at that time your answer was that you considered it a mistake not to have taken a basket approach to the industry.

I was wondering if you could revisit the issue, now that valuations have contracted so dramatically.

And also, considering that health care spending is outpacing inflation, and that there are significant moats in the industry, I was wondering if you could share with us your thoughts on the health care industry at large.

WARREN BUFFETT: Charlie may be better equipped on that than I am, but it certainly — it's been, as an industry, a very, very good business over time. And if you take the aggregate capital in it and what it's earned over time, it's been a very good business.

And we did make a mistake, your memory's 100 percent accurate, in we'd — in what we said in earlier meetings, because we should have taken a package approach. We actually did buy a tiny, tiny bit, but that's worse than buying none almost. I mean, it's just aggravating — back there in '93.

It's certainly the — they're certainly the kind of businesses that, as an industry, we can understand. We would not have great insights on specific companies. So, if we did something, we would be more inclined to do it on an industry-wide basis.

It's hard to evaluate the individual companies. As you know, Bristol-Myers has recently had a big stumble, and even Merck has fallen back. And so, it's hard to pick the winners.

But that's no reason not to have a basket approach to the industry. And at some valuation level, it would be something we would think very hard about. And it's something where we could put quite a bit of money if it happened, which is another plus to us.

Charlie?

CHARLIE MUNGER: Well, I mean, failed to get it right the last time. We'll probably fail to get it right the next time. (Laughter)

WARREN BUFFETT: I don't know what he had for lunch. (Laughter)

4. Accounting at Coca-Cola and its bottlers

WARREN BUFFETT: OK, we'll go to number 1. Well, wait a second, is there anybody at number 9? Probably not, now.

AUDIENCE MEMBER: Yes, there is.

WARREN BUFFETT: OK, good enough. Nine.

AUDIENCE MEMBER: Phil McCaw (PH), from Greenwich, Connecticut.

Could you discuss if and how you take into account the individual balance sheets of the Coca-Cola bottlers to the Coca-Cola Company, and if you view various regulatory control issues as a potential problem for Coca-Cola?

WARREN BUFFETT: Yeah, well, certain Coca-Cola bottlers became quite leveraged, the ones that were, in general, acquiring companies. Coca-Cola Enterprises certainly became very leveraged over — it started out fairly leveraged, and it became more leveraged in recent times.

And they have a business that's a solid, steady business, but it's not one with abnormal profitability. So, it can take leverage, in the sense that it won't be subject to huge dips, but it also is a business where it's very tough to increase margins significantly.

So, if most of the money goes to debt service, you know, that is something that you have to take into account when you value the equity.

It's a fairly capital-intensive business, the bottling business. On average, you'll probably spend between 5 and 6 percent of revenues on capital expenditures just to stay in the same place.

And in a business that, before depreciation, makes — and interest and taxes — makes maybe 15 cents on the dollar, having 5 or 6 cents on the dollar go to capital expenditures is a pretty healthy percentage of that. That's true at the Pepsi-Cola bottling company, too.

It's just the nature of the bottling business. It's a reason why I like, basically, the syrup business better than the bottling business. It's less capital-intensive.

And I think that the bottling business is a perfectly decent business. It isn't a wonderful business because the — it's very competitive out there.

I mean, on any given weekend, the big supermarket in town, or the Walmart, or whatever, is going to be featuring one or the other of the colas, and they're going to — it's going to be based on price. And you're going to read ads saying, you know, 12 for something or other, or 6 for something or other.

And it has become something where a lot of people will switch from one to another, based on price, on that weekend. And that makes it a tough business for bottlers. But it's a decent business.

But it doesn't, in terms of the Coca-Cola Company, itself, its bottlers are going to do perfectly OK over time. And they've got to earn enough money to be able to sustain that kind of capital expenditure and earn a cost of capital.

And if they get in trouble, it's because, if they pay too much for another bottler, it gets tough to make the math work.

Was there a second question about Coca-Cola then, too?

AUDIENCE MEMBER: Well, I was curious if you concern yourself, when you see FASB-type issues come out about control —

WARREN BUFFETT: No. Yeah, no, I understand. I'm talking —

AUDIENCE MEMBER: Combining all the balance sheets, type of thing.

WARREN BUFFETT: Yeah, that really doesn't make any difference to us. I mean, in the end, the Coca-Cola Company, there's no question about it in my mind, the Coca-Cola Company needs a successful bottling group in order to prosper as a syrup manufacturer.

But the profitability of bottling will allow that. And the capital requirements at the — at Big Coke, as it's called — are relatively minor, so most of the money they make can either be used as dividends or share repurchases.

But nobody's going to run out of money at Coca-Cola, nor are their bottlers, basically, going to run out of money. So, it is not a big balance sheet issue at all. And whether the figures are consolidated or otherwise, the economics are basically the same.

I mean, you have a, you know, there's not going to be a capital crunch of any kind. It would show different ratios if you consolidated and if you didn't, but it really wouldn't change the basic economics any.

Charlie?

AUDIENCE MEMBER: Thank you.

CHARLIE MUNGER: Yeah, I don't think it changes anything on a basic level. But ideally, in the world, you wouldn't have capitalization structures that are designed partly for appearance's sake.

AUDIENCE MEMBER: Thank you.

WARREN BUFFETT: We — thank you.

5. Accounting is a starting point, but it doesn't always reflect reality

WARREN BUFFETT: We pay a lot of attention to what we regard as the reality of the balance sheets and economic conditions and cash situation, all of that of a business. And sometimes we think accounting reflects reality, and sometimes we don't.

It's a good starting point for us always, but I mean, there are companies in the United — there's at least one company, at least last year, that was using a 12 percent investment return assumption on its pension plan, and there are other companies that use, I think, even below six, certainly six.

And in the end, should we look at the figures the same of one company, particularly if the pension fund's a big element, that uses 12 and six? No, we look at what it says they're using.

But, in our minds, we don't think the company that's using a 12 percent assumption is likely to do any better with their pension fund than one of the one's that's using six. In fact, we might even think the one that's using six is likely to do better because we might think they're more realistic about the world.

So, we start with the figures of the companies we look at, but we've got our own model in mind as to what they will look like. It's true of the businesses we own a hundred percent of. Some of them have some debt in them, some of them don't, partly that situation's inherited.

In the end, we've got the same metrics that apply to them, whether they happen to have some debt on their own particular balance sheet or not, because in the end, we're not going to be willing to have very much debt at all at Berkshire.

And where it's placed doesn't really make any difference because we're going to pay everything we owe, no matter where it is. And it's almost an accident whether company A or company B has a little debt attached to it.

6. New goodwill accounting is "making sense"

WARREN BUFFETT: Area 10, is there anybody there?

AUDIENCE MEMBER: Yes, sir. My name Adam Chud. I'm from Columbus, Ohio. I attend the Ohio State University.

My question is, your comments on the new standards for the accounting of goodwill?

WARREN BUFFETT: Yeah, the question about the new standards for goodwill.

Actually, if you read, I think, the annual report — maybe the 2000 annual report, and maybe even earlier.

But we prescribed — we said what we thought would be the preferable system for how goodwill was handled, namely, that it would not be amortized, and that combinations of companies be accounted for as purchases. And it pretty well is what ended up coming out of the accounting profession.

So, the goodwill rules now are in accord with what we believe they should be. And for a long time, they weren't.

You might argue that it was against our interests to have what we think proper accounting has put in, because some people were averse to buying businesses because of a goodwill charge they would incur, whereas it didn't make — it made no difference to us whatsoever. We just looked at the underlying economics.

So we may have a little more competition, even, on buying businesses simply because now, competitive buyers are not faced with a goodwill charge which may have bothered them but didn't bother us. I regard the present goodwill rules as making sense.

Charlie?

CHARLIE MUNGER: Well, I agree.

WARREN BUFFETT: OK.

AUDIENCE MEMBER: Thank you.

7. I used a hearse to pick up your aunt for a date

WARREN BUFFETT: Area 1.

AUDIENCE MEMBER: My name is Martin Wiegand, from Bethesda, Maryland.

Thank you for hosting this wonderful and formative shareholder meeting. Thank you also for running Berkshire in a manner that is an example to corporate America and the world. You make us proud to be shareholders.

My question, you touched on just before the lunch break. Did the compensation plans at Berkshire and its competitors have anything to do with the mispriced insurance policies they issued?

And if so, has Berkshire or its competitors changed their compensation plans to correctly price those policies?

WARREN BUFFETT: Incidentally, I asked you this last year, I think, but are you my Martin's son or grandson?

AUDIENCE MEMBER: Son.

WARREN BUFFETT: Son, OK. Good enough. It — Martin's father and I went to high school together. Matter of fact, your Aunt Barbara and I went to high school together also.

And she went out on one date with me, and that was the end. (Laughter)

It was not because I didn't ask her out again. (Laughter)

I picked her up in a hearse. I think that kind of put the — (Laughter)

8. General Re's "cultural drift"

I think compensation plans lead to a lot of silly things, but I would say that, at Berkshire's insurance companies, I don't think our problems resulted from compensation plans at all.

I think we had an — and we're talking about General Re here basically, because that's where we had the problem.

I think General Re had an enormously successful operation, which went on for a long time. And I think that there was some drift away, perhaps because competitors were drifting away in a big way, too, from certain disciplines, and we paid a price for that.

But I don't think the comp plans entered in at — in any significant way, if at all, into the fact that we did drift away for a while.

I think it — I think you want to have rational comp plans. I think we've got a rational comp plan at General Re, but — and it's quite similar to what we had before. And I just don't think that was the problem.

It's very difficult, it's difficult in the investment world, when other people are doing things that look like they're working very well, you know, and they get sillier and sillier. It's — it could be difficult for many people to not succumb and do the same things.

And that happens in investments, but it also happens in insurance. And it was, you know, it's a competitive world, and your people are out there every day, and they're competing against Swiss Re, and Munich Re, and Employers Re, and all of these people.

And you've worked hard to get clients, and the client says, "I want to stay with you, but the competitor says if I go with him, I don't have to do this or that, or I can get it a little cheaper," or whatever. You know, it's tough to walk away. And it may even be a mistake to walk away in certain cases.

So, I just think that there was a — what you might call a cultural drift. I don't think it was a shift, but it was a drift. And I think it was produced, in part, by the environment in which the company was operating. And it took a jolt to get it back. And I think that it is back.

I think it's probably stronger than ever in terms of what we have now, but I would not attribute it much to the compensation system.

But I have seen a great many compensation systems that are abominations and lead to all kinds of behavior that I would regard not as in the interest of shareholders. But I don't think we've had much of that at Berkshire.

Charlie?

9. "Demented" and "immoral" stock options

CHARLIE MUNGER: Yeah, I think if you talk generally about stock option plans in America, you see a lot of terrible behavior caused. And, no doubt, they do a lot of good at other places. But whether they do more good than harm overall, I wouldn't know.

I think, in particular, if you have a corporation where a man has risen to be CEO, and he now has hundreds of millions of dollars in the stock of the company.

He's been loyal to the company and the company's been loyal to him for decades, and he has his directors vote him a great stock option annually to preserve his loyalty to the company, and his enthusiasm to the business when he's already old, I think it's demented.

WARREN BUFFETT: How about when they grant options as he leaves the company?

CHARLIE MUNGER: I — and I also think it's immoral. I think that there comes a time when — (Applause)

I don't think you would improve the behavior of the surgeons at the Mayo Clinic, or the partners of Cravath, Swaine & Moore, if you gave the top people stock options in their sixties.

I mean, by that time, you ought to have settled loyalties, and you ought to be thinking more about the right example for the company than whether you take another hundred million for yourself.

WARREN BUFFETT: Yeah, well, we had a case — (Applause)

We've inherited some option plans because the companies we merged with had them. And in some cases they got settled for cash at the time, in some cases they continued on, depending on the situation.

But more money has been made from options at Berkshire by accident, and that, you know, this is not — it just happened that way, but more money was made by people that had options on General Re stock during a period when General Re contributed to a decrease in value of Berkshire.

So we had all of the other managers essentially, in a great many cases, turning in fine results, and we had a bad result at General Re, and yet more money, by a significant margin, was made under options at General Re than had been made probably by all other entities combined.

But it was an accident, but that's the point, it leads — it can lead to extremely capricious compensation results that have no bearing on the performance of the people that, in some cases get great benefits, and in other cases people did great jobs and were — their efforts were negated by results elsewhere.

So, it's — it would be very capricious at Berkshire — you can argue that at Berkshire, for those that succeed me and Charlie, that anybody that is in the very top position at Berkshire has got the job of allocating resources for the whole place.

There could be a logically constructed option plan for that person, and it would make some sense because they are responsible for what takes place overall.

But a logically constructed plan would have a cost of capital built into it for every year. We don't pay out any dividends, so why should we get money from you free?

We could put it in a savings account and it would grow in value without us doing anything. And a fixed-price option over 10 years would accrue dramatic value to whoever was running the place, if they had a large option, for putting the money in a savings account or in government bonds.

So, there has to be a cost of capital factor in to make options equitable, in my view, that there can be cases where they make sense. They should not be granted at below the intrinsic value of the company.

I mean, the market — a CEO who says, you know, my stock is ridiculously low when a merger — when somebody comes around and wants to buy the company, but then grants himself an option at a price that he's just gotten through saying is ridiculously low, that bothers me.

So if somebody says, you know, I wouldn't — we don't want to sell this company for less than $30 this year because it's going to be worth a lot more later on, you know, my notion is that the option should be at $30 even if the stock is 15.

You know, otherwise you have a — actually a premium built in of — for having a low stock price in relation to value. And I've never gotten too excited about that.

Charlie, you have any further thoughts on options?

CHARLIE MUNGER: Well, we've been — we're so different from the rest of corporate America on this subject that, you know, we can sound like a couple of Johnny One Notes, but I don't think we ever quite tire of the subject. (Laughter)

A lot is horribly wrong in corporate compensation in America. And the system of using stock options on the theory they really don't cost anything has contributed to a lot of gross excess. And that excess is not good for the country.

You know, Aristotle said that systems work better when people look at the different outcomes and basically appraise them as fair. And when large percentages of people look at corporate compensation practices and think of them as unfair, it's not good for the country. (Applause)

WARREN BUFFETT: It will be hard to change though, because basically, the corporate CEOs have their hands on the switch. I mean, they control the process.

You can have comp committees and all of that, but as a practical matter — I've been on 19 public boards, Charlie's been on a lot of them.

And in the end, the CEOs tend to get pretty much what they want. And what they want tends to go up every year because they see other people getting more every year. And there's a ratcheting effect, and the consultants fan the flames. And it's very difficult to get changed.

And right now, you've got corporate CEOs descending upon Washington, doing everything from trying to persuade to threaten your elected representatives to not have options expensed. And it's — I think it's kind of shameful, actually.

Because it, you know, this group, who is getting fed very well under the system does not want to have those — what clearly is a compensation expense recorded because they know they won't get as much. I mean, it's that simple. And it's not based on anything much more complicated. (Applause)

10. Float size isn't limiting investments

WARREN BUFFETT: Area 2?

AUDIENCE MEMBER: Good afternoon. David Winters, Mountain Lakes, New Jersey.

Mr. Buffett and Mr. Munger, thank you for hosting "Woodstock for Capitalists." I know it's a lot of fun for everybody, and I think a lot of fun for you, too.

Assuming growth of low-cost float and the sins of the past do not impede progress, does the sheer size of the float create constraints that change the allocation of future investments to more high-quality fixed-income obligations rather than equity coupons or workouts that can grow over time?

It seems otherwise Berkshire is incredibly well positioned if valuations ever decline.

WARREN BUFFETT: Well, I think the answer is we probably are pretty well positioned if valuations decline.

And it's a good question. If you have 37 billion of float, are you going to be more constrained to conventional investments than if you were working with a half a billion or a billion, as we were not so long ago?

As long as you have a huge capital position, which we have and will continue to have, and as long as you have a lot of outside earning power, which we have and will continue to have, I don't think we're constrained very much.

I mean, that — we'll always want to have a significant level of liquidity, relative to any kind of payment pattern that we see for a good length of time.

But we will probably be operating with so much capital and with so much earning power, independent of the insurance business, and with so much liquidity, that we really will be able to make decisions as to where — as to how — the assets should be deployed, in terms of, simply, where we see the best returns and virtually no risk.

And sometimes we see virtually no risk in equities when they're extremely cheap. We don't see that situation now, but we could see it again. And I don't think we'll be much — I don't think we'll be very constrained when the time comes.

Charlie?

CHARLIE MUNGER: Yeah, our constraint doesn't come from structure, it comes from a lack of enthusiasm for stocks generally. The bonds are held as a default option.

11. Price of gold not a factor in valuing a business

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: Dear Mr. Buffett and Mr. Munger, my name is Adrian Chur (PH), and I'm a shareholder from Hong Kong.

Thank you for your leadership and inspiration, as always. It's wonderful, always, listening to you. If I may, I would like to ask of you both gentlemen, a question in two parts.

Perhaps I can ask the second part after you've answered the first part. The first part of the question relates to the Fortune article dated 10th of December you included in our shareholder materials.

In this article, you mentioned that one couldn't explain the remarkable divergence in markets by differences in the growth of GNP. However, one could explain the divergence by interest rates.

The first question I have is this: I wonder, sir, if you were to look at the price of gold during the two periods of times you mentioned, that is to say 1948-'64 and '64-'81, if the explanation could be even more clear?

Thus, the logical reason would be why the Dow in '48 was 177 was because — and half the level of 1929, of 381 index points — is because of the 71 percent devaluation of the American dollar from 20.5 cents an ounce to 35 cents an ounce, which would put the fair value of the Dow at 166, after factoring in the record 50 percent per capita gain of the 1940s that you had mentioned.

WARREN BUFFETT: Yeah, I grew up in a household — and my sisters are here — where gold was talked about frequently. So I've been exposed to a lot of thinking on that over the years.

I don't really think gold has really — the price of gold, I should say — has anything, really, to do with the valuation of businesses.

It may reflect certain things that are going on in prices attached to those businesses at given times.

But I would not regard — I mean, the price of gold does not enter into my thinking in any way, shape, or form, in terms of how I value a business today, a year ago, 10 years ago, or tomorrow.

When we look at Larson-Juhl, the custom picture frame operation, you know, I'm not thinking against — I'm not thinking of that and relating it in any way to what gold has done.

So, I — it's just not a factor with us, any more than other commodities would be. I mean, you know, whether it's wheat, whether it's cocoa beans or whatever.

It has — you know, it has a certain hold on some people and they — but we don't look at it as an interesting investment and we don't look at it as a yardstick for valuing other investments.

Charlie?

CHARLIE MUNGER: Yeah, Warren is right when he says that interest rates are very important in determining the value of stocks, generally. And I think he's also right when he says gold is very unimportant.

12. Warning: Speculating is not investing

WARREN BUFFETT: And the second part of the question?

AUDIENCE MEMBER: Thank you, sir. The second part of my question is this: given your assumptions on gold, if you were to factor a significant decline in the value of the dollar against gold, let's say 40 percent or more, and given the correlation of 1929-'48 and '64-'81 eras positively to the decline of the dollar, and the negative correlation in the other two areas that you had studied, would you care to adjust the 7 percent total annual return you were quoted as expecting for common equity in the coming decade?

And in conjunction with that, would you care to comment on your expected rate or return on all other major asset classes, perhaps like bonds, real estates? And which would you believe offers the best value for investors? Thank you very much.

WARREN BUFFETT: Yeah. Well, except under unusual circumstances, my expected rate — my expectancy on something like bonds is what bonds are producing at a given time. I don't think I'm smarter than the bond market.

Now, you can say, when they — when those rates swing all over, does that mean I swing all over? The answer is pretty close to yes. I mean, that — I don't know what the right rate for bonds is. I think that if there's —

I'm very leery of economic correlations. I mean, I spent years fooling around with that sort of thing, and I mean, I correlated stock prices with everything in the world. And the — and you know, the problem was when I found a correlation.

I mean, it's — (laughs) — you know, you've seen these things on whether the AFC or the NFL wins the Super Bowl and all of that sort of thing. You can find something that correlates with something else.

But in the end, a business or any economic asset is going to be worth what it produces in the way of cash over its lifetime.

And if you own a — if you own an oil field, if you own a farm, if you own an apartment house, you know, with the oil field, it's the life of the oil field and what you can get out of it. And maybe you get secondary recovery, maybe you get tertiary recovery.

But whatever it may be, it's worth the discounted value of the oil that's going to come out. And then you have to make an estimate as to volume and as to price.

With a farm, you might make an estimate as to crop yield, and cost, and crop prices.

And the apartment house, you make an estimate as to rentals, and operating expenses, and how long it'll last, and when people will build other new apartment houses that potential renters in the future will find preferable, and so on.

But all investment is, is laying out some money now to get more money back in the future. Now, there's two ways of looking at the getting the money back. One is from what the asset itself will produce. That's investment.

One is from what somebody else will pay you for it later on, irrespective of what the asset produces, and I call that speculation.

So, if you are looking to the asset itself, you don't care about the quote because the asset is going to produce the money for you. And that's how — that's what society, as a whole, is going to get from investing in that asset.

Then there's the other way of looking at it, is what somebody will pay you tomorrow for it, even if it's valueless. And that's speculation. And of course, society gets nothing out of that eventually, but one group profits at the expense of another.

And of course, you had that operate in a huge way in the bubble of a few years ago. You had all kinds of things that were going to produce nothing, but where you had great amounts of wealth transfer in the short term.

As investments, you know, they were a disaster. As means of wealth transfer, they were terrific for certain people. And they were, for the other people that were on the other side of the wealth transfer, they were disasters.

We look solely — we don't care whether something's quoted because we're not — we don't buy it with the idea of selling it to somebody. We look at what the business itself will produce.

We bought See's Candy in 1972. The success of that has been because of the cash it's produced subsequently.

It's not based on the fact that I call up somebody at a brokerage house every day and say, "What's my See's Candy stock worth?" And that is our approach to anything.

On interest rates, I'm no good. I bought some REITs a couple of years ago because I thought they were undervalued. Why did I think they were undervalued?

Because I thought they could produce 11 or 12 percent, in terms of the assets that those companies had. And I thought an 11 or 12 percent return was attractive.

Now the REITs are selling at higher prices and, you know, they're not as attractive as they were then.

But you just look at — every asset class, every business, every farm, every REIT, whatever it may be, and say, "What is this thing likely to produce over time?" and that's what it's worth.

It may sell at vastly different prices from time to time, but that just means one person is profiting against another, and that's not our game.

Charlie?

13. Hard to predict when a bubble will burst

CHARLIE MUNGER: Yeah, what makes common stock prices so hard to predict is that a general liquid market for common stocks creates, from time to time, either in sectors of the market or in the whole market, a Ponzi scheme.

In other words, you have an automatic process where people get sucked in and other people come in because it worked last month or last year. And it can build to perfectly ridiculous levels, and the levels can last for considerable periods.

Trying to predict that kind of thing, sort of a Ponzi scheme which is, if you will, accidentally thrown into the valuation of common stocks by just the forces of life, by definition that's going to be very, very hard to predict. But that's what makes it so dangerous to short stocks, even when they're grossly overvalued.

It's hard to know just how overvalued they can become in addition to the overvaluation that exists. And I don't think you're going to predict the Ponzi scheme effect in markets by looking at the price of gold or any other correlation.

WARREN BUFFETT: Charlie and I probably — I mean, I'm pulling a figure out of the air — we have probably agreed on at least a hundred companies, maybe more, that we felt were frauds, you know, bubble-type things.

And if we had acted on shorting those over the years, we might be broke now, but we were right on probably just about a hundred out of a hundred. It's very hard to predict how far what Charlie calls the Ponzi scheme will go.

It's not exactly a scheme in the sense that it isn't concocted, for most cases, by one person. It's sort of a natural phenomenon that seems to — nursed along by promoters and investment bankers and venture capitalists and so on. But they don't all sit in a room and work it out.

It just — it plays on human nature in certain ways and it creates its own momentum, and eventually it pops, you know. And nobody knows when it's going to pop, and that's why you can't short, at least we don't find it makes good sense to short those things.

But they are — it is recognizable. You know when you're dealing with those kind of crazy things, but you don't know when the — how high they'll go or when it'll end or anything else.

And people who think they do, you know, sometimes play in it. And other people know how to take advantage of it, I mean there's no question about that.

You do not have to have a 200 IQ to see a period like that and figure out how to have a big wealth transfer from somebody else to you, you know. And that was done on a huge scale, you know, in recent years. It's not the, you know — it's not the most admirable aspect of capitalism.

14. Stock options as compensation isn't sinful, but …

WARREN BUFFETT: Area 4.

AUDIENCE MEMBER: Yes, good afternoon, Mr. Buffett and Mr. Munger. My name is Ho Nam (PH), and I'm from San Francisco, California.

I have a question related to an issue you touched on a few moments ago on the debate over whether or not stock options should be expensed and reflected on the income statement of companies.

With the current system, shareholders are incurring the burden of stock options since exercised options dilute earnings per share.

As a shareholder of companies that issue stock options, I think I'm OK with that, especially in entrepreneurial companies that may not have enough cash to attract talent from larger competitors, or in cases where you have younger employees or lower-level employees who do not have the cash to purchase stock without the use of options.

I have a two-part question. If companies are required to expense stock options and it hits — impacts the P&L, does it — would that lead to double-counting the impact of stock options?

And the second part is, if the use of stock options are largely eliminated, might that impact the competitiveness of entrepreneurial companies which help drive innovation and growth and create more of a dividing line between shareholders and employees?

WARREN BUFFETT: Yeah, the first question is that there really isn't the double-counting necessarily.

For example, let's just take a company with a million shares of stock outstanding, selling at a hundred dollars a share.

And let's say that options are granted for 9 million shares — we'll make it extreme — at a hundred dollars a share. At that moment, you've given 90 percent of the upside to the management. We're taking a very extreme example. That's been a huge cost to the shareholders.

Now, interestingly enough, if the stock was selling at $100 a share, the fully diluted earnings are exactly the same as the basic earnings in that year, because the dilution is not counted at all unless the stock is selling above, and then only by the difference in the market value and what it costs to repurchase the optioned shares. So, there is not double-counting.

And you can — you could issue — the very fact that you issued that million, the options on 9 million more shares at 100, would undoubtedly cause the price to actually fall well below 100 and there would be no dilution shown in terms of the way GAAP reports diluted earnings.

The second question, as to whether, if you expense the options, it would discourage the option use.

Well, the argument, you know, that is made when there — people issue options is that it's doing more for the company than giving people cash compensation. It may be more convenient than cash compensation, too, for young and upcoming companies.

But the fact that you are doing something in terms of paying people in a way that you say is even more effective than paying them in cash, to say that therefore you shouldn't have to record the payment, I've never really followed.

I don't have any objection to options under some conditions. I've never taken a blanket position that options are sinful or anything of the sort. I just say they are an expense.

And to be truthful with people about what you're earning, you should record the expense. And if a company can't afford to be truthful, you know, I have trouble with that.

And we will take, as we've said, you can pay your insurance premium to me in options. There'd be lots of companies I'd be happy to take options in and give them credit.

I'd take options above the market. Give me a 10-year option 50 percent above the market in many companies, and we will take that — appropriate number of shares — and take that in lieu of cash.

But that means we simply like, you know, the value of what we're getting better than the equivalent amount of cash and we think the company that gives it to us has incurred an expense.

We've received something of value, they've given something of value up, and that's income to us and expense to them.

And I think all of the opposition, at bottom, to the — to expensing of options comes from people who know they're not going to get as many options if they're expensed. And you know, they would like cash not to be expensed, but they can't get away with that, you know. I mean —

CHARLIE MUNGER: Yeah. (Laughter)

WARREN BUFFETT: If you had an accounting rule that said the CEO's salary should not be counted in cash, believe me, the CEOs would be in there fighting to have that rule maintained.

I mean, because no one would — they would feel that they were going to get more cash if it wasn't expensed, and options are the same way.

It's another argument I get a kick out of, I was just reading it the other day, where they say, "Well, options are too tough to value."

Well, I've answered that in various forms, but I notice that — what is it, Dell Computer, you know, has a great number of put options out, and it's going to cost them a lot of money on the put options they have out.

And for a company to say, "We can't figure out the value of options, and therefore we can't expense them," and then at the same time be dealing in billions of dollars' worth of options, they are saying, "We are out buying or selling options in the billions of dollars, but we don't know how to value these things." That strikes me as a little bit specious — a little disconnected, cognitive dissonance, as they say.

Charlie?

CHARLIE MUNGER: Yeah, I'm not at all against stock options in venture capital, for instance. But the argument that prominent venture capitalists have made, that not expensing stock options is appropriate because if you expense them it would be counting the stock options double, that's an insane argument.

The stock option is both an expense and a dilution, and both factors should be taken into account in proper accounting.

John Doerr, the venture capitalist, as he argues to the contrary, is taking a public position that, "Were it offered to me as part of my employment, I would rather make my living playing a piano in a whorehouse." (Laughter)

WARREN BUFFETT: We always get to the good stuff in the afternoon. (Laughter)

I hope the children are in bed.

15. Hard to predict what happens after a bubble bursts

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Good afternoon. My name is Bob Baden (PH), from Rochester, New York.

Mr. Munger, this morning, while discussing index funds, you used the example of Japan as a real example of poor performance of a major index over a long period.

Indeed, the S&P 500 index declined over 60 percent, in real terms, from the early '60s through the mid-'70s.

Could you discuss the mental models you use to consider the impact of inflation or deflation on your investment decisions and the likelihood of either occurring over the next decade?

CHARLIE MUNGER: Well, that's partly easy and partly tough.

If interest rates are going to go way up, you can obviously have a lot of deflation of stock prices. And a lot of that happened in the American period you're talking about.

What's interesting about Japan is that I don't think anybody thought that a major modern Keynesian democracy, pervaded by a good culture in terms of engineering, product quality, product innovation, and so forth, could have a period where you would have negative returns over 13 years without major depression either.

WARREN BUFFETT: (Inaudible)

CHARLIE MUNGER: I think — and that it would occur while interest rates were going down, not up. I think that was so novel that the models of the past totally failed to predict it.

But I think these anomalies are always very interesting, and I think it's crazy for Americans to assume that what's happening in Argentina, what has happened in Japan, are totally inconceivable forever in America. They are not totally inconceivable.

WARREN BUFFETT: You had a huge bubble in equity prices in Japan, and now you've had interest rates go to virtually nothing.

You've had the passage of time, the country hasn't disappeared. People are going to work every day, and you've had this — the Nikkei, you know, now at a third of what it sold for not that many years ago. It's an interesting phenomenon.

CHARLIE MUNGER: And huge fiscal stimulus in the whole period from the government.

WARREN BUFFETT: Post-bubble periods, I think, depending on how big the bubble is and how many were participating in it, but post-bubble periods, I think, can produce fallout that not everyone will be terribly good at predicting.

16. Ben Graham and the long/short model

WARREN BUFFETT: Six?

AUDIENCE MEMBER: Hi, I'm Steve Rosenberg (PH). I'm 22, from Ann Arbor, Michigan. It's a privilege to be here.

First, I'd just like to thank you both for serving as a hero and positive role model for me and many others. Much more than your success, itself, I respect your unparalleled integrity.

I have three quick questions for you. The first is how a youngster like myself would develop and define their circle of competence.

The second involves the role of creative accounting in the stories of tremendous growth and success over many years. GE, Tyco, and IBM immediately come to mind for me, but I was hoping you could also discuss that issue in relation to Coke.

Some people have said that their decision to lay off much of the capital in the system onto the bottlers, who earn low returns on capital, is a form of creative accounting.

On the flip side, others counter that Coke's valuation, at first glance on, say, a price-to-book metric, is actually less richly valued than it seems because they earn basically all the economic rents in the entire system.

My final question is, if you could comment on the A.W. Jones model, the long/short equity model. I understand that it doesn't make sense for capital the size of Berkshire's to take that type of a strategy.

But it just seems to me that playing the short side in combination also seems incredibly compelling, even giving the inherent structural and mathematical disadvantages of shorting. And I was wondering if you could talk a little bit more about why you would have lost money on your basket of a hundred frauds.

WARREN BUFFETT: Yeah, it's an interesting question. And we'll start — we'll go in reverse order.

Many people think of A.W. Jones, who was a Fortune writer at one time, and who developed the best-known hedge fund, whenever it was, in the early '60s or thereabouts, maybe the late '50s even.

And for some of the audience, the idea originally with A.W. Jones is that they would go long and short more or less equal amounts and have a market-neutral fund so that it didn't make any difference which way the market went.

They didn't really stick with that over time. And I'm not even sure whether A.W. Jones said that they would. But they, you know, sometimes they'd be 140 percent long and 80 percent short, so they'd have a 60 percent net long, or whatever it might be.

They were not market-neutral throughout the period, but they did operate on the theory of being long stocks that seemed underpriced and short stocks that were overpriced.

Even the Federal Reserve, in a report they made on the Long-Term Capital Management situation a few years ago, credited A.W. Jones with being sort of the father of this theory of hedge funds.

As Mickey Newman, if he's still here, knows, I think it was in 1924 that Ben Graham set up the Benjamin Graham Fund, which was designed exactly along those lines, and which even used paired securities.

In other words, he would look at General Motors and Chrysler and decide which he thought was undervalued relative to the other, and go long one and short the other.

So, the idea — and he was paid a percentage of the profits. And it had all of the attributes of today's hedge funds, except it was started in 1924.

And I don't know that Ben was the first on that, but I know that he was 30 years ahead of the one that the Federal Reserve credited with being the first, and that many people still talk about as being the first, A.W. Jones.

Ben did not find that particularly successful. And he even wrote about it some in his — in terms of the problems he encountered with that approach.

And my memory is that a quite high percentage of the paired investments worked out well. He was right. The undervalued one went up and the overvalued — or the spread between the two narrowed.

But the one time out of four, or whatever it was, that he was wrong lost a lot more money than the average of the three that he was right on.

And you know, all I can say is that I've shorted stocks in my life, and had one particularly harrowing experience in 1954. And I have — I can't — I can hardly think of a situation where I was wrong, if viewed from 10 years later.

But I can think of some ones where I was certainly wrong from the view of 10 weeks later, which happened to be the relevant period, and during which my net worth was evaporating and my liquid assets were getting less liquid, and so on. So, it's — all I can tell you is it's very difficult.

And the interesting thing about it, of course, is A.W. Jones was a darling of the late 1960's. And Carol Loomis is here, and she wrote an article called "The Jones Nobody Keeps Up With." And it's a very interesting article, but nobody's writing articles — nobody was writing articles about A.W. Jones in 1979.

I mean, something went wrong, and there were spin-offs from his operation. Carl Jones spun off from his operation, Dick Radcliffe spun off from his operation. There were — you can go down the list.

And out of many, many, many that left, they — a very high percentage of them bit the dust, including suicides, cab drivers, subsequent employment — the whole thing. And these people were —

There was a book written in the late '60s, it had a lot of pictures in it. I don't remember the name of it, but it showed all these portraits of all these people that were highly successful in the hedge fund business, but they didn't bring out a second edition. So, it's just tough.

Logically, it should work well, but the math of only — you can't short a lot of something. You can buy till the cows come home if you've got the money. You can buy the whole company if need be, but you can't short the whole company.

A fellow named Robert Wilson, there's some interesting stories about him. He's a very, very smart guy, and he took a trip to Asia one time, being short, I think it was Resorts International or maybe it's Mary Carter Paint, it was still called in those days.

And he lost a lot of money before he got back to this country. He's a very smart guy, and he made a lot of money shorting stocks, but it just takes one to kill you.

And you need more and more money as the stock goes up. You don't need more and more money when a stock goes down, if you paid for it originally and didn't buy it on margin. You just sit and find out whether you were right or not.

But you can't necessarily sit and find out whether you're right on being short a stock.

I think I'll let Charlie comment on that before I go to your other two questions.

17. "Creative accounting is an absolute curse"

CHARLIE MUNGER: Well, he asked about creative accounting and he named certain companies. I wouldn't agree that all those companies were plainly sinful, although I'm sure there are significant sins in the group as a whole.

Creative accounting is an absolute curse to a civilization. You can argue that one of the great inventions of man was double-entry bookkeeping, where we could keep our economic affairs under better control.

And it was a north Italian development, spread by a monk. And anything that sort of undoes the monk's work by turning this great system into kind of a tool for fraud and folly, I think, does enormous damage to the country.

Now, I think a democracy is ordinarily set up so it takes a big scandal to cause much reform. And there may be some favorable fallout from Enron because that was certainly the most disgusting example of a business culture gone wrong that any of us has seen in a long, long time.

And what was particularly interesting was it took in, eventually, a lot of nice people that you wouldn't have expected to sink into the whirlpool.

And I think we'll always get Enron-type behavior, but it may be moderated some in the next few years.

WARREN BUFFETT: A question of accounting and the economic profits to be gathered in the bottling system versus the production of the syrup, Coke. I've just gotten through reading the annual reports of Coca-Cola FEMSA and Panamco, which are two big Latin American bottlers.

And I mean, they make pretty decent money, quite significant money. And there is more money in owning the trademark. It isn't the plants that make the syrup or anything to sell. The trademark is where a huge amount of value is.

The trademark is where a huge amount of value is in See's Candy. You know, those are big, big assets.

And I would say that you can make good money as a bottler. A lot of bottlers have become rich over the years. If I had a choice between owning the trademark and owning a bottling business, I'd rather own the trademark, but that doesn't mean the bottling business is a bad business at all.

And it's riding on the back of a trademark. I mean, that is why a bottling system is valuable, is because it has the right to sell a trademarked product, which hundreds of millions of people every day are going to go in and ask for by name. And the right to distribute that product is worth good money.

And it really — I don't see any accounting questions in that sort of thing. In other words, if the Coca-Cola Company did not own a share in any of its bottlers, and for many years it either owned a hundred percent of a bottler, or a large part, or — and very few of those — or none of it.

But if they owned no interest in their bottlers, I think the economics would be very, very similar to what they are now.

I mean, the bottlers would still be able to borrow a lot of money because they would have contracts with the Coca-Cola Company, and that were important, and that would allow them to make decent money distributing the product.

But they don't make the kind of money that you make if you own the trademark. That's just the way it works.

18. How to stay in your "circle of competence"

WARREN BUFFETT: What was the first question again that —

AUDIENCE MEMBER: It was how a youngster like myself would define and develop a circle of competence.

WARREN BUFFETT: Oh, yeah, that's a good question. And I'm — you know. I'd — I would say this, if you have doubts about something being into your circle of competence, it isn't.

You know, I mean, in other words, I would look down the list of businesses and I would bet you that you can — I mean, you can understand a Coke bottler. You can understand the Coca-Cola Company. You can understand McDonald's.

You can understand, you know, you can understand, in a general way, General Motors. You may not be able to value it.

But there are all kinds of businesses. You can certainly understand Walmart. That doesn't mean whether you decide whether the price — what the price should be — but you understand Walmart. You can understand Costco.

And if you get to something that your friend is buying, or that everybody says a lot of money's going to be made, and you don't — you're not sure whether you understand it or not, you don't.

You know, I mean, and it's better to be well within the circle than to be trying to tiptoe along the line.

And you'll find plenty of things within the circle. I mean, it's not terrible to have a small circle of competence. I'd say my circle of competence is pretty small, but it's big enough. You know, I can find a few things.

And when somebody calls me with a Larson-Juhl, that is within my circle of competence. I hadn't even thought about it before, but I know it's within it. I mean, I can evaluate a business like that.

And if I get called — I got called the other day on a very large finance company. I understand what they do, but I don't understand everything that's going on within it, and I don't understand that — whether I can continually fund it, you know, on a basis, independent from using Berkshire's credit, and so on.

So, even though I could understand every individual transaction they did, I don't regard the whole enterprise, or the operation of it, necessarily as being within my circle of competence.

Charlie?

CHARLIE MUNGER: Yeah, I think that if you have competence, you almost automatically have a feeling of where the edge of the competence is. Because after all, it wouldn't be much of a competence if you didn't know its boundary. And so, I think you've asked a question that almost answers itself.

And my guess is you do know what you're perfectly competent to do, you know, all kinds of areas. And you do have all kinds of other areas where you know you'd be over your depth.

I mean, you're not trying to play chess against Bobby Fischer or do stunts on the high trapeze if you've had no training for it.

And my guess is you know pretty well where the boundaries of your competence lies. And I think you also probably know pretty well where you want to stretch the boundary. And you've got to stretch the boundary by working at it, including practice.

WARREN BUFFETT: And one of the drawbacks to Berkshire, of course, is that Charlie and I, our circles largely overlap, so you don't get two big complete circles at all, but that's just the way it is. And it's probably why we get along so well, too.

19. Population growth and "carrying capacity"

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Good afternoon, gentlemen. Wayne Peters is my name, and I'm from Sydney, Australia.

WARREN BUFFETT: I'd have never guessed.

AUDIENCE MEMBER: No. (Laughter)

I'll speak a little slower so my accent doesn't throw you.

WARREN BUFFETT: Good.

AUDIENCE MEMBER: My question goes further to the resolution on population control raised this morning. Firstly, can I just say I voted against it, and I guess that's just the beauty of the democratic society?

Of concern, however, was the gentleman's implication that the world's population has decreased, or is decreasing.

Having read the book Charlie recommended last year, by Garrett Hardin, called "Living Within Limits," I've got a reasonable feel and understand the population grew by about 1.7 percent last year, which is approximately 67 million people.

In my terms, I'd relate that to approximately 4 times the population of Australia, clearly an alarming rate over the long term if you're talking, you know, 500 or a thousand years.

Reading between the lines, my guess is that the issue of population growth is likely to be a key focus of the Buffett Foundation.

My question to you this afternoon is, how do you currently see this critical issue being tackled?

WARREN BUFFETT: Yeah, well, population projections are just that, they're projections. And they've been notoriously inaccurate over the years. And the gentleman that made the motion referred to a recent New York Times story.

And there are some — there are projections that, based on fertility rates and what happens to them in different countries, under different economic conditions and all that, I mean, you can come up with all kinds of projections.

I don't know the answer on it. Nobody does at any given time. And the carrying capacity of the Earth has turned out to be a lot greater than people have thought in the past, but there is some amount that does relate to the carrying capacity. It may have been expandable, but it's not infinitely expandable.

And I would suggest that the errors of being on the low side, in terms of population relative to estimated carrying capacity, the danger from those errors is far, far less than the dangers from overshooting, in terms of population compared to carrying capacity.

And since we don't know what carrying capacity is or will be a hundred years from now, I think that, generally, that mankind has an interest in making sure it doesn't overshoot, in terms of population. And if it — there's no great penalties attached to undershooting at all that I see.

And it's very, you know, it's the old analogy. If you were going to go on a spaceship for a hundred years and you knew in the back of the spaceship there were provisions — there were a lot of provisions, but you didn't know exactly how much — in terms of filling the front of the spaceship with a given number of people, you would probably err on the low side.

I mean, you would — and if you thought maybe it could handle 300, in terms of the provisions, I don't think you'd put 300 people in there. I think you'd put about 150 or 200.

And you'd figure that you just didn't know, you know, for sure, the spaceship would get back in a hundred years. You wouldn't know how much was in the back. And you would be careful, in terms of not overshooting the carrying capacity of whatever the vehicle you were in.

And we are in a vehicle called Earth. We don't know its carrying capacity. We have learned that it's a lot larger than might have been thought by Malthus or somebody a few hundred years ago, but that doesn't mean it's infinite at all.

And I don't — the one thing I will assure you is that the projections that were run in the New York Times, you know, a few weeks ago, are not going to be the ones that are going to be run 50 years from now, or 30 years from now.

And it's not the sort of thing that is cured after the fact. I mean, you're not going to go around trying to intentionally reduce the population. It's much better to prevent population growth than to try and correct afterwards. And Garrett Hardin has got some interesting stuff on that.

Charlie?

CHARLIE MUNGER: Yeah, I will say that the whole controversy has been interesting in the way both sides don't understand the other side's model.

But by and large, on the population alarm side, the ecology side, they've always underestimated the capacity of modern civilization to increase carrying capacity.

And the more they underestimate, why the least — the less they seem to learn. That is not to the credit.

And the other side has equal folly. I think it's — I think you're just talking about the human condition.

It's a complicated, controversial subject and people feel strongly about it, and they learn slowly. And I just think that's the way it's going to be as far ahead as you can see.

WARREN BUFFETT: I think the chances of a world inhabited by 15 billion people having behavior, on average, better than if the world were inhabited by 5 billion people is low, but you know, that is — we'll never find a way to test that. But that's my instinct on it.

20. Expect "satisfactory" results

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: My name is Bert Flossbach. I'm from Cologne, in Germany. And first of all, I would like you gentlemen, for all the monitoring you have done and the pristine investment philosophy, which is more and more followed in Germany as well.

My question refers to the importance of realism. If the dim prospects of the — on the stock market Mr. Munger made earlier become true, and given that the size of Berkshire Hathaway diminishes the impact of small investments, what do you think would be the realistic return on the float over the next 10 years or 20 years?

WARREN BUFFETT: Well, I wish I knew. The only thing I can tell you is it'll be less than it's been in the last 20 years.

But I think it'll be satisfactory, compared to most alternatives. But I don't know whether the alternatives are going to produce 4 percent a year or 8 percent a year. I don't think they're going to produce 15 percent a year.

And I would think that if we obtain very low-cost float, which I think we should and I think we will, and we keep getting chances to buy businesses on reasonable terms, not sensational terms, and we get occasional market — which we've even had a few occasions of things we've done in the bond market the last few years. We haven't made huge amounts of money, but we've made a pretty good amount of money. And we'll see some things to do on equities.

I think overall, we can have a return that we won't be ashamed of, but we won't come close to a return that you might think, looking back, we could achieve, but —

We don't think the returns on equities are going to be terrible over the next 20 years. We just think that people whose expectations were built by 1982 to 1999 are going to be very disappointed.

But there's nothing wrong with earning 6 or 7 percent on your money. I mean, there — it's — in a world of relatively low inflation, you know, how much more is capital entitled to than that? I mean, it has to come out of somebody.

And to keep doing it on increasing amounts of money, if you earned much higher returns than that, you would have a whole shift in the national income stream over time.

So, I think we'll get chances to do things that will leave us satisfied, but the question is whether they leave you satisfied.

Charlie?

CHARLIE MUNGER: Well, I certainly can't improve on that, but it won't stop me from trying to say something. (Laughter) The —

I think one of the smartest things that a person can do under present conditions is just dampen the expectations way down from the investment achievements of the past, including, of course, with reference to Berkshire stock. I think that's maturity and good sense.

All that said, I like our model and I like what we have in place, and I like what's been coming in recently.

And I think we've had a lot of fun in the past, and some achievement, and my guess is we'll continue to do that.

And I'm just up here, most of the time, to indicate to the rest of you that maybe you've got 10 more tolerable years coming out of Warren — (laughter) — and I'm doing the best I can at that. (Applause)

21. Discipline is more important than location

WARREN BUFFETT: Number 9, please.

AUDIENCE MEMBER: Good afternoon. I'd like to get back to the basics and talk about the insurance side, which is the core of Berkshire.

In ’98, when we bought Gen Re, they had a Lloyd’s syndicate, DP Mann, now known as Faraday. In addition, in 2000, we bought the Marlborough Agency.

I’d like to get your perspective on what you see is happening at Lloyd’s and their future, as well as our commitment to the Lloyd’s market.

WARREN BUFFETT: Yeah, well, we do have what is now known as the Faraday syndicate. And actually, our takedown of their capacity, which I think was maybe, I don’t know, in the area of 30 percent a few years back, is now well into the mid-90s percent.

So, we, in effect, have a much larger commitment, through Faraday, to the London market. And I would think we would do pretty well with that commitment.

But in the end it really doesn’t make any difference whether you’re in London or whether you’re in Washington, as GEICO is, or whether you’re in — I mean, actually, for a while, Ajit lived here in Omaha, or whether, you know, you — it really depends —because you’re — it’s a worldwide market.

You’re going to see things — assuming that you have a reputation for paying claims and for having the capital to do things, and being willing to act — you’re going to see things every place in the world.

It’s really like investing. I mean, you can invest, whether you’re in London or Omaha or New York. It doesn’t make any difference where you’re located.

What counts is the ability to, and the discipline, to look at thousands of different things and select from them a group to do, because you can do anything in the world in insurance.

I mean, we could write tens of billions of premiums in, you know, in a month if we just opened the floodgates, but it’s out there.

There’s lots of business out there. There’s lots of investment opportunities — or investment choices — out there. And the question is, is what you say yes to and what you say no to.

And that should be determined by what you are able to evaluate and, in the case of insurance, even if they’re attractive, preventing an aggregation risk that could cause you major embarrassment at some time.

But we don’t have any — we don’t specifically think the London market is better than the U.S. — being domiciled in the U.S. — or vice versa. And as you know, we have an operation domiciled in Germany. And that isn’t the key to it.

You know, the key is having people making decisions daily where they accept risks they understand and that are properly priced, and avoiding undue aggregation, and the occasional problem, in terms of dealing with people that are less than honest.

But the first two items are the important ones day in and day out. And that can be done at Lloyd's, it can be done at Omaha.

I mean, National Indemnity did not have any great geographical advantage in sitting at 30th and Harney, but it's done very well, just in its primary business, ever since Jack Ringwalt founded it in 1941, or whatever year it was.

I mean, it — and Jack Ringwalt — some of you here may have known him — Jack Ringwalt — a very good friend of mine — but Jack Ringwalt was not an insurance genius.

And he never, you know, my guess is he never looked at an actuarial book in his life or even thought about it. But he just was an intelligent fellow who had enough sense to do — to stick with what he understood in virtually all cases, and to make sure that he got paid appropriately for the risk he was taking.

And he beat the pants off, you know, people that had been around for a hundred years in Hartford, who you know, had vast agency organizations and huge amounts of capital and actuaries and all kinds, you know, all kinds of data and everything.

But they didn't have the discipline that he had. And that's what it's all about.

So, I don't really relate it to geography. I would like to be exposed to as much business in the world as possible and have that exposure be manifested through people that have the disciplines I talked about.

And if we can see everything that takes place in the world, and people want to come to us for one reason or another, often because of our capital position or our willingness to take on volatility —

If those people come to us, wherever they come to us, and the people that they — who represent us use the guidelines we've talked about, we'll do very well.

And you know, the more places they have to intersect with us, as far as I'm concerned, as long as that intersection takes place with people who have that discipline.

Charlie?

CHARLIE MUNGER: Yeah, the insurance business is a lot like the investment business at Berkshire.

If you combine a vast exposure with a vast decline rate, you have an opportunity to make quite a few good decisions.

WARREN BUFFETT: And I think we're making them now. You can check on me next year on that.

22. Life advice: take care of your most important asset

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: I'm Lowell Chrisman (PH), from Phoenix, Arizona. I am retired and teaching in — seniors in high school. I wish they could be here to hear you today.

I'm teaching these people an investment course part-time. And the first class I went to, they asked me to teach them how to prepare for retirement.

I would like to know what the two or three things are that you would suggest that I include in this course.

WARREN BUFFETT: Well —

CHARLIE MUNGER: What the hell does Warren know about retirement? (Laughter)

WARREN BUFFETT: Yeah. We haven't even thought about it.

Now, let me give you one suggestion for that group. I use this sometimes when I talk to high school — a bunch of high school seniors down in Nebraska Wesleyan, a few weeks ago.

Tell the youngsters in the class, they're probably around 16 or 17, and if they're like I was when I was 16, you know, I was only thinking of two things.

And Martin's Aunt Barbara wasn't going out with me, so I was down to cars. (Laughter)

I tried hearses, but that didn't work. The —

And let's assume, and I use this with — let's assume a genie appeared to you when you turned 16, and the genie said, "You get any car you want tomorrow morning, tied up in a big pink ribbon, anything you name. And it can be a Rolls Royce, it can be a Jaguar, it can be a Lexus, you name it, and that car will be there and you don't owe me a penny."

And having heard the genie stories before, you say to the genie, "What's the catch?" And of course, the genie says, "Well, there's just one. That car, which you're going to get tomorrow morning, the car of your dreams, is the only car you're ever going to get. So you can pick one, but that's it."

And you still name whatever the car of your dreams is, and the next morning you receive that car.

Now, what do you do, knowing that's the only car you're going to have for the rest of your life? Well, you read the owner's manual about 10 times before you put the key in the ignition, and you keep it garaged.

You know, you change the oil twice as often as they tell you to do. You keep the tires inflated properly. If you get a little nick, you fix it that day so it doesn't rust on you.

In other words, you make sure that this car of your dreams at age 16 is going to still be the car of your dreams at age 50 or 60, because you treat it as the only one you'll ever get in your lifetime.

And then I would suggest to your students in Phoenix that they are going to get exactly one mind and one body, and that's the mind and body they're going to have at age 40 and 50 and 60.

And it isn't so much a question of preparing for retirement, precisely, at those ages, it's a question of preparing for life at those ages.

And that they should treat the importance of taking care and maximizing that mind, and taking care of that body in a way, that when they get to be 50 or 60 or 70, they've got a real asset instead of something that's rusted and been ignored over the years.

And it will be too late to think about that when they're 60 or 70. You can't repair the car back into the shape it was. You can maintain it. And in the case of a mind, you can enhance it in a very big way over time.

But the most important asset your students have is themselves.

You know, I will take a person graduating from college, and assuming they're in normal shape and everything, I will be glad to pay them, you know, probably $50,000 for 10 percent of all their earnings for the rest of their lives.

Well, I'm willing to pay them 10 percent for — $50,000 for 10 percent — that means they're worth $500,000 if they haven't got a dime in their pocket, as long as they've got a good mind and a good body.

Now that asset is far, far more important than any other asset they've got, unless they've been very lucky in terms of inheritance or something, but overwhelmingly their main asset is themselves. And they ought to treat their main asset as they would any other asset that was divorced from themselves.

And if they do that, and they start thinking about it now, and they develop the habits that maintain and enhance the asset, you know, they will have a very good car, mind, and body when they get to be 60. And if they don't, they'll have a wreck.

Charlie? (Applause)

23. Why Berkshire won't be providing guards to airports

WARREN BUFFETT: Number 1?

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. I'm George Brumley, from Durham, North Carolina.

It's been reasonably argued that the most critical factor in evaluating a business is establishing the sustainability of a competitive advantage.

Let's assume that we have knowledge in hand about a few truly unique companies that possess sufficient strengths to out-duel the competition, and that we can therefore estimate future cash flows with relative certainty.

I admit that getting this far is far from easy, moreover it seems that the wild card of an unchecked tort system has grave potential to turn even such sound analysis on its head.

Predicted cash flows and reasonably estimated terminal values can be effectively driven to zero for business owners via a transfer to both litigants and litigators.

My question is, how should intelligent investors attempt to factor such uncertainty into their valuations of potential investment opportunities?

WARREN BUFFETT: Charlie's the lawyer, so I'll tell him how — I'll have him tell you how to protect yourself from his brethren.

AUDIENCE MEMBER: And I have quick follow-up.

CHARLIE MUNGER: I think it is entirely fair, as an investor, to just quitclaim certain areas of business as having too many problems.

I almost feel that way about workman's compensation insurance in California.

In other words, the system morphs into something that is so unfair and so crazy that I'm willing to pretty much, at least, leave it behind. And I think there are all kinds of areas like that.

Another fellow and I once controlled a company that invented a better policeman's helmet. And we told them not to make it. We told them to sell it to somebody else who was judgment-proof or — we wanted the policemen to have the helmet, but we didn't want to make it.

I think there are whole areas of activity where, for the already rich, the tort system makes participation foolish. And I think you can sort of figure out where those are and avoid them. I don't think the tort system is going to be fixed quickly.

WARREN BUFFETT: Yeah, George — actually, George Gillespie is, I think, here today. And he and I were directors of Pinkerton 20 years ago. And in fact, we owned a very significant percentage of Pinkertons, although it was controlled by the family foundation.

But one of the interesting problems then was a question of whether we would want to supply guards, for example, at airports.

And if you think about it, Berkshire, itself — well, forget about Pinkerton — would be absolutely crazy to go into the business of supplying guards to airports.

We might be more responsible, in terms of selecting the guards. But if we were to have a guard, say, at that Portland airport from which a plane took off — or where from what the original boarding was of the people that took off from Logan — or we are the guards at Logan or wherever — we might have been held liable for billions and billions of dollars.

You know that people would have gone after us because we would have had deep pockets and we would have had an employee of ours, and people would have said that if it hadn't for your employee, these people wouldn't have all died, and everything else wouldn't have happened.

And for us to be in a business, like Charlie and the helmet business, I mean, for us to be in a business like that would be madness when some other guy operating out of his basement can have guards and if, you know, if they blow up the whole airport it doesn't make any difference because he's judgment-proof.

So, it actually is a system that may discourage, perhaps, more responsible people from ever even dreaming of being in that kind of business.

And unfortunately, I would say that the range of businesses, since 1980, when we were thinking about that sort of thing at Pinkertons, the range of businesses to whom such reasoning might apply has probably enlarged to a significant degree.

There's just a lot of things that a rich corporation shouldn't do because they will pay a price if they are wrong, or if even somebody maybe suspects they were wrong, that would be incredibly disproportionate to what somebody in different economic circumstances would bear.

It's absolutely a selection by the tort system of people that are going to provide certain services and products. And I don't know any answer for that except to avoid it.

24. Finova deal won't be as profitable as expected

WARREN BUFFETT: Now, you had another question, George?

AUDIENCE MEMBER: Yes, just briefly, if you could give us an update on the economics of the Finova deal?

WARREN BUFFETT: Well, the Finova deal is about like — well, it is like when we wrote the annual report.

And actually, Finova's annual report deals with this, too. I think most of you know the terms of it.

We guaranteed what was originally going to be a $6 billion loan that enabled creditors to be paid a large percentage of their claim in the Finova bankruptcy. And we only took down 5.6 billion of the 6 billion because there had been payments made faster at Finova.

Finova was a failed finance company, a very big one, and we were in partnership with Leucadia in this operation. And they have management responsibility, and they're doing a fine job.

That loan of 5.6 billion, on which, in effect, we make roughly a 2 percent override on 90 percent of the loan. So, if it had been 6 billion, we would have had a carry of 108 million a year, although it was going to come down.

Now the loan is down to 3.2 billion, I believe. There was a bulk sale of some franchise receivables for about 500 million to GE Credit here not so long ago.

So the exposure's down to 3.2 billion, but of course the 2 percent override is down to 2 percent on 3.2 billion.

We feel — well, after September 11th, many of the assets at Finova were aircraft. And they were not the latest of aircraft, and they were not to the greatest of lessees in many cases.

So there was a big hit to the aircraft portfolio, and there was — there were other receivables relating to resort properties and that sort of thing, which were also hit by anything that impacted travel and that sort of thing.

So the portfolio was worth less — appreciably less — on September 12th than it was on September 10th. And that will not, in my view — our 3.2 billion, as far as I'm concerned, we've guaranteed it, but I think that is very close to 100 percent OK.

And then there's a group of bonds underneath it which are the residual bonds, you might say, of the ones that existed in the bankruptcy, because 70 percent got paid off and 30 percent didn't. And we own that means of that residual — we own 13 percent or so.

Those bonds are going to be worth a lot less than we thought they were going to be worth the summer of last year.

We bought our position at 67 cents on the dollar, and we've already — we got 70 cents on the dollar, plus these bonds, plus we get the override on the Berkadia loan.

So we got all our money back, and then some, on the bonds that we bought, and we get the override on the Berkadia, so we will, in all likelihood, almost certainly, I would say — although, who knows? I mean, I didn't know about September 11th — but we will almost — we're very, very likely — to make a significant amount of money on the whole transaction, but not as much money as we thought we were going to make last summer.

And we feel very pleased with the way Leucadia's handling things, but there is not as much value in that portfolio today because of the events of September 11th.

Charlie?

CHARLIE MUNGER: Yeah, it's an interesting example of Ben Graham's margin of safety principle. A whole lot has gone wrong that we didn't predict, and yet we're coming out fine.

WARREN BUFFETT: Yeah, we should make some hundreds of millions in aggregate over time on it, but a lot went wrong. But we, as Charlie said, we had a margin of safety when we bought into it, and we felt we had a margin of safety, and it turns out we needed it.

AUDIENCE MEMBER: Thank you.

25. "Hard to find real estate that's really mispriced"

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: I'm Bob Kline (PH), from Los Angeles.

I wonder if you could give us a glimpse into your investment process, the way you approach looking at a particular industry. And I wonder if you could use real estate as an example.

I know real estate hasn't been a big, huge part of Berkshire's portfolio over the years. And I wonder if that's because you view real estate as a commodity business or if, maybe, the cash flows from real estate tend to be more predictable than, perhaps, from some other industries, and thus, it tends to be less likely to be mispriced, and therefore less likely to find terrific bargains in real estate. So —

WARREN BUFFETT: Yeah, you're — go ahead.

AUDIENCE MEMBER: So, just wondering if we could — if we were watching a discussion between you and Charlie hashing out the merits of real estate,[tell us] how it would go.

WARREN BUFFETT: Well, it would go like all our other conversations. He would say no for about 15 minutes — (laughter) — and I would gauge by the degree to which he — the emotion he put into his 'no's as to whether he really liked the deal or not. (Laughter) But the —

We've both had a fair amount of experience in real estate, and Charlie made his early money in real estate. The second point is the more important point.

Real estate is not a commodity, but I think it tends to be more accurately priced — particularly developed real estate — more accurately priced most of the time.

Now, during the RTC period, when you had huge amounts of transactions and you had an owner that didn't want to be an owner in a very big way, and they didn't know what the hell they owned, and all of that sort of thing, I mean, you had a lot of mispricing then. And I know a few people in this room that made a lot of money off of that.

But under most conditions, it's hard to find real estate that's really mispriced.

I mean, when I look at the transactions that REITs engage in currently — and you get a lot of information on that sort of thing — you know, they're very similar. But it's a competitive world and, you know, they all know about what a class A office building in, you know, in Chicago or wherever it may be, is going to produce.

So at least they have — they may all be wrong, as it turns out, because of some unusual events, but it's hard to argue with the current conventional wisdom, most of the time, in the real estate world.

But occasionally there have been some, you know, there could be big opportunities in the field. But if they exist, it will certainly be because there's a — there'll probably be a lot of chaos in real estate financing for one reason or another.

We've done some real estate financing and you have to have the money shut off to quite a degree, probably, to get any big mispricing across the board.

Charlie?

CHARLIE MUNGER: Yeah, we don't have any competitive advantage over experienced real estate investors in the field, and we wouldn't have if were operating with our own money as a partnership.

And if you operate as a corporation such as ours, which is taxable under Chapter C of the Internal Revenue Code, you've got a whole layer of corporate taxes between the real estate income and the use of the income by the people who own the real estate.

So, by its nature, real estate tends to be a very lousy investment for people who are taxed under Subchapter C of the code relating to corporations.

So, the combination of having it generally allows the activity for people with our tax structure, and having no special competence in the field means that we spend almost no time thinking about anything in real estate.

And then such real estate as we've actually done, like holding surplus real estate and trying to sell it off, I'd say we have a poor record at.

WARREN BUFFETT: Yeah, C corps really, it doesn't make any sense. I mean, I know there are C corps around that are in real estate, but there are other structures that are more attractive.

There really aren't other structures — I mean, Lloyd's is an attempt at it, to some degree — but there aren't other structures that work well for big insurance companies, or —

I mean, you can't have a Walmart very well that does not exist in a C corp. So, they are not subject to S corp, or partnership competition, that determines the returns on capital in the discount store field.

But if you're competing with S — the equivalent of S corps — REITs or partnerships or individuals, you've just got an economic disadvantage as a C corp, which is, for those of you who don't love reading the Internal Revenue Code, is just the standard vanilla corporation that you think of — all of the Dow Jones companies, all of the S&P companies, and so on.

And as Charlie says, it's unlikely that the disadvantage of our structure, combined with the competitive nature of people with better structures buying those kinds of assets, will ever lead to anything really interesting.

Although, I would say that we missed the boat, to some extent, during the RTC days. I mean, it was a sufficiently inefficient market at that time, and there was a lack of financing that— we could have made a lot of money if we were — had been geared up for it at that time.

We actually had a few transactions that were pretty interesting, but not — but nothing that was significant in relation to our total capital.

CHARLIE MUNGER: We thought significantly about buying the Irvine Corporation —

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: — when it became available. So, but that's the only big one I can remember that we seriously thought about.

WARREN BUFFETT: Yeah, and that was in 1977 or so, as I remember?

CHARLIE MUNGER: Way back.

WARREN BUFFETT: Yeah, Mobil Oil was interested, and you know, Don Bren ended up putting together a group for it.

And that kind of thing could conceivably happen, but it's unlikely.

26. The problem with how Black-Scholes values options

WARREN BUFFETT: Number 3?

AUDIENCE MEMBER: Hello, my name is Joseph Lepre (PH). I'm a shareholder from Minneapolis, Minnesota, and I'd like to thank you for this opportunity to ask a question.

Mr. Buffett, you mentioned earlier today that you'd be willing to sell insurance in exchange for stock options. If possible, could you please describe a methodology for the valuation of stock options, particularly in cases where there is no market pricing data available for the option being valued?

WARREN BUFFETT: Yeah, I would — I could figure out what I would pay for an option on a private business. I could figure out what I could pay for an option on a public business. It might be a little easier. I could figure out what I'd pay for an option on an apartment house or a farm.

I had a friend, I mean, when I was 20 years old, we developed a big plan and we were going to go out and option out — option farms, you know, outside of what were then the city limits of Omaha.

And we figured that if we offered a farmer a modest amount, which would be annual income to him, to option his farm at double the price it was bringing then, that it would, you know, he would be happy to sell for double the price that year, and maybe we could do something. And it might have worked out OK.

Every option has value. You know, I've got a house worth X. If you offer me a few dollars to give you an option at 2X for 10 years, I'm not going to take it, because there are all kinds of possibilities in terms of inflation.

All options have value. And people that get options usually understand that better than people that give options. I'm not talking about stock options now, but in other arenas.

So we would be happy, you know. I mean, what I could get — let's say — we'll just pull one out of the air. Let's take an untraded company like Mars, Inc.

Would I be happy to have an option, a 10-year option on a piece of Mars, Inc. at some given price?

Sure, I would. And there's an amount I would take for that — I would take in lieu of getting cash if I was writing a big insurance policy with Mars, Inc. They're not going to do this with me, but that —

And I would be happy, you know, instead of if you buy homeowner's insurance from me, if you want to give me an option on your house for 10 years, I'll take that in lieu of the premium.

I'll make my own calculation as to value. It won't be Black-Scholes, although that might be the best arrangement under many circumstances, but I would probably crank into — in my own case.

We've bought and sold options some. And as a matter of fact, on June 3rd, Berkshire Hathaway will receive $60 million if the S&P 500 closes at 1150-something or below.

And two years ago, when the S&P was 14-something, we agreed for — on that June 3rd option, or whatever it was — $400 million nominal value, where, in effect the counter party would get the profit above 2,000 and something, 42 percent up from the current cash price. And we got the profit between 5 and 20 percent on the downside on a put.

People who were calculating the values of options at that time, under traditional methods, felt that that was a cashless transaction — that the value of the call that we gave was equal to the value of the put that we received. You know, I decided differently.

So, we don't accept, blindly, option values as determined by the calculations of people who win Nobel Prizes. Instead, you know, we actually put an aspect of judgment into some.

There would be businesses that would come out with identical Black-Scholes values on options for 10 years, and we would pay a different amount for one than the other, maybe a significantly different amount.

But we would pay something for just about any option. And you know, it is the nature of prices in this world to change, and economic conditions to change. And an option is a chance to participate in a change without giving up anything other than that original premium you pay.

Many people just don't seem to grasp that, but believe me, the people who are getting options on stock do grasp that.

And the people who are giving them, which are the shareholders, you know, represented by a group like this, who don't have any real voice in giving it, but they sometimes don't fully realize what's being given away.

Imagine, you know, going up a few miles away from here and having two farms for sale. And you say to the guy, "How much do you want for them?" and they both say a thousand dollars an acre, but the one guy says, "But every year, I want you to option, you know, I want you to give me 2 percent of the place back at a thousand. So, you know, at the end of 10 years, 20 percent of the upside belongs to me, but you've got all the downside." I mean, which farm are you going to buy? The one without the options or the one with the options? It's not very complicated.

And we will — we are dead serious when we say we will take options in lieu of cash. Incidentally, the company that gives us those options in lieu of cash for an insurance premium has to record the expense in terms of the fair value of the option they've given us.

The only item for which they don't have to record that as expense is compensation. But if they give it to us for their light bill, or if they give it to us for their insurance premium, or they give it to us for their rent, they have to call it a cost.

But only when it comes to the CEO's compensation, and other people like it, do they not have to record it as a cost, and that's because they've been able to get Congress to bow to their will and to their campaign contributions.

Charlie?

CHARLIE MUNGER: Yeah, the Black-Scholes crowd really did get a Nobel Prize for inventing this formula to value options, not executive stock options, but just options generally.

And if you don't know anything about the company, except the past price history of stock transactions —

WARREN BUFFETT: And dividends.

CHARLIE MUNGER: — and if it's — and the dividend being paid — and if the option is over a very short term, it's a very good way of approximating the value of the option.

But if it's a long-term option and you think you know something, it's an insane way to value the option.

And Wall Street is full of people with IQs of 150 that are using Black-Scholes to value options that shouldn't be tortured into the model.

And all of corporate — of America is using Black-Scholes to price stock options in the footnotes of the accounting statements, and they do that because it comes up with the lowest cost number.

WARREN BUFFETT: Well, they not only do that, but they assume the term is less than the actual term of the option. And I mean, they'll do everything they can, and I've been in on these discussions. They'll do everything they can to make the number look as low as possible. It's that simple.

CHARLIE MUNGER: And they're using a phony process to determine the number in the first place. So, it's a Mad Hatter's tea party, and the only thing that's consisting — consistent — in it is that the whole thing is disgusting. (Laughter and applause)

27. Investment bankers are "in the lucky part of society"

WARREN BUFFETT: Number 4, please.

AUDIENCE MEMBER: I'm John Golob, from Kansas City. I'm mostly retired, but also teach a course on financial markets at the University of Missouri in Kansas City.

I always tell my students that I learned much more about investing at Berkshire Hathaway meetings than I ever did from my professors at the Wharton School. (Applause)

I have a general question about investment banks. Now, given your connection with Salomon, I'm always surprised at sort of the attitude you represent to this industry. Somehow I get the idea that you view them as just their main social value is charging very high fees for unnecessary churning.

I'm wondering if you have any perspective on the general influence of investment banks in U.S. finance that is — rising or falling.

I hate to be a Pollyanna, but I might hope that Enron-like debacles would reduce, maybe, the influence of investment banks, that people wouldn't necessarily trust, you know, some of the advice they're giving.

WARREN BUFFETT: I think Enron is bound to have some favorable fallout in various areas. I mean, it — to the extent that it causes people to look more carefully at how various entities behave and that sort of thing. No, I think Enron was a plus for the American economy.

And the truth is our capital system, you know, despite all kinds of excesses and errors and everything else, you know, one way or another, we've come up in this country with 50-odd-percent of the world's market value for 4 1/2 percent of the world's population.

So, you know, I'm not negative on how the American capital system has developed. I do get negative about how certain people behave within that system, but you know, they would behave badly in any system. So, you know, it's the human condition.

But that is, you know, Charlie and I still think we should criticize things that we think are improper, but we don't criticize the whole system in any way, shape, or form. It's — you know, it's been a tremendous economic machine in this country.

But I would say that a market system, and I don't have anything better than — in fact, I think a market system is responsible in a material way for the prosperity of this country. So, I have no substitute in mind for the market system.

I do think it produces extraordinarily inequitable results, in terms of some overall view of humanity, and that that should be largely corrected by a tax system.

I don't think it should be any comparable worth system or anything like that. I just — the idea of the government trying to — (laughs) — assign all that just strikes me as wild.

But the market system lets a fellow like me, you know, make so much money because I know how to allocate capital, you know, compared to a great teacher, or nurses, cancer — whatever. I mean, it just showers rewards on somebody that has this particular skill at this particular time.

And that's great for me, but it should — there — in a really prosperous society, that should — there should be some corrective aspects to that.

Because it really strikes me as inappropriate that the spread of prosperity in a hugely prosperous economy should be decided totally by the quirks of skills that come into play and get rewarded so hugely from the market system.

So, I — but I, you know, I believe that — that's why I believe in a progressive tax system, and so on.

I would say, in terms of investment banking particularly — I mean — (laughs) — I was standing one time with an investment banker, and he was looking out the window, and he said, "Just look." He says, "As far as you can see, nobody's producing anything." And I said, "Yeah, that seems to be a mandate they take pretty seriously, too." (Laughter)

But it — you know, there is a huge amount of money in a system, you know, with 14 trillion, or whatever it may be, of market values, and where people are spending other people's money, and corporations, and where the more you spend for something, sometimes you get — gets equated with value as in fairness opinions, and all of that sort of thing.

It's quite disproportionate to what I really think the ultimate contribution to the country is of various people, but I don't have a better system — (laughter) — to substitute for it. I don't want anybody to think — come away thinking that I think we ought to tinker with that very much.

I think that the — I think your tax system should be the way that you distribute the prosperity in a somewhat better way.

When we ask people to go to war, you know, or that sort of thing, we don't take the person who's made the most money and say, "Well, they benefited the most from society, so we'll send them and put them in the front lines," or anything like that.

I mean, we — there's various aspects of being a citizen in this country that I think should make sure the people that don't get the great tickets for — that make them prosper in a market setting, they still should do pretty darn well, as far as I'm concerned.

And really, people like me shouldn't, you know —

It doesn't make any sense to compensate me the way this world has. And it wouldn't have happened if I'd been born in Bangladesh, or it wouldn't have happened if I had been born 200 years ago.

You know, somebody — another one of those genie stories. Imagine, you know, when I was — 24 hours before I was born and there had been some guy with exactly my DNA right next to me, who was also going to be born in 24 hours. And the genie had come to the two of us and said, "We're now going to have a bidding contest.

"And the one that bids the most of their future income gets to be born in the United States, and the one that loses in this is born in Bangladesh. And what percent of your future income will you give to be born in the United States?"

I'd have gone pretty high in the bidding. (Laughs)

You know, I mean, that would have been an interesting test of how important I thought my own abilities were compared to the soil in which I was going to be planted.

So, I, you know, I feel I'm lucky, and I am lucky, I mean, obviously. But I think we ought to figure out ways to take care of the people that are less lucky.

And I think that investment bankers should consider themselves in the lucky part of society.

And you know, there's nothing wrong with what they do. Raising capital for American business is a fine thing and all that. I just think that they are paid, in relation to the talent and that sort of thing they bring to the game, I think they are paid obscenely high, but I think that's true of me, too.

Charlie?

CHARLIE MUNGER: Yeah, the — but I would argue that the general culture of investment banking has deteriorated over the last 30 or 40 years. And it — remember, we issued a little bond issue, Warren, way back?

WARREN BUFFETT: Yeah, 6 million.

CHARLIE MUNGER: Diversified Retailing. And we had this very high-grade investment bankers from Omaha and Lincoln. And they cared terribly whether their customers, whom they knew, were going to get their money back.

WARREN BUFFETT: Yep.

CHARLIE MUNGER: And they fussed over every clause in the indenture, and they talked about whether we were really OK. And so, that was a very admirable process that we were put through.

WARREN BUFFETT: Yeah, we were screened in that.

CHARLIE MUNGER: We were screened, and intelligently screened. And it may not have been too intelligent to let us through, but it was an intelligent process.

And I'd say the culture on Wall Street lately has drifted more and more to anything that can be sold at a profit will be sold at a profit.

WARREN BUFFETT: Yeah. Can you sell it? That's the question.

CHARLIE MUNGER: Can you sell it is the moral test. That is not an adequate test for investment banking. And —

WARREN BUFFETT: And there used to be two classes of investment bankers, too, really. I mean, there were the ones that did the screening and all of that.

And then there was a really low-class element that essentially merchandised securities no matter what they were. And there were clean lines, but the lines have disappeared.

CHARLIE MUNGER: Yeah, so it hasn't been good to have this deterioration of standards in high finance.

And will it ever swing back? You would certainly hope so.

WARREN BUFFETT: You can see why were so popular at Salomon. (Laughter)

CHARLIE MUNGER: But in fairness, we had a very effective investment banking service from Salomon.

WARREN BUFFETT: That is true. That is true. And we — when we sold the B stock, for example, now we set the rules. And they wouldn't have done it that way necessarily, but they did a very good job of doing it the way we asked them to do it.

And so, we said we don't want people hyped into the stock. We want a very low commission and we're going to issue as much as the market takes so that nobody gets excited about the after-market behavior and buys because they think it's a hot issue.

I mean, we set a bunch of rules we thought were rational, and Salomon did a terrific job of following through on that and doing exactly what we asked them to. And it was successful by our standards.

So, no, I would say they did a terrific job in that case.

CHARLIE MUNGER: And they thoroughly enjoyed doing it, the people working on the job.

WARREN BUFFETT: That's true.

CHARLIE MUNGER: They'd never done one like it before.

WARREN BUFFETT: That's true. Yeah.

We've changed our whole opinion here in a matter of seconds. (Laughter)

CHARLIE MUNGER: Well, but there's a lesson in that.

Certain kinds of clients get higher quality service than other kinds of clients. In fact, there are many clients who should never be accepted at all at investment banking houses, yet they are.

WARREN BUFFETT: Are you thinking of the fellow at Normandy? (Laughter)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: I mean, can I you imagine that guy even getting in the door? I mean, it just — it blows your mind. I mean, he went to jail subsequently. He should have.

CHARLIE MUNGER: He was married to his high school teacher, who was at least two decades older than he was.

WARREN BUFFETT: Charlie has more opinions on this kind of thing than I do, but go ahead. (Laughter)

CHARLIE MUNGER: There were enough peculiarities in the situation. (Laughter)

I wouldn't have thought it so peculiar, except that he was a man and she was a woman.

28. Dexter Shoe acquisition was a mistake

WARREN BUFFETT: OK, number 5. (Laughter)

AUDIENCE MEMBER: Good afternoon. Mike Envine (PH) from Chelmsford, Massachusetts.

I noticed in the annual report that you took a charge-off for Dexter and put it under the management of H.H. Brown.

And I was thinking back, I believe in 1985 you wrote about the process you went through in closing the textile business. And I was wondering if you could elaborate how this situation is different.

I believe you indicated, in the textile business, that despite excellent management, it wasn't possible to earn an economic return on the assets.

WARREN BUFFETT: Yeah. Did you say that we took a charge-off on H.H. Brown?

AUDIENCE MEMBER: No, I meant to say we took a charge-off on Dexter.

WARREN BUFFETT: Oh, Dexter, yeah, absolutely. We lost a very significant amount of money on Dexter, thanks to a dumb decision that I made, and maybe several dumb decisions.

And I mean, that is a business that went offshore in a huge way. They're close to 1,200,000,000 pairs of shoes made in — or used in this country. I never can figure out how they get to that number. I mean, I use a pair — (laughs) — about every five years. But four for every man, woman, and child. I don't know, but that's the number.

And you know, I don't know whether it's 5 percent now, but it's something in that area, are made in this country, and hundreds of thousands of jobs have gone offshore with that.

The textile business, as you know, has gotten almost destroyed in this country. And when you have somebody like Burlington go into bankruptcy, you know, a wonderful company, spent lots of money on keeping their plants up to date and all of that sort of thing.

But in the end, you know, if you're paying 10 times as much per hour for labor as somebody else, it's awfully hard to be that good.

And that's going on in furniture manufacturing now, too. We have a number of furniture retailers and, you know, Bill Child, or Irv Blumkin will go over to the Orient fairly frequently now. We'll buy — we buy a lot — a lot of furniture comes from there. And that trend is moving in that direction in a very significant way.

And your question is — was your question why Fruit of the Loom would be different?

AUDIENCE MEMBER: No, I was just wondering if there's any hope for Dexter, or if it's going down the same path as with textiles?

WARREN BUFFETT: Oh, no, well, Dexter is now part of H.H. Brown, and it's selling product which, overwhelmingly, is produced abroad. And H.H. Brown sells a very significant amount of product that's produced outside the United States, although they still produce a lot of product in the United States.

But — no, the Dexter — we will have a significant shoe business. The shoe business — we had some contracts on the books from Dexter that were unprofitable, and they will run for another quarter. But we made a fair amount of money in the shoe business in the first quarter. Justin made money.

I think our shoe business will be OK. It won't be a bonanza over time, but I think our shoe business — we've got very good management in there. We've got good management at H.H. Brown, and we've got good management at Justin.

And I would expect that we would have a substantial and a reasonably profitable shoe business in the future, but we will not be able to do it with a hundred percent or 90 percent or 80 percent domestic-produced shoes.

And in that respect, I was very wrong in paying what I did, and paying it in the manner I did, which was stock in the case of Dexter, for a domestic shoe manufacturer.

Charlie?

CHARLIE MUNGER: Yeah, that shows, which is important to show, that no matter how hard you work at having systems for avoiding error and practices of trying to stay within your circle of competency, et cetera, et cetera, you still make mistakes. And I think I can confidently promise that it won't be our last mistake.

WARREN BUFFETT: OK, here's our Blue Chip Stamps. (Laughter)

But you know, you might think about this a bit, too. We had a lot of workers up in Dexter, Maine, and we've had a lot of workers at some of the H.H. Brown plants.

And you know, we take a little hit financially and we make it up by some trading strategy in government bonds or something like that, that requires, you know, no effort and not really too much brain power.

And when you think of the consequences to the people that have spent a lifetime learning one trade, you know, and who live in those areas, and through no fault of their own — none, I mean they've done a good job — they've done a great job — working.

They're productive, but in the end, you know, their cost was 10 times or more, and they weren't getting paid that well, but 10 times what it could get done for elsewhere in the world.

So, we haven't really paid the price for that change in economic conditions. I mean, it's the people who work there, the people who work at Burlington, or wherever, where the jobs disappear.

And that's no argument for huge tariffs or anything of the sort. But retraining doesn't do much good if you've worked in our textile mill, as many people did years ago, and you're 60 years old and you only speak Portuguese.

Or if you work in Dexter, Maine, and you're 58. I mean, retraining, it gets kind of meaningless. So, we're the lucky ones, you know, basically in these situations.

And it is tough when you know one trade, particularly if you live in a small town, not lots of other employment opportunities or anything. So, you know, we have a charge-off and they have a huge change in their lives, basically.

29. Contrarian shareholder thinks annual report is too short

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Jack Hurst (PH), Philadelphia. I have 3 questions, or 3 points.

The first is, I want to thank you for the pleasure it is to shop at Borsheims or Nebraska Furniture Mart, or even Benjamin Moore.

You have terrific people working there, and I've never been as satisfied with products as with what I've bought at those firms.

WARREN BUFFETT: Oh, well, thank you for that. And I thank you on behalf of the managements. They are terrific people that work at those companies.

AUDIENCE MEMBER: I agree with that.

You've dropped quite a bit from the annual report. There must be some God-given decree that it be limited to 72 pages.

But I wondered if you could put that in an internet message, such as that wonderful table about GEICO, its renewal policies and new policies, and the four pages at the end of the report about the business categories, where you separate the insurance from the finance from the manufacturing, and also that discussion that you had of look-through earnings. I think that it's invaluable for looking at the company.

WARREN BUFFETT: OK, well, I appreciate the suggestions. And I —

AUDIENCE MEMBER: I have a third point. Oh, go ahead.

WARREN BUFFETT: But we do go through a — I mean, I don't know whether 72 pages is the magic number, or when I get to about 11,000 words, but occasionally, you know, we do make an editorial decision.

The look-through earnings, for example, didn't seem that important, and they're fairly easy to roughly calculate, for anybody that's interested. But you know, they are something that if I wrote for 15,000 words, I would have included.

So, I appreciate the suggestion on it, and I don't think anybody's accused me of writing too short a report — (laughter) — yet. But I'll take —

It's certainly on the — it's possible on the internet to put up anything, and we'll put up any material we've given you here before the opening on Monday morning so that nobody has a jump on any information.

We try to make it — I mean, I really want to cover the things that would be important to me if I were hearing about them on the other end. And we try to keep it to some number of pages, but I'm glad you want more. (Laughs)

30. Simplicity helps keep audit fees low

AUDIENCE MEMBER: OK, the third point is — the first of March, the Wall Street Journal analyzed — or compared — the auditing fees by the fees related to audit services and other audit services for the 30 stocks in the Dow Jones Industrial Average.

And there seems to be an inverse relation between the amount of non-audit fees with respect to market capitalization, an inverse correlation with that factor to the five-year compound growth of earnings, or the five-year total return for the companies.

And for the top — for the companies with the lowest ratio of non-audit fees to market capitalization, the increase in earnings was 10 percent annually. The total return was 18 percent annually.

For the other — for the total — it was 5.2 percent return annually on increase in earnings, and 11 percent increase in total return.

Is it because these non-audit fees are non-productive that it has this result? Or is it a chance — just a spurious fluctuation? Or is there something to the relation?

WARREN BUFFETT: I don't know the answer to that. And I hadn't seen what you are referring to. But it doesn't totally surprise me, because we like places that care about expenses.

And you know, I've never — I think Jack Welch had something in his book about no, you know, no company ever getting — going broke from cutting expenses too rapidly.

And when you see managements that are pretty lavish in what they toss around, you know, I think on balance that group doesn't do as well for shareholders as the other, but I have no statistical way of proving that.

And I don't know a way that — I don't know how you would set up a sample that would really be valid in terms of one kind versus the other kind.

But what you say doesn't shock me. We try to watch all expenses around Berkshire.

And I think that, at our subsidiaries, we — generally speaking — we have managers that are very, very good about that.

And I think that our audit costs, relative to the size of the enterprise and all of that, I think, are fairly low, although they're not as low as they were a few years back. But it's something that we care about, I can assure you of that.

I don't know how to — I wouldn't want to buy stocks, though, or sell stocks, based on any kind of statistical measure like that, even though that it looks good on what they call a backtest.

Charlie?

CHARLIE MUNGER: Well, one of the reasons our audit costs are so low is we have this passion for keeping everything simple. We don't want to be difficult to audit. And we prefer activities that are simple.

If you take the See's Candy company, the whole company goes to cash at the end of December every year, as if it were a farm where the crop came in and was sold in December.

I mean, an idiot could audit the See's Candy company without getting into trouble. (Laughter)

And there's a lot in Berkshire that's like the See's Candy company. It would be really hard to screw up.

31. Arthur Andersen as Enron's collateral damage

WARREN BUFFETT: We don't like complicated accounting. I mean, it — we really do like things that produce cash.

And Enron is a good example. Enron's grotesque in what happened. But there's no question in my mind that auditors have been unduly compliant to client wishes over the last few decades, and more so as they went along, even to the point where they started suggesting what I would consider quite dubious accounting to people in mergers and so on, so as to make their figures look better later on. And I've seen it firsthand.

So, I just — I think that although the auditors are supposed to work for the shareholders, that they got too much so they were working for management.

But I think that Enron may push them back significantly, even in the other direction. So, I think Enron will have a distinct beneficial effect on auditing, and it was needed.

CHARLIE MUNGER: Well, it's going to have a distinct beneficial effect on one fewer auditors. (Laughter)

WARREN BUFFETT: Yeah, although — (applause) — you know, it's an interesting question, and Charlie and I may differ on this. I mean — I don't think that — I don't know how many people Andersen employed, but it was a huge number.

And I certainly — it's clear that the weaknesses and culpability at Andersen goes far beyond anything remotely we saw at Salomon.

But it would have been a shame for Salomon, with 8,000 people, to have, actually, the bad acts of one guy, and the lapse in terms of reporting and all of that — which was a big mistake, but by a few other people — cause 8,000 people to get dislocated in their lives and lose their jobs.

I don't know, how do you feel, Charlie, about, you know, the bottom 40,000 people at Andersen who really didn't have a damn thing to do with shredding or the Houston office or anything of the sort? I mean, their lives are really getting changed in many cases.

CHARLIE MUNGER: I regard it as very unfair and totally undeserved in all those cases. Yet even so, I think that capitalism without failure, as somebody once said, it's like religion without sin or —

WARREN BUFFETT: Religion without hell.

CHARLIE MUNGER: — religion without hell.

I think when it gets this bad, and the lack of adequate control mechanisms throughout the system, I mean, Andersen plainly didn't have a good total system of control.

And I think that it may be that capitalism should just accept this kind of unfairness in all these individual cases and let the firms go down.

WARREN BUFFETT: Well, let's say you and I did something really terrible, Charlie, at Berkshire. How do you feel about the 130,000 people then? I mean, should they —

CHARLIE MUNGER: You'd feel terrible about them, and there's no question about it.

And — but I'll tell you something, they wouldn't go down. The way we're organized, they wouldn't go down.

Warren, there's nothing you can do that is going to destroy the value of the subsidiaries — (applause) — and the careers within the subsidiaries.

You can blow your own reputation, you can blow the reputation at the holding company level, but you can't destroy their livelihood. I — that is a good —

WARREN BUFFETT: Well, we can mess up —

CHARLIE MUNGER: — way to be organized.

WARREN BUFFETT: We can mess up their lives though, I mean, if they lost their funding. Or yeah, I mean, I agree with you about their —

CHARLIE MUNGER: Not very much.

WARREN BUFFETT: — viability, but you know —

CHARLIE MUNGER: Not very — Andersen was particularly vulnerable, being a professional partnership.

But maybe you should be extraordinarily careful if you're a professional partnership, with what clients you take on and how far you go for them.

The law firms that I admire most have fairly strict cultures of risk control. I think it's crazy, in the kind of world we inhabit, to operate in any other way.

32. No formula to pick out great investors

WARREN BUFFETT: OK, number 7. (Applause)

AUDIENCE MEMBER: My name is Rheon Martins (PH), from Cape Town, South Africa, and I became a big fan and avid reader of your ideas about 10 years ago.

In 1999, I did an MBA and was nicknamed Warren Buffett, because I quoted you in all the classroom discussions.

All I wanted to learn was how to value a stock and think about the stock prices, but sadly I was rather disappointed to find out that our MBA did not really teach that.

Mr. Buffett and Mr. Munger, my question is this: if you had to predict who would be the superior investors from a group of young, bright people, who share your investment philosophy and possess the realism and discipline you referred to earlier, which characteristics or work habits would you like to know about the individuals in the group?

And what weighting would you place on each factor to ensure the greatest probability of your prediction being correct?

WARREN BUFFETT: Well, that's too easy a question for me, so I'll let Charlie answer that. (Laughter)

CHARLIE MUNGER: I think the fair answer to that one is that I'm not capable of answering it.

WARREN BUFFETT: No, but I do — I think this: I think that's exactly right. I mean, if you ask me what should — how should you pick a wife, you know, 18 percent to humor, 12 percent to looks, you know, 17 percent, you know, to parents.

I can't give you the formula, but I think you'll make the right decision, you know — (laughter) — when you get —

And I think if Charlie and I were around a dozen very bright MBAs with good records and all of that, and we spent some time with them, I think we'd have a reasonable chance of picking somebody from that group that might not necessarily be number one, but they would be in the upper quartile, in terms of how they actually turned out.

And I — but I can't tell you how to, you know, I can't write out a software program or anything that will enable you to do that.

It — you know, I had that problem exactly at Salomon that went — on that Saturday morning, whatever it was, August 17th, and I had to pick a guy to run the place.

And there were a dozen or so people that all thought that they were the ones, or a number of them thought they were the ones to run it.

And they all had high IQs, and they all had lots of experience in investment banking and everything, and I — you know, in the end, I had to pick one.

And I did pick the right one, I will say that. And you know, was I — could I be a hundred percent sure at that time it was the right one? Well, probably not, but I felt pretty sure I had the right one.

And I can't tell you — I've had people say to me, "Well, what did you ask them? And how did you evaluate it?" and all, because I only had about three hours to do it.

And, I don't know. I mean, I can't write you out a set of questions that you should ask somebody.

And, you know, some of it may be body language and different things of that sort. There are a lot of variables in it.

But I think, in the end, you would have picked the same person I picked if you'd been in that spot.

You'd had to pick somebody in the three hours. And it — but quantifying it for you, I just — I can't do it.

Charlie, have you got —

CHARLIE MUNGER: Yeah, well, when multiple factors are causing success, you get these anomalies. You have two people who are going to be equally successful, and one is terribly good at A and terrible at Z, and the other is terribly good at Z — is very good at Z — and terrible at A.

They're equal. Which factor is most important? The answer, it doesn't matter in that case. When you've got multiple factors, great strength in one will compensate some for weakness in another.

And the factors can be quite different. I think the investment world is full of people who are succeeding based on quite different sorts of talent.

WARREN BUFFETT: We'll try to do better next year.

33. Why See's won't be sold at Costco

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Good afternoon. My name is Catherine Dorr (PH), from Minneapolis, Minnesota. This is my first time here. Thank you for hosting this meeting today.

With the political and financial and corporate developments since September 11th, I am thankful every day that persons of your integrity and the managers that you have are still managing my inheritance money.

And I believe that the character and integrity is the most important criteria. I can sleep well at night.

I have two questions. The first one is for Mr. Munger.

When will there be a permanent store location, not a cart, of See's Candies at the Mall of America in Bloomington, Minnesota? (Laughter)

This is the largest indoor shopping mall, I believe, in the country, and hosts thousands of domestic and foreign visitors each year. A hint, you can sell See's Candies to other nationalities when they visit us.

Also, is it possible for Costco stores to sell See's Candies, since Mr. Munger has a shareholder interest in Costco? I would be interested in his answer. We could sell related products in our system. And I'll wait for his answer to ask the second question to Mr. Buffett.

CHARLIE MUNGER: The — the short answer to your questions is that, under our decentralized system, decisions of that kind go, rightly, to the person in charge of See's, who's here, Chuck Huggins.

And he may not be here through this afternoon session. He may have some limited interest, but Chuck can answer those questions. He knows a lot about candy.

WARREN BUFFETT: We had a Helzberg — we do have a Helzberg's at the Mall of America though, incidentally.

CHARLIE MUNGER: We have a what?

WARREN BUFFETT: We have a Helzberg's operation at Mall of America which does fine.

And I would add, we have not done as well moving away from the West as Charlie and I might have — well, certainly as well as we hoped for when we originally bought See's.

I mean, we've done way, way better in terms of the overall result, but it has been interesting to us.

Now, bear in mind, no one really makes any money with boxed chocolates through retail — through their own retail outlets in the United States, except for See's.

I mean, it — there's only one pound per capita of boxed chocolates, roughly, sold in the United States. I'm told I gave the wrong figure on — I said 64 ounces per year on people drinking. You really don't look like you only drink 64 ounces of liquid a year, it was a day.

But on this one, it is one pound per capita per year on boxed chocolates. So, it is not a big business. It's not a business — well, the truth is hundreds and hundreds of firms, including some that were a lot larger than See's, have failed. And there really is no one making any money elsewhere.

Russell Stover makes very good money selling through a distribution channel that is different, but nobody's found a way to do it in stores. We've found a way to do it in the West. We have not found a way to do it elsewhere.

And it's very irritating to me, and to Chuck, as far as that's concerned, that we can't figure out a way, because it's so successful when it works, as it does in the West.

But the answer is you can look at Archibald Candy, you know, the bonds are selling for 50. They own Fanny Farmer and Fannie May and Laura Secord up in Canada.

It is a very tough business in this country, because Americans just don't buy much boxed chocolate.

They're always happy to get it as a gift. Everybody in this room would love to get a gift of it, and they may buy it when they're here, but you don't normally walk down the street and — or walk in a mall and buy it for yourself. It's usually a gift or it's usually at holiday time.

So we don't do as well as you might think we would when we get to very successful malls that are located in other parts of the country.

We have opened holiday shops, kiosks really, at 50 stores at Christmastime, around the country, away from our natural territory. And we make some money out of that, but we wouldn't make money if we were there year-round.

And we've been thinking about it, I'll guarantee you, for 30 years because it's a terrific business where it works.

And it's a very good question you ask, because you would think, I mean and the Mall of America is an obvious example.

Simon would be tough to deal with, the landlord, but we could figure out a way to do that.

And the — but you would think we could make money at a Mall of America.

And we do fine with Helzberg's there, but I'm not positive a candy store would work. But we may try one, just because you asked the question. We'll — I'll talk to Chuck about it. (Laughter)

AUDIENCE MEMBER: OK —

WARREN BUFFETT: How about Costco?

AUDIENCE MEMBER: My second question —

CHARLIE MUNGER: Oh, Costco —

AUDIENCE MEBER: Oh, I'm sorry.

CHARLIE MUNGER: Costco makes its own decisions, and so does See's. And I wouldn't think of getting into that one.

AUDIENCE MEMBER: Oh.

WARREN BUFFETT: Well, I'll get into it. (Laughter)

We don't want people discounting our candy, it's very simple, any more than Rolex wants somebody discounting their watches.

And we will not — we're not going to go through any distribution channel at See's. We're already getting a bargain at our retail prices — (laughs) — and we're not going to go through any other distribution channel — any distribution channel at See's that's going to discount.

And Costco has no interest, and I don't blame them. I mean, they are based on giving people special prices. And that's fine, and God bless them, and, you know, we'll buy things from Costco, but we're not going to sell a product where the price is part of the integrity of the product — we're not going to sell it through a distribution system that — where discounting is basic to their whole approach.

Costco is a wonderful operation, and See's is a wonderful operation, and never the twain shall meet. (Laughter)

AUDIENCE MEMBER: Very logical.

34. Why Berkshire issued its B shares

AUDIENCE MEMBER: My second question is to Mr. Buffett.

Since I am a new shareholder, and because this is my first attendance here, I am not sure if this question has been asked before or not. And if it is addressed in your publications, I may have overlooked it, so please bear with me.

This is on the relationship between the A and the B shares. On page one of the booklet it states, quote, “Each share of Class A stock is entitled to one vote per share, and each class of — each share of Class B stock is entitled to 1/200th of one vote per share,” close quote.

Calculating the voting weight per share would therefore be 200 Class B shares equaling one vote equally weighted of one Class A share. However, the Class B share price is 1/30th, traditionally, of a Class A share.

Given that the B share owners are purchasing into the same corporation and assets as the A share owners, and the cash is just as green no matter which share you buy, therefore it would be logical that the voting weight and price relationship of the shares be proportional all around, either 1/30th or 1/200th of pricing and voting weight, respectively.

The question, therefore, is why are the B shares not given voting weight of 1/30th instead of 1/200th? Or conversely why the B shares are not priced at 1/200th of an A share?

This may or may not be popular depending on with share you own. And I would appreciate your insight on that.

WARREN BUFFETT: Yeah, thank you. It’s a good question. I — you may not be aware of the history of the issuance, but we issued the B shares — there were no — I mean, they’re just a common share, so we renamed the old shares A shares. But we issued the B shares, whatever it was, what, seven or eight years ago, Charlie? Something like that.

And we did that in response to some people, particularly a fellow in Philadelphia, who we felt was going to induce people who really didn’t understand Berkshire at all into a terribly expensive way of owning tiny pieces of Berkshire, probably sold on the basis of an historical record that we did not think was representative of what could be incurred in the future.

In other words, we were disturbed by somebody who saw a chance to make a lot of money off of people who were really uninformed, using our stock as the vehicle.

And we were going to reap the unhappiness of those people subsequently. They’re going to run into tax problems and various administrative cost problems, and so on.

So, to ward that off, and only to ward that off, I mean, we issued the B stock, which effectively put that fellow out of business, because it was a better vehicle for doing what he was going to try and get people to do, at great profit for himself.

And when we issued it, it had not existed before, and we made — we put two differences in it from the A stock.

A, we wanted to create a lower value per share, so we did it on a 1/30th basis. At the time, it was around $1,100 or thereabouts because the A was selling for in the low 30,000.

But we put on the prospectus, which is a very unusual prospectus in other respects, we put on there we were going to differentiate the stock in only two ways, but we were going to differentiate it in those two ways.

And one was the voting power, because we didn't want to issue the stock and we didn't want to change the voting situation much.

And the second way was in terms of the designated charitable contributions, which we — the A was going to continue to enjoy and the B would not participate in.

And the reason the B wasn't going to participate in it is because the amounts would have gotten to the point where it would have been an administrative nightmare. I mean, this year, we designated $18 on the A shares. We've got a lot of one-share B holders, which would be 60 cents. And it just — it does not make any sense.

And we saw that, so we just said if you buy the B shares, you're buying into an instrument which economically is equal to 1/30th of an A. In voting, it is not equal to 1/30th of an A because we don't want to change the voting that much.

And it does not — it has a slight economic difference in terms of the fact it doesn't get to participate in the charitable contributions program, which is a very small item relative to the whole capitalization, but it's still — it's something.

But we do not — you'll notice our A and B, compared to other companies that have different voting arrangements — I was just looking at one the other day where the premium for the voting stock is 10 or 12 percent, or something like that, relative to the economic interests.

That's because people assume that if, you know, if the company's ever sold, or anything like that, the guy that owns the A will get treated better than the B. And Charlie and I have been in a situation where we got somewhat taken because of a situation — because of a relationship like that.

We will treat the B exactly as the A, except for those two things, which, at the time of issuance, we set out as being differences. We set — and those two items, everybody saw coming into the picture, and they're going to stay — they will stay as part of the picture.

Actually, you know, in terms of when the meeting will be held two years from now, you know, we aren't even going to vote by votes in a sense.

I mean, I'm going to get a sense of what people want to do, but I regard, in that respect, I think that it ought to be the most convenient for the most people, not for the most number of shares.

A will not vote any different than B or anything because, you know, you're all individual people and I want whatever works best for the most.

But in terms of those two other items, they were set out that way and they'll stay that way.

If — you know, if we'd set out a different — we would not change the relationship once the — of the two stocks once they were issued. We would not benefit one relative to the other, but those are the terms of the two.

Charlie?

CHARLIE MUNGER: Yeah, we had to issue the B stock to frustrate the ambitions of this jerk promoter. And — (laughter) — yet, we didn't want to split the A stock down into — all of it — down to tiny little fractions, which would have frustrated him, but forced us to have a stock split we didn't want.

So, we created a vehicle which was — had these two slight disadvantages, and that kept most of our capitalization in its traditional A-stock and also frustrated the promoter. It's an historical quirk. It's an accident of life.

WARREN BUFFETT: And the B is sold at a remarkably consistent relationship to the A. If the discount got as low as — or as high, I should say, as — I think it was over 4 percent for a small period of time — but it's, generally speaking, the B is sold at parity to slightly, very slightly, below parity.

And indeed, A shares get converted to B, and that would not happen unless the B were at parity. So, it — I think it's worked out pretty well. I mean, we didn't — we backed into it, but I don't think anybody's been disadvantaged by it.

35. Leasing of silver doesn't affect its price

WARREN BUFFETT: Number 9?

AUDIENCE MEMBER: I'm reading the question of Mark Rescigno (PH), from New York. "I've idolized you since I first heard of you 10 years ago. My only regret so far is that both of my children are girls, so I couldn't name them Warren."

WARREN BUFFETT: How about Warrenella? (Laughter)

AUDIENCE MEMBER: That might work.

Is there any merit to the argument that leasing of silver is suppressing the price of the metal, and thereby not allowing it to reflect the fundamentals?

WARREN BUFFETT: Oh, you hear that all the time. I don't think so. And in the end, the question of where it'll sell will be affected by how much there is around and how much there isn't.

And people get upset with shorts and they get upset with forward sales by producers, and they get upset with leasing, and all of that sort of thing. But in the end, if silver gets tight, it will go up in price. And if it isn't tight, it really doesn't make much difference whether it's leased or not.

It's like companies that get upset about the short position of their stock. I've even had a few people write me because there'd be some —

I don't care whether there's a thousand shares short of Berkshire or 300,000 shares short, it really doesn't make any difference, because someday, the people that are short have to buy and, you know, it's part of markets.

So the leasing of silver takes place because somebody's got some silver around, would rather get a small amount of income by leasing it to somebody that needs to use it for one reason or another.

But it's because the silver was sitting around in the first place that it's available for lease. And it really doesn't make much difference, I don't think, in terms of pricing over time.

Charlie?

CHARLIE MUNGER: I have nothing to say.

WARREN BUFFETT: Oh. (Laughter)

36. Buffett criticizes ABC News report on Kirby vacuums

WARREN BUFFETT: OK. It's — we've got time for one more question from number 10, and that will complete the cycle, also. So, shoot.

AUDIENCE MEMBER: My name is Jerry Miller (PH), Highland Park, Illinois, shareholder. I don't want to end this meeting on a down note, although I'm going to do it. (Laughter)

Before I say that, I would like to make a positive statement, one of many, but I'll hold it to one.

I have —since I've been retired, I've gone to quite a few shareholders meetings. And I only wish there was some way I could force most of the CEOs to attend.

They may not understand what's going on, but I would just like them to see how a shareholders meeting should be handled.

And now for the down — (applause) — a little bit.

I'm downstairs. I can hear some good results.

The — if you're going to sit behind the desk that says the $37 billion buck stops here, you're going to have to handle all questions. The one that I was really surprised I didn't hear, and I — today from anybody, including you — the two of you — would —

Although they've taken the 'E' word away from us, and the 'AA' word away from us, I don't want them to take the Berkshire Hathaway 'K' word away from us.

Do you understand that? If you do, just wave a finger. And if not, I'll explain it.

WARREN BUFFETT: Well, you're 0 for 2 at the head table. So, you better explain it. (Laughter)

AUDIENCE MEMBER: This morning, I had to chide some of the fellows down the stairs at the Kirby. A couple of weeks ago, there was a stain — or a tarnish — appeared on the Berkshire Hathaway name, and a little crack appeared in the charisma. Did you happen to see the program?

WARREN BUFFETT: Yeah, I saw the program. And it was interesting because it was focusing on the sales practices — or alleged sales practices — of some people that don't work for us, but work for distributors, just like salesmen work for Ford dealers or something of the sort.

And particularly, it was talking about them selling to older people. And interestingly enough, over 10 years ago, we put in a policy, which to my knowledge is the only one like it in the country, in that anybody, anybody over 65 who buys a Kirby vacuum and is unhappy for any reason, any time, up to a year, 11 months and 29 days later, can tell us so and they get their money back without question.

And I don't know of another consumer durable sold like that in the country. And one of the interesting things was that the fellow they interviewed, who talked about his mother having bought one and being terribly unhappy about it, had actually used the product for eight or nine months and gotten a full refund.

And that fact was not mentioned on the program, nor was the fact even that we had this policy. And I really regard that as rather extraordinary journalism.

AUDIENCE MEMBER: I trust you're not dusting off — (applause) — your Salomon notes then to read to the Kirby people.

WARREN BUFFETT: No, I can understand your reaction to the program, because it was pointed out to ABC News several times prior to the program, that this policy existed, that 300-and-some people in the previous year, and if they gave us a trade-in on the — on it and we — and they decided to call it off 11 months later, we gave them their money back, plus a machine equal to the — or better than the machine they gave us. And not a word was said about that in the program.

So, it — I do not regard it as a great moment in ABC journalism.

AUDIENCE MEMBER: Anyway, thanks for (Inaudible) —

Morning Session - 2003 Meeting

1. Buffett welcomes "real shareholders"

WARREN BUFFETT: (Applause) Thank you. We promise not to sing. (Laughter)

Good morning, and we're delighted to have you all here.

One of the things that makes it fun to run Berkshire is that we see real shareholders. We have — we probably have a larger proportion of our shares held by individuals and not by institutions than virtually any large company in America. And that's the way we like it.

We love it when you come, we get to see you, you buy our products. You know, there's still a few things left downstairs so — (laughter) — feel free to leave anytime during the meeting when Charlie's talking — (laughter) — to go down and make a few purchases.

2. Andy Heyward and "Liberty's Kids"

WARREN BUFFETT: Now, we're going to do as we've always done.

First of all, I'd like to — I would like to give very special thanks to Andy Heyward. Andy, would you stand up if you will please? (Applause) Andy is the man that — there he is. (Applause)

Andy does those cartoons, he recruits Walter Cronkite and Bill Gates, and he does the script. He gets Charlie and me to do recordings. And it's just wonderful the production he's put on.

And for those of you — last year I mentioned a program that's on public broadcasting called "Liberty's Kids."

It's running in — consecutively. There's, I think, 40 episodes. It tells the story, really, of the founding of the country, and it's a marvelous way to learn history.

I've watched a number of the sessions myself, and it kind of comes back to me from my early days, grade school and high school.

And Andy's done, I think, the parents of America and the country, a real service in producing this. And I will predict that a hundred years from now, people will be watching "Liberty's Kids."

So I really salute Andy Heyward, and be sure to catch it on public broadcasting. And Andy, thanks for a wonderful production. (Applause)

3. Day's agenda

WARREN BUFFETT: Now, we're going to follow our usual procedure of leisurely proceeding through the formal part of the business in three or four minutes. And — (laughter) — then we will —

I'll have a few comments, actually, on our business, and then — and a couple of acquisitions — and then we will spend the rest of the day, until 3:30 with a break for lunch, we will spend here to answer any questions you have.

We have microphones in various zones, and we will proceed around and try to get every — any subject that's on your mind, fire away and I'll answer the easy ones and Charlie will answer the tough ones. (Laughter)

4. Calibrating Munger's answers

WARREN BUFFETT: So now we will go through the formal part of the business, they've written a little script for me and I will go through this. The meeting will now come to order.

Oh, I should introduce Charlie over here, not that he needs an introduction. But Charlie — (Applause)

Charlie and I have been partners of one sort or another since 1959. We both grew up a good bit here in Omaha, but we didn't know each other at the time.

We both worked at the same grocery store. We had a similar experience, we found that neither one of us liked hard work. (Laughter)

And if you go down to the Western Heritage Museum, they just opened an exhibit of that grocery store. It's a permanent exhibit, and actually, I loved it. Charlie worked there a few years before I did in the past, but we didn't actually meet until I was 28 or 29, and Charlie was a few years older, as he still is.

And — (laughter) — we have worked together now for — in one way or another — for 44 years. We've never had an argument. And we disagree sometimes on things.

He — you have to learn to calibrate Charlie's answers. He — when I ask him whether he likes something, if he says, "No," that means we put all our money in it. I mean, that is a huge — (Laughter)

If he says, "That's the dumbest idea I've ever heard," that's a more moderate investment that we make. And then you have to calibrate his answers, but once you learn to do that you get a lot of wisdom.

5. Berkshire directors introduced

WARREN BUFFETT: We have our directors with us, and I'll introduce them. We have, if you'll stand please as I call your name and then you can — it'll be hard to do — but you can withhold your applause till they're all standing.

Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Ronald L. Olson, and Walter Scott Jr., in addition to Charlie. Those are the directors of Berkshire Hathaway. (Applause)

As we mentioned in the annual report, we will be adding some directors who meet the four tests that I laid out in the report. We'll be adding some of those, probably within the next year. When we're required — whenever we're required to do so, we will be doing it.

And we will have people who have a lot of their own money on the line, just like you do, in Berkshire. And they will prosper or suffer in relation to how Berkshire does, and not in relation to their directors' fees or other things.

So they will be selected for business savvy, which they will have.

They will be selected for interest in the company, which is almost guaranteed by their holdings.

They will be selected by their shareholder orientation, which, again, I think that their holdings will produce. And we will have those people on board, probably by our next meeting.

6. Formal business meeting begins

WARREN BUFFETT: Also with us today are partners in the firm of Deloitte and Touche, our auditors. They're available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire. And I might say that almost any question would be appropriate.

Mr. Forrest Krutter, secretary of Berkshire, he will make a written record of the proceedings. Miss Becki Amick has been appointed inspector of elections at this meeting, and she will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg. We will conduct the business of the meeting and then adjourn to the — adjourn the formal meeting. After that we will entertain questions that you might have.

WARREN BUFFETT: Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 5, 2003, being the record date for this meeting, there were 1,309,423 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting.

And 6,763,493 shares of Class B Berkshire Hathaway common stock outstanding, with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number 1,071,967 Class A shares and 5,228,705 Class B shares are represented at this meeting by proxies returned through Thursday evening, May 1.

WARREN BUFFETT: Thank you. That number represents a quorum and we will therefore directly proceed with the meeting.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with and the minutes approved.

WARREN BUFFETT: Do I hear a second? Motion has been moved and seconded. Are there any comments or questions? We will vote on this motion by voice vote. All those in favor say “aye.”

VOICES: Aye.

WARREN BUFFETT: Opposed? You can signify by saying, “I’m leaving.” (Laughter)

The motion is carried.

7. Berkshire directors elected

WARREN BUFFETT: The first item of business at the meeting is to elect directors. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholder that is present has not turned in a proxy and desires a ballot in order to vote in person, you may do so. If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you.

Will those persons desiring ballots please identify themselves so we may distribute them?

I now recognize Mr. Walter Scott to place a motion before the meeting with respect to election of directors.

WALTER SCOTT: I move that Warren E. Buffett, Charles T. Munger, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Ronald L. Olson, and Walter Scott Jr., be elected as directors.

WARREN BUFFETT: Sounds good to me.

It has been moved and seconded that Warren E. Buffett, Charles T. Munger, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Ronald L. Olson, and Walter Scott Jr., be elected as directors.

Are there any other nominations? Is there any discussion?

The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections a ballot on the election of directors voting and proxies in accordance with the instructions they have received?

Miss Amick, when you're ready you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders, in response to proxies that were received through last Thursday evening, cast not less than 1,058,098 votes for each nominee.

That number far exceeds a majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as any cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss. Amick. Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, Charles T. Munger, Ronald L. Olson, and Walter Scott Jr., have been elected as directors.

8. Proposal to include Class B shares in charity program

WARREN BUFFETT: The next item of business is a proposal put forth by Berkshire shareholder Christopher J. Fried, the owner of two Class B shares.

Mr. Fried's motion is set forth in the proxy statement, and provides that the shareholders request the company allows Class B shareholders who own at least seven registered shares of Class B stock to become eligible to participate in the shareholder-designated contributions program.

The directors recommended that the shareholders vote against this proposal.

We will now open the floor to recognize Mr. Fried, or his designee, to present his proposal.

CHRIS FRIED: Thank you, Mr. Buffett. Good morning, my fellow shareholders.

My name is Chris Fried, and I am here to present a shareholder proposal.

This proposal is designed to extend the shareholder-designated contribution program to include Class B shareholders.

Let me first start off by saying in our shareholder's "Owner Manual," there is a statement that I'd like to quote at this time.

"Although our forum is corporate, our attitude is partnership. Charles Munger and I think of our shareholders as owner-partners, and of ourselves as managing partners.

"We do not view the company, itself, as the ultimate owner of our business assets, but instead view the company as a conduit through which our shareholders own the assets."

With that in mind, I present the following proposal for a vote.

This proposal would extend the shareholder contribution program to Class B shareholders who own at least seven registered shares of Class B stock. Under my proposal, each Class B stock would be allocated 1/30th the value to Class A donation rate.

Currently the Class A rate is $18 which translates to 60 cents per Class B share. The required minimum seven registered shares results in no less than $4.20 being donated by a Class B shareholder.

This figure is important, for when inflation is taken into account, the donation rate will be on par with the original 1981 donation level when the shareholder — proposal — designated program was initiated.

I do understand that there are certain perks involved with owning a Class A share. However, those perks should only be limited to voting rights and the ability to convert Class A shares to Class B shares.

Therefore, I believe that is an appropriate — to extend the shareholder-designated program to Class B shareholders.

If Berkshire Hathaway is to truly follow — truly follow what it preaches about this firm being a partnership among all of its shareholders, then Class B shareholders must have the right to at least have the option to take part in the shareholder-designated contribution program.

Thus, I ask my fellow Berkshire Hathaway shareholders to vote in affirmative on this matter. Thank you for your time.

WARREN BUFFETT: Thank you, Mr. Fried. And you're absolutely right that Charlie and I do regard our shareholders as partners, and we have ever since we really started.

In fact, Berkshire, in a sense, evolved out of a couple of partnerships. Charlie had a partnership, I had a partnership, we made an investment in certain things. And a lot of our original partners are still with us as shareholders.

The partnership — but partnerships have partnership agreements, and when we set forth — or when we issued the Class B shares some years ago, we set forth the relative terms of the partners. And the Class A and the Class B are quite similar in economic terms, but they're not identical.

And at the time we issued those shares to a new group of partners, Class B partners, we explained, quite clearly I believe, exactly what differences there were.

There was a difference in voting rights, there was a difference in that the Class A could be converted to B, but not the reverse. And there was a difference in the shareholder-designated contribution program.

Ever since we issued those shares, I don't know, maybe six or seven years ago, we, in effect, have had a compact with both the A and B shareholders that they — that we would treat the two classes in a way consistent with what was explained at the time of issuance.

So if we were to change the vote, the conversion ratio, or the shareholder-designated contribution program, we would, in effect, be changing a deal that was made, and that has been recognized as having been made, ever since the B shares were issued.

People have bought the A shares in preference to B because of certain reasons. People have bought the B shares for other reasons. But they have relied on the fact that we would abide by what we said we would do at the time we issued those shares.

We'll not take anything away from the B, we'll not take anything away from the A. We'll run things just as they are.

And in the future, you know, I happen to have shares — my holdings — concentrated in A shares.

But the A will never get any advantage over the B except for the ones we laid out at the time of issuance of the B.

It would actually be unfair to A shareholders, and particularly to A shareholders who have bought since the B was issued, to tell them that the economic relationship between the A and B was being changed, even though only in a slight way, to the benefit of the A — benefit of the B — and the detriment of the A.

We wouldn't do that in either direction, so that's why we recommended to vote against it.

Charlie, do you want to add anything?

CHARLIE MUNGER: Well, not only is all of that true, but the cost of getting down to all of B would — it would be a very inefficient process.

WARREN BUFFETT: Yeah, well of course — and that's the reason, back when we issued the B, I mean, we anticipated that.

So it seemed like something that would offer very little value to the B at a significant cost to the company, and therefore we spelled it out quite clearly, I believe, in the original prospectus, and it's been spelled out in every annual report subsequently.

So it's the deal, and the deal is that — is also that we never change things to benefit the A in any way over the B, except as originally explained in the original prospectus, and subsequently in all the annual reports.

Is there a second to Mr. Fried's motion?

What do we do if we don't get a second, Charlie?

CHARLIE MUNGER: It dies.

WARREN BUFFETT: OK. I guess it just died. (Laughter)

But, there's nothing inappropriate about bringing something like that up (inaudible).

I mean, I understand exactly, you know, what you're thinking about. But I think you have to think of fairness to both classes.

Moving right along — figuring out where we are.

9. Formal business meeting adjourned

WARREN BUFFETT: I guess we're moving along to adjournment of the meeting. And after that we will have the questions we talked about, and I'll also tell you a little bit about the business, since the annual report come out — came out.

Walter Scott, do you have a motion to put before the meeting?

WALTER SCOTT: I move we adjourn the meeting.

WARREN BUFFETT: Do we have a second?

VOICE: I second.

WARREN BUFFETT: Motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say, "aye."

VOICES: Aye.

WARREN BUFFETT: All opposed say, "No." The meeting's adjourned. (Laughter and applause)

10. Microphones for questions

WARREN BUFFETT: Now, I'd like to bring you up to date on a couple of things, and then we will proceed with questions.

We have eight microphones placed around the auditorium here, and we will proceed regularly around and just keep going around, and around.

And Marc, do we have anything in the — any microphones in the Music Hall or not? I'm not aware. Maybe if Marc could come up and inform me whether there's (inaudible) Music Hall or not, we can —

VOICE: There's two in there.

WARREN BUFFETT: There's two microphones in the Music —

VOICE: Yes, nine and 10.

WARREN BUFFETT: Nine and 10 are in the Music Hall. And are there quite a few people there?

VOICE: Yeah, it's full. It's full.

WARREN BUFFETT: It's full?

VOICE: Yeah.

WARREN BUFFETT: Oh OK.

We haven't put microphones out on the sidewalks yet, but we'll get to that someday. (Laughter)

11. McLane acquired from Walmart

WARREN BUFFETT: We've made — we've contracted to make — two acquisitions this year.

You just read about one, perhaps, in this morning's paper, but it went on the tape at 7:45 yesterday morning, Central Time, and that involved the contract to buy McLane's from the Walmart company.

McLane's is the very large wholesaler to all kinds of institutions, but convenience stores, quick-serve restaurants, the Walmart operation itself, theaters, restaurants.

And this year we'll probably do something like 22 billion of business. So it's a very substantial enterprise, with distribution centers around the country, with much in the way of transportation equipment.

Walmart had owned McLane's since about, I believe, 1990. It grew substantially while they owned it. It's been run by a terrific manager who's here with us today, Grady Rosier, and Grady took the business from 3 billion to 22 billion, or thereabouts.

Walmart, for very good reasons, wants to specialize in what they do extremely well, and through Goldman Sachs and Company, we were approached by them a little while back about the possibilities of buying the business.

It's a — it really makes sense for both sides, because Walmart knows what to do with the capital very, very well in their own business, and has lots of opportunities. And this was something of a sideline to them.

On the other hand, their ownership of McLane's resulted in certain people that would be logical customers of McLane's not wanting to do business because they didn't want to do business with a competitor.

And we plan to see all those people very soon, and explain to them that that's no longer the case, and they can sleep well at night doing business with us and not worry about benefiting their competitor, Walmart.

So this deal — a representative of Walmart came up last Thursday to Omaha, a week ago this past Thursday, a CFO. And we made a deal in, maybe, an hour or two and shook hands. And when you shake hands with Walmart, you have a deal.

And so the time remaining until yesterday morning, a contract was put together and it must go through the Hart-Scott-Rodino process in — to be cleared. But there's obviously no conflict, so we fully expect that, in just a few weeks, that McLane's will become part of Berkshire.

It serves, presently, about 36,000 of the 125,000 or so, convenience stores. If you take the 50 largest convenience store chains in the country, it does 58 percent of the business with those companies. Sells each convenience store an average of, perhaps, 300,000 or a slight bit more of product a year, which those convenience stores then resell to the consumer.

It also serves about 18,000 quick-serve restaurants, primarily those operated by Yum! Brands: the Taco Bell, and Pizza Hut, and Kentucky Fried Chicken group.

And it will have opportunities to serve many more as we go along. So we're delighted.

If any of you get a chance to see Grady, or better yet, if any of you own a convenience store, step forward and we'll be glad to give you our card. (Laughter)

It's really — you know, Walmart knows that we will be a good owner, they know we'll be good for the people that work at McLane's.

They know our check will clear, that we won't, you know, make a proposition and then run into financing difficulties, or try to jiggle around the contract later on.

And it's just an ideal way to do business, and we're delighted to add McLane's to the Berkshire group of companies.

It's a very narrow-margin business, obviously. I mean, when you get up to 22 billion of sales and you've got Hershey, and Mars, and people like that on one side, and you've got buyers like 7-Eleven and Walmart on the other side, they're not going to leave a lot in between.

But you have to perform a valuable service for them in order to earn, you know, say, one cent on the dollar, pre-tax.

But McLane's knows how to do it. It's a very efficient operation, and it will continue to deliver value to both their vendors and their customers.

12. Clayton Homes purchase

WARREN BUFFETT: The other acquisition that is in the works is Clayton Homes. Clayton is the class of the manufactured home industry, and the acquisition came about in kind of an interesting way.

Every year for the last five years, a group of about 40 finance students from the University of Tennessee in Knoxville would come up to Omaha, and they would have a lot of fun in Omaha. They'd go to the Furniture Mart.

And then in the afternoon they'd come to Kiewit Plaza and the 40 students or so, with their professor, Al Auxier, would have a session with me. We'd just have a classroom session for a couple of hours, and wonderful group of students.

And generally at the end of the session they would give me a football, or a basketball, they've got a great women's basketball team at the University of Tennessee, and so we'd have a good time together.

And, matter of fact, a year ago, when they came up, Bill Gates, by chance, was in town. So I presented him as a substitute teacher, which is a post he's always wanted. (Laughter) And students got quite a surprise.

This year when they came, 40 or so students, we had a good session together, a couple of hours at Kiewit Plaza. And when they got through, they gave me a book. And it was the autobiography of Jim Clayton, who started and ran Clayton Homes, and built it into a huge success.

And he'd written a nice inscription inside, and I mentioned to the students and the professor that the — that I was an admirer of Clayton. I'd followed the manufactured home industry in other ways, not always so successfully, and I'd seen what Clayton had done.

And so I said I look forward to reading the book, which I did. And then I called Kevin Clayton, Jim Clayton's son, and Kevin is the CEO of the company. And I told him how I'd enjoyed his dad's book.

And I said we still had a little money left in Omaha — (laughter) — and, if they ever decided to do anything, you know, we would be interested. And I suggested at what price we might be interested in.

A phone call or two later, a couple of phone calls, we made a deal.

And I had not been to Knoxville. You know, I checked out a few manufactured homes. Suggested that my family buy a repo. (Laughter)

But that deal came about in that manner. And that's the way things tend to happen at Berkshire.

It, you know, the phone rings or we pick up the phone, in this particular case. And the manufactured home industry got into significant trouble, very significant trouble, because credit terms — well, they went crazy on credit four or five years ago.

And when you go crazy on credit, you suffer in a very big way, and that's what happened to that industry.

Conseco, that some of you may have read about, ended up holding — or servicing I should say — $20 billion worth of manufactured home credit and they got in big trouble, for that and other reasons.

And Oakwood, where we own some junk bonds, went into bankruptcy. They're a big operation in the country, most of the — couple of the other biggest players in the industry are losing significant money.

Manufactured home companies have lost the ability to securitize the receivables they get when they sell these — when they sell homes. And so the industry's been in the tank.

This year, or this past year, there were maybe 160,000 new manufactured homes sold, but there were also about 90,000 repos came back and that depresses the market enormously. And like I say, financing sources have dried up. A lot of people that lent money have left the field.

So for the strong, as Clayton is, and particularly with the financial backer like Berkshire, it should be a good field. Twenty percent or so of all the new single-family homes are manufactured homes in this country.

I mean, you can — we can put you in one for about $30 a square foot, and if you compare that to a site-built home, it's quite a deal. I mean, I was amazed.

They have 2,500 square foot homes, two stories, I mean, it's changed a lot over the last 30 or 40 years.

And we've got an operation that is, even the competitors would admit, it's clearly the class of the field.

But even for Clayton, financing was getting more difficult. I mean, the lending community got burned very badly in manufactured homes, and people have sworn off them, from the lending standpoint.

And Clayton did securitize an issue in February this year, but they had to keep more of the bottom layers of the securitization themselves.

So it's a good marriage, and it's one where we will be useful to them. And we should do very well together in the future.

13. Earnings get insurance boost

WARREN BUFFETT: The first quarter, I'll just — I don't have final figures yet, and we'll put this — what I say today — we'll put it on the website so that everyone has the information before the opening on Monday.

But the economy, as you know, has been quite sluggish. It's really been sluggish for a very long time.

It's interesting, I wrote in a letter that's also on the website, right after September 11th, I put something up there.

And I said that we were in — we had been in a recession, which was not something that was generally acknowledged at that time, and I thought would be longer and deeper than most people anticipated.

And what has happened is that, really since late 2000, housing and autos have done quite well, but the rest of the economy has just been plain sluggish. And it continues.

During that time we've dropped the federal funds rate dramatically down to 1 1/4 percent. Charlie and I weren't — probably wouldn't have predicted that we might ever see that in our lifetime, and maybe it'll even go lower.

And we're running a huge budget deficit now, but business continues to be sluggish.

So our non-insurance businesses generally did not do great in the first quarter.

Our insurance businesses did extraordinarily well. And we will show — when the first quarter report is published — we will show an underwriting profit of about 290 million pre-tax, which is after about 140 million of charges for retroactive insurance, the acquisition costs on that — which I'm sure many of you that don't love accounting — all I can tell you is that it's a charge that many companies don't bear but that we willingly bear because it gives us benefits.

But our $290 million is after that charge.

Our float grew by, probably, at least 1.3 billion, so we're up to 42 1/2 billion or so of float. And people — that means people have — are letting us use that money.

And as I said in the first quarter, did it not only cost us nothing to use the money, but, in effect, people paid us to use the money, which we would like them to continue to do. (Laughter)

And I don't see our float growing much from this point. Charlie said last time that it was impossible for it to grow, but it probably would. I don't know whether he'll change his opinion on that, but I think — I really think our insurance businesses are in exceptionally good shape.

We have some of the best insurance businesses in the world.

GEICO's premium volume was up a little over 16 percent in the first quarter, and in April it was up just right at 17 percent. It had a 6 percent, roughly, underwriting profit in the first quarter.

Gen Re, thanks to an incredible job by Joe Brandon and Tad Montross, has turned the corner in a big, big way, and it showed an underwriting profit in the first quarter.

Ajit Jain made so much money I don't want to even tell you about it. (Applause)

Some of our primary operations — yeah, you should give him a hand. I mean, that — (Applause)

When you get Charlie to clap, you know he's made us a lot of money. (Laughter)

And our primary businesses, particularly U.S. Liability and National Indemnity primary operations, and our Homestate Company, they've all done — they're all doing remarkably well. And I —

You never know what's going to happen in insurance. I mean, there could be an 8.0 earthquake in California or Tokyo, or there could be one in New Madrid, Missouri, as there was a couple hundred years ago. And it could happen tomorrow, there could be huge hurricanes this summer, whatever.

But I can't imagine having a much better group of companies or managers than we have, and they're all working well now.

For a while, Gen Re was a drag, but that's not true now. And I think that we have an excellent chance of having very low cost, and perhaps even no-cost or negative cost float over the next five years or so, or really as far as the eye can see.

Now, that doesn't mean it won't fluctuate around. But if you average it out, I think we will have our float at a very cheap price. And it's — you know, as [TV personality] Martha [Stewart] would say, "Having 42 1/2 billion for nothing is a good thing." (Laughter)

Now, with that, I think we've covered — the first quarter was a good quarter. Overall, it's the best operating earnings we've ever had. Now, we've got more capital now than we've ever had, but nevertheless it will be a good quarter.

And I would estimate, I think it's fair to say, Marc [Hamburg], that from operating earnings we will have something like 1.7 — in the range of 1.7 billion. We had some securities gains too, but I don't count those because they can do anything from quarter to quarter. We don't pay any attention to the timing of those.

But we — from a straight operating standpoint, 1.7 billion or so after-tax. Am I safe with that number, Marc? Or — OK. What could he say? (Laughter)

We don't change numbers at Berkshire, I promise you that. There are — a lot of companies do, but fewer now than did a few years ago. (Laughter)

So, we're going to get the questions in. Charlie, do you have anything to add about acquisitions or operations, or anything else you'd care to say?

CHARLIE MUNGER: Well, I hate to be an optimist, but — (Laughter)

WARREN BUFFETT: Does he ever. (Laughs)

CHARLIE MUNGER: We really added a lot of wonderful businesses to Berkshire in the last few years. It's been some delightful business.

WARREN BUFFETT: That's all you're going to get out of him, folks. (Laughter and applause)

14. Bright future for NetJets but no profit this year

WARREN BUFFETT: OK we're going to start around and we — as we've added two microphones to the Music Hall — and let's start with zone 1, which is over on my right. And do we have the first question?

AUDIENCE MEMBER: Good morning. I'm George Brumley from Durham, North Carolina.

My first question is related to Executive Jet. It's been almost five years since the acquisition of Executive Jet, a purchase in a much different economic and geopolitical environment.

What business metrics do you use to measure success in an industry with as much flux as this one, and what has changed in those metrics since the time of acquisition?

What are the prospects for Europe, and have those prospects changed?

While none of the competitors approach Executive Jet in terms of scale and scope, what impact are they having on the competitive environment?

And lastly, would you please explain the long-term aspect of the business model, as many of the jets age out of the program?

WARREN BUFFETT: OK George, I got through college answering fewer questions than that. (Laughter)

But George's uncle [Fred Stanback] was best man in my wedding, so he gets all he wants.

The — NetJets, as you will see in the first quarter, had a significant loss. A large portion of that loss was caused by the write-down of planes because there — of —

I love it, they call it in the trade, they call them pre-owned planes. I call them used planes. But the — they did the same thing in manufactured homes, so they call them pre-owned homes instead of used homes.

But in any event, putting aside the euphemisms, there — the used plane market, well the entire business aircraft market, is very soft. The used plane market has far more planes for sale than, say, three or four or five years ago.

That's going to affect the production of new planes — already has. And it affects pricing in used planes, and we have bought back planes from people leaving the programs, which we do and will continue to do.

But we have bought during a declining market, some of those, and we have had write-downs in connection with those planes. And you will see in our first quarter report, I believe that that's probably the only operation we have that's losing money.

And we have — it's a popular product, it's a growing business, it's going to be a very big business in my opinion over the years. And we see it every day. I mean, we write a lot of business, and customers are joining us.

There are three main competitors. I think it's fair to say that they're losing significant money from operations, forgetting about any markdowns they might have on their own inventories.

Our market share, we get figures from the FAA as to registrations and as to people that are selling their planes.

And our share of market, which was always the largest, has gone up dramatically in the last couple of years. It's gone up to roughly 75 percent, in terms of value of planes. And we're talking 75 percent of the four-company market. It's gone up even higher than that, in terms of net planes. In other words, new planes sold, less planes coming back.

But the pricing we are receiving does not — in the U.S. it would be — absent this one write-down — it would be very, very modestly profitable.

In Europe, we have lost and we are losing significant amounts of money. Business jets in Europe, the total is about one — and I'm not talking about ours, I'm talking about all — are about roughly 1/10th the number as in the United States, even though the population is similar.

So we have grown from a small base quite rapidly over there. Nobody else will be taking us on. It's part of a service that will be part of a very big business worldwide, in my view, over the years. I don't think anybody else can come in after us.

So I think it's integral, and it is integral, to our operation. Half the — roughly half the miles flown in Europe arise from American owners. And that will just do nothing but get bigger over the years, because our number of — every month our number of owners goes up, goes up significantly.

We have people here from Marquis, who have essentially — they've become a customer of ours, and then they resell cards for 25 hours. And they have added 40 or 50 customers a month in recent months. So it's a popular service, it will be a much bigger business.

I think there will be a shakeout at some point, and maybe fairly soon. You can look at the Raytheon prospectus and — or the Raytheon 10K, and you will find some interesting information about their operation. And you can — it's not hard to figure out what's going on.

I don't know the answer as to when the shakeout will occur. But I can assure you that we will not be one of the shook. (Laughter)

Charlie, do you want to comment on it?

CHARLIE MUNGER: No. (Laughter)

WARREN BUFFETT: He'll comment on the profitable operations. He gives me the one —

The long-term business model is that, basically, we believe that, you know, perhaps 10 times the number of people that are now flying with us will be flying with us some years in the future.

That having the best service, the best record, and the best policies for safety and security, will leave us very dominant in the field, and that people will pay an appropriate price for the service.

And we see all kinds of evidence of that. But we do not see a profit this year, in my view, at NetJets.

15. "What we really want is cost-free float"

WARREN BUFFETT: Let's go to number 2.

AUDIENCE MEMBER: Good morning. I'm Marc Rabinov from Melbourne, Australia.

I had two related questions for you gentlemen, basically both related to float.

Float, as you indicated, has become a very large part of our asset base. Assuming our policy holders continue to renew with us and we keep control of our combined ratio, can we count the float as pseudo equity when calculating the intrinsic value of Berkshire?

And the related question was, can we not expect the float to keep growing at, say, 10 percent per annum for the next five to 10 years given that we're still really a minority player in this segment? Thank you.

WARREN BUFFETT: Well, I wish it would grow at 10 percent or so, at least if it were profitable, which I do have a belief that it's likely to be.

Our float is 42 1/2 billion on March 31st, roughly.

I think the entire float of the American property-casualty industry, you know, could be something in the — roughly — in the area of 500 billion. So we may be some figure like, you know, 8 percent or a little bit more, maybe even 9 percent, somewhere in that range.

Of the total P-C float in the United States — now, it's true we have a little outside the country, too, but the big part of the world P-C market is in the United States.

When we started out in 1967, I think maybe we had 10 million of float. So to go from 10 million to 42 billion, frankly, surprises me. But it also — it's going to be much harder to grow at significant percentage rates in the future.

And our goal — we love the idea of growing — but what we really want is cost-free float. I mean, that is the goal, and growth is not a — not at the top of the list at all. I mean, I hold our managers responsible, not for delivering more float. I hold them responsible for delivering profitable float.

And that is key in our mind at all the time. If it comes along, we love it. But we will find out whether it comes along or not.

The first part of your question, if indeed 42 1/2 billion can be obtained at no cost, or even better yet at a profit, its utility to us is like equity.

Now, you couldn't realize it upon liquidation, necessarily. Oh you wouldn't realize it on liquidation. And you couldn't necessarily realize it on sale, that would depend. So I'm not telling you how to count it as in terms — whether you count it in terms of intrinsic value, you have to make that decision.

But it has the utility to us of 42 1/2 million — 42 1/2 billion — of funds derived from equity without issuing common shares. And that's one of the reasons we've always been so enthused about it now for, what, 35 or 36 years. It's a great business for us.

And every now and then we got off the track. You know, we got off the track in the early '80s, we had a problem or two in the mid '70s, and we had a problem with Gen Re for a few years.

So it — there's nothing automatic about it, and I will say this: I think, for most companies in the P-C business, that — the P-C business is not a great business. It's a commodity business to too big a degree.

So I do not think most companies in the P-C business will get float at an attractive cost. We have to be an exception.

But we have some exceptional companies and some exceptional managers, and I truly believe that we will obtain our float at considerably less cost than the industry. And that is the goal.

GEICO, if it would continue to grow at 16 percent, for example, this year, that adds a billion of premium volume. Well that doesn't generate as much float at GEICO as it generates at Gen Re, but it generates float. So GEICO's float will grow. I would, you know, I'd bet my life on that.

But certain of our other transactions are more opportunistic in nature, and that float could even shrink.

And if the float shrinks, you know, that is fine with me as long as we produce underwriting profits. We'll go wherever it goes.

Charlie?

CHARLIE MUNGER: Yeah, with interest rates as low as they are now, this float we have so laboriously built up isn't worth so much to us on a short-term basis. After all, what — if — what do we have, $16 billion of cash on hand earning a very low rate of return?

So the incremental dollar of float doesn't look all that advantageous now. But we have a more long-term view than that. We figure that eventually, we'll do a hell of a lot better than 2 percent.

WARREN BUFFETT: We're not getting 2 percent on that 16 billion, Charlie. (Laughs)

We have — we do have, incidentally on March 31st, we have roughly 16 billion in cash, not counting any cash in the finance operation, because that's a little bit phony in terms of its utility. I mean, it's offset by borrowed money.

But it — other than the finance operation, we have right at 16 billion in cash and cash equivalents, and we also have a lot of bonds and things of that sort.

On that 16 billion, you know, we are probably getting about 7/10ths of 1 percent, three-quarters of 1 percent, call it, after-tax on $16 billion, which does not make us salivate.

But — (laughter) — we would rather, you know, avoid salivation than to encounter problems. And we will use — Walmart put out the figure yesterday of roughly 1 1/2 billion for a combination of a small trucking company, plus what they sold us.

And we will, you know, we will use money, but money keeps coming in, too. If we earn a billion-seven in the first quarter, that billion-seven is pretty much all cash. And then on top of that we had the billion — billion-three or so float increase.

So float increase plus retained earnings, not counting securities gains, maybe $3 billion. Now we're not going to keep that up, but there's a lot of money coming in.

And — but we are getting some chances to deploy it. And if we deploy — if we get it at less than — at zero or less cost, it has —it's very close to, in our — it has the utility of equity in a very big way.

16. Black-Scholes option pricing model is "insane"

WARREN BUFFETT: Let's go to number 3.

AUDIENCE MEMBER: Good morning, gentleman. My name is Hugh Stephenson (PH). I'm a shareholder from Atlanta.

You had indicated in the past that you did not think that the volatility base to Black-Scholes models for options pricing was correct.

Would you share with us how you would evaluate those options as you use them in the business or see them in the marketplace?

And also if you would update us on your thoughts on the asbestos tort situation, given the recent development of national settlement trusts, et cetera?

WARREN BUFFETT: Yeah, we — Charlie and I have thought about options all our life. I mean, my guess is Charlie was thinking about that in grade school.

And — (laughter) — you know, and I — you have to understand— you don't have to understand Black-Scholes at all — but you have to understand the utility and, in a general sense, the value of options. And you have to understand the cost of issuing options, which is very unpopular subject in certain quarters.

Any option has value. I mean, I bought a house in 1958 for $31,500. And let's assume the seller of that house had said to me, "I'd like an option on it, good in perpetuity, at $200,000." Well, that wouldn't have seemed like it'd cost me much if I'd give it to him, but an option has value.

Any option has value, and that's why some people who are, you know, kind of slick in business matters sometimes get options for very little or for nothing. I'm not talking about stock options. I'm just talking about an option to purchase anything.

They get options for far less than, really, a market value would be. Black-Scholes is an attempt to measure the market value of options, and it cranks in certain variables.

But the most important variable it cranks in that might be subject — well, might be a case where if you had differing views you could make some money — but it's based upon the past volatility of the asset involved. And past volatilities are not the best judge of value.

I mean, if you had looked at a five-year option at — on Berkshire stock — at various times Berkshire stock's had a fairly low beta, as they call it. Beta is a measure that — people in academia always like to give Greek names to things that are fairly simple, and so that they have sort of a priesthood. (Laughter)

You know, it's — so it's like priests talking in Latin or something. I mean, it kind of cows the laity.

But they — beta is a measure of past volatility. Berkshire's had a low volatility, but that didn't mean that the option value of it, to anybody that really understood the business, was lower than a stock with a higher beta.

And I think Charlie — what Charlie said is that — last year, is that for over — that for longer-term options in particular, Black-Scholes can give some silly results.

I mean, it misprices things, but it's a mechanical system. And any mechanical system in securities markets is going to misprice things from time to time, and that's —

We made one — as I mentioned last year — we made one large commitment that basically was — had somebody on the other side of it using Black-Scholes and using market prices — took the other side of it and we made $120 million last year.

And we love the idea of other people using mechanistic formulas to price things, because they may be right 99 times out of 100 but we don't have to play those 99 times. We just play the one time when we have a differing view.

Charlie, do you want to comment on —?

CHARLIE MUNGER: Yeah, Black-Scholes is a — what I would call a know-nothing value system.

If you don't know anything at all about value compared with price — in other words, if price is teaching you all that can be known — then Black-Scholes, on a very short-term basis, is a pretty good guess, you know, for what a 90-day option may be worth in some stock or another.

The minute you get into longer-term options, or you don't have the know-nothing factor so extreme, it's crazy to use Black-Scholes. People use it just because they want some kind of a mechanical system.

But at Costco, for instance, within a fairly short period, we issued stock options at 30, and we also issued stock options at 60. And Black-Scholes valued the options we issued at 60 as the strike price way higher than the options we issued at 30. Well, this is insane.

WARREN BUFFETT: But we like a certain amount of insanity. (Laughter)

CHARLIE MUNGER: Yeah, well, it's good for Warren who picked up this extra $120 million. But —

WARREN BUFFETT: I mean —

CHARLIE MUNGER: — so he's fonder of this kind of insanity than I am. (Laughter)

WARREN BUFFETT: No, we will pay you real money if you will deliver to our offices at Kiewit Plaza somebody who wants to use the Black-Scholes model and is willing to price 100 options for three years, willing to — using the Black-Scholes model — and letting us pick and choose among those.

Because, as Charlie says, it's a know-nothing affair. And we are know-nothing guys, in respect to an awful lot of things, but every now and then we find something where we think we know something, and anybody that's using a mechanistic formula is going to get in trouble in that situation.

But options have value. I mean, we issued options, in a sense, last year when we when we sold those — the 400 million of bonds. And we know what we're giving up when we sell those bonds.

I mean, we may have gotten, what — a negative coupon of sorts, but that's because we gave up option value. And it, you know, it wasn't — it isn't truly a negative cost instrument at all, because options have value.

17. Buffett recalls sneaking out to race tracks with high school golf coach

WARREN BUFFETT: Let's go to number 4.

AUDIENCE MEMBER: Hello, my name is Martin Wiegand from Bethesda, Maryland. And first I'd like to thank you, and all the folks working here at the microphones and staffing the booths, for hosting this wonderful shareholders' weekend. We enjoy your efforts. (Applause)

WARREN BUFFETT: Thanks, Martin.

AUDIENCE MEMBER: My question is about a company getting its employee compensation aligned with shareholder interest.

Charlie Munger, in one of his "Outstanding Investor Digest" interviews, cites the case of FedEx getting it right.

In the newspapers, we've all just read about American Airlines, Bethlehem Steel, and a lot of other companies getting it wrong. I find precious little written about compensation systems.

Would you share with us how you get it right at Berkshire companies?

Also, your old golf coach and racetrack friend, Bob Dwyer, asked me if you would like to share with us your pick in the Kentucky Derby. (Laughter)

WARREN BUFFETT: Is Bob back there with you, Martin?

AUDIENCE MEMBER: No, in the middle.

WARREN BUFFETT: Oh. Bob and I did spend a lot of time at the racetrack in high school. He was not only the basketball coach at Woodrow Wilson High, but he was also the golf coach.

And whenever I wanted to go the races he would write an excuse to my other teachers saying that we had to go out for the golf team. (Laughter)

And then we would head off to Charles Town, or Havre de Grace, or Pimlico or someplace.

And he cleaned up his act subsequently. (Laughter)

It's good to have Bob with us. He was known for his famous three-iron shots. He was known as "Trolley Wire" Dwyer in those days.

18. "Crazy" to use stock options as compensation

WARREN BUFFETT: Charlie, do you want to talk about comp a little?

CHARLIE MUNGER: Well, as the shareholders know, our system is different from that of most big corporations. We think it's less capricious.

The stock option system will give extraordinarily liberal awards sort of by accident to some people. And it'll deny other people any reward at all at some different time, in spite of great contributions made by the people who are getting nothing.

So except where we inherit it, we just don't use it. But we must be in a minority — far less than 1 percent, right?

WARREN BUFFETT: It's where we like to be, right.

It's interesting, we inherited some stock options at Berkshire, primarily in the General Re transaction. And, not through any failing of anybody or — there's no aspersions to be cast at all, but those options turned out to be quite valuable.

They would not have been valuable if General Re had been left alone as a standalone company. They were — they profited from the fact that other parts of Berkshire did well, and the money went to the people that had these options who delivered nothing to the performance of Berkshire for a while.

Now, that's — that is not an indictment of anybody, in the least, at Gen Re. It's an indictment of an options system which represents a lottery ticket, and also a royalty on the passage of time.

Because as you know, an option holder has benefits from retained earnings and benefits not at all from dividends. And that puts his interest, maybe, quite contrary to that of the shareholders.

So we believe in paying for performance, but we believe in tying performance to what is actually under the reasonable control of the person that's being measured.

And we — to give a lottery ticket on the overall results of Berkshire Hathaway to someone who is running a business that's 1 percent of the whole is really crazy.

And I would say that you have seen probably more misdirected compensation throughout the corporate system — corporate America — in the last five years, you know, than in the hundred years before that. It's been extraordinary.

There was wealth creation in the '90s, just like in the '80s, in the '70s, in the '60s, in the '50s. But there was a wealth transfer like had never been experienced before.

And, you know, you can't blame people for wanting to cash in on it. You know, if anybody wants to walk up and hand me a half a dozen lottery tickets for the Nebraska lottery, you know, I'll accept them. But it will have nothing to do with how I do in terms of running Berkshire.

Actually, Charlie and I think a properly designed options system, which includes cost of capital and some other factors, and ties it to the performance of the people involved, we think that can make sense, when we've used various incentive programs that are similar to that.

But the idea of just passing them out and telling people that for 10 years they get a free ride and then repricing — you know, if your stock goes down, their stock doesn't go down, their option price goes down. You know, that is not our idea of a great compensation system.

CHARLIE MUNGER: Yeah, if we are right with our general approach, it has considerably important implications.

Because the natural implication is that more than 99 percent of corporate compensation systems are more than a little crazy in America.

And I want to emphasize that Berkshire is not illiberal. I mean, we've got various incentive systems out where people make tens of millions and may make hundreds of millions.

And so, we're not against rewards for people who make vast contributions.

But a system that's basically capricious, and which doesn't tailor the results per person and per activity very well, we just think it's crazy.

WARREN BUFFETT: We love to see people that are associated with Berkshire making money, as long as they're making money for you at the same time. It's very simple.

And — but we don't want them to get a free ride off your money. (Applause)

Compensation's an interesting subject and I'm going to write about it next year, some. But, you know, it's not a market system. You can read all you want. I mean, you know, the PR people will tell you, you know, that "Joe Smith's compensation was determined by a market system and he's just like a baseball player," anything of the sort.

But he's not just like a baseball player. You know, the baseball player negotiates with somebody who's spending his money to hire the baseball player, and making a calculation whether he's better off laying out the money out of his own pocket — the owner of the team — to get that player.

But when you get a comp committee at a large American corporation, you have somebody with an enormous interest in the amount of comp on one side of the table.

And you've got somebody on the other side of the table, who was not picked because they were the Doberman of the board, believe me — and who is dealing with what — many times is what my friend, Tom Murphy, used to call "play money."

I mean, you know, it's almost meaningless to the person on one side of the table whether somebody gets 100,000 shares of restricted stock or a million shares of restricted stock, and it's not meaningless to the guy on the other side of the table.

Almost every other negotiation in American business, you have some parity of concern. But you do not have a parity of concern, you know, in terms of the — in terms of comp at the top levels.

You have a parity of concern when you get down to labor unions. I mean, the management wants to keep down the prices and the union wants to get more money. And that's a real negotiation.

And you have, you know, you have lots of other real negotiations in American business, but the compensation in many companies — not all, obviously — but in many, many companies has not been a real negotiation at all.

And the management has hired comp consultants to come in, and I have never seen a comp consultant come in and say, "We ought to reduce this guy's salary."

I’ve also never seen a comp consultant come in and say, “Why don’t you get rid of this bozo?” You know, I mean — (laughter) — they can’t all be wonderful.

But — you know, can you imagine a comp consultant doing that and ever getting another assignment? It wouldn’t happen.

So it’s a bad system, and it needs improvement. And it may be getting a little improvement. And as I wrote in the annual report this year, what happens with comp is the acid test of corporate reform.

Because frankly, the CEOs of America, they don’t care whether their boards are diverse, or not diverse, or anything of the sort. They care about how much money they make, in a great many cases.

And you, the owners, and big owners in particular, you know, have to provide some countervailing force, or you’ll have what you’ve had in the last 20 years, which is an enormous disparity in the rates of compensation of people at the top compared to people at the bottom.

And also a disconnect between the comp of people running businesses and the results of the owners who gave them the money. So arise, (inaudible) shareholder. (Applause)

19. Low inflation helps investors, but keep expectations low

WARREN BUFFETT: Let’s go to number 5.

AUDIENCE MEMBER: Good morning. Good morning, my name is Matt Sauer and I’m from Durham, North Carolina.

In a 1977 Fortune magazine article titled “How Inflation Swindles the Equity Investor,” you argued that corporate earnings in aggregate acted like a bond coupon, and thus, were negatively impacted by high inflation.

Due to high inflation at the time, you posited a world where a 12 percent return on corporate equity would —was reduced to 7 percent after taxes, and netted out to 0 percent in real terms.

You have been sounding downcast about the prospects for equities for several years, much of which we assume relates to extreme starting valuations.

If inflation was decidingly bad for investors in 1977, isn’t the relative lack of it in today’s economy at least one mark in the plus column for equity owners?

Is there also a future inflation expectation component in your warnings that investors are likely to be disappointed by equity results?

WARREN BUFFETT: Well, I would — there's no question that the lack of inflation is a plus for owners. I mean, the real return you will obtain, in my view, from owning American business — if purchased at similar prices — the real return will be higher if we have long periods of lower or close to no inflation, than if we had long periods of high inflation.

I don't think there's any question about that. Because that article went onto explain how you got taxed on nominal returns and fictitious returns in real terms.

So your question about which period is better for investors — a low inflation period over any long period is better for investors.

And the problem, as you pointed out also, was the starting point, in terms of predicting modest returns for equity investors.

The returns weren't necessarily so modest, I predicted. They were just modest compared to what people had begun to think returns would be during that long bull market from 1982 to 1999.

There were polls taken by Gallup working with, I think, PaineWebber at the time — now they've moved it over to UBS Warburg — that showed the expectancy of people in the stock market. And those returns that people expected got up to 14 or 15 percent, as I remember.

And they were thinking they were going to get 14 or 15 percent in a low-inflation environment.

Well that, you know, that was dreaming. And there's nothing wrong, in a low-inflation environment, at all, in earning, you know, 6 or 7 percent. That's probably as well —

Well, it is as good as will happen, because in a low inflation environment how much is GDP going to grow? Well, GDP, you know, if you have a 2 percent inflation and even 3 percent real growth, you're talking about 5 percent, in nominal terms, GDP growing.

If GDP grows at that rate, over time corporate profits will grow at — more or less, at that rate.

And if corporate profits grow at 5 percent a year, the value of those corporate profits, the capitalized value, will probably grow at something like that over any long term with sort of a normal starting point.

And add that to dividends and, you know, you will get 6 or 7 percent before frictional costs. Investors incur a lot of frictional cost. They don't have to, but they do. And that often is 1 1/2, 2 percent of their investment.

So the math isn't bad, it's just bad for those people that got used to, or expected, very high returns based on looking in the rearview mirror back in 1998 or 1999.

Charlie?

CHARLIE MUNGER: My general attitude is just slightly more negative than Warren's. (Laughter)

WARREN BUFFETT: You've heard it, folks. (Laughter)

That isn't the end of the world. I mean, in effect, if the people who own American business get 5 to 6 percent of the pie — $10 trillion economy now, someday a $20 trillion economy.

But if we get 5 or 6 percent of the pie, those of us who put our capital out to produce goods and services for American business — for American consumers, American population — is that a, you know, I don't know whether that's — you know, that's exactly what somebody who designed the universe would come up with.

But it doesn't strike me as crazy in either direction. You know, I think that — that's a lot of goods and services to go to people that put up the capital, but you — and you've got, you know, a hundred million-plus people in the working force that are working to turn that out for you, using your capital.

And it provides a — what I would regard as a pretty decent real return if you have low inflation.

If you get into high inflation, as I wrote about back in '77, you could easily have the real return, to investors, get to a very, very low number, and perhaps negative.

I mean, inflation can swindle the equity investor, as I wrote back then, and I used 7,000 words to explain why, and will be glad to send you a copy of that article if anyone's still interested.

But inflation is the one thing that, over a long period of time, can turn investors' results, in aggregate, into a negative figure. And it's the investors' enemy.

Charlie, does that bring forth any further thoughts?

CHARLIE MUNGER: I don't think you'll get perfect help on these subjects from the economics profession, either. They have certain standard formulas.

To an economist, when a manufacturing job goes to China, that's just so much productivity increase. And if you ask one, well suppose all of the manufacturing jobs in America went to China. Wouldn't that be a little too much efficiency increase?

And the answer would be no. And people actually get paid for thinking like this in major universities. (Laughter and applause)

WARREN BUFFETT: Yeah, if — what would get across the point, of course, is if all the teaching of economics got exported to China, in which — (laughter) — at that point a new insight would appear.

20. Managers decide whether to come to annual meeting

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Jack Hurst (PH), Philadelphia. I have a question about the managers, and a comment and a question about the insurance operation.

These meetings are a lot more fun with more subsidiaries and more managers. I also think more educational, because you get to interact with them.

Is there any feed — do you get any feedback from the managers that they enjoy coming here and they get anything out of the meeting?

WARREN BUFFETT: Well, we have a number of our managers here and I — but we don't require anybody to come. I mean, we have managers that, very, very seldom have come to a meeting.

And I don't keep names, I can't even tell you which ones they are. But you know, if they enjoy it, they come.

Many of them, of course, have operations down below, selling you things, and some of them come to help out in that respect. But we've got a — you know, we have a sensational group of managers.

They run their own businesses, they're extraordinary at doing what they do and we don't get in their way. We don't demand that, virtually, that they do anything, except work for the owners.

But you will — I hope you meet some of them here today because they — you know, the ones that are here, obviously, enjoy interacting with the shareholders.

And it's fun to put faces to functions. I mean, it — I enjoy it, I think a lot of them enjoy coming here.

And the people that are working downstairs, you know, they volunteer to come. And they enjoy seeing the shareholders, and they enjoy bragging about their companies, and they've got a lot to brag about.

And I hope you thank them when you see them because, you know, it's a lot of effort for them.

I got here at six o'clock this morning, but there were people that were here a lot earlier than that, and they were working yesterday to get ready for this. And I want to thank them myself.

Charlie? (Applause)

CHARLIE MUNGER: I don't think our managers who come to this meeting are picking up new tricks. Most of our managers know all the tricks that are related to their businesses.

But this is a very interesting place, and it gets more interesting every year. And part of what makes it interesting is not discreditable, and I think people like being part of it.

WARREN BUFFETT: Yeah, our managers — in a few respects, we'll occasionally work together.

Sometimes a manager of subsidiary A will check with some of the others, not through Omaha, directly themselves. And they will say, you know, "What are you paying for software?" or "What are you paying for UPS?" or whatever it is, and "Can we make a better deal if we pool our efforts?"

There are times when we have saved money, sometimes pretty real money. But that has never been instituted by Omaha, it's never been overseen by Omaha.

It's because manager A decides to call manager B. And you know, they like each other and they can make their own operation better, sometimes by combining purchasing power, and occasionally by just having an idea here or there. But there's no organized way of going at that in Berkshire and nobody has to play.

21. Decisions not based on "sweeping future projections"

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: I'm John Bailey (PH) from Boston.

I'd like to ask about our consumer businesses, which means that I have to ask about the consumer in general.

The situation, as I understand it, is that over the last 30 years or so the median consumer has seen his income rise only a little faster than inflation, and much slower than GDP, overall.

Income inequality is at a 400-year high. The present value of lifetime income for the median person has improved slowly. Yet the size of his lifetime liabilities, such as health care, housing, education, and retirement, has ballooned.

The economic net worth, then, of the consumer may be poorer than they think.

To cope, the median guy has put his wife to work, borrowed against the house, and also the credit cards.

So I think this may have some implications for the sustainability of consumer businesses. And seeing that we've been buying a number of them recently, how do we think about this problem? And are there any non-obvious risks that we should be considering?

WARREN BUFFETT: The American consumer, overall, is better, but not dramatically better off than 10 years ago. Even somewhat better off than 20 years ago. But you're quite right in that there's been considerable inequality, in terms of the progress of people financially during that period.

We don't have broad ideas about — I mean, we don't make decisions on what business we buy based on some sweeping future projections about things.

We think America will do pretty well over time. In fact, we'd — we're quite sure it will do pretty well over time and that our kids will live better than we live. My kids would say that wouldn't be so difficult. (Laughter)

But the — and the grandchildren will live better. You know, that has been the history of the American economy. The real income per capita grew sevenfold, I believe, in the 20th century. That is huge.

You know, it cost $18, as I remember, to make a three-minute station-to-station call from New York to San Francisco 40 years after the telephone was invented. And at the time the $18 was more than the average weekly wage in the United States.

You know, think if some little kid had picked up the phone on the other end and there went the whole weekly wage while you tried to get, you know, your daughter on the phone, or whatever.

So it — people will be better off in this country decade after decade. But we don't — we're not big on being futurologists or anything at Berkshire.

I will tell you this, in terms of our consumer businesses, right now, they're very soft.

Our furniture and jewelry businesses generally — candy business, businesses dealing with the consumer day by day — are soft, and the first quarter the earnings were down.

22. "Desirable" GDP shows how economy affects households

WARREN BUFFETT: One of the things you have to think about — and people don't — they don't focus on this very much. But you read about GDP, and this is one reason I think — I really think we've been in a recession now — not a huge one, but — or not a violent one — but for over two years.

When the government talks about GDP, A, they talk about GDP, we'll say, going up 2 percent. But of course, the population of the country, you know, goes up something over 1 percent per year. So it's per capita GDP that counts. And that has gone very close to no place.

But the more important factor, to some extent, is that GDP counts the people that, you know, have you take off your shoes when you go to get on an airplane. You know, it counts extra police. It counts all of these things that don't really translate into — they translate into goods and services that the country wants, but they are not goods and services — I mean, they're goods and services we wish we didn't want. And they — all of that counts the same way.

If there's a — 20 guards at the airport instead of three guards, that goes into GDP. But does it make you feel any better about how you're spending your paycheck every month? Probably not.

And when you get into a war, for example, if you drop planes into the ocean, you know, that's part of GDP, the cost of manufacturing those planes. But it doesn't do anything for you at your house.

So in terms of what I would call "desirable GDP," I think my guess is that, on a per capita basis, that has gone no place in the last few years as we've diverted resources to other things that don't really translate to what goes into your house or onto your table.

And the quality of GDP is something that is not really talked about very much when you pick up the economic reports every day.

Charlie?

CHARLIE MUNGER: Yeah, and the type of figures you gave us about inequality tend to obscure a basic and important fact. If the same families were permanently at the top of the economic heap there would be huge resentments about current inequality.

But when the coupon clippers and the DuPont family go down, and somebody creates something like Pampered Chef and comes up, in a real sense, something wonderful is happening in terms of equality, even though at the end it looks like there's been no progress.

That much churn makes people think the whole system is fairer. (Applause)

WARREN BUFFETT: We prefer not to be part of the churn, though, actually, at this point, I think. (Laughter)

We were much more in favor of churn 30 or 40 years ago. (Laughter)

23. Buffett didn't learn accounting from books

WARREN BUFFETT: Number 8, please.

AUDIENCE MEMBER: My name is Johann Freudenberg (PH). I come from Germany.

I would like to know the accounting book you like best. Thank you. (Laughter)

WARREN BUFFETT: Well, it's been a long time since I've read an accounting book. I read Finney back when I was in college, I remember that. And I always liked accounting. And for any of you in business, you know, you basically can't get enough accounting.

But I don't — you know, I am not really up to date on accounting books. Maybe Charlie's been reading some of those lately.

I would hope, actually, that if you read the Berkshire reports over time that you get certain, perhaps, lessons on accounting.

But I think you learn more accounting, probably, in terms of — well I mean, once you know the basics of it, by reading good business articles that deal with accounting issues, accounting scandals, that sort of thing.

I mean, what you really need to know is you need to know how the figures are put together, the underlying principles of it, and then you have to know what can be done with those.

And — you start with the accounting figures as the raw material of understanding a business, but you have to bring something additional to that.

And I can't think of any good books on that subject. I think I've read a lot of good magazine articles that contributed to my knowledge over the years.

And I've just, you know, I've read a lot of annual reports, and seen what people can do with accounting.

And as I've said before, if I don't understand it, I figure it's probably because the management doesn't want me to understand it.

And if the management doesn't want me to understand it, there's probably something wrong going on. I mean, people don't obfuscate with numbers, usually, without a purpose. And when you run into that the best thing to do is you stay away.

Charlie?

CHARLIE MUNGER: Yeah, asking Warren, you know, what good books he knows about accounting would be — it's like asking him what good books does he have about breathing. (Laughter)

The — and — (applause) — what the implication of that is, is that you start by learning the basic rules of bookkeeping, which are sort of like the basic rules of addition and subtraction. And then you have to spend a lot of time before that accounting gets related to the larger reality, and that's a lifelong process.

24. Many credit insurers "don't really know what they're doing"

WARREN BUFFETT: OK, we're going to try to go to the Music Hall. Number 9. Is this working?

AUDIENCE MEMBER: I believe so.

WARREN BUFFETT: OK, good.

AUDIENCE MEMBER: Bill Ackman from New York City, and my question is as follows:

Insurance companies — could you comment on insurance companies taking on credit risk through the sale of credit derivatives, the adequacy of the accounting for these derivatives?

And finally, could you explain why the financial guarantee insurers, who are the primary sellers of these derivatives, have the same triple-A rating Berkshire has, despite their more than 140-to-one leverage, and the correlated nature of the risks that they take on?

WARREN BUFFETT: Well, I think you should go to work for Standard and Poor's or Moody's.

The question about credit insurance or credit guarantees of one sort or another, you know, that's become very popular.

And it's become — actually, popular with, sort of, the standard insurance, property-casualty insurance, companies in recent years.

And I would say that, in many cases, the people participating in that business don't really know what they're doing.

It's so easy in the insurance business — it's the curse of the insurance business — it's also one of the benefits of it — is that people hand you a lot of money for writing out a little piece of paper.

And what you put on that piece of paper is enormously important. But the money that's coming in that seems so easy can tempt you into doing very, very foolish things.

We had a situation here in Omaha 15 or 20 years ago in the mid-'80s where Mutual of Omaha — largest health and accident association in the world, at least at one point — and they decided to go into the reinsurance — property-casualty reinsurance business.

And in a very, very, very short time they wrote not very many contracts, and it resulted in wiping out half of the net worth of everything that had built up over many, many decades.

If you are willing to do dumb things in insurance, the world will find you.

I mean, you do not — (Laughter)

You can be in a rowboat in the middle of the Atlantic and just whisper out, “I’m willing to write this,” and then name a dumb price, and you will have brokers swimming to you, you know — (laughter) — with their fins showing, incidentally. (Laughter)

It is brutal. I mean, if you are willing to do dumb things, there are people out there, and it’s understandable. But they will find you, and you will get the cash up front.

You will see a lot of cash and you won’t see any losses, and you’ll keep doing it because you won’t see any losses for a little while. So you’ll keep taking on more and more of this, you know, and then the roof will fall in.

And I mentioned in the annual report how GEICO had taken in, you know, 70-odd thousand dollars — $70,000 — of premiums in the early ’80s for a few policies, and they thought they were just picking cherries at the time, and they reinsured a lot of it. And so far we’ve lost $93 million.

Now, the most we could make was 70-odd thousand, and I don’t know what the most we can lose is. But I know that 93 million has gotten my attention. (Laughter)

When you’re playing in a game like that, you can’t afford to make a mistake. I mean, it’s — the mistake — a single mistake or a few mistakes that are correlated, as you’ve mentioned — because these things do correlate — a few mistakes will overcome a lifetime of savings.

I mean, it is — you will make a few cents on the dollar when you’re right, and you will lose incredible sums when you’re wrong.

And in credit insurance, when you go around — a lot of people went around guaranteeing credits based on ratings.

And they said, well, we’ll guarantee a whole bunch of single-A ratings, or we’ll create these structured arrangements that involve A-rated credits.

And they would use a lot of studies that would show that X percent of A-rated credits defaulted per year, and you go back to the ’30s, and all these back-tested arrangements.

But the problem with that is that what the questioner mentioned is correlation. And when things go bad, all kinds of things correlate that no one ever dreamed correlated.

And what you had, of course, in the debt field was you had a whole bunch of, say, telecoms or energy companies, that were all rated similarly. But they were correlated in a huge way and you weren't getting a diversification. You were getting a concentration that would — you didn't realize.

And there's nothing more deadly than unrecognized concentrations of risk, but it happens all the time.

So I would say we see a B-double-A credit enhanced to a triple-A credit by somebody guaranteeing it, and they may guarantee it for 10 or 15 basis points. And yet the spread in market yield might be 100 basis points.

That does not strike us as smart.

And I would say this about the triple-A rating. They have a triple-A rating for claims paying, but they don't carry, I don't think, general triple-A.

There's only, I think, eight or nine triple-As left in the United States. Berkshire Hathaway's one of them. But I believe there's only one other insurance company, which is AIG, and then there's a half a dozen other companies.

So those companies are not in the same class, credit-wise, as Berkshire, nor are they recognized as being in the same class.

But I would say you could get into a lot of trouble at 140-to-one — at some point — insuring credits.

Charlie?

CHARLIE MUNGER: Yeah, he also asked about the quality of accounting. And in my view, at least, the quality of accounting in America for derivative transactions is still terrible. And it's terrible in that it's too optimistic.

And one of the places where it's most terrible is when you talk about guaranteeing future credits way, way out — years ahead.

That sort of thing just lends itself to people getting very optimistic in their assumptions and in their audited figures.

And people pay attention to the audited figures, not the underlying reality. So therefore, if the accounting is lousy, the business decisions are lousy. And I think that's going on mightily as we sit here.

WARREN BUFFETT: Yeah, there are dozens of insurance organizations or trading organizations in the country that have written credit guarantee contracts in derivative form in the last few years, in fact, on a huge scale.

I will guarantee you, virtually, that every single one of those contracts that was written, in the first week, whoever wrote it, you know, recognized some sort of an income account or an income entry, and that somebody got paid a little bit of money for writing each one of them.

And you know that many of those are going to go bad, and maybe, as a category, that it's going to be a terrible category. But nobody ever wrote a contract and recorded a loss at the time they wrote it. I mean, they just don't do it.

And I will tell you that there are a lot of those contracts that if somebody wrote them for me, 10 seconds later I would've paid somebody to take them off my hands, so that I would've regarded them as having a built-in loss. Nobody ever records a built-in loss on a derivative contract.

In fact, I find it extraordinary that you have two derivative dealers, and dealer A and dealer B write a ticket, and dealer A records a profit and dealer B records a profit, you know, particularly if it's a 20-year contract, you know? I mean, that is the kind of world I'd love to live in, but I haven't found it yet.

25. We try to look "a long way into the future"

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Hey, good morning, Charlie, Warren. Jerry McLaughlin from San Mateo checking in from the Music Hall.

You should see yourselves over here. We're about 12 feet from wall-size images of both of you, which is interesting, but the See's Candy box is so big, I understand what Tantalus went through now.

WARREN BUFFETT: How many people do you have in the Music Hall?

AUDIENCE MEMBER: We probably want to get a cop to estimate, but I'd say it's a couple of thousand.

Anyway, moving right along — hoping I can get a twofer here.

One is, at Branders, small company we run, we're seeing — we're spending a lot more on employee benefits anymore.

Health insurance in particular is going up and up again. And lots of times, in the press years ago and now again a little bit, you're hearing the drumbeat of a health care crisis and what it costs employers to provide health insurance.

I got to figure that's on the minds of a lot of Berkshire operating company managers. I'm wondering whether both of you feel — I mean, is crisis the right word, with respect to cost?

Looks like bigger percentages of our GDP are going to health care. Is that because we think we're getting better health care, or is it really just sort of inflationary?

Second thing is, at the risk of you thinking we're all a bunch of kooks over here, a couple of people over on this side of the hall have asked me to ask you, Warren, whether you're seriously considering being cryogenically frozen at some point — (laughter) — I think, hopefully, in the distant, distant future.

WARREN BUFFETT: What —?

CHARLIE MUNGER: Cryogenically frozen.

WARREN BUFFETT: Oh, we had that last year.

AUDIENCE MEMBER: Yeah, and the guy who asked the question last year has put me up to a follow-up for him.

Hey, and finally, unrelated to those two —

WARREN BUFFETT: Do I look like I'm closer to where I need it? (Laughter)

AUDIENCE MEMBER: Last thing is, when you guys look at companies and you're thinking about earnings into the future, just do you have any rule of thumb? How far in the future do you think you can look, typically, with a company you believe in, you think you understand the business?

Is it five years, 10 years? Do you really think you've got, you know, sort of the perpetual, into infinity income stream to calculate the value on? Thanks.

WARREN BUFFETT: Yeah, well we don't project as far out as we might have to if we thought we could be successfully frozen. (Laughter).

But we really — you know, we're going to own these businesses forever. So, we want a business that we think is going to have, if run well, some kind of competitive advantage — over many decades.

I mean, we're not going to resell them. And we better have something that is not only good now but that's going to stay good.

So we don't buy hula-hoop companies or pet rock companies, and we don't buy companies in industries that we think will have great explosions in demand, but where we don't know who the winners will be.

So we look a long — we try — we like to think we're looking a long way into the future.

26. Munger: 15 percent of GDP for health care is "not crazy"

WARREN BUFFETT: On health care costs — the only company-wide managers meeting — and we had far fewer managers then — but we had a meeting of most of the then-smaller number of managers 15 or 20 years ago where we did talk about what the various companies were doing on health costs, because they were then the fastest increasing part of our cost structure.

And today, workers' compensation costs would probably be — and some other insurance costs unrelated to health would be also — would, at least in the last couple of years, have moved up even more dramatically than health costs.

But health costs are huge for us. In many cases, you know, running 6- or $7,000 per employee, but moving up at a fast rate.

And you know, that is an inflationary part of the U.S. economy that we can't solve and our employees can't solve. And it becomes a big part of the kind of cost — it's a raw material cost — we had higher energy costs in the first quarter.

But health costs are the ones that are going to just keep coming and coming, in my view, and I don't have any great answers for it.

Charlie runs a hospital and knows a lot more about the health system than I do, so we'll see what he has to say.

CHARLIE MUNGER: Well, I would argue that the quality of the medical care delivered, including that from the pharmaceutical industry, has gone up enormously. And, of course, the cost has, too, but it's a much richer country.

And I don't think it's crazy if the United States wants to spend 15 percent of GDP on health care. If it went to 16 or 17, I wouldn't consider it the end of the world.

Eventually, of course, there would be a place where it wouldn't be smart to spend so much.

WARREN BUFFETT: Do you think, if we're spending 13 or 14 percent and other countries that seem to have fairly good systems are spending 7 or 8 percent, that we're getting our money's worth, relative to them?

CHARLIE MUNGER: Well, certainly they're getting more value per dollar out of their 7 percent than we're getting out of our 15. But does that mean that it's crazy for us to spend 15? I don't know.

I would guess not. But I don't see any sign from anything I see that it isn't continuing to go up.

WARREN BUFFETT: It's a — I don't know how much we — we never aggregate figures around Berkshire from the various companies because it wouldn't mean anything. But we spend a lot of money on health care.

And certain states, it's far higher than others. It makes a lot of difference where you're located.

27. Buffett: Giving and getting love is true success

WARREN BUFFETT: Number 1?

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. My name is Justin Fung (PH). I am 13 years old, from California. This is my third consecutive year in attendance.

First of all, I would like to wish you the best of health so we can continue to come to Omaha for many years to come. (Applause)

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: Thank you for answering my question on friendship last year. My question this year is, how do you define success and happiness? Are they related? And how would one achieve that? Thank you.

WARREN BUFFETT: Well, I tell college students that when you get to be my age, you will be successful if the people that you would hope to have love you, do love you.

I mean, you — if — Charlie and I know a few people that have got a lot of money, and they get testimonial dinners, and they get their names on buildings, and the truth is, nobody loves them.

And you know, not their family, not the people who name the buildings after them. You know, it's sad.

And it's — unfortunately, you know, it's something you can't buy. I mean, Charlie and I have talked a lot of times, if we could just buy a million dollars' worth of love, you know, I mean? It would be so much more satisfactory than to try and be lovable. (Laughter)

But it doesn't work that way, you know?

The only way to be loved is to be lovable. It's — and I hate to tell you that at 13, and — but the nice thing about it, of course, is that, you know, you always get back more than you give.

I don't know whether it was Oscar Hammerstein or who said, you know, "A bell's not a bell till you ring it, a song's not a song till you sing it. Love in the heart isn't put there to stay. Love isn't love till you give it away." And basically you'll always get back more than you give away.

And if you don't give any, you don't get any. It's very simple.

I don't know anybody my age that is loved by a lot of people — we had a dinner the other night, Don Keough was there — everybody loves Don Keough, you know, and for good reason.

And there is nobody I know that has — that commands the love of people around them, people they work with, their family, and their neighbors— that is other than a success or feels other than a success.

I don't know how the people feel that — where they know that nobody loves them, but I can't believe they feel very good.

So it's very simple. You can't get rid of love. If you try to give it out, you get it back more than you've given. And it's the best thing.

Charlie, what do you speak for? (Laughter)

CHARLIE MUNGER: Well, you don't want to be like the motion picture executive in California, and they said the funeral was so large because everybody wanted to make sure he was dead. (Laughter)

And there's a similar story about the minister saying at the funeral, "Won't anybody stand up and say a good word for the deceased?" And there was this long silence, and finally one guy stood up and he said, "Well," he said, "his brother was worse." (Laughter)

WARREN BUFFETT: Look, I would say this. Look around at, you know, people older than you are, look around at, you know, your older relatives or whatever, and you will not see a — an unhappy person who is loved by those around them.

I mean it — and it's — most people in this room are going to do very well financially. Most of the college students I talk to are going to do well financially.

And some of them are going to have very few friends — real friends — as they get older, and others, people won't be able to do enough for.

And I see it around me all the time. So that's our advice for the day on that.

28. Buffett doesn't remember giving advice to Richard Rainwater

WARREN BUFFETT: Number 2. (Applause)

AUDIENCE MEMBER: Hello, my name is Kevin Truitt (PH) and I'm a shareholder from Chicago, Illinois.

Mr. Buffett and Mr. Munger, thank you for putting on this marvelous event for your shareholders and partners. I thoroughly enjoy and love coming here.

I get so much education from this, in that the people here are just wonderful.

I have three, hopefully short, questions. The first two questions are for you and Mr. Munger, and the third question is for you.

My first question is, Mr. Munger, you are largely credited with moving Warren away from the cigar-butt approach to investing, as it was practiced by Ben Graham. It's been stated that it was the purchase of See's Candy that taught you this important lesson of buying good businesses.

At what point did you realize that this concept of buying good businesses was a better long-term investment strategy? And what was it in your discussions with Warren that allowed you to persuade him to move in that direction?

Mr. Buffett, what was it in Mr. Munger's arguments for buying good businesses that persuaded you to abandon the cigar-butt approach and move in his direction?

My second question is, in both your experience have you or Mr. Munger ever known of a company that has regained or replaced its competitive advantage once it was lost?

My third question for you, Mr. Buffett, is, early in his career Richard Rainwater sought you out and asked you what it took to become a successful investor. Can you tell us what he asked you and what you told him? Thank you. (Applause)

WARREN BUFFETT: The last question, I don't remember at all. I mean, Rainwater called me a couple of times, but I don't really remember the conversation.

That was a lot of years ago and I probably said the same — I would have said the same thing to his as if I got a question asked in this meeting.

So I've really had no contact with Richard Rainwater over the years. Like I say, I think I met him once, I believe, and he called a couple of times, so —

29. See's Candies lesson: listen to criticism

WARREN BUFFETT: Charlie, do you want to answer the first question about how you —

CHARLIE MUNGER: Yeah, well, I think there's some mythology in this idea that I've been this great enlightener of Warren Buffett. (Laughter)

Warren hasn't needed much enlightenment, but we both kept learning all the time, so that the man we were five years earlier was less sensible than the man who ultimately was there.

And See's Candy did teach us both a wonderful lesson. And it'll teach you a lesson if I tell you the full story.

If See's Candy had asked $100,000 more, Warren and I would've walked. That's how dumb we were at that time.

WARREN BUFFETT: Ten-thousand more. (Laughter)

CHARLIE MUNGER: And one of the reasons we didn't walk is while we were making this wonderful decision we weren't going to pay a dime more, Ira Marshall said to us, "You guys are crazy. There are some things you should pay up for," quality of business — quality, and so forth. "You're underestimating quality."

Well, Warren and I instead of behaving the way they do in a lot of places, we listened to the criticism. We changed our mind.

And that is a very good lesson for anyone. The ability to take criticism constructively is — well, think of all the money we made from accepting that one criticism.

And if you count the indirect effects from what we learned from buying See's, you can say that Berkshire's been built, partly, by learning from criticism. Now, we don't want any more today. (Laughter)

WARREN BUFFETT: We also like the peanut brittle, too. (Laughter)

30. From "cigar butts" to high-quality companies

WARREN BUFFETT: The — Charlie explained, I had learned investment, and got enormous benefit out of that learning, from a fellow who concentrated on the quantitative aspects, Ben Graham.

And who didn't dismiss the qualitative aspects, but he said you could make enough money focusing on quantitative aspects, which were a more sure way of going at things and would enable you to identify the cigar butts.

He would say that the qualitative is harder to teach, it's harder to write about, it may require more insight than the quantitative. And besides, the quantitative works fine, so why try harder?

And on a small scale, you know, there was a very good point to that.

But Charlie really did — it wasn't just Ira Marshall — but Charlie emphasized the qualitative much more than I did when I started.

He had a different background to some extent than did, and I was enormously impressed by a terrific teacher, and for good reason.

But it makes more sense, as we pointed out, to buy a wonderful business at a fair price, than a fair business at a wonderful price.

And we've changed our — or I've changed my focus anyway, and Charlie already had it — over the years in that direction. And then of course, we have learned by what we've seen.

I mean, we — it's not hard when you watch businesses for 50 years, you know, to learn a few things about them, as to where the big money can be made.

Now, you say when did it happen? It's very interesting on that. Because what happens, even when you're getting a new, important idea, is that the old ideas are still there. So there's this flickering in and out of things. I mean, there was not a strong, bright red line of demarcation where we went from cigar butts to wonderful companies.

And it — but we moved in that direction, occasionally moved back, because there is money made in cigar butts.

But overall, we've kept moving in the direction of better and better companies, and now we've got a collection of wonderful companies.

31. Hard to regain a lost competitive advantage

WARREN BUFFETT: In terms of competitive advantage and then regain — lost and then regained — there aren't many examples of that. In the property-casualty company, I've got a friend who always wants to buy lousy companies with the idea he's going to change them into wonderful companies.

And I just ask him, you know, "Where in the last hundred years have you seen it happen?"

I mean, GEICO got into trouble in the early '70s, but it had a wonderful business model. It did get off the tracks, but it wasn't because the model went astray, it's because they'd started reserving incorrectly and went crazy on growth, and a few things like that. But the basic model was still underlying it.

You might argue that one company that lost its competitive position and then came back in a different way, actually, was Pepsi-Cola. I mean, they were "Twice as much for a nickel, too."

They were selling on a quantitative basis, the fact that you got to guzzle more of the stuff for a nickel — twice as much, as the slogan went — and they lost that edge, post-World War II, when costs went up a lot.

And so they basically changed their marketing approach successfully, and that's very, very seldom done. But you have to give them credit for that.

To some extent, Gillette lost its competitive position somewhat in the '30s, lost market share against what they called penny blades and all that, and then regained it in a very big way in the next 10 or so years when their market share went up enormously.

But generally speaking, if you lose your competitive position — the Packard Motor Company had the premier car in the mid-'30s. The Cadillac was not the premier — it was the Packard.

And then they went downscale one year and they never came back. They jumped their sales that one year because everybody wanted to own a Packard, and now you could own one a little cheaper. But they never regained that upscale image again.

And certain department stores have done that, too. They've had a upscale image. And you can always juice up your sales, particularly if you've got a great upscale image, by having, you know, this sale or that sale, and going downmarket.

It's very hard to back upmarket again, and you've seen some great department stores that have had that — or specialty stores — that had that problem.

Charlie, you got any thoughts on that?

CHARLIE MUNGER: No more.

WARREN BUFFETT: OK.

32. "Fretful disposition" will hurt your long-term performance

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Hi. I'm Bruce Gilbert (PH), a stockholder from New York City.

And about four or five years ago, I put most of my family's portfolio — actually all of it — into Berkshire Hathaway.

And over the past four or five years, the stock price has remained rather steady, and I've withstood the year 2000, when friends were making 50 percent and I was losing 50 percent on my investment.

But I have to admit, when I read your Fortune article last year and you referred to the stock price as expensive, I felt badly.

Now I spend my days sometimes having fun, figuring out the value of Berkshire Hathaway.

But at night after that comment I could also wake up in worry and fret. And I realize you talked, recently, a lot about the qualitative and quantitative aspects of things.

And I guess I would like you, with your self-reflective position, and knowing that I'm asking you to do something like maybe talking about your breathing, what went into that comment to call the stock price expensive, in terms of your weights and measures?

What price, what value? What do you think about the company and its stock price when you say it's expensive?

WARREN BUFFETT: I think if you — I don't remember the exact wording of that article, but I'm quite sure that I told the author of that article, and I'm almost positive it was in the article, that said I thought it was more attractive than owning the general market or the S&P.

So I was saying that I preferred it to the general market. I'm certainly happy having 99 and a large fraction percent of my net worth in it. I've never sold a share, I am not the least bit uncomfortable about holding it until the day I die, and quite a bit thereafter. (Laughter)

But I have not thought stocks were cheap at all for some time. And I've never wanted to encourage anybody, particularly in the last few years, to buy Berkshire or any other stock because — the market — I felt that the — you know, I felt we had a great bubble.

And you know, I think Berkshire's value has improved — I think Charlie does, too, fairly significantly — in recent years.

And I would — if I had a chance to swap, tax-free, my Berkshire for the S&P 500, or for any mutual fund or anything, you know, I wouldn't even give it a thought. But that does not mean I think, you know, either Berkshire or stocks are cheap.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

WARREN BUFFETT: I don't think we've ever recommended the purchase or sale of Berkshire, that I can remember. We did say at one time we would repurchase shares, which has a certain underlying message to it.

And we said at other times we wouldn't buy shares. That doesn't mean we'd sell shares at all, but we wouldn't have bought them under the prevailing conditions.

But we have stayed away from recommending, actually not only the purchase or sale, not only of Berkshire, but just of any other specific shares.

We've only given our views, occasionally, on what we think about the level of the stock market, generally.

But I do think, if you go back and look at that article — I wish I had it here. But I think you'll find that I said I preferred it to equities, generally. It —

CHARLIE MUNGER: I do think that there's a lot to be said for developing a temperament that can own securities without fretting. I think that the fretful disposition is the — it's an enemy of long-term performance.

WARREN BUFFETT: Well, it's almost — I think it's almost impossible if you're — to do well in equities over a period of time if you go to bed every night thinking about the price of them. I mean, Charlie and I, we think about the value of them.

But we would be happy, just as in that movie — if they closed the Stock Exchange tomorrow, you know, Dick Grasso wouldn't be happy and Jimmy Maguire, our specialist, wouldn't be happy.

It wouldn't bother me and Charlie, at all. We would keep selling bricks, selling Dilly Bars, selling candy, writing insurance. You know, a lot of people have private companies and they never get a quote on them.

You know, we bought See's Candy in 1972. We haven't had a quote on it since. Does that make us wonder about how we're doing with See's Candy? No, we looked at the company results.

So you — there's nothing wrong with focusing on company results. Focusing on the price of a stock is dynamite, because it really means that you think that the stock market knows more than you do.

Now if the stock market may know more than you do, but then you shouldn't be in stocks. I mean, you should have — the stock market is there to serve you and not to instruct you.

So you need to formulate your ideas on price and value, and if the price gets cheaper and you have funds, you know, logically, you should buy more, if — and we do that all the time.

Where we make our mistakes, frankly, is where we focus on price and value and we start buying, and the price goes up a little and we quit, you know, like Charlie referred to, we might have done on See's Candy.

A mistake like that cost us $8 billion in the case of Walmart stock a few years ago, because it went up in price. And you know, we are not happy when things we're buying go up in price.

We want them to go down, and down, and down. And we'll keep buying more and — hopefully we won't run out of money. Of course, that's a different story.

Charlie?

CHARLIE: No.

33. Triple-A rating won't "cause us to do anything stupid"

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hi. David Anglin (PH) from St. Louis, Missouri. Thanks for the weekend, it's very nice. It's always entertaining here.

According to an article in The Economist, the triple-A rating is very important quality for reinsurance to have. Swiss Re, Munich Re have lost their triple-A ratings. Gerling is out of the ballpark.

Will the reinsurance business at Berkshire become unintentionally exposed to higher risk because it is now a major reinsurer still holding a triple-A rating, even though it practices a very severe underwriting discipline?

WARREN BUFFETT: No, the triple-A can't increase our risk, because it should not affect what we do.

It may affect what gets offered to us. I mean, logically we should get business offered to us first, and last. I mean, we are the reinsurer that's going to pay for sure, five years from now, 10 years from now.

So when — I mean, we have contracts, we have structured settlements with paraplegics that are counting on us to make a payment to them 50 years from now.

And those people are in wheelchairs, they may be on — you know, they may be on oxygen, all kinds of things. And they are depending on a little piece of paper that has our name on it, and it says we're going to pay them for the rest of their life. And it's very, very important to them whose name is on it.

But that shouldn't cause us to do — it shouldn't cause us to do anything at all stupid. It just means that people that care about security of future promises should come to us.

But there's no reason at all, because Munich or Swiss Re loses their triple-A, that we should underwrite in any way differently than we do now. It just should mean that we have more to choose from.

And I can assure you that, as these companies lose their triple-A — and a number have in the last year or year and a half — we have been tightening our underwriting very materially at Gen Re.

Now, it needed tightening — but we are now, in my view — we have the right — we have a great underwriting culture at Gen Re, and historically it had it most of the years. It drifted away from that, but I think it's back in spades now. So I don't think you have to worry about that.

Charlie?

CHARLIE MUNGER: Well, I certainly hope we are better underwriters than Munich Re.

WARREN BUFFETT: Well, let's not name names. (Laughter)

No, no, Munich is a fine company. (Laughter)

The rule at Berkshire is we praise by name and we criticize by category. (Laughter)

And I do think Munich is a fine company, but they lost their triple-A, frankly, because they probably had — they were too exposed on the equity side — on the asset side — in equities, relative to net worth, and I think they probably agree with that.

But they have a very strong and important position in insurance. And we do a lot of business with Munich Re, and will continue to do so. But there are others we won't do business with, incidentally.

I mean, there are some very weak reinsurers in the world and if there were to be a major natural catastrophe, or if there were to be a major financial catastrophe, there are a number of reinsurers, in my view, that would not pay. And we conduct our affairs so we'll always be able to pay.

34. Planned all along to exercise Cologne Re buy option

WARREN BUFFETT: Number 5?

AUDIENCE MEMBER: Good morning, gentlemen. My name is Olaf Heine (PH) from Germany. And not surprisingly, I have a question concerning the German reinsurance market, fitting nicely in the context of the questions before.

When you acquired General Re, I believe you inherited, also, a substantial stake in Cologne Re. Now in your last letter to your shareholders, you hinted that a major reinsurance company might be in trouble, widely believed to be Gerling Re, just mentioned.

You also mentioned, about an hour ago, that Germany was kind of a drag insurance-wise — (laughs) — if you are — if I understand you correctly.

WARREN BUFFETT: I don't — I mean, I don't believe I — I didn't mean to say that.

AUDIENCE MEMBER: OK, but it helps to formulate the question. (Laughter)

WARREN BUFFETT: OK, well, for the purpose of your question we'll assume I said it — (laughter) — yeah. But I didn't say it.

AUDIENCE MEMBER: So now Gen Re decided to exercise a call option on the remaining shares of Cologne Re, another German reinsurance company. And my question simply is, what motivated you to do so?

WARREN BUFFETT: Yeah, that's a good question. And it was mis — it was sort of somewhat misreported in the press, what happened on that.

What really happened is that Gen Re — I don't know whether it would be about six or seven years ago now — acquired a significant position in Cologne from the controlling shareholder, with a put and call arrangement for the remainder.

I don't even know the history, exactly, of why they went for this two-step transaction, but basically it was a two-step purchase.

So that all along we have accounted for Cologne as if we were going to exercise the option. Because, in effect, if we didn't exercise, they would exercise. And it was fait accompli that we would buy that stock right from the start.

So we made no affirmative — we made an affirmative decision six or seven years ago to buy a very significant percentage of Cologne. We now have — will have about 89 percent when the option's exercised.

But there's nothing new in the fact that we are now doing it. The put and call arrangement, as I remember, became effective, essentially, this year.

So this was the year that something had to be done, and was planned to be done all along. And it reflected no new judgment, no new decision about Cologne in the year 2003.

It reflects a decision that was made in 1996 or ’97, whenever the original purchase was made.

And Cologne is an integral part of General Re. I mean, we knew all along that we would own 89 percent of it, pursuant to this contract. And it — that’s always been in our thinking, from the moment we sat down with the Gen Re management to make a deal some years ago.

So the press has sort of implied that there’s something new in this transaction that’s occurring this year, and there really isn’t.

35. Berkshire buyback is possible, but not likely

WARREN BUFFETT: Number 6. Charlie, you don’t have anything on that? No.

AUDIENCE MEMBER: Good morning — Mr. Buffett. This is Abhishek Dalmia coming from the land of Mr. Ajit Jain, (inaudible) India. The question is —

WARREN BUFFETT: If you have any more like Ajit over there, send them. We need them. (Laughter)

AUDIENCE MEMBER: Right. My question pertains to the allocation of a company’s free cash. And the question is, under what circumstances would Berkshire consider parting with its money for a share buyback program, as opposed to retaining it for future acquisitions? Thank you.

WARREN BUFFETT: Yeah, that’s a good question and we addressed that a bit back a couple of years ago. In fact, I think our annual report for 1999 came out on March 12th — I believe it was March 12th — on a Friday night or a Saturday morning.

That was the day the NASDAQ hit its high and Berkshire hit its low, on that exact day. And we said we would — the next morning, on the internet — on a Saturday morning — we said we would repurchase, but we wanted you to have the annual report first, but we might repurchase at those levels.

And the NASDAQ never saw its level of 5100 again, and Berkshire never saw its level of whatever it was, 41,000 or thereabouts.

Our preference — and we stated this 20 years ago, even to — is to buy businesses. We are — we want to add businesses of a quality with managers of a quality equal to those we already own, at prices that make sense. And that’s our number one preference.

If we thought Berkshire was significantly undervalued and we thought the likelihood of using the money to buy businesses — the probability was low — we would be buying stock in — we probably wouldn't be able to buy a lot of stock in, but we would only buy stock in if we thought the stock was selling significantly below intrinsic value.

And there's no magic figure for intrinsic value. Intrinsic value is a range. Charlie would name a different number than I would name, but our ranges would be quite similar, if we were to write them down on a piece of paper now. But they wouldn't be identical.

So we leave a — we would leave a significant margin of safety and would want to buy at a — what would be a clear-cut, to us, discount from the lower levels of intrinsic value we might calculate.

It's not our number one preference. We would rather add — we love it when we add good businesses to Berkshire.

But we would have to — if the stock — if we could add intrinsic value per share by repurchasing, and we've given all the shareholders relevant information about the value so that we weren't putting anything over on them, that they had the same information we had, we would buy in stock.

I think it's unlikely that happens, that we don't find other opportunities to do things at a time like that. But it could happen, and it almost happened in March of 2000, and then things turned around very, very abruptly.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

36. MidAmerican will grow, even if utilities law isn't repealed

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Good morning. My name is Ken Goldberg (PH) from Sharon, Massachusetts.

What is your long-term vision for MidAmerican Energy?

And specifically, assuming the repeal of the Public Utility Holding Company Act, what is the nature of the type of assets that you would be interested in acquiring, be they generation, transmission, distribution-type properties?

WARREN BUFFETT: Yeah, MidAmerican already is a big part of Berkshire. I would say it's likely to become much bigger. It will be easier to have it become much bigger if the Public Utility Holding Company Act, which was enacted in 1935 — if it were repealed.

Public Utility Holding Company Act, which is a melodiously named — called PUHCA — (laughter) — was enacted in 1935 in a reaction to what Sam Insull and people like that had done in the 1920s. It was very understandable.

But I really think it is quite outdated now. I mean, it is now 68 years later.

And I think we bring something to the utility field. In fact, I think we brought it in the last year.

There might well be a couple of companies that wouldn't — would be in bankruptcy now if we hadn't been in a position to act very quickly on certain things.

So — but with or without the repeal — and I think there's a reasonable chance it'll be repealed. But with or without repeal, MidAmerican, which is big now, will become quite a bit bigger. And it could become a whole lot bigger.

Now, in terms of what kind of assets we'll buy, we don't have a —any clear-cut preference, for example, as to whether it would be a natural gas pipeline, or whether it would be a domestic utility, or conceivably, a utility, even, in some country that we felt good about.

We will look at things as they come along. We're always ready to act. I would say that it's certain we'll look at a few big deals this year. Whether we get one done or not depends on competition, depends on the sellers, and some things like that.

But something will happen with MidAmerican — over — you know, whether it's this year, or next year, or the year after, we'll get a shot at doing something significant.

And the nature of the energy field is you're talking big money, always. I mean, these are not lemonade stands. And you know, we're talking in the billions, frequently, on the kind of assets involved.

So it will be a — we've got a fabulous management — we've got two people running that in Dave Sokol and Greg Abel, who are — they're terrific businesspeople.

You know, they — and, incidentally — I should mention this publicly — they have done things that have made Berkshire significant money that had nothing to do with MidAmerican.

In other words, they have spent their time and energy, weekends, putting together a couple of things that MidAmerican itself could not do, but Berkshire could. And they didn't get paid a dime for that and MidAmerican did not get paid a dime for that.

So they have contributed to Berkshire's welfare beyond what they've contributed simply as managers of MidAmerican.

So it's a terrific asset. We love the idea of pouring money — (applause) — behind them, and you'll see something happen.

Charlie?

CHARLIE MUNGER: Well, I — the really interesting thing about it is the fact that the field is so big. I mean, you're talking about an enormous field.

One thing a modern civilization needs is energy, so we'll be very disappointed if there aren't more activities.

37. Why Buffett doesn't get a performance fee

WARREN BUFFETT: Number 8.

When we get through with number 10 we're going to break for lunch, and then we'll come back and start all over again after 30 or 40 minutes. But I'd like to get through 8, 9, and 10.

Eight.

AUDIENCE MEMBER: I'm Norman Rentrop from Bonn, Germany.

Mr. Buffett and Mr. Munger, I have a thank you and a question for you. Thank you for allowing us shareholders to invest with you on equal terms, with almost no management fee and no performance fee. (Applause)

I came to fully appreciate it when I compared my 10 years of holding Berkshire Hathaway to a private equity fund, which over the same 10 years earned 19.8 percent before fees, and 11.2 percent after fees. — (Buffett laughs)

Now my question. Back in the 1950s and 1960s when you had a partnership, Mr. Buffett, you asked for and got a performance fee of 25 percent of what was earned above 6 percent a year.

WARREN BUFFETT: Correct.

AUDIENCE MEMBER: What caused you to switch from that performance fee to that no fees we are enjoying today? Was it the wisdom that to give is better than to receive? (Laughter)

WARREN BUFFETT: Try again. (Laughter)

AUDIENCE MEMBER: And do you feel that this switch from performance fee to no performance fee, that that is fully appreciated? And what did it mean to you personally?

WARREN BUFFETT: Well, I appreciate what you had to say, and I will — I would pay to have this job I have. I would pay a lot of money. And I hope I don't get tested on that, but you know, it's —

Why in the world — if I can work with people I like, and get the same result they have, and end up with all kinds of money, you know, why do I need to make some further override on them?

I was changing my position in life significantly when I started that partnership in 1956. A couple of the people that — well I guess, yeah, [Buffett's sister] Doris may be the only original partner here. But Doris, would you stand up? She joined on May 5th, 1956, wherever she is.

And the — you know, those people gave me their money but I wasn't — I needed some money then, too. And I did get an override, which I thought was fair.

I got no management fee at all, though. I never charged — today, most of the people who run hedge funds charge 1 percent a year, and then some percentage of the profits. I did not do that.

And I did have all my money in after 1962, so that the downside would be equal to the upside.

But I've always felt about the people as partners. And when we got into Berkshire — originally we got into Berkshire, Berkshire was owned by the partnership. So if I had taken a salary then I would've been double-dipping, in effect, by getting money out of Berkshire before, in turn, the partnership participated.

And frankly, by the time I got — where I was running Berkshire I had all the money I needed. And you know, I'd rather get the same result as my partners than have me get a different result. And it can't make any difference.

I mean, it'll make a difference in the size of my foundation someday, perhaps. You know, but so what? I like living the way I live.

Charlie?

CHARLIE MUNGER: Well, you raise a very interesting question, and it has parallels, if you go back.

[Andrew] Carnegie was always very proud that the bulk of his fortune had been earned where he took no salary at all from Carnegie Steel. John D. Rockefeller the First took practically nothing in salary.

Over the years — the original Vanderbilt prided himself on living on his dividends and taking no salary.

It was a common culture in a different era. And you realize that all those people had the psychology of being the founder, and maybe that's what influenced Warren.

WARREN BUFFETT: What influenced you, Charlie?

Charlie doesn't take anything either, so —

CHARLIE MUNGER: I was delighted to get rid of the psychological pressure brought by — brought on me by getting fees based on performance. I think Warren was, too.

If you're highly conscientious in your relations with other people, and you hate to disappoint, you're going to suffer more if you are liberally rewarded with performance fees.

So I think there was an enormous advantage to us, so I guess we should be thanking you.

WARREN BUFFETT: I should — (Applause)

Bill Gates has never taken an option at Microsoft, and takes a very small salary. And you'll find it interesting. The only reason he takes the small salary is if there — he feels that, if there's a bad year at some time in the future, he wants to be able to take a cut in salary at the same time he's asking other people to cut back.

And that is the reason. I mean, he takes peanuts as it is, but he just figures that — Bill is a very conservative guy, and he figures that some year there'll be a bad year. And he wants — if he's asking other people to take a 5 percent cut, he wants to be able to take a 90 percent cut, or something, himself.

But he's never taken an option, and I don't believe [Microsoft CEO] Steve Ballmer has either. They have gotten rich with their shareholders and not off their shareholders, and that's an attitude we admire.

38. "Mild wakeup call" on derivatives

WARREN BUFFETT: Number 9? (Applause)

AUDIENCE MEMBER: Good morning. I'm Whitney Tilson, a shareholder from New York City.

There was a lot of talk among the Berkshire faithful when you took what I believe was the unprecedented step of pre-releasing a portion of your annual letter, published in Fortune, which focused primarily on the dangers of derivatives — which you called "financial weapons of mass destruction."

I have two questions related to this — the first to you, Mr. Buffett.

Could you tell us the story of how the Fortune article came about? Were you trying to draw extra attention to something that you feel strongly is a great risk to our financial system?

And the second question to both of you, since you're warning about derivatives, there's been a huge rally in the credit markets, in general. Does this reflect investors' lack of concern for these systemic risks or is it caused by other factors?

WARREN BUFFETT: The first question, my friend [Fortune Magazine journalist] Carol Loomis is the editor of the Berkshire report. And we wouldn't get out the report without her. I mean, she is the world's greatest editor, in addition to being the world's greatest business writer.

So when I gave the report to her to edit — and it did not come back unmarked, I might add — she and I talked about — I mean, I was interested in having the section on derivatives because I thought it had a broader — I hoped it would have a broader audience than just the Berkshire annual report.

And I felt that publishing it, which had no relationship to the Berkshire business, basically, except the history of Gen Re's involvement, would not be, in any way, compromising fair disclosure, in terms of Berkshire's results itself.

So the primary reason for having it in Fortune was I hoped for a wider audience, basically, by having it in Fortune.

And you know, Charlie and I think there is a low, but not insignificant, probability — and low — that sometime, maybe in three years, maybe in five years, maybe in 20 years, and very possibly never, that derivatives could accentuate, in a major way, a systemic problem that might even arise from some other phenomenon.

And we think that's inadequately recognized. We think the problem grows as derivatives get more complex and as their usage increases.

So it was a call — what we hope was a mild wakeup call — to the financial world that these things could be very troublesome.

And of course, we saw it in the energy field in the last two years. It almost destroyed, or destroyed certain institutions that never should have been destroyed.

And the — we also saw, in 1998, the whole financial system almost become paralyzed, particularly in the credit markets, you know, by the action of a firm, which was not solely based on derivatives, but would not have gotten into as much trouble as it did without derivatives.

So it's a subject that no one quite knows what to do with. Charlie and I would not know how to regulate it, but we think we have had some experience in seeing both the firm's specific dangers in that field, and we think we have some insight into the systemic problems that could arise.

And you know, that people really — they don't want to think about it until it happens. But there are some things in the financial world that are better thought of before they happen, even if they're low probabilities.

And we're thinking about low probabilities all the time, in terms of Berkshire. I mean, we don't want anything to go wrong in a big way at Berkshire. And we therefore, I think, think about things that a good many people don't think about — simply because we worry about that.

And when we get our social hats on we think about it in terms of something like derivatives for financial systems of the world. And we have had some experience at both Salomon and at Gen Re.

And Charlie was on the audit committee at Salomon, and he saw some things in the audit committee in relationship to trading itself, and derivatives in particularly, that made him wonder why in the world people were doing these sort of things. I'll let Charlie expand on that.

CHARLIE MUNGER: Yeah, in engineering, people put big margins of safety into systems — atomic power plants being the extreme example. And in the financial world, in derivatives, it's as though nobody gave a damn about safety.

And they just let it balloon, and balloon, and balloon in usage, and number of trades, and size of trades.

And that ballooning is aided by this false accounting, where people are pretending to make money they're not really making.

I regard that as very dangerous, and I'm more negative than Warren in the sense that I'll be amazed, if I live another five or 10 years, if we don't have some significant blow-up.

WARREN BUFFETT: They've been advertised, and sometimes in a fairly prominent way — they've been advertised as shedding risk for participants in the system, and reducing risk for the system.

And I would say that I think they have long crossed the point where they decrease risk to the system, and now they enhance risk. Because you have — the truth is, the Coca-Cola Company couldn't bear the foreign exchange risk that they run, or the interest rate risk that they run, and all of that sort of thing.

But when the Coca-Cola Company starts laying those off, and every other company in the world — major company — does with just a relatively few players, you have now intensified the risk that exists in the system.

You have not shed risk at all, you have transferred it, and you have transferred it to very few players. And those players have huge interdependencies with each other, and to some extent, central banks and all of those similar institutions are vulnerable to the weaknesses of those institutions.

When Charlie and I were at Salomon, you know, they hated it if we brought up — and so therefore, we didn't do it — that we were too big to fail.

But the truth was that if Salomon failed at that time, the problems for the rest of the system could well have been significant. They might've been — who knows exactly what they would have been? But they could have been quite significant.

And when you start concentrating risks in institutions which are highly leveraged, and who intersect with a few other institutions like that — all bearing same risks, all having the same motivations in the trading departments — to take on more and more esoteric things because they can book more and more immediate profits, you are courting danger.

And that's why I wrote about it this time. And I — it's not a prediction, it's a warning.

39. Do managers love the business or the money?

WARREN BUFFETT: Number 10, and then we will break for lunch right after this.

AUDIENCE MEMBER: Good morning, my name is Ho Nam from San Francisco, California. I have a two-part question regarding how you evaluate your managers.

In your annual report, you wrote that Berkshire Hathaway owns "good to great" businesses and employs "great to great" managers, and we're thankful for that.

When you hire a manager, or are evaluating the management team of a business you're thinking about buying, what are the qualities you look for?

And some of your managers were entrepreneurs who started their businesses from scratch when their business models were unproven, and some of them took over businesses that were already performing well when they took charge.

What are the qualities of a great entrepreneur that might be different from those of a manager who can be great at running a company that's established, but may not be able to start a business from scratch and tinker around with a business model and figure out how to make it successful?

WARREN BUFFETT: Yeah, well we love managers that have a passion for their business. And when we're buying a business we have to ask ourselves, "Do they love the money or do they love the business?"

If they love the money, there's nothing wrong with that, but they probably wouldn't be running the business for us a year or two down the road.

I think one difference is that people that create their own businesses, the entrepreneurs, probably, on average would have a significantly greater degree of passion for those businesses than somebody that was just brought in a few years ago and sees themselves as making a profit in a few years on reselling the business and leaving.

I — you'll find exceptions in both camps. But we've had terrific luck with the entrepreneurs who basically love their businesses the way I love Berkshire. I mean, they are not going to let anything happen to their businesses.

They can — you know, they'll tell me to butt out if I'm going to screw up something in their operations, and they don't regard them — I mean, in a certain sense, I mean, they know they're part of Berkshire.

But they regard them in a certain jealousy, almost, as being their businesses, and we love it that way.

And you know, we can spot it when we see it. And we also can avoid it.

We have never — I just got one in the other day, something from an investment banker on somebody that wants to resell a business they bought a few years ago.

Well you know, the chances that they haven't doctored up the figures in some way or are trying to sell, I mean, you know, they're — it's a piece of meat to them. And if it's a piece of meat to them, you know, what am I going to do with it?

So we — if we make the proper judgment about the passion they have for their business, they're going to keep running — they may have a lot of money in the bank — but they're going to keep running the businesses for us, because they love those businesses.

And they really are motivated the same way I am. You know, it wouldn't make any difference what I get paid, you know. I'm identified, in my own mind, with how Berkshire does.

I really don't care how the rest of the world thinks about how Berkshire's doing. I mean, in other words, when we looked like we were out of step a few years ago, that really doesn't make any difference to me, as long as I feel OK about how Berkshire is doing.

But I do — you know, that's how I measure what I'm doing every day — not by the price of the stock, but by what's going on in the business. And that's what — we have a group of managers like that, and there —

I don’t think there’s — well, there can’t be a company in the country, in my view, that, if you could figure out some way to measure the passion involved, in terms of running their business, I don’t think there’s anybody that could come close to matching the quantity that we have managed to marshal together at Berkshire.

It’s been accidental over time, but it’s really almost unique. I think it is unique.

Charlie?

CHARLIE MUNGER: Well, it’s very interesting to think about what matters most, the passion or the competence that was borne in?

Certainly Berkshire is full of people who have a peculiar amount of passion in their love for their own business. And I would argue that probably the passion is more important than the brainpower.

WARREN BUFFETT: Yeah, and by the time they get to us, if they were passionate but incompetent, they don’t get to us.

I mean, they’re not going to be there unless they’re competent, but the question is whether they had a passion for money or a passion for their business, to some degree.

And they all like money, and the reason — and they like it, partly, because it enables them to build the business they love.

But they don’t — we’re not going to see an incompetent, but passionate, manager by the time we start laying out a lot of money for a business.

They got weeded out a long time ago. So I don’t have to weed those out, but I do have to weed out the ones who want to cash a big paycheck and go off and do something else at some time. And like I say, we’ve had great luck at that.

But we have literally — I mean, we see lots and lots of businesses owned by — usually owned — by financial operator types, where it’s absolutely clear that, you know, they have come in, they’ve leveraged it up, they’ve played games with the accounting.

They — that has about run out, you know, and they want to sell it. And interestingly enough, fairly often, those are built by — bought by — other financial operators who think they’re going to play the game a second time.

Afternoon Session - 2003 Meeting

1. Pretax operating profits clarification

WARREN BUFFETT: OK. We have no afternoon movie, so we'll get to business in a second. And if everybody will just find their seats, please.

I've been advised by [Berkshire CFO] Marc Hamburg to make sure I make clear what I may not have made clear earlier.

In terms of the figures we gave you about the first quarter: A, I think I said we had 16 billion of cash or cash equivalents, which is correct. We had a $290 million pretax underwriting profit. I think I said that.

What possibly I may have misstated, we had a billion-seven-hundred million, pretax operational gain. We had actually also, by coincidence, very close to a billion-seven of after-tax, counting securities gains. But our operating gain, excluding security gains, was about a billion-seven, pretax.

2. Read everything, ignore management, wait for "fat pitch"

WARREN BUFFETT: Let's start right in at number 1.

AUDIENCE MEMBER: Yes. My name is Oliver Graussa (PH), and I'm from Vienna, Austria.

And my question has two parts. And so, the first part is, how do you get a few excellent investment ideas to be so successful? Do you read any special newspapers or industry magazines? Or do you visit the headquarters or any subsidiaries of companies?

And which sources of information, like books, for example, Value Line, Standard and Poor's, Moody's, databases like Reuters, Bloomberg, DataStream, annual reports, internet, and so on, do you use to get the right impression of a company?

And the second part, if you (crowd noise) think that a company like The Washington Post, GEICO, or Gillette has a very competitive product, what are the steps before you ultimately decide to invest in the company?

Which publications do you read to get the best knowledge of the product? And how important is the balance sheet and profit and loss account statement of the company? Thank you very much.

WARREN BUFFETT: Thank you.

The answer to the first part is sort of — and maybe the second part — is sort of all of the above. I mean we — (laughter) — read a lot. And we read daily publications, we read weekly or monthly periodicals, we read annual reports, we read 10-Ks, we read 10-Qs.

And fortunately, the investment business is a business where knowledge cumulates. I mean, everything you learn when you're 20 or 30 — you may tweak some as you go along, but it all kind of builds into a knowledge base that's useful forever.

And we — at least, you know, I read. Charlie used to read. May still read a fair amount.

But I read a lot of 10-Ks, read a lot of annual reports. Forty or 50 years ago I did a lot of talking to managements. I used to go out and take a trip every now and then and really drop in on maybe 15 or 20 companies. I haven't done that for a long, long time.

I find — everything we do, pretty much, I find through public documents.

When I made an offer for Clayton Homes, I'd never visited the business. I'd never met the people. I'd done it over the phone. I'd read Jim Clayton's book. I looked at the 10-Ks. I knew every company in the industry. I look at competitors.

And I try to understand the business and not have any preconceived notions. And there is adequate information out there to evaluate a great many businesses.

We do not find it particularly helpful to talk to managements. Managements frequently want to come to Omaha and talk to me, and they usually have a variety of reasons that they say they want to talk to me, but what they're really hoping is we get interested in their stock. That never works.

You know, managements are not the best reporting parties in most cases. The figures tell us more than a management does. So we do not spend any real amount of time talking to management.

When we buy a business, we look at the record to determine what the management's like, and then we want to size them up, personally, as I said earlier, whether they will keep working.

But we don't give a hoot about anybody's projections. We don't even want to hear about them, in terms of what they're going to do in the future. We've never found any value in anything like that.

But just a general business knowledge, you know, what we've seen work, what we've seen has not worked. There's a lot you absorb over time. Charlie?

CHARLIE MUNGER: Yeah. The more basic knowledge you have, I think the less new knowledge you have to get.

And the game is a lot like that fellow that plays chess blindfolded. He's got a memory of the board and everything that happened before. And that enables him to do the next move in a way he never could if you just showed him the board midgame, cold.

And so there — and in terms of what publications, I don't know, Warren. I would hate to give up The Wall Street Journal.

WARREN BUFFETT: Oh, you'd also hate to give up The Buffalo News.

CHARLIE MUNGER: Yeah. (Laughter)

WARREN BUFFETT: But you could — well, you want to read lots of financial material as it comes along.

And actually, The New York Times has a far better business section than they had 25 years ago.

But you want to read Fortune, you know. You want to read lots of annual reports. You really want to have a database in your mind so that you can tell what kind of a business you're looking at, in general, by looking at the figures.

It's far overrated — we never look at any analyst reports. I mean I don't think I've, you know, if I read one it was because the funny papers weren't available, you know — (Laughter)

It just isn't — I mean, it — I don't understand why people do it.

But there's a lot of data out there. And, you know, the beauty of it is — it's really what makes the investment game great — is you don't have to be right on everything.

You don't have to be right on 20 percent of the companies in the world or 10 percent of the companies in the world or 5 percent. You only have to get one good idea every year or two.

So it's not something — you know, when — I used to be very interested in horse handicapping, and the old story was — and I hope Bob Dwyer is still here — that, you know, you could beat a race but you can't beat the races. And you can come up with a very profitable decision on a single company.

I would hate to be measured — if somebody gave me all 500 stocks in the S&P and I had to make some prediction about how they would behave relative to the market over the next couple years, I don't know how I would do.

But maybe I can find one in there where I think I'm 9 in 10, 90 percent, in being right.

It's an enormous advantage in stocks, is that you only have to be right on a very, very few things in your lifetime as long as you never make any big mistakes.

CHARLIE MUNGER: What's interesting is that at least 90 percent of the professional investment management operations don't think the way we do at all.

They just think, if they hire enough people, they can be better at determining whether Pfizer or Merck is going to do better over the next 20 years.

And they can do that, stock by stock, all through the 500 and have wide diversification. And at the end of 10 years they'll be way ahead of other people, and, of course, they won't.

Very few people have this idea of searching for just a few opportunities.

WARREN BUFFETT: Yeah. You wait for the fat pitch. Ted Williams wrote about that in a book called "The Science of Hitting." He said the most important thing in being a good hitter, you know, is to wait for the pitch in the sweet spot, basically.

But, you know, I've always said that the way to get a reputation for being a good businessman is to buy a good business. You know? (Laughter)

It's much easier than taking a lousy business, you know, and showing how wonderful you are at it, because I haven't seen that done very often.

3. "We do our best to explain" Berkshire

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Good afternoon. David Winters. Mountain Lakes, New Jersey. Thank you again for hosting the Berkshire weekend. It's just great.

Interest rates are the lowest they've been in, I think, two generations. Equity values, in aggregate, are still high. Berkshire has meaningful free cash flow, a short-duration bond portfolio, and you're a buyer of low-multiple, high-quality private businesses, and a few stocks.

Assuming that the stimulative economic policies to deal with the recession eventually cause interest rates to go up and, maybe, equity values to come down, Berkshire seems very well positioned to benefit. Would you comment?

And also, are there any concerns on both of your parts about investors inadequately understanding the conglomerate structure of Berkshire and, therefore, improperly pricing the shares?

WARREN BUFFETT: Well, to answer the second question first, we hope the latter wouldn't be true, because we do our best to explain it. I mean I used 14,000 words in the last annual report, which caused certain members of my family to ask whether I was getting paid by the word. (Laughter)

The — we want you to understand Berkshire, and I hope that comes through. That's why we have these kind of meetings. That's why we spend a lot of time writing an annual report. We try to tell you what we would like if the position was reversed — if our positions were reversed.

And we think that the information in the annual report, if read by somebody that — they have to have some understanding of business and accounting, but if they don't, you know, nothing is going to help, really, in terms of helping them with the business.

But we think if they have some understanding of it, we have given them the information that Charlie and I would need in order to come up with our rough ideas of a valuation of Berkshire, and we hope we get across what it's all about.

You know, there are a lot of companies in Berkshire, but it's not important that you understand the nuances of every single one. Looking at what happens in aggregate, in many cases, will be sufficient.

4. "Strange things happen" in markets

WARREN BUFFETT: In terms of how we're positioned, you know, we have 16 billion of cash, not because we want 16 billion of cash, or because we expect interest rates to go up, or because we expect equities to go down.

We have 16 billion in cash because we don't see anything that makes us want to part with that cash where we feel we're getting enough for our money.

But we would spend — we spent a Monday morning on the right sort of business, or even if we could find equities that we liked, or if we could find — like last year we found some junk bonds we liked. We're not finding them this year at all, because prices have changed dramatically.

So, we're not really ever positioning ourselves. We're simply trying to do the smartest thing we can every day when we come to the office. And if there's nothing smart to do, cash is the default option.

Charlie?

CHARLIE MUNGER: In terms of future opportunities, the issue is, is it at all likely that there'll be an opportunity like 1973-4, or 1982, even, when equities generally are just mouthwatering?

I think there's a very excellent chance that neither Warren or I will live to see either of those occasions again.

If so, Berkshire's not going to have a lot of no-brainer opportunities. We're going to have to grind ahead the way we've been doing it recently, which is not all bad.

WARREN BUFFETT: It's not impossible, though, we'll get some mouthwatering opportunities. I mean you just don't know in markets. It's unbelievable what markets do over time.

And since you brought up interest rates, you know, in Japan the 10-year bond is selling to yield 5/8ths of 1 percent. Five-eighths of 1 percent.

I don't think there's anybody in our annual meeting of 20 years ago, certainly including Charlie and myself, who would have dreamt that a 10-year bond of a country, you know, running a significant deficit would be selling at 5/8ths of 1 percent.

I mean would you say so, Charlie? (Laughs)

CHARLIE MUNGER: Would I ever. But strange things happen.

WARREN BUFFETT: Strange things happen.

CHARLIE MUNGER: But if that could happen in Japan, something much less horrible for the investing class could happen in the United States. It's not unthinkable.

I mean we could be in for a considerable period when the average intelligent, diversified investor in common stocks, using fancy paid advisors, just doesn't do very well.

WARREN BUFFETT: But you could argue that if what we warned against, and hope doesn't happen, with derivatives should happen, it might create enormous opportunities for us in some arena. I mean, you know, but we — wouldn't be good for society, but it might very well turn out to be good for us.

If you get chaotic markets — you had a somewhat disorganized market in junk bonds last year, because there were a lot of them created much faster than the funds available to absorb them were coming in.

Now, this year you have just the opposite situation. You have money pouring in to junk bond funds. Billion dollars a week, roughly, and that's changed the whole price situation. The world hasn't changed that much. It's just that the chaos has left the market for those instruments.

5. "Intrinsic value is terribly important and very fuzzy"

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Yes. Hello. Paul Tomasik. Thornton, Illinois.

Ben Graham and the model of value investing — I'd like to bring the discussion back to that.

And what's interesting and exceptional about you, and Charlie, and Ben Graham, is the self-discipline. The incredible self-discipline.

And if you look at the model and try to think how to present it to teach others that self-discipline, I think you have to make a little tweak to it in two areas. And that's what I'd like you to comment on.

One, intrinsic value. It's always discussed that you calculate intrinsic value. But in practice, I think you find a number that is guaranteed — 99 percent likely — to be less than intrinsic value.

Classic example was in 2000 when you said you'd buy shares back at 45,000. You weren't saying that Berkshire Hathaway's intrinsic value was 45,000. You were saying it was significantly more. And anyone who bought it for less than 45,000 is grateful to you.

The other area is the hidden assumption in the model. And that is, it's assumed that once you find a value stock and you buy it, that the intrinsic value isn't going to go down. And that's a second part of the analysis that has to be part of the discipline.

So even though you found a value stock, you still haven't done all the work. You have to analyze, is the intrinsic value going to go down. In particular, companies throw away intrinsic value is the most common. Management gives it away.

That hasn't happened at Berkshire Hathaway, although I don't want to give an unqualified comment on that, since I see you're remodeling the offices, so we don't know how much intrinsic value's been thrown away there.

So, if you could comment on the two things. Do you calculate intrinsic value, or a number that's absolutely positivity under intrinsic value, that's the number you put in the equation?

And even when you find a stock selling for less than this lower bound of intrinsic value, do you still do the homework on the second part and analyze, will the intrinsic value go down in the future? Thank you.

WARREN BUFFETT: Yeah, I would feel somewhat better qualified to speak on self-discipline if I weighed about 20 pounds less, but — (laughter) — for the moment we'll ignore that.

The second part of your question, relating to intrinsic value going down. Actually, if you compute intrinsic value as reflecting the discounted value of future cash flows, that should have, built into it, a calculation that allows for the fact that certain businesses are going to earn less in the future than now.

It isn't that their intrinsic value goes down then, because you should build it into your calculation right now.

But, you know, as we point out many times in the past, intrinsic value is terribly important and very fuzzy, and we do our best to work with — in the kind of businesses where we think that we have the highest probabilities — where our predictions are of a fairly highly probable nature. And that leaves out all kinds of companies.

It's pretty good. We'll say it's something like a natural gas pipeline. I mean the chances of big surprises in a pipeline should be relatively small. That doesn't mean they're zero, but they're relatively small.

Now, let's assume that you had a gas pipeline, which some have, where either the supply of gas is going to run down or where there are competitive pipelines that may be trying to take away your contracts that you wrote 10 years ago and expire in two years and you're going to have to cut prices.

I would say that two years from now, when you have to cut prices, the intrinsic value hasn't gone down from today, if you properly calculate it today and build in the fact that profit margins in the future will be lower than today.

We looked at a pipeline recently where we think they are going to be vulnerable to competitive price pressures because of alternate ways of getting gas to market through other pipelines.

And the calculation is entirely different — the calculation isn't different — the results are different, in terms of that pipeline versus the pipeline that is the low-cost way of delivering gas from one market to another, and will remain the low-cost producer.

But it isn't — if properly calculated, you build in the prediction of decline in future operating years. You don't wait till you get there to anticipate it.

You know, Charlie's famous for saying that all he wants to know is where he's going to die so he'll never go there. (Laughter)

Well, that's part of predicting in business. I mean, there — I love the — I really have never seen an investment banker's book. I hope to see one someday, and I hope I can survive the shock when I do see it, where the earnings of the business being offered go down.

Lots of businesses' earnings go down. And they're going to go down. And I get all this nonsense, you know, where they project it out for 10 years and it always goes up. It just isn't the real world.

And you have to analyze businesses — some businesses are going to be subjected to enormous competitive pressures that aren't extant today.

And we made that mistake, for example, at Dexter Shoe. I mean we bought a business that was earning $40 million, or so, pretax. And we assumed that the future would be as good as the past, and we couldn't have been more — I couldn't have been more wrong.

So that was a case of projecting into the future, conditions which were not going to exist in the future — competitive conditions. That's part of, you know, that's part of business.

And I will tell you that, you know, 20 percent of the Fortune 500 — but I don't know which 20 percent — are going to be earning, you know, significantly less money probably five years from now than they are today.

And that's what the game is all about. Figuring out what those future cash flows are likely to be. And when you can't — when you feel you can't come up with reasonable estimates in that respect, you move onto the next one.

Charlie?

CHARLIE MUNGER: Yeah. We have this simple, old-fashioned discipline, which Warren likens to Ted Williams waiting for a fat pitch.

I don't know about Warren, but if you said to me, "Charlie, you can go into the business of managing money the way other people do, where you're measured against indexes and you got consultants choosing consultants that are reviewing you to committees," I would just hate it.

I would regard it as being put into shackles. And shackles where the very system was preventing me from delivering value. Warren, how would you feel about that —

WARREN BUFFETT: Yeah, we wouldn't

CHARLIE MUNGER: —chore?

WARREN BUFFETT: — do it. We wouldn't do it. We never did do it, as a matter of fact.

And one of the, you know, the initial — when we formed the partnership on May 5th, 1956, I passed out to the seven limited partners something called the "ground rules."

And, you know, I said, "Here's what I can do and here's what I can't do. And here's some things I don't know whether I can do or not, maybe." It was fairly short.

But the idea of setting out to do something that you know you can't do, that can't be — you know, that's got to lead to problems.

I mean, if somebody tells me I have to high jump seven feet, and we could even move that down to four feet now — (laughter) — you know, between now and sundown or I'll be shot, you know, I will go out and buy a bulletproof vest. (Laughter)

CHARLIE MUNGER: Yeah, the general system for money management requires people to pretend that they can do something that they can't do, and to pretend to like it when they really don't. And I think that's a terrible way to spend your life, but it's very well paid. (Laughter)

6. Freddie Mac, Fannie Mae, and systemic derivatives risk

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hi. I'm John Golob from Kansas City. I have a follow up question on derivatives.

After the press zeroed in on the comments in your annual letter, the head of Fannie Mae got up and said, well, Mr. Buffett's criticisms don't apply to Fannie because, number 1, we have simple vanilla derivatives that are priced in the market. And secondly, we need derivatives to protect against interest rate risk.

And I guess, given what happened to the savings and loan industry back in the '80s, that seems reasonable.

So my first question is what is your rejoinder to Mr. Raines?

And the second part of my question gets to your concern about the connection between derivatives and systemic risk. And that is, do Fannie and Freddie play a particularly prominent role in this concern? Thank you.

WARREN BUFFETT: Yeah. I have a lot of respect for Frank Raines. I think he's done a good job at Fannie Mae. I don't know the situation intimately.

The problem, as you mention, is that an operation like Fannie Mae or Freddie Mac, or savings and loans in the past, had this problem, which is inherent in the mortgage instrument, in matching — or coming close to matching — assets and liabilities.

And the reason they had that terrible problem, which did in many institutions, was the optionality in a mortgage instrument.

And in a mortgage instrument, particularly as the years have progressed, you buy a — you know, if you buy a mortgage — or somebody else takes out the mortgage, you own it — you have a 30-year instrument if it's a bad deal and you have about a 30-minute instrument if it's a good deal.

The buyer — the person who takes out the mortgage — can call off the deal at any time at relatively low cost. And the public has been sensitized to that more and more as time has gone by, so they've been quicker to refinance for very small differentials.

Now, many years ago, they had what they called due-on-sale clauses in California. I think — were they invalidated, Charlie, or what happened with those? So that there were ways of shortening up the mortgage expected maturities.

But it's a fundamental problem when you are operating on borrowed money in a very big way, which is what S&Ls did and what Fannie does, and Freddie, that you have this very long-term instrument, and it — but it can be very short-term if it becomes advantageous to you, and rates go down and you want to keep it. Or it becomes very long-term if rates go up and nobody wants to refinance.

And under those circumstances, if you run a huge institution, or even a smaller one, but that has a high — highly leveraged, you are going to look for one way or another to try to match the duration of your liabilities as close as you can to the duration of your assets, and have various methods to protect yourself against the optionality that exists with the counterparty, in effect, your asset.

That's not easy to do. And Fannie, and Freddie, and other institutions, attempt to do that through various types of derivative instruments, as well as other things, in terms of the kind of debt they issue themselves and so on.

And they're very smart, and they do it — you know, my guess is they do a better job than Charlie and I could do at it, but it can't, by its nature, be perfect.

And under some circumstances, where you get large gaps — the thing you worry about in financial markets, and it doesn't happen very often, but your — the thing that really destroys people are what the academics would call six-sigma, or five-sigma, or seven-sigma events, which are things that are never supposed to happen, basically.

And sigma is a method of describing the probabilities that they will happen in any given period — the number of sigmas.

Financial markets don't lend themselves well to modeling based on that. You know, they do most of the time, until it doesn't work. And when it doesn't work, you know, chaos reigns.

And there are more six-sigma events that happen in financial markets — or theoretical six-sigma events — than any study of probability curves would ever come up with.

And that's — when you have gaps or discontinuities, when markets close, whatever it may be, those are what cause institutions to go out of business.

And derivatives, in my view, anyway, accentuate the possibility of it happening and the extent of the damage, if and when it should happen.

Again, we don't think we mathematically can tell you what the probabilities are of something like that, and we think anybody that does tell you, you know, is kidding you.

And I've had managers of hedge funds sit down with me and tell me that they had, you know, a 28 percent probability of returns between 30 and 40 percent. Come up with all these exact figures. Anybody comes up with exact figures in finance, watch out.

So, I would say that if I were running Fannie or Freddie, I would be terribly conscious of what was happening in there, and I would understand this basic problem I have, which I can guarantee you, Frank Raines understands extremely well, of the optionality built into his assets.

And I would try to come as close to matching that. And if I did it through derivative instruments or whatever, I would try to match — I would try to reduce the troubles that could be produced by that optionality to a minimum.

And then I would get very worried about who the counterparties were, because anytime somebody promises to pay you a lot of money if something terrible happens to you, you better be very sure that they can and will pay, because the terrible thing that's happening to you may be presenting terrible things to them.

You know, that will happen in the insurance industry from time to time. And that's why reinsurance recoverables are a dangerous asset to have.

It will happen in the derivative markets.

When LTCM had troubles with one type of asset, they had troubles with a lot of types of assets, and everybody else they were doing business with was having a lot of troubles with those same things.

And that's why the Federal Reserve stepped into something they never dreamt they would have stepped into. They stepped in to force, essentially, a solution, which may have been the right thing to do, incidentally.

But they — for some obscure hedge fund that nobody in the world virtually had heard of, until that point, and had started threatening the U.S. — the stability of the U.S. financial system.

Charlie?

CHARLIE MUNGER: Well, I think you're right to point to this creditworthiness of the counterparty risk.

My guess is that both Fannie and Freddie have been pretty intelligent at thinking through a whole lot of different scenarios where they'll be OK, or close to OK, if all the counterparties pay.

And I would bet a lot of money that they weight the possibility that counterparties won't pay a lot lower than we do.

I think a lot of the counterparties are behaving in a lot more dangerous way than Fannie and Freddie are, and that — and the counterparties can get in trouble because of that. And they can translate that trouble to people who assume that they're hedged.

WARREN BUFFETT: And that's true of the mortgage guarantee institutions that take part of the risk away.

Fannie and Freddie are very sophisticated institutions. Very, very sophisticated institutions.

But if you depend too much on other people, there can be periods in financial history where all the sophistication in the world may not save you. The best thing to do is to be able to count on your own resources.

And at Berkshire that's basically the way we operate. And it may be safer than necessary, but, you know, Charlie and I are rich enough already. We do not need to stay up at night.

7. "We do not run a big currency risk"

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: My name is Joseph Lapray (PH). I'm a shareholder from Minneapolis, Minnesota. Thank you for this opportunity to present a question.

At last year's meeting, I believe that Mr. Munger made a comment to the effect that it was not inconceivable that the U.S. dollar could someday suffer a collapse in value, similar to that which had recently befallen the currency of Argentina.

I am concerned that in the event of a collapse in the value of the dollar relative to foreign currencies, that Berkshire Hathaway's insurance operations may find themselves having to pay for replacing property whose cost is denominated in sharply-appreciated foreign currency.

I have two specific questions. First, does Berkshire Hathaway have any way to protect itself from the effects of inflation induced by a possible currency collapse?

And second, do you have any ideas about how individual investors can protect themselves from currency risk? Thank you.

WARREN BUFFETT: Yeah. I'll ask Charlie first to comment on whether he said exactly what the gentleman said last year.

CHARLIE MUNGER: Well, I don't — I wasn't predicting that the United States would go to hell as much as Argentina has. (Laughter)

What I was predicting is that all kinds of things could happen here that are unthinkable, based on past recent experience. And Berkshire, Warren, by and large, our liabilities are denominated in dollars.

WARREN BUFFETT: Right.

CHARLIE MUNGER: We don't have a huge foreign currency exposure at all.

WARREN BUFFETT: No, well, we have — you know, we may have — we have a few billion dollars, at least, denominated in liabilities in other currencies, but we also have assets in those currencies, pretty much.

So, we don't think about it day by day in terms of matching euro assets against euro liabilities. But in a general way, we don't get way out of whack, either.

I mean, we do not have lots of liabilities around the world in other currencies which are only matched by assets in U.S. dollars. Most of our assets and liabilities, overwhelmingly, are going to be in U.S. dollars.

But we'll have a — you know, we will have, maybe at the present time, a couple of billion that — of liabilities, primarily in euros, and we have at least that much in the way of assets.

So, we don't run big — we do not run a big currency risk at Berkshire.

Now, if you talk about the value of the dollar declining dramatically, you know, we all face that risk if we have a lot of dollar assets. I personally don't worry about the American currency getting worth far less, relative to other currencies, as much as I worry — I don't really worry about it.

But I think there's a probability that sometime in the next 20 or 30 years that you could have rampant inflation in this country again. You'll have probably have it around the world. And it's probably more likely in a good many other countries than it is in the United States.

But inflation is always a latent danger to an economy. I mean I always think of inflation as being in remission at all times, because it's something that has a cause that will recur, in terms of human behavior, from time to time, I think, in terms of how legislatures behave and governments behave.

So, I think that the probability of high inflation at some point during the next, say, 20 or 30 years is — it's not a low probability. I hope it doesn't happen.

Charlie, do you have anything?

CHARLIE MUNGER: Well, in the long-term practically all currencies go to hell. In other words, it's a product, like the Roman — what was it, denarius or something?

You take the British pound, you take the American dollar, so far.

And if you want to go out 200 years, will some politicians in the United States ruin the currency? I think the answer is yes. But I wouldn't anticipate some horrible event in the near future. And —

But if things really went to hell, Argentina started confiscating property of shareholders. And if that starts happening and the government is doing it, we probably won't be able to protect you. (Laughter)

WARREN BUFFETT: That sounds like kind of a nervous laugh to me. (Laughter)

8. Acquisition opportunities growing like a rolling snowball

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Yeah, hi. I'm Gautam Dalmia (PH) from India.

Sirs, if I would take you back to the start of your investing careers, I assume it would have been harder for potential acquisition opportunities to come by.

The question I would like to ask you sirs is, how did you ensure then that you had good enough deal flows coming to you to be able to choose from?

I have one more question. The Berkshire subsidiaries do not have a retirement policy. What are the implications of this on retaining and motivating employees who are potential successors to senior management?

WARREN BUFFETT: First question about deal flow. It's a term I actually don't like very much, because we don't think of them as deals, exactly. That has a little too much of the connotation of something to be bought, and then again something to be sold.

But we do like acquisition opportunities. And really that's just achieving that so that we get the calls when we should get the calls. And there aren't lots of those, because we're talking about good-sized businesses. We're talking about owners that love their businesses.

And it's going to happen occasionally, but it's going to happen a few times a year, probably.

I think in the U.S. now, that we get a pretty reasonable percentage of the calls that we should get, and that was not true 20 or 30 years ago. We didn't hear from anybody 20 or 30 years ago, to speak of, because we were looked at much more as being a marketable securities operation. And we just weren't as well known.

It feeds on itself, obviously. If we acquire companies, and the people from whom we acquire them are happy about the deal, you know, we're going to hear from more people.

We bought our first furniture operation in 1983. That really led to four other transactions, because the people in the first one were happy and they talked to us about the second one. And the people in the second one were happy and so on.

So, you know, it's like — Charlie always describes compound interest as being like, you know, being at the top of a very large hill with wet snow and starting with a snowball and getting it rolling downhill. And that's a little bit like the acquisition situation works.

We've been on a — by being around 38 years, it's been a long — it's been a high mountain, in terms of the length the snowball is going. By now, it's going at a pretty good clip, and it's a pretty good size, and it attracts a lot of snow. And that's good for us.

Outside the United States we do not seem to be on the radar screen, so we don't seem to hear about those as much. But we're hearing about enough in the United States.

It's not a flow, in the sense of — I don't hear about one a week. You know, I don't, probably, hear about one a month.

But the ones we want to hear about, most of them, I think, we're getting the calls now. I think we're getting a higher percentage of the calls now than ever in our history we would have gotten.

And, you know, that's all to the good. And if we can do the same thing outside this country, that would be a plus, too. But this country's a big market and we'll just try and spread the word further.

And Charlie, what was that other question?

CHARLIE MUNGER: Well, he talked some about deal flow, and there's a general assumption that it must be easy to somehow arrange things that you just sat behind a desk and people brought in one wonderful opportunity after another, and you finally selected two out of 100 and it would be a virtual cinch.

That was the attitude in venture capital until the last two or three years.

We didn't have any of that in the early days, right, Warren?

WARREN BUFFETT: No, that's right.

CHARLIE MUNGER: We were finding our own securities. And we were just looking at the public markets to see what was available in securities.

And when we started buying companies, there must have been 20 years when we didn't buy more than one or two a year.

WARREN BUFFETT: Yeah. They were fairly few and far between. And we didn't have the money to buy very big ones, either.

I mean it was a big deal when we bought Associated Cotton Shops for what, in effect, was 4 million, or when we bought Hochschild Kohn when we had to come up with 6 million of equity, as I remember, for that deal.

And National Indemnity, itself, was 7 million for National Indemnity, and I think a million-4, a million-7 for National Fire Marine. And I mean that was all we could handle in those days.

So the snowball has, you know, it's built up as it's gone down the mountain. And we hope there's a lot of mountain left and a lot of wet snow, and we're looking for it.

CHARLIE MUNGER: But it's fair to say that we were rooting around for those opportunities. We weren't sitting behind our desks and waiting for some commission salesman to come in and present us with opportunities to sign our name. I can't think of anything we bought in the early days that way.

WARREN BUFFETT: No, no.

CHARLIE MUNGER: Warren, you chased down Jack Ringwalt. Didn't you go to him?

9. Buffett tells how he didn't let Jack Ringwalt wriggle out of National Indemnity deal

WARREN BUFFETT: Well, Jack Ringwalt, who ran National Indemnity, and some of you here in the room knew, Jack was a very interesting guy and a friend.

And Jack, for 15 minutes every year, would want to sell National Indemnity. Something would make him mad. A claim would come in or something of the sort. (Laughs)

So, for 15 minutes every year he would want to sell. And a friend of mine, Charlie Heider — who may be here today — and I had discussed this phenomenon of Jack being in heat once a year for 15 minutes. (Laughter)

And I told Charlie if you ever caught him in this particular phase to let me know.

And there was a day that Charlie called and said, "You know, Jack's ready." And I said — (laughter) —"Well, get him over here." So, he came about 11:30 and we made a deal in that 15-minute zone. (Laughter)

And this is absolutely true. It's a fascinating story, because Jack, having made the deal — and we really did make it in 15 minutes — Jack, having made the deal, really didn't want to do it, and — but he was — he wouldn't have backed out of a deal.

But he said to me after we'd shaken hands, he said, "Well," he says, "I suppose you'll want audited financial statements." And if I'd said yes, he would've said, "Well, that's too bad then. We can't have a deal." (Laughter)

So, I said, "I wouldn't dream of looking at audited financial statements. They're the worst kind," you know. (Laughter)

And then Jack said to me, he says, "I suppose you'll want me to sell my agencies," and, "— to you as well." And I said, "Jack, I wouldn't buy those agencies under any circumstances."

If I'd said yes to that, he would have — that I wanted him to sell the agencies — he'd say, "Well, yeah, I wouldn't be able to do it, Warren. We must have misunderstood each other."

So, we went through about three or four of those. And finally, Jack gave up and sold me the business.

He was an honorable guy, because he really, I don't think, wanted to do it, but we met down at Charlie's office at 19th, I think, and Douglas, and Jack was about 10 minutes late picking up this 7 million for National Indemnity.

He was about 10 minutes late, because he was looking for a parking meter with a few minutes left on it. (Laughter)

And that's when I knew he was my kind of guy. (Laughter)

CHARLIE MUNGER: But at any rate, this process is not easy, and practically anything where you sit behind that desk and this wonderful deal flow is just coming by, you're in a very dangerous seat.

10. No telecom stocks, but maybe junk bonds

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Gentlemen, my name is Jim Maxwell (PH). I am from Omaha, Nebraska.

You put your toe in the water, so to speak, with Level 3 when you gave a deal, or, you know, got involved in that deal with them.

And I'm wondering if there's anything — any area — in the telecommunications industry that appeals to you now, or any specific company that appeals to you?

Much more importantly, I want to ask about Global Crossing. They're in bankruptcy court right now. The U.S. military uses them for communications. Data, telecommunications, or something like that.

There are two companies that want to buy their assets out of the bankruptcy court. One is a Chinese company. One is a company from Singapore. The U.S. says, "No way, José." They don't want China to get control of the assets of Global Crossing, mainly because of the military security.

In the last week, the Chinese company has backed out. The Singapore company has come in and said, "We will buy the 80 percent stake and — that is now available." But still, if that sale goes through Global Crossing will not be in U.S. hands.

Part of my concern is, if these two companies were in a relationship that was friendly, they were willing to be together, I could see the possibility that they would — the Singapore company would sell, later, its portion to the Chinese company.

Have you ever considered — and if not, why not — buying the assets out of the bankruptcy court, which would be a fire sale? I think that would be good for Berkshire Hathaway.

In addition, it would be good for the United States and for future generations. I would suggest that would be your civic duty, gentlemen. (Laughter)

WARREN BUFFETT: Well, I hope I don't get arrested for leaving without doing this. (Laughter)

I, frankly, don't have the faintest idea how to evaluate telecommunications companies down the road. That doesn't mean I don't understand, at all, what they do. I probably understand a little bit of what they do.

But in terms of figuring out the future economics in that business, what they're going to — this player or that player is going to look like five or 10 years down the road, I simply don't know.

And I think it's — it looks like the people who thought they knew three or four years ago didn't know either, I might add, but that's another question.

Charlie, what do you know about the telecommunications business?

CHARLIE MUNGER: A little less than you do. (Laughter)

WARREN BUFFETT: He's in trouble. (Laughs)

We don't have any idea. You know, if you take — pull out a name, BellSouth, Verizon, I have no idea how that all comes together five or 10 years from now.

I mean, I know people are going to be chewing Wrigley's chewing gum or eating Hershey bars or Snickers bars five, or 10, or 15, or 20 years from now.

They're going to be using Gillette blades, they'll be drinking Coca-Cola, you know. And I have some idea what the profitability of each one of those will be over time and all of that.

I don't have any idea how telecommunications shakes out. And I wouldn't believe anybody in the business that told me they knew because, you know, what would they have been telling me five years ago? So, it's just a game I don't understand.

That isn't — there's all kinds of things I don't understand. I don't know what cocoa beans are going to do next year. You know? I mean, it'd be a lot easier if I did. I could just make all my money on cocoa beans and be much simpler than trying to run a whole bunch of businesses out of Berkshire.

But there's — I don't worry about what I don't know. I worry about being sure about what I do know. And telecommunications doesn't fall within that group.

CHARLIE MUNGER: Mostly, Berkshire, in its history, has bought common stocks that practically couldn't fail.

But occasionally, Berkshire just makes an intelligent gamble where there's plenty of chance of failure, but there's enough chance of success so the gamble is worth taking. And I think it's fair to say that telecommunications falls in that so far.

WARREN BUFFETT: Yeah. We might buy some junk bonds in that business. In fact, we have in several areas.

But as I put in the annual report, we expect losses in junk bonds. We expect, over all the probabilities, we'll have a decent result — maybe better than decent.

But we do expect losses, because we are dealing with institutions that have demonstrated that they don't have large margins of safety in their operations. Sometimes — not at all in Level 3, but sometimes, we're dealing with managements that are quite suspect.

And I would say that in the history of Global Crossing you had that, although that doesn't attach itself to the assets now.

But very often in the field, when people get highly leveraged, sometimes they get tempted to do things that they wouldn't be tempted to do otherwise. And that's happened in the junk bond field, obviously, and always will happen.

But that's the reason we expect to have significant losses, and actually we've — they haven't been that significant.

We've had losses. And — but they — we haven't seen our biggest loss yet, believe me, in junk bonds. But we'll make a lot of money out of some of them, too.

It's a different field. It's like being an insurer of substandard risks. You'll have more accidents, but you can charge a premium that makes it work out.

But our business — in general, when we buy businesses, we want to buy superior risks.

We don't want to buy a hundred businesses for operation by ourselves, with the idea that 15 of them are going to be train wrecks and that the other 85 will take care of it. That's not our approach to building Berkshire.

Charlie, got anymore?

CHARLIE MUNGER: No.

11. Nobody can "successfully dethrone Coca-Cola"

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Yes. My name is Pete Banner (PH) from Boulder, Colorado.

First of all, Mr. Buffett and Mr. Munger, most of us consider you fellows our heroes, and thank you for that. (Applause)

WARREN BUFFETT: Well, thank you.

AUDIENCE MEMBER: Yes. On a lighter note, versus the chaos —

WARREN BUFFETT: You can stay on the same note. It doesn't bother us. (Laughter)

AUDIENCE MEMBER: I wanted to ask what prompted you — considering your general aversion to technology — what prompted you to invest $100 million in Level 3 Communications convertible bonds?

And if I get a twofer, I'd like to know, do you still consider Coca-Cola as you once described as "The Inevitable."

WARREN BUFFETT: Yeah. The answer to the second one first.

The — Coca-Cola I think has — ever since I described it that way, in terms of the — I talked about in terms of the probabilities that they would dominate the soft drink market and not lose market share in any way. That they would grow over time.

You know, it's happening year after year. I don't think the global market share of Coca-Cola products has ever been higher than it is now, and I don't see anything that changes that in the future.

I mean, it is a huge distribution system that has been getting into the minds of more and more consumers since 1886, when John Pemberton, you know, Jacob's Pharmacy in Atlanta, first served up the first one.

It is in the minds of people, the product, all over the world, and it — there'll be more people and it will be in their minds more firmly. And over time, they should make a little more per drink.

So, I don't know how in the world anybody would successfully dethrone Coca-Cola.

12. Buying Level 3 bonds is a "bet on the people"

WARREN BUFFETT: In terms of Level 3, we like the people. We think they're smart people, and they owed too much money, you know. And they recognized it. And they've done some very intelligent things, in the way of attacking that problem, and, you know, we bet on the people.

Charlie knows way more about the physical world than I do, but, you know, I have yet to see an electron. And I just have no working relationship with them at all. I can't identify with them. So, I do not know a lot about the technology. I never would.

I mean you could explain it to me and I could probably regurgitate it on some test or something, but I wouldn't really understand it.

But I think I understand the people involved, and we were quite willing to make that bet. It's of a different sort than we usually do, but we did it and we're happy we did it.

Charlie?

CHARLIE MUNGER: Nothing more to say.

13. Why Berkshire invested in Mark Byrne's hedge fund, Value Capital

WARREN BUFFETT: Number 9, please.

AUDIENCE MEMBER: Hi, this is Steve Rosenberg (PH) from West Bloomfield, Michigan, now living in New York.

Mr. Buffett, the values that you and Charlie stand for and your supreme integrity are an inspiration. Thank you both for serving as such exceptional role models.

I have three quick questions for you. The first involves Value Capital — (applause) — L.P. Your preliminary FIN 46 disclosure appears to indicate leverage employed of roughly 20 billion in assets, 60 million in equity, or 30 to 35 times.

Without revealing any proprietary strategies, how do you derive comfort from this investment given your aversion to risk, other highly-levered partnership blowups, your enthusiasm in shutting down Gen Re Securities' black box activities as soon as possible, and all of this, aside from the fact that it's less than 1 percent of Berkshire's equity, and that Mark Byrne is running it?

My second question involves manufactured housing. Can you comment some more on your enthusiasm for the underlying economics of the business, given what appears to be a commodity product with a high level of seller fragmentation, over-capacity, and large blowups on the financing side?

And what advantage — even if Berkshire's advantage is in the financing, why not stick only to the financing and not the manufacturing?

And my final question involves the gains on securitization that you see in that segment.

Does the preponderance of gains reported indicate a mispricing of credit risk somewhere in the chain, perhaps analogous to the disconnect you were talking about between triple-B and triple-A spreads in the synthetic market and in the bond market? Thank you.

WARREN BUFFETT: Why don't you elaborate on that third point on securitizations just a bit more? I'm not sure I totally have your point on that.

AUDIENCE MEMBER: Just the fact that usually you see gains rather than losses on securitization —

WARREN BUFFETT: Oh yeah.

AUDIENCE MEMBER: — all the time. Does that indicate that somewhere, when you're slicing and dicing it, someone is paying too much, not taking the credit risk into — not valuing it properly.

WARREN BUFFETT: Yeah. OK. Three questions.

Value Capital is run by Mark Byrne, as you mentioned.

We've made a lot of money with the Byrne family. We made money with Jack, and we like Mark and Patrick, who we know — Charlie and I know very well.

And Mark is a very, very bright guy who runs what is, in effect, a hedge fund specializing in fixed income-type securities around the world.

And Mark and his family have significant money of their own in Value Capital, but we have 95, or so, percent of the capital in there. And we do not in any way guarantee their obligations.

Mark operates with a degree of leverage that is less than most people that operate in that field, but it's a lot compared to the way we operate at Berkshire.

And that's OK with us. We wouldn't do it with a hundred percent of our money. We wouldn't do it with 50 percent of our money. But we think it's a reasonable business, as run by Mark, as long as he's got a lot of money on the downside as well as the upside, which he does.

And he's a very decent guy, in addition to being a very smart guy. So, we're comfortable with that. It may have to get — the figures may have to get consolidated in our balance sheet.

We disclose them all now in our first quarter report. You will see them set out. And, in effect, we've got 600 and some million, a couple hundred million of retained earnings that Mark has earned for us, and we feel quite comfortable with that as an investment.

We do not regard it as a business part of Berkshire. The consolidated financial statements may make it look like we do, but it is not. We are a limited partner. We have a corporation in between. We have no guarantees of anything they do.

And we're very happy with Mark running that piece of money, even though he does it, as you say, in fixed-income strategies that involve a lot of — they involve derivatives, they involve borrowed money. But I've looked at the positions and they all make sense to me.

And they would make sense, because Mark is a very smart guy, and the money means a lot more to him than it does to us. So, we feel OK with that.

We don't like the idea of consolidating, in the sense that we don't think it will make — we think it makes our figures less representative of what's really going on than the way we handle it presently, but the rules are the rules and we'll do what they say.

The second point. Charlie, do you want to comment on Value Capital at all?

CHARLIE MUNGER: No.

14. Clayton Homes is "class player" in manufactured homes industry

WARREN BUFFETT: OK. (Laughter)

The second. Manufactured housing. You know, it is — I mean practically everybody in manufactured housing is losing money now, and Clayton is making money.

They've had much sounder policies, in terms of how they've operated over the years.

One of the things they do — most of their houses are sold through their own retail units. They have about, I think, 297 or so retail outlets of their own. And those managers are on a 50/50 profit split, basically, as I remember it, with Clayton. And they're responsible for all of the paper they generate.

So, unlike what was going on a few years ago in manufactured housing, where a manufacturer would sell a house, maybe a floor plan, to a dealer. And then that dealer could borrow, maybe — if I he got some kind of a purchaser on the note, maybe 125 or 130 percent of invoice price, if he could just create a warm body out there someplace that would give him some apparent down payment. That situation was just built for disaster.

But at Clayton, the profit or loss off that person who buys the product goes till the obligation is fully paid for.

So if a dealer takes inadequate down payments or sells to people he shouldn't be selling to, it's going to be his problem, and he's going to get the repo back. He's going to have to sell it himself. He's going to get the loss on the paper charged to him. And that produces an entirely different kind of behavior at the retail level than occurred with many of the other manufactured housing manufacturers.

But it's not an easy business. It's — Clayton does it the right way. And in fact, if you read Jim Clayton's book, he will — he tells in there about the time he bought his first home in Indiana. And he tells about a little of the funny business that went in, in terms of how the manufacturer behaved.

And he described some of the systems that people use to gain the financing. And those activities are coming home to roost in a huge way for both the manufactured housing companies and for the people that finance the retail paper.

Clayton did it right, basically, and they'll continue to do it right. Even so, there is such a stain over the whole manufactured housing industry, in terms of financing, that even — Clayton is the only one that has — is able to securitize.

And, as I said earlier, they cannot securitize to the extent — without us — they wouldn't be able to securitize to the extent that they could have a year ago.

It's an industry in big trouble. I think we'll do fine in it, because I think we're in with a class player. I think they've got these systems in place that have the right incentives, which you need all the way through the system. And I think Berkshire will make them even stronger, because we will not securitize. We'll keep it for the portfolio.

The gains on securitization — the point you made is essentially correct, that some of the — when you see a company with lots of gains on securitization, you ought to get a little suspicious. I don't want to get into more detail than that because it's an accounting question.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that, either.

15. Goodwill impairment charge not needed for Gen Re

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Phil McCaw (PH), Warren, from Connecticut.

Could you comment on Gen Re and goodwill impairment charges since you purchased it, and how it's evolved in your thinking, and if it even became a part of your thinking?

WARREN BUFFETT: Sure. The question is — relates to the fact that, if you buy a business at a price over tangible assets, that you set up a goodwill account.

And if at any time in the future that that goodwill becomes impaired, you should, and must, if the accounting is proper, run a charge to reduce that goodwill item. You run a charge through the income account.

We have a large goodwill item for Gen Re, because it was the biggest acquisition we ever made. We paid substantially more than book. And the question is whether that goodwill is impaired.

And certainly, if the operations of Gen Re of the last couple of years — not including this year — but of the years '98 through 2001, more or less, were representative of the future, you would say that there has to be a big goodwill charge there, and I would agree with you.

I think that as Gen Re is operating now, and had the capacity to operate — and it's being realized now, thanks to a couple of great managers we've got there — I think that — I personally think that Gen Re is worth more now today than at the time we bought it. And I think you will — its float has increased substantially, and I think that you will see the float turn out to be cost-free over time.

One thing I should have mentioned, actually, is — and I looked at a draft of our 10-Q. We have to — I think we should put this in there. We — Gen Re, up until this year, was discounting worker's comp reserves at 4 1/2 percent, which was not conservative. That — we inherited that situation.

But we have changed that to discounting comp reserves going forward at 1 percent. So the accounting is more conservative going forward now — 2003 — by a fair margin, than it was in prior years and in a method we inherited.

So that the figures you see would be somewhat better if we had continued the old discounting at 4 1/2, rather than go to the new discount rate. And in the draft I saw, the 10-Q, that wasn't in there. I think we should get that in there, [Berkshire CFO] Marc [Hamburg], while I think of this.

Charlie?

16. We "deplore solving operating problems by accounting maneuvers"

CHARLIE MUNGER: Yeah. That accounting issue is of a type that is very common within Berkshire. We are so horrified by the terrible business decisions we see made all around us by people who are relying on over-optimistic accounting, that we tend to almost reach for opportunities to make our accounting very conservative. Way more than other people.

We think it protects our business decision-making, as well as our financial integrity.

I don't know why we ever got into this business of trying to get the accounting result as close to the chalk as we could possibly get it. What is wrong with the world when everything is a little bit under-reported? I mean —

WARREN BUFFETT: Yeah, generally people think that reporting, you know, and transparency and all that, has improved over the years. And I felt much better working with the financial statements in 1960 than I feel working with financial statements in 2000.

And, frankly, in many ways I thought they taught me more about what the company was really about than the current ones do, even though there was far less detail.

And what we really deplore is solving operating problems by accounting maneuvers.

And, you know, Gen Re had some problems in the mid-'80s, when everybody did, and they went to discounting their worker's comp reserves. And they — you know, it was a quick fix, but it's like heroin. And you get on it and it's not easy to get off.

And we — Charlie and I have seen that time and time again. People that think, you know, trade loading, whatever it may have been, they think they're going to solve something by paying accounting games.

And they're encouraged by their CFOs sometimes and frequently they were encouraged by their big-name auditors, in one way or another, to really play with the numbers.

And it catches up with you. You might as well face reality immediately, and take whatever operating steps are necessary to solve problems. Or, if you can't solve them, just give up on them.

But whatever you do, playing with the numbers, it never works, although I guess if you're 64 1/2 and you're going to retire at 65, it might get kind of tempting. (Laughs)

17. Munger on recognizing "bullshit earnings"

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: Good afternoon, gentlemen. Andy Marino of Chapel Hill, by way of Boston.

You have argued against the use of alternate measures of profitability, such as earnings before interest, tax, depreciation, and amortization, as measures of business performance.

At the same time, you have frequently cited the incompleteness of generally accepted accounting in reflecting economic reality for some businesses, implying that there are some necessary and proper adjustments.

Beyond what you recently described in the annual report as the folly of omitting depreciation, could you elaborate on your thoughts on other pitfalls of alternative financial presentations?

Is EBITDA, in your view, just too often used as a shorthand for cash flow, or is the entire concept of recasting accounting data a suspect exercise?

And which revisions might be appropriate, if any? And what might be viewed as red flags? And does it matter to you who is making those adjustments? Analysts, investors for their own purposes, or company managements, in terms of how that information should be viewed?

WARREN BUFFETT: Yeah. We regularly told you, for some years before the accounting change was made here a year or so ago — we told you, you should not count goodwill amortization.

You know, it was required under GAAP, and we, obviously, complied with GAAP, but we told you every year, virtually, that I can remember, we said, "This is not really an economic expense."

And we ignore it in our own calculations of earnings, in terms of what we will pay for businesses. We don't care whether there's a goodwill item or not, because it's immaterial to economic reality.

So, we have been quite willing, at Berkshire, to tell our own owners to ignore certain things. And if they disagreed with us, they could look at the GAAP figures. But we felt they were getting misled by looking at the amortization of intangibles.

That doesn't mean we think all intangibles were good, but we just — we did feel that that was a — that was an arbitrary decision that didn't make any sense at all.

And we felt — obviously, as we've talked about — we felt the crazy pension assumptions have caused people to record phantom earnings, in many cases.

So we're willing to tell you when we think there is data that is more important in economic analysis than GAAP figures. We'll talk to you about it.

Not thinking of depreciation as an expense, though, strikes us as absolutely crazy.

I can think of very few businesses — I can think of a couple — but I think of very few businesses where depreciation is not a real expense.

Even at our gas pipelines, I mean, you know, at some point, A, they'll need repairs, but beyond that, at some point they become obsolete. I mean there won't be gas there 200 years from now, we know that.

So, it — depreciation is real, and it's the worst kind of expense. It's reverse float. You know, you lay out the money before you get revenue. And you are out cash with nothing coming in.

And depreciation — any management that doesn't regard depreciation as an expense, you know, is living in a dream world, but of course they're encouraged to do that, you know, by investment bankers who talk to them about EBITDA.

And then, you know, certain people have built fortunes on misleading investors by convincing them that EBITDA was a big deal.

And when we see companies that say, "Hey, we don't pay any taxes, you know, because we don't have any earnings for tax purposes, and don't count depreciation and all of that," you know, that's coming — in our view, many times that's coming very close to a flimflam game.

You know, I get these people that show me — you know, they want to send me books with EBITDA in it, and I just tell them, you know, "I'll look at that figure when you tell me you'll make all the capital expenditures."

If I'm going to make the capital expenditures, there's very few businesses where I think I can spend a whole lot less than depreciation year after year and maintain the economic strength of the business.

So I think the EBITDA has been a term that has cost a lot of investors a lot of money.

You saw it in the telecom field. I mean the idea — they were spending money so damn fast, you know, I mean they couldn't have it coming in the door fast enough from investors.

And then they pretended the depreciation was not a real expense. That's nonsense. I mean it couldn't be worse. And a generation of investors where sort of brought up to believe in that.

We, at Berkshire, will spend more than our depreciation this year. We spent more than our depreciation last year. We spent more than our depreciation the year before that. You know, depreciation is a real expense, just as much as, you know, the expenditure for lights.

It's not a non-cash expense. It's a cash expense. You just spend it first, you know. I mean the cash is gone, and it's a delayed recording of cash. How anybody can turn that into something they use as a metric that talks about earnings is beyond me.

Charlie?

CHARLIE MUNGER: Yeah, I think you would understand any presentation using the word EBITDA, if every time you saw that word you just substituted the phrase, "bullshit earnings." (Laughter and applause)

WARREN BUFFETT: I knew he'd do it sooner or later, folks.

CHARLIE MUNGER: And the man —

WARREN BUFFETT: He made it through the morning, but never all day. (Laughter)

CHARLIE MUNGER: And the man asked the question also, says, "What remaining big accounting troubles exist?"

The real lollapalooza is pension fund accounting, and, to some extent, post-retirement medical liabilities. Those are horribly understated now in America, and they're very big numbers.

WARREN BUFFETT: I've looked at financial statements, and you've seen them too in the last few months, where companies are recording pension income in the hundreds of millions, while at the same time being underfunded in their pension plan in the many billions.

And, you know, they just aren't facing up to reality at all, and they don't want to because they want to take the hit. And they're this — you know, it's the same mentality as stock option expenses.

And they are paying people with stock options. But, you know, we pay people with cash bonuses, and I suppose, you know — well, it isn't really true, but we might like it if we didn't have to record cash bonuses as an expense. I mean it's a way we pay people.

And you can say, "Well, why don't you put it in the footnotes and leave it out of the income account like they do with option expenses," which is a form of compensation, too.

But the — you know, the answer is that a bunch of people who cared very much about having their stocks float to unreasonable prices, at least in our view, found they could do it a lot easier if they didn't count compensation expenses.

And, you know, why not put all expenses in footnotes? Just have an item there that says "sales" and then have the same figure for net profit. And then just have all the — (laughter) — expenses in the footnotes, you know.

And people with a straight face, you know, say, "Well, it's in the footnotes, so therefore everybody knows about it and we don't have to count it — put it in the income account."

It's amazing what people with high IQs will do to rationalize their own, you know, their own pocketbooks.

And Charlie has another explanation for why there's been this denial of the reality of expense — option expense — in terms of people's ego getting involved with their own records.

You want to elaborate on that, Charlie? Don't name names. (Laughter)

CHARLIE MUNGER: No, I'm so tiresome on this subject, and I've been on it for so many decades.

It's such a rotten way to run a civilization. To make the basic accounting wrong is very much like making the engineering wrong when you're building a bridge.

And when I see reputable people making these perfectly ridiculous arguments to the effect that it's unthinkable that options be expensed.

WARREN BUFFETT: Or it's too difficult to value them.

CHARLIE MUNGER: Well, because it's too difficult to value, or God knows what reason.

And a lot of them are people you'd be glad to have marry your daughter. (Laughter)

WARREN BUFFETT: Yeah, because they're rich, for one thing. (Laughter)

CHARLIE MUNGER: Yet, the truth of the matter is they're somewhere between crazy and crooked. (Laughter)

WARREN BUFFETT: Put him down as undecided. (Laughter)

It's really astounding. The interesting thing is, of course, now, is that the four auditing firms left, what they call the Final Four now in the auditing — (Laughter)

They have now — and listen, I'm glad they did it, too. And I tip my hat to them for doing it. But they've now said that they really do think options are an expense. So this is —

You know, it kind of reminds of you what happened during the Reformation, isn't it? You know, when you'd have these places sway back and forward, you know, as they get carried by one argument or the other.

In fact, I think there was that famous vicar of Bray who would swing from Catholicism to Luther, back and forth, as this little town went back and forth in Germany.

And finally, the townspeople gathered and they said to the vicar — they said, "It's understandable that we're confused by all that's going on in theology, and we really don't know much about it, and so we swing back and forth."

But they said, "We find it a little disgusting that you, a man of the cloth, would also keep swaying back and forth." And they said, "Have you no principle?" "And he said, "Yes, I have one principle." He says, "It's to remain the vicar of Bray." (Laughter)

I think we've seen a little of that in the auditing profession, but I think they've actually found the true religion now, so I don't want to sit here and criticize them.

But, you know, you now have four firms that lobbied against options being counted as an expense in 1993 that have written the FASB and say that options should be an expense.

And I don't know how in the world something could have not been an expense in 1993 and be an expense in 2003.

Certainly didn't apply to utility bills or, you know, raw materials or anything of the sort. But that's the human condition.

18. No comment on "opportunistic" bond strategies

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Yes, hi. Sam Kidston. I'm a shareholder from Cambridge, Massachusetts. I have a couple of quick questions for you guys.

First of all, other than your general criteria for investing in any company, what are your criteria for investing in banks? And has your general view toward investing in banks changed over time?

Second question would be, in terms of a discount rate, do you feel it's appropriate to use your cost of capital at the current risk-free rate?

And then in the past, you've mentioned that you do some sort of pseudo-bond arbitrage, and would you please specify what types of trades you do in this area?

WARREN BUFFETT: Oh, you would like our buys and sells for Monday morning? (Laughs)

We don't — we're not going to talk about specific strategies that, you know — we obviously they're profitable or we wouldn't be doing them, and we think other people might copy them if we talked about them, so —

And we have pointed out, incidentally, and we will continue to point it out, that there's not a long life to these bond strategies. That doesn't mean we might not reemploy them when circumstances called for it later on.

But they're not like earning money out of See's Candy or, you know, out of Fruit of the Loom or something. They're opportunistic situations that we're pretty well positioned to engage in at certain times.

19. Banks can be "surprisingly" profitable

WARREN BUFFETT: The question about banking, you know, banking — if you can just stay away from following the fads, and really making a lot of bad loans, banking has been a remarkably good business in this country.

Certainly, ever since World War II, it's — the returns on equity from — for banks that have stayed out of trouble has really been terrific.

And there are many — there are certain banks, I should say — in this country that are quite large that are earning, you know, maybe 20 percent on tangible equity.

And when you think you're dealing in a commodity like money, that's fairly surprising to me.

So, I would say that I guess I've been surprised by the degree to which margins in banking have not been competed away in something as fundamental as money.

How about you, Charlie?

CHARLIE MUNGER: Well, what you're saying, in fair implication, is that we sort of screwed up the predictions, because banking was a way better business than we figured out in advance.

We actually made quite a few billions of dollars, really, out of banking, and more in American Express. But basically that was while we were misappraising it.

We did not figure it was going to be as good as it actually turned out to be. And my only prediction is that we'll continue to make failures like that. (Laughter)

WARREN BUFFETT: It's fairly extraordinary, in a world of — particularly a world of low interest rates, that you'd find financial institutions basically doing pretty much the same thing, you know, where A competes with B, and B competes with C, without great competitive advantage, and having them all earn really high returns on tangible capital.

Now, part of it is that they push — they have pushed the loan-to-capital ratios higher than 30 or 40 years ago, but that — nevertheless they earn high rates of returns. They earn much higher rates of returns on assets alone, and then they have greater leverage of assets-to-capital so that produces returns on capital that really are pretty extraordinary.

And, you know, banks — certain banks — get into trouble because they make big mistakes in lending, but it's not required of you, in that business, to get into trouble. I mean you can — if you keep your head about you, it can be a pretty good business.

20. Look at opportunity costs, not "cost of capital"

WARREN BUFFETT: The question about a discount rate, when you talk about our cost of capital, that's worth bringing up, because Charlie and I don't have the faintest idea what our cost of capital is at Berkshire, and we think the whole concept is a little crazy, frankly.

But it's something that's taught in the business schools, and you have to be able to answer the questions or you don't get out of business school.

But we have a very simple arrangement in terms of what we do with money. And, you know, we look for the most intelligent thing we can find to do.

If we've got money around or — if we look — we don't buy and sell businesses this way, but in terms of securities we would — if we find something that's at 50 percent of value, and we own something else at 90 percent of value, we might very well move from one to another. We will do the most intelligent thing we can with the capital we have.

And so, we measure alternatives against each other, and we measure alternatives against dividends, and we measure alternatives against repurchase of shares.

But I have never seen a cost of capital calculation that made sense to me.

How about you, Charlie?

CHARLIE MUNGER: Never.

And this is a very interesting thing that's happened. If you take the most powerful freshman text in economics, which is by [Greg] Mankiw of Harvard, and he says on practically the first page that "intelligent people make their decisions based on opportunity cost."

In other words, it's your alternatives that are competing for the use of your time or money, that matter in judging whether you take action or not.

And of course, those vary greatly from time to time and from company to company. And we tend to make all of our financial decisions based on our opportunity costs, just as like they teach in freshman economics.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And the rest of the world has gone off on some crazy kick where they can create a standard formula, and that's cost. They even get a cost of equity capital for some business that's old and filthy rich. It's a perfectly amazing mental malfunction.

WARREN BUFFETT: Yeah, it's a — (Laughter)

21. PetroChina investment not a "big deal"

WARREN BUFFETT: Number 3. Is there anybody we've forgotten to offend? (Laughter)

AUDIENCE MEMBER: Hi. My name is Karen Kalish. I'm from St. Louis. And I think I'm the first woman to ask a question today. (Applause)

WARREN BUFFETT: We're all for that.

AUDIENCE MEMBER: My late uncle, Bill Shield at Robert W. Baird, first bought Berkshire for our family when it was $337.

And I'm very grateful to you two, because I've been able to start a foundation in St. Louis and give money away. And I give it to reading and literacy programs.

But I'm very curious about the Buffett-Munger philosophy and practice of philanthropy.

And my second question has to do with China. You made an acquisition recently, PetroChina, and I'm curious of what you think about China.

WARREN BUFFETT: Well, the second question, we have about — I think — about five equity investments in companies that are domiciled and that operate primarily, or entirely, outside the United States.

We don't list all our investments. We listed, I believe, last year, all those above $500 million. And we have never had — I think maybe since Guinness some years back — I don't think we've ever had one hit the threshold of reporting in the Berkshire report, although we've owned some.

And the Hong Kong stock exchange has just recently changed their requirements so that you have to report 5 percent of the holding of any company listed on the Hong Kong stock exchange.

And our PetroChina holdings, actually, are now, whatever it is, 13 percent, but they're only 13 percent of something called the H shares.

The Chinese government owns 90 percent of the company. The H shares own 10 percent. They sold that to the public a few years back. So we own 13 percent of a very small percentage. And it's kind of a fluke of reporting that we're required to report that particular holding. And like I say, we own four or so others in international securities.

We don't make any great judgment about China. You probably know more about China than I do. We simply look at investments around the world and we try to buy into things that we think offer the most value.

And if they're in the United — we might prefer, slightly, that they be in the United States, and we might have strong preferences against — or strong biases against certain countries.

We would regard the United States as number one because we understand the game the best here. We understand the tax laws and all that sort of thing, and the corporate cultures and so on. But we would regard a number of other countries as virtually equivalent to the U.S.

And there's others that would have been marked down some, and then we'd have a whole bunch we wouldn't go into under any circumstances because we just don't understand them well enough.

But, you know, we think we understand something like the oil business in China reasonably well. And at a price relative to what we think the future cash generation is, we would make a decision on something like that.

But it's not a big deal. It's a big — it became reportable because of this peculiarity of the law, where if you own a certain percentage of something that's only 10 percent of the whole pie, you still have to report it.

The Chinese government is firmly in control of PetroChina. I mean, if we vote with the Chinese government, the two of us will control PetroChina. (Laughter)

22. Why we're giving money "back to society"

WARREN BUFFETT: The question about philanthropy. Charlie, you want to swing at that one first?

CHARLIE MUNGER: I think it's fair to say that both of us feel that the very fortunate owe a duty to the general civilization, and even to the country of which he's a member.

Whether you give as you go along or have the Buffett system of moderate giving as you go along and immense giving in due course, I regard as a matter of personal taste.

I would understand the second position in that I would hate to spend all my time every day having people ask me for money. And I don't think Warren could stand it. Is that right, Warren?

WARREN BUFFETT: Let's not even try. Let's not even try, Charlie. (Laughter)

No, we — I mean, it's a matter of record, and it hasn't changed for, I don't know, 25 years, probably, but basically everything I have at the date of the later of the death of myself or my wife, goes to charity.

I mean 99 and a significant fraction. And since my children are here, I'm not going to carry it out to 8 decimal places. But — (laughter) — you know, why not? It —

Think of it this way. Here's — let's just assume that, instead of being born as I was in a single birth, that I were in the womb and there was an identical twin next to me. Same DNA. Same everything. Personality. Propensity to work. Propensity to say — whatever. Identical twin. Wasn't Charlie. Might look like him, but — (Laughter)

And there we are, the two of us. And a genie appeared. And the genie said, "I've got a proposition for the two of you. You're going to be born in 24 hours. Same talents. Everything identical. And one of you is going to be born in Omaha, and one of you is going to be born in Bangladesh.

"And I'm going to let you two decide which one gets to be born in Bangladesh and which one gets to be born in Omaha. And I've got this system. And I'm going to — the way I'm going to work it is that we start the bidding, and whichever one of you bids the highest proportion of your estate to go to society when you die, gets to go — be born in the United States." I think you'd bet a hundred percent, you know.

You hear all of this about, you know, grit and pluck and all of these things, and how, you know, you have applied yourself working all your life, and you've done all these wonderful things.

Well, just imagine if I'd been born in Bangladesh. You know, and I'd walked down Main Street and said, you know, "I allocate capital." You know? "Let me show my stuff." (Laughter)

I'd have died of malnutrition. I mean, it would — I wouldn't have made it through the first few months.

The society that Charlie and I work in, I mean we were luckier than hell. I mean when we were born, the odds were 50-to-1 against us being born in the United States. So we hit the jackpot.

And basically, it — you know, we've had all of the fun of working with this and working with good people. And money, obviously, opens lots of doors in life to interesting things.

And it goes back to society. Like Charlie says, it can go back on the installment system through life. It can go back in a lump sum at death.

I've mixed the two to some extent, but I weight heavily the lump sum.

But, you know, that's where it belongs. I mean, it — there's no reason why little — generations of little Buffetts, now and the next one, you know, and a hundred years from now, should all be commanding the resources of society just because they came out of the right womb. You know, what sort of justice is that?

So basically, it's going back to society. (Applause)

Were my children applauding there? Did we check that out? (Laughter)

23. Many great businesses can't boost profits by spending more capital

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hi there. My name is Alex Rubalcava. I am a shareholder from Los Angeles.

I have a question about the financial characteristics of the businesses that you like to acquire and invest in.

In your reports and other writings, Mr. Buffett, you state that you like to acquire businesses that can employ a large amount of capital to high returns.

And in reading the writings and speeches of yourself, Mr. Munger, I've seen you say in Outstanding Investor Digest and other publications, that you enjoy investing in companies that require very little capital.

And I was wondering if these statements are at odds, or if they are two sides of the same coin? And if you could elaborate using Berkshire companies, that would be great.

WARREN BUFFETT: Sure. It's a good question.

The ideal business is one that earns very high returns on capital and could keep using lots of capital at those high returns. I mean that becomes a compounding machine.

So if you have your choice, if you could put a hundred million dollars into a business that earns 20 percent on that capital — say 20 million — ideally, it would be able to earn 20 percent on 120 million the following year, and 144 million the following year and so on. That you could keep redeploying capital at these same returns over time.

But there are very, very, very few businesses like that. The really — unfortunately, the good businesses, you know, take a Coca-Cola or a See's Candy, they don't require much capital.

And incremental capital doesn't produce anything like the returns that this fundamental return that's produced by some great intangible.

So we would love the business that earn — that could keep deploying, in fact, even well beyond the earnings. I mean we'd love to have a business that could earn 20 percent on a hundred million now. And if we put a billion more in it, it would earn 20 percent more on that billion.

But like I say, those businesses are so rare. There are a lot of promises of those businesses, but we've practically never seen one. There've been a few.

Most of the great businesses generate lots of money. They do not generate lots of opportunities to earn high returns on incremental capital.

You know, we can deploy X at See's and earn a lot of money, but if we put 5X in we don't earn any more money to speak of. We can earn high returns on X at The Buffalo News, but if we try to make it 5X we don't earn any more money.

They just don't have the opportunities to use incremental capital. We look for them, but they don't.

So, the great — you've seen — I mean, we will talk theoretically about the businesses that can earn more and more money with incremental capital at high returns.

But what you've seen is that we've bought businesses, largely, that earn good returns on capital, but in many cases, have limited opportunities to earn anything like the returns they earn on their basic business with incremental capital.

Now, the one good thing about our structure at Berkshire is that we can take those businesses that earn good returns in their business but don't have the opportunity for returns of those similar magnitude on incremental money, and we can move that money around to buy more businesses.

Normally, if you're in the — take the newspaper publishing business, which has been a fantastic business over the years — you earned terrific returns on your own invested capital.

But if you went out to buy other newspapers, you had to pay a very fancy price, and you didn't get great returns on incremental capital.

But the people in that business felt that the only thing they knew was newspaper publishing or media of one sort or another, so they felt that their options were limited.

We can move money anyplace that it makes sense, and that's an advantage of our structure. Now, whether we do a good job of it or not's another question, but the structure is enormously advantageous in that respect.

We can take the good business, the See's Candy — See's has produced probably a billion dollars pretax for us since Charlie and I wouldn't have gone up 100,000, you know, back in 1972.

If we tried to employ that in the candy business we'd have gotten terrible returns over time. We would have gotten anything to speak of. But because we moved it around it enabled us to buy some other businesses over time, and that's an advantage of our structure.

Charlie?

CHARLIE MUNGER: Yeah. And if you take a business that is a good business, but not a fabulous business, they tend to fall into two categories.

One is the business where the whole reported profit just sits there in surplus cash at the end of the year. And you can take it out of the business and the business will do just as well without it as it would if it stayed in the business.

The second business is one that reports the 12 percent on capital but there's never any cash. It reminds me of the used construction equipment business of my old friend, John Anderson. And he used to say, "In my business, every year you make a profit, and there it is, sitting in the yard."

And there are an awful lot of businesses like that, where just to keep going, to stay in place, there's never any cash.

Now, that business doesn't enable headquarters to drag out all the cash and invest it elsewhere. We hate that kind of a business. Don't you think that's a fair statement?

WARREN BUFFETT: Yeah, that's a fair statement. We like to be able to move cash around and have it find its best use. And, you know — but that's our job. And sometimes we find good uses.

It would be terrific if every one of our great businesses, and we've got a lot of great businesses, had ways to deploy additional capital at great rates, but we don't see it.

And, frankly, you know, it doesn't happen — I mean Gillette has a great razor and blade business, I mean, fabulous.

There's no way they can deploy the money they make in the razor and blade business to keep putting more money in that kind of business. It just doesn't take that kind of capital. They have to deploy some money of it, but it's peanuts compared to the profits.

And the temptation then is to go out and buy other businesses, and of course that's what Charlie and I do when we face that, but we don't think that, overall, the batting average of American industry in redeploying capital has been great. Nevertheless, it's what we try and do every day.

In a sense, we sort of knock the very procedure that has gotten us to where we are. Is that a fair statement, Charlie? (Laughs)

CHARLIE MUNGER: Absolutely. And that has always worried me. I don't like being an example of an activity where most people who try and follow it will get terrible results. And we try and avoid that by making these negative comments. (Laughter)

WARREN BUFFETT: We'd make negative comments anyway. (Laughs)

Number 5. It's more fun.

24. Buffett: I don't ask my friends for favors

AUDIENCE MEMBER: I'm Will Graves from Winter Park, Florida. I'm a graduate instructor with Webster University. And I'd like to address two questions to Mr. Buffett.

I appreciate the accessibility of Mr. Buffett. He makes us feel so warm here. Could I call you Dad?

WARREN BUFFETT: Yeah. (Laughter)

AUDIENCE MEMBER: I've got one question regarding a National Treasury situation and one considering a national treasure.

Back in September 11, you appeared on "60 Minutes" and performed a national service, taking your valuable time and giving up your private life for a few moments by speaking about the general stock market, and how people should not be getting too excited, and they shouldn't be worried about investing for the long-term.

And what I was wondering is, if you would ever consider making another appearance on “60 Minutes” at the time when whoever the president is at the time brings up the Social Security debate.

I spend a lot of time with non-profit organizations, and the outrage that you hear from the working poor is that we talk about the tech turnaround, the tech profits of the last few years.

They’ve gone through a whole cycle where people became multimillionaires at a time when the working poor never even got a minimum wage increase.

And if you think of people like this who have a net worth of a thousand dollars or less, just as an example, and just imagine what it’s like for them to be forced, in the future, to be horrible investors because the U.S. government forces them to have something called Social Security, which they can’t get out of, and they get a lousy return.

What I’m wondering is, if you would consider, when we have a candidate, whoever it might be at the time, say that you don’t want to put a small portion of Social Security into the long-term stock market because it’s a risky proposition? If you would take your track record on “60 Minutes” and say, “I don’t think so.” That’s the first question.

And number two, while I’m asking you to volunteer for something, I found myself being thrust into something in the last three weeks.

I went to Cypress Gardens the last day with about 20,000 people there. And the lady was handing out 15,000 fliers. Several weeks from now I’ll be before Governor [Jeb] Bush with the Friends of Cypress Gardens. We have a website, FriendsOfCypressGardens.org, trying to keep a developer from clear-cutting the trees in Cypress Gardens, a national treasure.

And my question is, would you consider contacting your cousin, [musician] Jimmy Buffett, about possibly helping us in some way? Doesn’t have to be money. It might be an appearance. Just might be some connections, where you might be able to help us in our efforts.

WARREN BUFFETT: I get asked to contact — probably the one I get asked to get contact the most is Bill Gates, but I get asked to contact all kinds of people.

And I mean, everybody is slipping me envelopes with letters in them, sending things to the office and saying, “Won’t you get this person?” and all they can say is no. I don’t do — I don’t make requests of my friends, basically, for anything.

And I just — I would spend the rest of my life doing it. They would feel — I would never know — (applause) — you know, what they were doing — you know, I would never know what they were doing because I was asking, versus what they really felt. I mean it’s an impossible — from my standpoint at least — that’s an impossible game to get into, in terms of that.

I mean when [Washington Post publisher] Kay Graham was alive, everybody, you know, wanted her for one reason or another. And they've all got causes.

And, frankly, they, you know, they want to use me to get her, or Jimmy Buffett, or whomever, to say yes to something that they're saying yes to, partially because they feel they don't want to say no to me.

And I, you know, that — I just don't want to use my friendship for that purpose, frankly. And I don't do it, even for things that I strongly believe in, myself. I do them — they may know what I'm doing, and if they want to pick up on it, fine.

But I have never — I can't remember ever requesting anybody to make a contribution or do anything myself. I mean what I do is a matter of record, and, you know, if other people want to pick up on it, fine.

But I've never had one of those honorary dinners where they send out, you know, to all the suppliers to Berkshire and everything and start leaning on them and saying, you know, "We're honoring Warren."

Well, hell, if they want to honor me they can honor me without soliciting all my friends for money. I mean, I don't consider that much of an honor if the reason they picked me was because I got rich friends. So, I just don't do that.

25. "There's something unattractive about a very rich guy that pops off on everything"

WARREN BUFFETT: On the public policy question, what I did on September 11th, when [former General Electric CEO] Jack Welch and [former Treasury Secretary] Bob Rubin and I went on there, you know, I will do those things occasionally. I've written some op-ed pieces.

I think — and I get tempted very often, in fact I've written some that I haven't sent in.

But I do think that there's something unattractive about a very rich guy that pops off on everything. And you may think, by listening to us today that you've got two guys up here that do like to pop off on everything. And we do have opinions on almost everything.

But I just think there are some things I get — you know, I wrote on campaign finance reform, and I've written on taxes. And I will do more of that, but I do try to hold myself in check, somewhat, because there's a little bit of, you know, this, "I'm rich, therefore I'm right"- type stuff that I don't think sits very well.

And I know when I see it in other people I don't like it that, you know, "I'm a celebrity therefore, you know, you got to listen to me on everything that I say." It just — it turns me off at some point.

But like I say, I have done it, and there could be occasions — and there will be occasions — I'm sure, when I'll cross my threshold level and figure I really want to say something and people can ignore it or otherwise.

And — but I think there's some danger of overexposure on that sort of thing, and I think you've seen it with certain people.

Charlie?

26. Keep Social Security money out of stocks

CHARLIE MUNGER: Warren, would you agree or disagree that forcing a certain part of Social Security into common stocks is a good idea?

WARREN BUFFETT: No, I would not. Actually, I would not agree with the one that the gentleman suggested.

I think that, actually, Social Security has been a tremendous thing for the working people of this country. It's been an intergenerational pact. It's not insurance.

It simply says, like a family might say, except it extends the concept of family to the whole United States, that if you produce for this country when you're between the ages of — and I think the upper age limit should be extended — but between the ages of X and 65, that society will provide some base level of income for you for the rest of your life.

And I think a rich society should do that. So, I think the when you have a $10 trillion society, you know — (applause) — we should do that.

CHARLIE MUNGER: I would agree. I think Social Security, you can argue, is one of the most successful governmental programs we have. And people treat it as a pure disaster coming or something like that.

That's not my view at all, and I wouldn't put it in common stocks, either. I think Social Security works pretty well just about the way we're doing it.

WARREN BUFFETT: Yeah, we will give a base income to every — and we should in this country — to everybody that leads a reasonably productive life. And they don't have to worry about how long — you know — whether they live to be 90 or 100.

And people do worry in their old age. And we don't need a bunch of people who, you know, go off to war when we need to defend, you know, the rights of our country, and act in every way as good citizens, but they just don't happen to have the ability to make a lot of money, you know, well, like maybe Charlie and I can.

I think they need a base level, and I think that an intergenerational compact like we have — it's really a magnificent idea. And I think the country's a lot better off for it.

I think that telling them that they can save 500 bucks or a thousand bucks and put it into stocks and have everybody lobbying Washington about, you know, who will handle it. You know, everybody thought it was a great idea a few years ago, and I think it's a very bad idea, frankly.

Charlie? (Applause)

CHARLIE MUNGER: I like it a lot less than you do. (Laughter)

27. Simple compensation plans and no consultants

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Good afternoon. My name is Ravi Gilani. I come from New Delhi, India.

I have questions regarding management policies. Since you follow quite different management policies, I would like to know the impact of them on the management CEO's motivation.

Mr. Munger has mentioned that where capital is unimportant in a business, you tend to give the CEO a part of the earnings. You have also mentioned that you do not greet good work by raising the bar. Clearly, static earnings over a period of time may become successively less valuable.

My question is in, now, four parts. Bearing the above in mind, could you give us an example of compensation policy in Berkshire subsidiaries which illustrate your thinking on the subject of executive compensation?

Number two, though you do change — charge — subsidiaries for using capital, and believe in linking rewards to bottom line performance, Mr. Munger does not respect economic valued added as a concept. Could we have your thinking on EVA as a tool to monitor and reward corporate performance?

Number three, do you restrict yourself to setting compensation policy for the CEO, or do you involve yourself in larger part of the organization?

And finally, you do not have any retirement age for the CEO. Does it impact the morale, motivation, of the people below the CEO?

WARREN BUFFETT: Charlie? (Laughter)

He knew that was coming.

CHARLIE MUNGER: Well, one, you're right. Where a business requires practically no capital, we tend to reward the management based on the earnings. The minute the business starts requiring capital we tend to put a capital factor into this compensation system.

We don't have any one standard system. They're all different, based on accidents of history and circumstances.

But where capital's an important factor, of course, we take it into account.

As far as the effects on morale, as far as I've ever been able to see, the morale's pretty good in the Berkshire subsidiaries. And the Berkshire managers practically never leave. And my guess is we have about as low a turnover rate as any place around. Is that right, Warren?

WARREN BUFFETT: Oh, I'm sure of that. And besides, the "no retirement policy" is wonderful for my morale. (Laughter)

And Charlie's.

The — you also asked about EVA. We would not dream of using something like that, although I think actually a few of our subsidiaries may use it in some way.

So, the subsidiaries set their policies for the pay of the people below the CEO, and the — all — they have all kinds of systems, because we have all kinds of businesses.

And, frankly, we've never had big problems with compensation because, I think, our arrangements are rational.

When capital is an important part of the business, we stick a charge for capital in. If it's an unimportant part of the business, we don't stick it in. We don't believe in making things more complex than needed.

So, we don't try for little — all kinds of little refinements — which a compensation consultant would come in and tell you was needed, because that's how he would justify a large bill. And he would also come in and tinker with it a little the following year, and the following year, and so on.

We have very simple systems on comp. But some of our businesses are terrific businesses, and so we have very high standards of performance before people get performance bonuses.

Some of our businesses are very tough businesses, and the threshold is much lower, but the managerial talent needed to reach that threshold is just as much as in the — with the higher threshold in other businesses.

It’s not a — compensation is not rocket science. I mean, people will want you to think it is, and you read these proxy statements and it blows your mind, what they get into. I mean, the proxy statements are thicker than the annual reports because they’re talking about the compensation of people.

And it is not that complicated. We’ve had — in 38 years, we have never had a CEO leave us to go to another business, except a few we’ve — where we’ve made the decision ourselves, but very few.

And it is — you know, I see all of the time and effort put in because, frankly, it pays off for the CEO to do it. And then they create a whole department that spends all their time attending conferences about, you know, compensation methods, and they have consultants in, and it becomes an industry.

And it isn’t going to break itself up. I mean you — when you get those — when you get a huge bureaucracy involved in making all kinds of pay determinations and everything, it’s never going to go away unless you do something about it. But that’s true of any bureaucracy we run into. We don’t have much bureaucracy at Berkshire done.

I think that there’s no question that our “no retirement policy” means that somebody who’s just itching to be the CEO of a business, and they see that the CEO is 65, and then 70, and then 75, above them at some of our companies, is probably not going to stick around.

I mean we don’t develop, naturally, lots of number twos because we can’t promise them that number one is going to go out the door. But as long as number one doesn’t go out the door, from our standpoint, that’s just fine.

And we occasionally have to replace managements, but it’s very occasional. I mean if — on an expectancy basis, you know, even with all the subsidiaries we have, you know, we may face one management succession problem, perhaps, every 18 months or something of the sort. And we’ve got all kinds of other businesses. So it’s not a big deal at Berkshire.

CHARLIE MUNGER: Yeah. And on EVA, there are ideas implicit in that that we use. For instance, hurdle rates by — based on opportunity costs. Perfectly reasonable concept.

But to us, that system, with all its labels and lingo, has a lot of baggage that we don’t need. We just use the implicit, simple stuff that’s buried in EVA.

WARREN BUFFETT: Yeah. We could spend a million bucks a year on consultants to get an answer we can get in five minutes, frankly. I mean it is — it just isn’t that complicated.

But can you imagine a consultant coming around and saying, “I’ve got a one-paragraph compensation arrangement for you?”

Are they going to be able to send you a large bill for, you know, their consultancy? Of course not. So, they've got to make things complicated, and we don't believe in that. We want things that are very easy to understand, and we've just never had a problem with it.

And we get good results out of our managers.

The main reason we get good results out of our managers is that, you know, they like hitting .400. They like hitting .400 and being fairly paid, but they — the fact that they batted .400 is the biggest thing to them, in life.

And it's, you know, it's sort of the way we feel. If we get a good batting average in our business performance, the pay is incidental.

Now, it shouldn't be incidental to our managers. It's got to be fair or they're going to — nobody wants to work in an environment where they feel they're being treated unfairly, but —

That is not a complicated procedure. And we do make them very specific to the enterprise that's under their control. We do not pay the people of See's Candy based on how The Buffalo News does or vice versa.

And I can show you a lot of crazy compensation systems in corporate America where that really is the ultimate effect of what's happening.

28. Buffett OK with large brokerages holding his stocks

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Good afternoon. This is — I'm Paul Butterfield from Clarksville, Maryland.

You wrote in the annual report about the dangers — the systemic dangers — of derivatives and the growth in derivatives.

An example would be a six-sigma event that would cause domino effect and dangers to the solvency and operations of, maybe, financial institutions and other firms, possibly including brokerage firms.

Would this — do you think this recommends to an individual investor that we might consider not holding stocks in street name?

WARREN BUFFETT: Charlie, how do you — they addressed that, somewhat.

There were some domino effects in the very early '70s in Wall Street. I think, certainly, the failures of some brokerage firms, in part, led to failures of others.

It wasn't a classic domino situation, and of course we had domino effects in banks if you go back a hundred years in this country.

Anytime you have financial institutions that interrelate in many ways, and have big receivables and payables, balances with everything, you've always got the danger of domino effects.

And that's a factor in the insurance business. It's a factor in banking business. I think it'd be less in the brokerage business.

I would think, if you owned securities in a cash account with any large stock exchange firm, you know, it wouldn't worry me.

We've got lots of — I've got lots of personal securities, you know, sitting with a very large stock exchange firm, and that does not bother me. But I mean, obviously, there have been little firms that have been fly-by-night types.

And I don't even know all the rules on margin accounts. But if somebody has got the right to repledge your securities and they get in trouble themselves, I don't know any more what the SIPC — there's a SIPC protection, but I'm —

CHARLIE MUNGER: It's not unlimited. You're liable.

WARREN BUFFETT: Yeah, I think that's true.

And no, I would think twice between having all my securities rehypothecated by somebody else.

A cash account. I think the cash accounts are segregated, aren't they, Charlie?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: Yeah.

29. States shouldn't buy stocks with taxpayer money

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. My name is John Norwood and I hail from Des Moines. Thank you for providing this opportunity to speak today.

I have two questions, one as an individual investor and one as a state resident.

The first has to do with intrinsic value. Can you provide some additional Cliff Notes for working with the Berkshire Hathaway annual report and calculating an intrinsic value for the stock? I'm a little bit hazy.

And the second question has to do with public sector investing. As an example, the state of Iowa is considering the creation of a $1 billion Values Fund.

What sorts of guidelines, strategies, and advice would you employ if you were responsible for investing this money on behalf of the general public?

Are there any significant differences when representing shareholders versus the general public? Thank you.

WARREN BUFFETT: Yeah, elaborate if you will just a second, because I am not familiar with that billion dollar — is the state of Iowa literally creating a billion dollar fund to invest in equities on behalf of the people?

AUDIENCE MEMBER: That's what's being proposed.

WARREN BUFFETT: Is that right? Oh.

Charlie, what do you think about that? That's a new one to me.

CHARLIE MUNGER: I think it's a pretty dumb idea. (Laughter and applause)

WARREN BUFFETT: Yeah. He lives in California. That's why I had him answer. I live right on the border here, so I — (Laughs)

Yeah, I would — I mean, I guess Iowa doesn't have any bonded debt, so I'm not sure what — they probably wouldn't be creating a margin account.

But I would think that most states or municipalities would want to let the citizenry invest on its own and would not want to be taxing people in order to set up an equity fund. So that strikes me as a pretty novel idea. Charlie —

CHARLIE MUNGER: In California, certainly the — of the investment management partnerships — use all kinds of political contributions to finagle their way into managing state pension funds, et cetera, et cetera. It's not a pretty scene.

To the extent that Iowa can dampen it down, why, I think they're better off.

30. Intrinsic value: "fuzzy," but essential

WARREN BUFFETT: The question on intrinsic value — you know, we've written about it in reports. I don't think there's much additional to say.

I mean, the intrinsic value of any financial asset, you know, is the stream of cash that it'll produce between now and Judgment Day, discounted by an interest rate that equates between all the different possible assets.

That's true of an oil royalty, a farm, an apartment house, an equity, a business operation, you know, a lemonade stand. And that — you have to decide what sort of businesses that you think you can understand well enough to make a — some kind of reasonable calculation.

It's not scientific, but it is the intrinsic value. I mean the fact that it's fuzzy to calculate doesn't mean that it's not the proper way to think about it.

And at Berkshire, you've got two questions. You've got the question of what the businesses we own now are worth. And then, since we redeploy all the capital they generate, you have to figure out what you're willing to assume about what we do with the capital.

And you can look back and say that, 35 years ago or so, that people perhaps underestimated what would be done with the capital that was generated, so that it looks very cheap if you look back on it now. But we're in a whole different game now with huge amounts of capital.

And you have to make a decision as to whether the billions and billions and billions of dollars we generate will be deployed in a way that creates lots more cash later on. And it's what Charlie and I think about, but we can't give any prediction on it.

Charlie?

CHARLIE MUNGER: Yeah, I think our reporting, considering the complexity of the enterprise as now constituted, is better than that of any similar enterprise I know, in terms of enabling a shareholder to calculate intrinsic value.

So, I think we've done better than anybody else, and we do it conscientiously. And if you ask, "Will we improve from here?" I don't think so.

WARREN BUFFETT: We've worked hard at doing what you're talking about, and it — but even working hard at it, I mean, we've given you the data we would want ourselves. We don't know the answer, but we do know it's what you have to think about.

And we do it when we buy McLane's, when we buy Clayton Homes. When we buy anything, we are attempting to look out into the economic future and say, "What kind of cash can this business generate over time? How sure do we feel about it? And how does the purchase price compare with that?"

And if we feel we're getting a — we have to feel fairly good about our projections. Won't feel perfect, because we — no one knows the answer precisely. We have to feel pretty good about our projections, and then we have to have a purchase price that's rational in relation to those.

And we get some surprises in both directions. Actually, if you go way back, we've had more pleasant surprises than we would have expected. But we won't get them from this point, mostly because of size, and also because the world's a little more competitive.

Charlie?

CHARLIE MUNGER: Nothing more.

31. Munger: Tort lawsuit system is "crazy"

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: My name is Vic Cunningham. I'm a shareholder from Wilton, Connecticut.

I heard your comments earlier about popping off. But actually, I find it admirable the way you guys, the two of you, have leveraged your clout as investors to be advocates for change.

You know, your outspoken comments on expensing stock options promoted, you know, productive discussions, in not only corporate boardrooms throughout this country, but more importantly on Capitol Hill.

Currently, tort spending in this country continues to rise as a percentage of GDP, and I would argue a lot of that's unproductive spending.

Is there a point — and it seems like right now that, you know, they're trying to stretch their tentacles, not only from, you know, tobacco companies but to consumer product companies like McDonald's and possibly even Coca-Cola.

Is there a point where you would use your considerable clout to try to guilt Congress into moving towards some kind of comprehensive tort reform for this country?

WARREN BUFFETT: Well, I'm sympathetic to the — what you're saying. I would say that our considerable clout is nothing compared to the clout of the plaintiffs' lawyers.

There's no question that — in a certain way, it's appalling when you look at the frictional costs to society of the tort system we have.

But Charlie is a lawyer. He can probably speak much more intelligently than I can as to how you could modify this, because there are plenty of things wrong, too.

I've — I mean it's sort of infuriating to see specious shareholder suits raised on, you know, any kind of a deal, just because there's a lot of DO — D&O insurance — and they know people will pay off rather than go through the nuisance of a suit.

And we never — we don't pay off — but corporate America does. And so, it's a game.

And the people that pursue that activity, you know, are not pursuing it, I think in many cases, because of a great pursuit of justice, but because it's a damn profitable sort of game.

And, you know, the people that are paying. It usually doesn't come out of their own pocket, so it gets back to that — the lack of parity in the interest of the people on both sides.

But then, when I look at some of the things that have happened in corporate America, I certainly don't want to get rid of the plaintiffs' lawyers either — entirely — because I think some terrible things have happened and I think people should pay.

I just wish the people paid rather than the D&O carriers, because when a D&O carrier pays, or when a company pays, it — the costs get socialized, and the people that did the wrong things seldom pay out of their own pockets.

I — Charlie, what — tell me, how do we improve the tort system?

CHARLIE MUNGER: Well, if you define the tort system to include the workmen's compensation system, which I would, you get terrible abuses.

In California, Costco has about one-third of its employees and two-thirds of its workmen's compensation expense.

California is an institutionalized fraud. Fraudulent chiropractors, fraudulent lawyers, fraudulent what have you. And they put this enormous burden on business. And of course, eventually the jobs will leave.

I had a friend who took a plant away from Texas where he had workmen's compensation expense of 30-odd percent, and took it to Ogden, Utah, where it went to 2 percent.

So fraud, allowed to run, builds on itself. And then you've got all these lawyers and lobbyists who like the fraud. And chiropractors and God knows what.

And so, it's a major problem. And in California, it's gotten so bad that my guess is there will be some reform, even with the two-thirds Democratic legislature.

WARREN BUFFETT: What would you change, in terms of the shareholder situation?

CHARLIE MUNGER: Well, that's harder, because if you take the worst of the plaintiffs' lawyers, half the time they're suing somebody that's behaved terribly.

Now, they're suing in a process where a lot of money is paid out, as you say, on a socialized basis, and doesn't really go to the people that were hurt. So, they're like a public scold that gets paid an enormous sum out of the public.

But certainly, a lot of the defendants in these cases that are screaming about the plaintiffs' bar have done some very regrettable things. So, I think that gets very hard to figure out what should be done.

The present system is crazy, and I don't know how I'd improve it. You could easily improve it if you could count on government being rational and fair, but how do you do that?

WARREN BUFFETT: Would you do anything toward making the people who are defendants in D&O situations pay any portion of it themselves or not?

CHARLIE MUNGER: I think there would be a great improvement, net, in Omaha — in America — if there were no D&O insurance. Zero. I think people — (applause) — would behave a lot better.

The counterargument is you'd never get anybody with any money who was willing to serve on a board. But my guess is that, net, even after taking into account that little problem, the system would work better than the present one.

32. "It's tough to buy things out of bankruptcy"

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: John Goss (PH), Key West, Florida.

You mentioned last year your frustration with buying companies out of bankruptcy. Were you surprised, from your past experience, that the court would not allow a breakup fee regarding your Burlington bid?

WARREN BUFFETT: That's a good question. We submitted a bid to the court. The management agreed to our offer and we submitted a bid in the bankruptcy of Burlington Industries. And our bid was 500-and-some million dollars.

And we provided a — what's called a breakup fee. I'll get to that in a second, but I think it was $14 million.

Now really, when we submit that bid of 500-and-some-odd million, our bid has to remain outstanding for a good many months. So in effect, by making that bid, I get back to the earlier statements I made about option value.

For $14 million, we were telling the creditors of Burlington that, for a period of maybe four months or five months, that they could sell us that business for our number or, for a considerable period, they could get more money for it.

Now that is a very low price, in my view, for a put. In fact, it's an inadequate price, but it's become sort of a customary percentage in terms of bankruptcy proceedings.

The court said that that was too much to charge as a breakup fee, or what I would call a put fee, and so they have set up a new procedure, which will result in Burlington getting sold some months from now to people who follow this new procedure.

I think that — I frankly think 14 million is inadequate, but it's roughly in the range of what has been allowed in many cases.

But we would never agree to that sort of a sum for that sort of exposure, outside of bankruptcy. It just doesn't make any sense. The world changes too much.

If you look at the value of businesses, as measured on the New York Stock Exchange, you'll see fluctuations of a hundred percent in a year. And for 2 or 3 percent, to commit 500-and-some million dollars at a fixed price for a business in a tough industry, I mean that's — that does not make a lot of sense.

I did it, so — but it got rejected. We would not — we will not participate in a procedure where we're going to bid hundreds of millions of dollars and where our bid has to remain outstanding.

And if the — you know, if there's a twin — if there's a World Trade Center disaster, or there's an earthquake in California, or there's a suspension of trading on the stock exchange, or all kinds of things, that our bid sits out there and we've gotten paid $5 million or something for it.

It just doesn't make any sense to me.

So, it's tough to buy things out of bankruptcy, although we've done it twice now. And both situations have worked out well.

But then we tried it a third time with Burlington, and we spent a considerable amount of time and money generating that bid. Weeks and weeks and a good many dollars, and it wasn't accepted.

So, you know, when I look at these experiences, I say to myself it's a lot easier to make a deal with Walmart, where I talk with them for an hour and we shake hands and we got a deal.

Or the other deals we've made in the last year where we buy Northern Natural in a day or two, or where we buy Kern River Pipeline in a few days, or the various businesses we've bought.

And bankruptcy, I think it's probably a necessary part of the procedure. I mean you have to comply with bankruptcy laws. But I would say it's a very awkward way to buy a business.

And if we have to submit bids that will remain outstanding for many months when people can top us, and only have a 1 percent fee for giving that sort of a put, we will not be making many bids.

Charlie?

CHARLIE MUNGER: Well, we know it was unreasonable, from our point of view, to have a transaction that didn't have that modest 2 percent commitment fee in it. The court had a different view, and he thought that the figure should have been different. And who knows. We'll see how it all works out.

33. "We like to go in heavy" when buying a stock

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: Gentlemen, Wayne Peters from Sydney, Australia.

My question goes to stock reweightings. Could you describe your thought process in, firstly, determining your commitment weighting level in a new investment? Now, marketable securities is what I'm referring to.

And secondly, your thoughts on potential reweighting. Your record, and clearly in the earlier days as opposed to now, would indicate that on average, you're either in a stock or out of it, though on occasion you've topped up and lightened up.

WARREN BUFFETT: Charlie? I'll let you have one. (Laughs)

CHARLIE MUNGER: I didn't fully understand that question.

AUDIENCE MEMBER: Charlie, I was just referring to how you make an initial commitment to a marketable security investment, in regards to making it maybe a 5, 10, 15 percent commitment. How heavy you decide to go into a position, initially.

CHARLIE MUNGER: Well, we ordinarily don't like small positions.

WARREN BUFFETT: Yeah, we like to go in heavy. I mean, if we want to invest in a business through the stock market, we want to put a lot of money in. You know, we do not believe in a little of this and a little of that.

So, at our present size, we're limited primarily by the availability of the quantity we want, rather than restricting ourselves based on some percentage of a total portfolio.

I can't — it's very hard for me to think of a stock we quit on, in terms of buying, except because we were going to run into some 10 percent limit where we would get liable for short-swing profits or become insiders or that sort of thing. But we almost never want to quit. Isn't that right, Charlie?

CHARLIE MUNGER: Well, not unless the price goes up.

WARREN BUFFETT: Yeah. And of course that's where we made our big mistakes. I mean we have — or I've made the big mistakes, actually. I —

There have been a couple of things that we knew enough to buy, that were in our circle of competence, where we could have bought lots of stock, except it went up a little bit and then we faded because of price.

We didn't fade because we didn't want to put more than X dollars in. If we find an idea that we want to put $500 million in, we probably would be even happier if we could put 3 or 4 billion in.

Good ideas are too scarce to be parsimonious with once you find them.

CHARLIE MUNGER: Yeah, having narrowly averted the mistake of being unwilling to pay up at See's Capital [Candies], we've gone on and made the same damn mistake several times, with respect to marketable securities. We evidently learn very slowly. (Laughter)

WARREN BUFFETT: It's cost us many, many, many billions of dollars, too.

CHARLIE MUNGER: Those are opportunity cost billions. They don't show up on the financial statements, but the amount of money that's been blown by dumb decisions at headquarters at Berkshire Hathaway is awesome. (Laughter)

WARREN BUFFETT: Well said.

CHARLIE MUNGER: Yeah. (Laughter)

34. Short-term rates don't affect investment decisions

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Hi, I'm Steve Casbell (PH) from Atlanta. My question involves interest rates.

When you calculate the intrinsic value of a business in a period of low interest rates, like we have currently, do you use a higher discount rate to factor in higher rates in the future?

And also, when — do you ever look at a company's free cash flow yield relative to current rates?

And if I could also get your thoughts on the dividend tax cut. If, by some miracle, the politicians think logically and get rid of the dividend taxes, would Berkshire ever pay a dividend?

WARREN BUFFETT: The question on discount rates, we use the same discount — I mean in theory — we would use the same discount rate across all securities, because if you really knew the cash they were going to produce, you know, that would take care of it.

We may be more conservative in estimating the returns of cash from some, but the discount rate we would use is a constant.

Now, in terms of where we commit, you know, we don't want to use the fact that short-term rates are 1 1/4 percent to think that something that yields us 3 percent or 4 percent is a good deal.

So we sort of have a minimum threshold in our mind about which we're — below which — we're unwilling to commit money. And we're unwilling to commit it whether interest rates are 6 or 7 percent, or whether they're 3 or 4 percent, or whether they're, on a short-term basis, 1 percent.

We just — we don't want to get hooked into long-term investments at low rates just because they're a little bit better than short rates would be or low Government rates would be. So, we have minimum thresholds in our mind.

I can't tell you precisely what they are, but they're a whole lot higher than present Government rates would be.

And at other times, we'd be very happy owning Governments, just because we feel that they offer attractive enough rates.

I would — when we're looking at a business, we're looking at holding it forever. And we want to be sure we're getting an adequate return on capital. We don't regard what we can get on short-term rates now as adequate, but we'll still sit in — rather than bend a little bit and start settling for lower rates for 30 years because rates for 30 days are so low, we would rather just sit it out and wait a while.

35. Dividends should be taxed

WARREN BUFFETT: The tax on dividends — you know, I've used this illustration before, but I'm paying about the same percentage of my income to the federal government as my secretary does.

Now, I pay more in income tax rates than she does. I pay a higher marginal tax rate, by some margin, than she does.

But she pays way more in Social Security taxes than I do, because I only pay on the first whatever it is, 70,000 or 80,000 of income. And so, she is paying, between what we pay at the company for her and what she pays, we're paying 12 percent or 13 percent or whatever it is of that.

So, we both end up paying fairly similar percentages of our income to the federal government every year.

If Berkshire were to declare a billion-dollar dividend, and my share of it was 330 million, and it were tax-free as the Bush people originally suggested — and it would be tax-free. I mean, we have lots of taxable earnings at Berkshire.

You know, I might be paying 1/10th of the rate to the federal government of my income that she would be.

Now, I can make the argument about the fact that structure shouldn't govern tax rates. That Subchapter S, and Subchapter C, and partnerships, and all of these things, that the tax codes should be neutral between them. And I've made those kind of arguments in the past.

But I can make no argument in my mind that says that I, with everything that — you know, all the luck I've had in life, you know, I was wired a certain way at birth that enabled me to make a lot of money.

And, frankly, it was better to be born a boy than a girl, in terms of money-making possibilities, in 1930. And probably still is, but not to the same degree.

I mean the fact that I would send 1/10th the portion of my income in a year to the federal government that my secretary would, I — it just — it screams at injustice to me, in terms of what the society gives back to me. (Applause)

So I am not for the Bush plan. Charlie?

CHARLIE MUNGER: Well, I agree with you. Even if you assume that the whole economy would work better if we'd never gotten into this double-taxation system on corporate earnings, which I don't think is a clear thing anyway.

But even if you assume that, I think when you live in a democracy where there's lots of envy and resentment and what have you, to have the absolutely most fortunate people paying practically no income taxes, I just think it's unacceptable.

I think there has to be some fairness in some of these arrangements, even if there's some theoretical argument that the economy might work a little better some other way.

WARREN BUFFETT: Yeah, there are IRAs now, obviously, that work very well for people with modest amounts of dividends. That they — they're getting tax deferred for a very long period of time, which has huge benefits.

The big benefits of exempting dividends would go to fellows like me and Charlie, you know. And that's not going to stimulate the economy. It's going to stimulate us, but — (Laughter)

And it's going to result in us sending a very small percentage of the income — of our income — to Washington compared to what the people, you know, working in our shoe factories send.

And that — you know, when somebody says, you know, "What did you do during the war, Grandpa?" I'm not sure that's what I want to explain to them.

36. Why Berkshire wants at least a 10 percent return

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Good afternoon. I'm Patrick Wolff from Arlington, Virginia.

Charlie, I can't resist telling you that I'm actually the fellow who plays the chess games blindfolded.

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: So, I look forward to not seeing you there tomorrow. (Laughter)

CHARLIE MUNGER: Right.

AUDIENCE MEMBER: I actually have a two-part question. I'd like to ask you to elaborate a bit how you think about opportunity costs. And I'm — I think I'm going to be elaborating very much on the very last question that was asked.

First of all, in the annual report you say explicitly that you look for a 10 percent pretax return on equity, in looking at common stocks. And I think you talked earlier about how you built up from that for 5 to 6 percent after-tax return, and then you layer on inflation, and then layer on taxes.

My first question would be, how do you adjust that required rate of return across periods of time? So, for example, when interest rates are higher. And do you look for a different equity premium return over different periods of time?

My second question would be, Warren, you just said that you actually would apply the same discount rate across the stocks.

And I'm sure you know that modern finance actually suggests that you should not do that — that you should be thinking about the timing of cash flows and, in particular, the covariance with the general market.

Now, you've made a point of emphasizing that when you think of risk, you think of risk primarily in terms of, will you get the cash flows that you predict you will get over time?

Sort of numerator risk, if you think in terms of discounted cash flow, which I think everyone here will have to acknowledge — your results speak for themselves — has probably been a very effective way of thinking about risk.

But there is a true economic cost to think about the timing of cash flows as well. And it may be a much smaller cost, but it is still a real cost.

I might, for example, suggest you think about somebody deciding between two jobs. The jobs are completely identical and the person expects to make the same amount of money from each job, but there's one difference. And the difference is one job will pay him more when the economy's in the tank, and the other job will pay him more when the economy's going gangbusters.

Now, if he asked you which job was actually worth more, my guess is you would tell him that the one that would pay him more when the economy's in the tank. And the reason is, if he wanted to make more money by moonlighting or doing something else, it'd be much easier when the economy's doing better.

That's the essential logic behind the idea that you look at the covariance of when cash flows come in with the overall market.

It's a real cost, even though it is difficult to measure, and even if it is a smaller risk than numerator risk, the risk of getting the actual cash flows, since it's a real cost, I imagine you must think about it.

And so, my second question to you would be how do you think about it? And if you decide not to, why?

WARREN BUFFETT: Now, first of all, I would like to say, Patrick, we appreciate you coming out, because Patrick — now, I don't know how many years it's been, but it's been a number, has volunteered on Sunday to play.

Now, I think he's playing six people or so, blindfolded, simultaneously, and after hearing that question you can understand how he does it. (Laughter)

But Patrick, as well as [champion bridge player] Bob Hamman, and then this year, [champion Scrabble player] Peter Morris and [champion backgammon player] Bill Robertie, all come out. And on Sunday they — we've got these extraordinary talents out there. And for people who like the various games they play, they devote an afternoon for it and ask nothing in return.

So, I — we really appreciate it, Patrick, and I'll look forward to seeing if you're peeking out of your blindfold tomorrow. (Laughter)

The question on opportunity costs and the 10 percent we mention. You know, basically that's the figure we quit on. And we quit on buying — we don't want to buy equities where our real expectancy is below 10 percent.

Now, that's true whether short rates are 6 percent or whether short rates are 1 percent. We just feel that it would get very sloppy to start dipping below that.

And we would add, we feel also, obviously, that we will get opportunities that are at least at that level, and perhaps substantially above.

So, there's just a point at which we drop out of the game. And it's arbitrary. There's no — we have no scientific studies or anything.

But I will bet you that a lot of years in the future we, or you, will be able to find equities that you understand, or we understand, and that have the probability of returns at 10 percent or greater.

Now, once you find a group of equities in that range, and leaving aside the problem of huge sums of money, which we have, then we just buy the most attractive. That usually means the ones we feel the surest about, I mean, as a practical matter.

There's just some businesses that possess economic characteristics that make their future prospects, far out, far more predictable than others. There's all kinds of businesses that you just can't remotely predict what they'll earn, and you just have to forget about them.

But when we get — so, we have, over time, gotten very partial to the businesses where we think the predictability is high. But we still want a threshold return of 10 percent, which is not that great after-tax, anyway.

Charlie, do you want to comment on that portion of that question first?

CHARLIE MUNGER: Yeah. The — I think in the last analysis, everything we do comes back to opportunity cost. But it, to some extent — in fact, to some considerable extent — we are guessing at our future opportunity cost.

Warren is basically saying that he's guessing that he'll have opportunities in due course to put out money at pretty attractive rates of return, and therefore, he's not going to waste a lot of firepower now at lower returns. But that's an opportunity cost calculation.

And if interest rates were to more or less permanently settle at 1 percent or something like that, and Warren were to reappraise his notions of future opportunity cost, he would change the numbers.

It's like [economist John Maynard] Keynes said, "What do you do when you change your view of the facts? Well, you change your conduct." But so far at least, we have hurdles in our mind which are basically — well, they involve, implicitly, future opportunity cost.

WARREN BUFFETT: Right now, with our 16 billion that's getting 1 1/4 percent pretax, that's $200 million a year. We could very easily buy Governments due in 20 years and get roughly 5 percent. So, we could change that 200 million a year to 800 million a year of income.

And we're making a decision, as Charlie says, that it's better to take 200 million for a while, on the theory that we'll find something that gives us 10 percent or better, than to commit to the 800 million a year and then find that, in a year or thereabouts, when the better opportunities came along, that what we had committed to had a big principal loss in it.

But that's — you know that's not — it's not terribly scientific. But it — all I can tell you is, in practice, it seems to work pretty well. People —

CHARLIE MUNGER: Years ago, when Warren ran a partnership, and to some extent the partnership that I ran was the — operated in the same way — we implicitly did what you're suggesting, in that part of the partnership funds were in so-called event arbitrage investments.

And those tended to generate returns, occasionally, when the market, generally, was in the tank. And alternative investments would more mimic the general market. So, we were doing what this academic theory prescribes, you know, 40 years ago. And — but we didn't use the modern lingo.

WARREN BUFFETT: Yeah, we've got some preferences for having a lot of money coming in all the time.

But we do go into insurance transactions with huge volatility, which could mean that a big chunk of money could go out at one time, or in a very short period of time.

And we won't give up a lot in expectable return for smoothness, but if you give us a choice of having money come in every week and the same present value of money coming in in very lumpy ways that we wouldn't know about, we would choose the smooth.

But if you give us a choice of a higher present value for the lumpiness, we will take the lumpiness. And that's usually the choice that's — I mean that's usually — we get offered that choice. And other people value smoothness so highly that we do get a spread, in our view, for lumpy returns.

37. Berkshire insures $1B Pepsi contest

WARREN BUFFETT: We are writing — and then we're going to close this up — but you will read a lot, or you may hear a lot, maybe you've heard it already, Pepsi-Cola's having a contest. They're going to have a drawing in September.

The contest goes through a lot of little phases, but in the end, there's going to be one person who's going to have one chance in a thousand of winning a billion dollars. That billion dollars will have a present value of maybe 250 million.

If whoever gets to that position hits the number, we will pay it. And we don't mind paying out $250 million as long as we get paid appropriately for us. And that would create bad cash flow that particular week. We're willing to — maybe even for two weeks. (Laughter)

We're willing to assume that for a payment, and very, very few people in the world are. Even those that can afford it. We would even assume it for 2 1/2 billion, present value.

We'd want more proportionally to assume it for that, but Charlie and I, I think, would agree that we would take that on if we got paid well enough for it.

We wouldn't do it for 25 billion, but we will do things, and therefore, you know, we get the calls on that sort of thing. And that is more profitable business, over time, than bread and butter business.

It also can, you know — it can lead you having an intense interest in watching the television show when the drawing takes place — (laughter) — making sure who draws the number, too.

Charlie, you have anything to add? Then we'll —

CHARLIE MUNGER: Yeah, once you're talking about opportunity cost that's personal to yourself and your own situation and your own abilities, you've departed from modern finance, totally. And that's what we've done.

We're intelligently making these guesses, as best we can, based on our own circumstances and our own abilities. I think it's crazy to do it based on somebody else's circumstances and somebody else's abilities.

Morning Session - 2004 Meeting

1. Welcome

WARREN BUFFETT: (Applause) Thank you.

Good morning. Some of you may have noticed a stunt man was used in that [video shown before the meeting]. (Laughter)

Arnold [Schwarzenegger] just couldn't handle some of those scenes. (Laughter)

Before we get started, I'd especially like to thank Andy Heyward, who's here today and if we can — I don't know whether we can find him out in the crowd, it's a little hard to see from up here.

But Andy runs DiC Productions. He does that cartoon for us and let's give him a big hand. (Applause)

Andy has produced a really extraordinary series telling the story of the beginning of this country called "Liberty's Kids." It's been on public broadcasting the last couple of years. It's great for kids but it's great for adults, too. I've watched a number of sessions myself.

And this summer, in July, it will go on sale at Walmart, a very special celebration. And for those of you who want to pick out something good for your children or your grandchildren, I can't think of a better series to have them watching. And thanks again Andy.

And thanks also to Kelly Muchemore who puts this whole production on. (Applause)

This is Kelly's show.

She, along with that dog Dudley, who you saw in the movie — Dudley is a regular at Berkshire Hathaway. We don't count him in the 15.8 [employees at headquarters], but she, along with Dudley, handle everything. I don't even give a thought to what's going to happen here, as might become evident during the meeting. (Laughter)

She is responsible for putting up that whole exhibition arrangement and really the whole thing. So, Kelly, I don't know where you are exactly, but in any event, thank you very much. (Applause)

2. Formal business meeting begins

WARREN BUFFETT: Now, we'll go through the business part of the meeting. And it may take a little longer than usual, but please be patient.

And I'd like to start out by calling the meeting to order. I'm Warren Buffett, chairman of the board of Berkshire Hathaway, and I welcome you to this meeting.

This hyperkinetic fellow next to me is Charlie Munger — (laughter) — the vice chairman. And we will have a good time, and I hope you do, too.

We work together because he can hear and I can see. I mean, it's — (laughter) — there are times where we can't remember each other's name, but we have a lot of fun together.

Now, any shareholder who wishes to speak regarding the shareholder proposal expected to be presented by Human Life International, or any other matters germane to the shareholder's meeting, should now go to microphone zone 1, which is in section 121 over on my right.

Or section 2, which is at section 221, I believe that's higher up on my right. And — let me see if I have that right. Yeah, or go to section 7, which is — or section 105 — which is microphone 7 on my left. Or to section 205, which is microphone 8.

If you'll go to — if you're going to want to talk about anything concerning the business of the meeting, not the questions afterwards, but just that relates to the matters germane to the meeting, please go there now, because I'm not going to be able to spot people in a crowd this size.

And when it comes time to do the business, we're going to ask anybody that cares to speak up on the business to be at those microphones. And that will be in just a couple of minutes.

Now after adjournment of the business meeting, I'll respond to questions that you may have that relate to the businesses of Berkshire but that don't call for any action at the meeting.

We had some complaints after last year that some people were asking six or seven-part questions. At least, that's the reason I'm giving that we're eliminating those.

The bigger reason is Charlie and I can't remember the first part by the time you get to the fifth part. (Laughter)

So, we are asking you to ask only one question. And don't try to get too clever about working three or four into a single question. And that will give more people a chance to get their questions asked. Only one question at a time and we will go around from microphone to microphone and get as many in as we can.

Now, we're going to do this until noon and then we'll take a break for lunch and we'll come back about one and we'll continue until 3:30. And anything goes on the questions. We'll answer almost anything, except questions about what we may be buying or selling.

You're free, of course, to wander around, go over and buy things. You know, we have a lot of things for sale over there.

It's — as I've pointed out in the past, it's better form to leave while Charlie is speaking than when I'm speaking, but you can — (laughter) — use your own judgment on that.

Now, I do want to remind you that any audio or video recording of this meeting is prohibited. That if anybody's seen recording the proceedings, we will have to ask you to leave. So, if you see anybody doing that, we would appreciate it if you would just inform one of the staff personnel around.

Because there's certain copyrighted material that we use and people, like Judge Judy, give us permission to use a segment like that. But it's not intended to be used in any commercial way. So, we do ask that no recording take place.

3. Directors introduced

WARREN BUFFETT: Now, I'll first introduce the Berkshire Hathaway directors that are present, in addition to myself and Charlie. Now, I'll ask the directors to stand as their names are read and ask that you withhold applause, if any — (laughter) — until all are introduced.

We have — I don't know whether we have anybody here from CalPERS, but they can register their own views as we go along. (Laughter)

And it is difficult to see from here, so if you'll just stand as I mention your name and remain standing until the end, when we will see whether you get any applause.

Susan T. Buffett. Howard G. Buffett. Malcolm G. Chace. David S. Gottesman — Sandy had a conflict today. There's a bat mitzvah, I believe, for a granddaughter, so he's coming in tomorrow for our director's meeting on Monday.

Charlotte Guyman. Donald R. Keough. Thomas S. Murphy. Ronald L. Olson, and Walter Scott Jr. And now you can go crazy. (Applause)

4. Four questions for the auditors

WARREN BUFFETT: Also with us today are partners in the firm of Deloitte & Touche, our auditors. They are available to respond to appropriate questions you might have concerning their firm's audit of the accounts of Berkshire.

In that regard, I wish to report that at Berkshire's audit committee meeting held on March 2nd, 2004, Deloitte & Touche responded to the four questions I suggested be asked to the independent accountants by all audit committees. And we're going to put these up in just a second.

With respect to Berkshire, the questions and the auditors' responses will be shown on the following slides.

And I might mention that I really do think these questions should be asked of all auditors, at least annually, perhaps even quarterly.

And I really think that, if such a procedure had been followed over the years — don't eat them all Charlie. (Laughter)

If such procedures had been followed over the years, there would have been a lot less trouble in corporate America.

I mean, for many years, particularly in the '90s, I think there was a weakening, frankly, in auditor vigilance. And the trick, as I've said, is really to have the auditors more worried about the audit committee than they are worried about the management.

And it's quite natural when they're, essentially, hired by the management and when they see the management regularly and they only see the audit committee infrequently, that it's tempting to listen a little bit more to management than the audit committee.

But these questions, if asked, in my view — and if the answers are put on the record — I think it would have a very helpful effect on behavior. Because once on the record, it means the auditors — it means they're on the line.

And I've been on a lot of boards of directors and I've seen, in retrospect, things go by that I wish had been called to my attention by the auditors.

So we have these four questions. And if we'll put up the first one — and I'd like to explain one item. Do we have those up? Yeah.

You can read the question and these are the responses, as we go along, that the auditors have given to these questions.

Now you'll notice on the first one that there is one item that — and incidentally, we owe a shareholder, who I think is going to speak later — it was his suggestion that we actually present these at the meeting. And I think it's a good suggestion. And I think if more companies did it, it would be a good idea. So I thank him for the suggestion.

The major item, which is not material, as auditors define it, but the major item in which we disagree and use a method which I will explain further — actually, it's been changed — but concerns the purchase of life insurance policies, or the reinsurance of people who are purchasing life insurance policies, their so-called viatical settlements.

And we have had a business, of sorts, in that. And it's likely to even be a larger business in the future.

And what takes place there is that somebody, usually elderly, has a life insurance policy and they'd rather have the money themselves than have their heirs get it later on. So, they want to cash out early.

And as you know, a life insurance policy typically has a cash surrender value. And sometimes those cash surrender values are quite low in relation to the actuarial value of the policy. So sometimes those people wish to sell a policy.

We had a case the other day where a 79-year-old woman had an insurance policy amounting to some $75 million. I've never met her, but she must be quite a woman, but — (Laughter)

The cash surrender value of that policy was $2 million. Clearly, for even a 79-year-old in the best of health, that was an inadequate sum for her to receive. But yet she wished to have the cash herself rather than eventually die and leave it to her heirs.

So, we paid — or we actually reinsured a transaction where somebody else did it, and we took only 50 percent of it, but I'm going to use a hundred percent figures.

We reinsured — we bought that policy for $10 million. And under accounting rules — GAAP accounting — we — it is recommended that we write that policy down immediately to the cash surrender value of 2 million. Well obviously, we think it's worth 10 million or we wouldn't have paid 10 million for it today.

But the rules, as they become more clear, say write it down immediately. I happen to think that rule is wrong. But last year, at the end of the year, there had been a total of $73 million applicable to such policies that reflected our purchase price as opposed to the cash surrender value.

In the first quarter of 2004, our activity has stepped up in this field some — the people we reinsure have stepped up their activities, so we get our 50 percent. And that amounts to — it's going to amount in the first quarter to about 30 million.

So, we have adopted — even though we think it's in incorrect — we have adopted the GAAP accounting. And you will see in the first quarter report of Berkshire the charge for the 73 million of last year plus the 30 million in the first quarter this year.

And that gets charged, believe it or not, to realized capital gains. And so, by buying these policies for X on one day and immediately writing them down substantially, that becomes a realized capital loss on our book. Now later on, we expect to get a perfectly satisfactory return from these policies. But that is the main item that is referred to in the auditor's answer on question one.

Now, if we'll go to number 2. You have time to read that.

I like the idea of this question being asked. I've read many reports where the footnotes are such that even if I reread them several times, I still don't know what's happened. And we try to write everything in plain English at Berkshire, and we try to explain things within the body of the letter that might give people the wrong impression if they simply looked at the figures, or that they might not be able to discern.

Because Berkshire's gotten so large that we — there are all kinds of things that are lumped together in the consolidated statements, that I think it's more helpful if we look at separately.

We're going to work at — annually — at trying to disaggregate numbers and information in a way that makes it most useful without turning out something as long as the World Book.

Third item is very simple.

And the fourth item relates to something that became very prevalent in corporate America in the 1990s, which was moving around numbers from one quarter to another or moving them for one year to another.

And I have seen a lot of that. It's deceptive. I like the statement that the two fellows at Google made the other day where they essentially said that if numbers are lumpy or peculiar when they get to them, they're going to be lumpy or peculiar when they get to the public.

And if there's some reason that requires explanation as to why they're lumpy, that the management should explain them. But the one thing they shouldn't do is start playing games from quarter to quarter or year to year in terms of moving numbers around.

And that became very fashionable. I hope it's on the way to being moderated and we will continue to — each year, we will give you these questions at the meeting and we will report on the auditor's answers.

5. Election of directors

WARREN BUFFETT: Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings. Miss Becki Amick has been appointed inspector of elections at the meeting. She will certify to the count of votes cast in the election for directors. The named proxy holders for this meeting are Walter Scott Jr. and Marc D. Hamburg.

Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 3rd, 2004, being the record date for this meeting, there were 1,278,436 shares of Class A Berkshire Hathaway common stock outstanding with each share entitled to one vote on motions considered at the meeting, and 7,766,293 shares of Class B Berkshire Hathaway common stock outstanding, with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 1,121,231 Class A shares and 6,473,904 Class B shares are represented at this meeting by proxies returned through Thursday evening, April 29th.

WARREN BUFFETT: Thank you. That number represents a quorum and we will therefore directly proceed with the meeting.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott, who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

VOICE: Seconded.

WARREN BUFFETTT: Motion has been moved and seconded. Are there any comments or questions?

We will vote on this motion by voice vote. All those in favor say “aye.”

VOICES: Aye.

WARREN BUFFETT: Opposed? Motion’s carried.

First item of business at this meeting is to elect directors. If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he and she may do so. Also, if any shareholder that is present has not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you.

Would those persons desiring ballots please identify themselves so that we may distribute them? And I now recognize Mr. Walter Scott to place a motion before the meeting with a respect to election of directions.

WALTER SCOTT: I move that Warren E. Buffett, Charles T. Munger, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, David S. Gottesman, Charlotte Guyman, Donald R. Keough, Thomas S. Murphy, Ronald L. Olson, and Walter Scott Jr. be elected directors.

WARREN BUFFETT: Is there a second?

It's been moved and seconded that Warren E. Buffett, Charles T. Munger, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chace, David S. Gottesman, Charlotte Guyman, Donald R. Keough, Thomas S. Murphy, Ronald L. Olson, and Walter Scott Jr. be elected as directors.

Are there any other nominations? Is there any discussion? Is there anybody that is at the microphones that would —

AUDIENCE MEMBER: Yes. Paul Tomasik, Thornton in Illinois.

I like the idea of inside directors. I think they're necessary. However, I think we should have the best available. In particular, I'd like you to consider the CEOs of the Berkshire subsidiaries.

If you compare their qualifications to Susan Buffett's and Howard Buffett's, I think you'll find that the CEOs have superior qualifications, particularly, business savvy and the ability to stand up to a forceful CEO.

I'd like to point out that we'll hear how many of these CEOs are independently wealthy and could easily say, "Take this job and shove it." So this is why I am withholding my votes for the directors. Thank you.

WARREN BUFFETT: Thank you. Charlie, do you have any thoughts on that?

CHARLIE MUNGER: I think we should go on to the next item. (Laughter and applause).

WARREN BUFFETT: The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of election.

Would the proxy holders please also submit to the inspectors of elections a ballot on the election of directors voting the proxies in accordance with the instructions they have received.

Miss Amick, when you are ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders, in response to proxies that were received through last Thursday evening, cast not less than 1,123,189 votes for each nominee. That number far exceeds a majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by the Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to the proxies delivered at this meeting, as well as any cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. Warren E. Buffett, Susan T. Buffett, Howard G. Buffett, Malcolm G. Chase, David S. Gottesman, Charlotte Guyman, Donald R. Keough, Thomas S. Murphy, Charles T. Munger, Ronald L. Olson, and Walter Scott, Jr. have been elected as directors.

6. Proposal to publish political contributions

WARREN BUFFETT: The next item is business is a proposal put forth by Berkshire shareholder Human Life International, the owner of one Class B share.

Human Life International's motion is set forth in the proxy statement and provides that the company be required to publish annually a detailed statement of each contribution made by the company and its subsidiaries in various political causes.

The directors have recommended the shareholders vote against the proposal. We will now open the floor to recognize the appointed representative of Human Life International to present their proposal. Is someone here to present that?

TOM STROBHAR: Yes, Mr. Buffett. My name is Tom Strobhar and I do represent Human Life International. And I'm here to present the shareholder resolution regarding political contributions.

But before I do, I'd like to give you a little background. Some of you may remember, two years ago, there was a resolution asking the company to end its charitable giving program.

The resolution said corporate charitable contributions should help, not hinder, the company and suggested certain contributions, especially those related to abortion and population control, were doing just that.

This proposal was soundly defeated by the shareholders, receiving less than 3 percent of the vote. Oddly enough, a little over one year later, Mr. Buffett, in his wisdom, did terminate this program citing the adverse impact his philanthropic interests were having on the livelihoods of some employees at the Pampered Chefs division.

At the time of the resolution, we first learned that Mr. Buffett and Mr. Munger were directing their money to their personal foundations rather than more recognized public charities.

While previous chairman's letters extolled the high participation levels among eligible shareholders, no mention was made that Mr. Buffett, who accounted for 31 percent of the equity of the company, was giving away almost 55 percent of the charitable gifts.

Why all of you B shareholders, who probably comprise a majority of the people in this audience, were excluded from giving, and whose vote on this proposal was dramatically diluted down to 1/200th of the value of an A share — which obviously is not quite democratic.

I refer you to the 1983 Chairman's Letter. In addressing why he wouldn't split the stock, Mr. Buffett describes something he calls "shareholder eugenics."

Mr. Buffett laments how it's impossible to screen entering members of the shareholder "club" for quotes, "intellectual capacity, emotional stability, moral sensibility, or acceptable dress."

Splitting the stock and lowering the price of admission to the club — Class B shareholders take note — "would attract an entering class of buyers inferior to the existing class" and "downgrade the quality of our present shareholder group," end quote.

All told, Mr. Buffett gave to his private foundation almost $100 million, much of it other shareholders' money. This money, in turn, was devoted almost exclusively to population control seeking to lessen the number of people at a time when Western nations, especially those in Europe and Japan, face economic calamity from a baby bust.

How do charitable contributions relate to political contributions? It wasn't until there was a resolution on charitable contributions that we received some disclosure. So too, with the resolution I'm about to present, did we find out the company gave a very modest $200,000 to various political candidates or causes.

While the charitable contributions may have been too much, the political contributions may be too little. Not necessarily from the company, but from other shareholders. If there are politicians or causes in which there is legitimate business interest in supporting, why not give the shareholders the opportunity to help them also?

By publishing the list, the word goes out to our thousands of shareholders who may wish to do the same with their own money. It costs little to publish, provides for transparency, checks any personal abuse, and sets an example to the rest of corporate America.

It also provides an opportunity for all the members of our shareholder club, even B shareholders, to get involved and help this company and help their investment.

And with that, I'd like to read the actual resolution, which I'm required to do.

"Within one month, after approval by the shareholders of this proposal, management shall publish in The Buffalo News a detailed statement of each contribution made by the company or of any of its subsidiaries, either directly or indirectly, within preceding fiscal year, in the respect of any political campaign, political party, referendum or citizen's imitative, or attempts to influence legislation, specifying the date and amount of each contribution and the person or organization to whom the contribution was made.

"Subsequent to this initial disclosure, management shall cause like data to be included in each succeeding report to the shareholders. If no such disbursements were made, to have the facts so noted in the annual report."

This proposal, if adopted, will require the management to advise its shareholders how many corporate dollars are being spent for political purposes, and to specify what politicians or political causes the management seeks to promote with these funds.

Political contributions are made with the dollars that belong to the shareholders of the group and they are entitled to know where their dollars are being spent. A vote for this proposal is a vote for full disclosure. Thank you.

WARREN BUFFETT: Is there anyone else that would care to speak on the motion?

Charlie, do you have any comment?

CHARLIE MUNGER: Well, I preferred our old charitable giving program to the way most corporations do it in America — (applause) — where the controlling officers decide. However, it's a dead horse. It's gone and there's no point beating on the corpse. (Laughter)

WARREN BUFFETT: The dead horse will now speak. (Laughter)

I just want to add one point, because it a little different than occurs at many other corporations. To my knowledge or memory, I don't believe Charlie and I have ever asked any employee or any vendor to Berkshire — any employee of Berkshire or a vendor to Berkshire — for either political contributions or charitable contributions.

There's been no — there's been no use of our positions to, in effect, extract money for our own personal causes, either in the charitable area or the political area. Is that correct, Charlie?

CHARLIE MUNGER: Yeah, but we don't deserve too much credit for not asking other people for charitable contributions. (Buffett laughs)

Think what the reciprocity implications would be.

WARREN BUFFETT: Yeah. (Laughter)

But it's a fairly common activity.

So here we are. We'll — if any shareholder's voting in person, they should now mark their ballots in the — on the motion and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections a ballot on the proposal, voting of proxies in accordance with the instructions they have received? Miss Amick, when you are ready, you may give your report.

BECKI AMICK: My report is ready. The ballet of the proxy holders, in response to proxies that were received through last Thursday evening, cast 27,287.605 votes for the motion and 936,045.815 votes against the motion.

As the number of votes against the motion exceeds a majority of the number of votes related to all Class A and Class B shares outstanding, the motion has failed. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. The proposal fails.

7. Shareholder proposal to "tell us the rules" on motions

WARREN BUFFETT: Does anyone have any further business to come before this meeting before we adjourn? If so —

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: —they should approach microphone 1 to be recognized. I believe we have someone.

AUDIENCE MEMBER: Yes. Paul Tomasik, Thornton in Illinois.

I have a proposal to put written rules for this meeting, the formal part, on the web, in order that this meeting can be conducted fairly and with good faith.

Would you like a little more comment?

WARREN BUFFETT: No.

CHARLIE MUNGER: No.

WARREN BUFFETT: The faster you can make it, the better. But go to it. (Applause)

AUDIENCE MEMBER: Well, that's it —

WARREN BUFFETT: That's it.

AUDIENCE MEMBER: — on that one.

WARREN BUFFETT: OK.

(To person sitting next to him) Is that a motion?

WARREN BUFFETT: Well, do you want to — would you place all — if you have more motions, would you place them, or is that it?

AUDIENCE MEMBER: No, certainly. The other three motions are to put the bylaws and the articles of incorporation up on the website, to write it into the bylaws how shareholders should present motions, and the fourth, to write it into the bylaws how shareholders can make director nominations.

To sum up, what these motions ask for is just tell us the rules. We'll follow them. That's it. Thank you.

WARREN BUFFETT: OK, thank you.

I actually think you came up with a very good suggestion on the audit committee report, which we've incorporated. I don't really think this would add much, but if there are any shareholders voting in person, they should now mark their ballots in the motion — on the motion — and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections a ballot on the proposal, voting the proxies in accordance with the instructions they've received.

Miss Amick, when you are ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders cast 1,153,600.52 votes against the motion. As the number of votes against the motion exceeds a majority of the number of votes related to all Class A and Class B shares outstanding, the motion has failed. The certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank, Miss Amick. The proposal fails.

I now recognize Mr. Walter Scott to place a motion before the meeting.

WALTER SCOTT: I move the meeting be adjourned.

WARREN BUFFETT: Is there a second?

VOICE: I second.

WARREN BUFFETT: A motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say "aye."

VOICES: Aye.

WARREN BUFFETT: All opposed say "no." The meeting's adjourned. OK, now we're — (Applause)

8. Rebuttal of calls for Buffett to leave Coca-Cola's board

WARREN BUFFETT: Now we're going to move into the questions and answers, at least questions. And just ask one as we spelled out before. And we will start with microphone 1, which is in section, what, 121 on my right. And we'll keep moving 1 through 12 until we get till noon. Microphone 1.

AUDIENCE MEMBER: Jonathan Mills (PH) from London, England.

I wondered if you could comment on the views of those people who have stated that, because of so-called conflicts of interest, you should leave the board of Coca-Cola and whether you had any intention of doing so.

WARREN BUFFETT: That we should do what with the board?

AUDIENCE MEMBER: Leave the board. That you personally should leave the board of Coke.

WARREN BUFFETT: I would say that whoever suggested that should do 500 sit-ups. (Laughter)

Actually, Charlie and I — certainly I have — well, I'll Charlie speak for himself — we like the idea and we've encouraged the idea of shareholders behaving like owners. I mean, shareholders have too often behaved like sheep in this country and they got shorn, in many cases.

And big institutional shareholders have sat on the sidelines while some things that might possibly have been corrected, had they gotten active, took place. So we have — we actually applaud the idea of shareholders behaving like owners.

The question is whether they, you know, can behave like intelligent owners. And I think that in the last year or two, as they've sort of woken up, they've searched for checklists of one sort or another to determine whether directors are appropriate in a given company or not.

And frankly, checklists are no substitute for thinking. The real job of the directors is to come up with the right CEO for a company and prevent him or her for overreaching. If they do that job well, the rest takes care of itself.

And you have to think some to determine whether that's taking place. You can't solve it by just running down a little checklist.

I think it was Bertrand Russell who said, "Most men would rather die than think. Many do." (Laughter)

And I think we've seen a little bit of what he was thinking about in some of the voting. I think it's absolutely silly, frankly, if Berkshire Hathaway owns 200 million shares of Coca-Cola, $10 billion worth, to not be able — it's a little silly not to think that the interest that Berkshire Hathaway has in selling some hours of training at FlightSafety would cause me to do something counter to the interests of the shareholders, when we have $10 billion riding on that side of the table. I mean, it's almost absurd, and somebody doesn't understand proportionality at all when they come to that sort of conclusion.

I also think it's absolutely foolish if — just to use Coca-Cola as an example. I think the directors of Coca-Cola haven't even looked, but I think we probably received something like $100,000 a year.

And if we were to go out into the welfare line and pick somebody out who has no income and say, "We'd like you to become a director," and that person would get $100,000 a year, which would be their entire income, and to say that person would be independent — you know, while they would be 100 percent dependent on their income — that person would be independent. Whereas Berkshire Hathaway, or myself representing Berkshire Hathaway with 10 billion of stock — and receiving the same $100,000 a year — is not regarded as independent.

So I encourage — I encourage institutional shareholders to — and large owners — to behave like owners. But I also encourage them to really think logically, as owners should think, in determining what causes they take on and how they vote.

Charlie? (Applause)

CHARLIE MUNGER: Yeah, I think that they, corporate America, needs a fair amount of reform. But the cause of reform is hurt, not helped, when an activist makes an idiotic suggestion — (laughter) — like the one that — (applause) — having Warren Buffett on the board of the Coca-Cola Company is contrary to the interest of the Coca-Cola Company. Nutty activities do not help the cause for which the person speaks.

WARREN BUFFETT: It's a little bit like having a slicing machine in an orchard where you're gathering together apples but you're also picking up a lot of rocks in the process and sticks and stones. So you have a slicing machine with a conveyer belt. And the slicing machine is programmed so that every time something is red and round comes down the line, it slices and comes down, but it doesn't come down on the rocks and everything and ruin the blades.

And, of course, that's fine until a red balloon comes down the line and then you get a big pop and the machine has followed its little guidelines but it's not slicing apples anymore.

And I think — I just — actually, institutions are coming new to really thinking about how they behave as owners. And you would hope that, in the evolutionary nature of learning — that not too many years distance — distant — they would actually think about what's good for the shareholders of the company.

9. Surviving inflation

WARREN BUFFETT: Let's go to microphone number 2, please.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, good morning. My name is Zachys Sarris (PH) and I am from Athens, Greece.

There is a widespread perception that we're heading towards an inflationary environment. What advice would you give to investors who need to preserve their capital and their purchasing power in such an environment?

WARREN BUFFETT: The best thing is to have a lot of earning power of your own. If you're the best brain surgeon in town, or even the best lawyer in town, you will retain purchasing power, in terms of your income, no matter what happens, you know, whether people are using seashells for money, or whatever as time goes by.

In the investment world, it's tougher. But Charlie and I think the best answer is to own fine businesses that will be able to price in inflationary terms and will not have huge capital investment that is required to handle the larger dollar volume of sales.

Some years ago, I used See's Candy in our — in the annual report — as an example of the kind of business that, more or less, can handle an inflationary world and maintain investment and value, no matter what happens to the currency.

Unfortunately, most businesses will not come out well in real terms during inflation. Their earnings may go up a fair amount over time, but they're compelled to put more and more dollars into the business just to stay in the same place.

You know, the worst kind of a business is one that's — makes you put more money on the table all the time and doesn't give you greater earnings. So you really want a business that can have pricing that reflects inflation and does not have very much capital investment that reflects inflation. But inflation is the enemy of the investor, in terms of real returns.

As you know, there are, in this country as well as a half a dozen other countries, there are what they call "inflation protected bonds" — we call them TIPS in the United States — where the income is adjusted — or, the principle amount is adjusted — to inflation. And that's not a bad investment for people that have worries about inflation heating up. And I think, incidentally, we're starting to see it heat up in this country.

Charlie?

CHARLIE MUNGER: Yeah, most people are going to get a very small real return from investment after considering inflation and taxes. I think that's an iron law of the world and if, for a brief period, some of us do better than that, we ought to be very thankful.

One of the great defenses to being worried about inflation is not having a lot of silly needs in your life. In other words, if you haven't created a lot of artificial demand to drown in consumer goods, why, you have a considerable defense against the vicissitudes of life.

WARREN BUFFETT: Charlie, we're selling consumer goods in the other room. (Laughter)

It's OK to talk that way at home, but — (Laughter)

CHARLIE MUNGER: It doesn't do any good there. (Laughter)

WARREN BUFFETT: I know the feeling. (Laughter)

10. Reluctance to hold special meetings for analysts

WARREN BUFFETT: Let's go to microphone 3.

AUDIENCE MEMBER: Good morning, gentleman. My name is Larry Coats, from Durham, North Carolina.

Mr. Buffett, after last year's meeting, my longtime friend and business partner George Brumley [III] sent you a letter addressing several issues. Having participated in the preparation of that letter and on his behalf, I thank you for your response.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: In such, you suggested that many of those issues would be appropriately addressed in this forum. In his honor, I'd ask you to address just one of those, and that is the ultimate generational transfer of Berkshire away from its current base of long-term, self-selected, and well-informed shareholders, and the potential of instituting a series of analyst meetings to address the relative lack of interest in, and ownership, and understanding of, Berkshire by institutional shareholders and investors. Thank you and good morning.

WARREN BUFFETT: Well, thank you. I mean, George was a wonderful man. A great analyst and a friend.

I have some problem with having meetings with subgroups of investors, such as institutional investors. If we had something like that, I think we would want it to be open to everybody. And, you know, that gets to be quite a production.

But I can understand, you know, why A) you'd like to see our managers and hear what they have to say about their businesses. We try to convey a lot about the businesses in the report, but —

Charlie, do you have any thoughts on that?

CHARLIE MUNGER: I don't think it fits our temperament at all well. Many corporations have a huge amount of effort spent in talking to groups of analysts. One of Berkshire's strengths has been that we don't spend time in that way.

That's a very time-consuming process. And it does give some shareholders some advantage over others. We try and be more egalitarian in events like this and the way we write the annual report, et cetera.

WARREN BUFFETT: Yeah, we really like the group of shareholders we have. I mean, we're not about enticing new people into it. But I know your point also is that the present shareholders could better understand Berkshire if they would listen to Bob Shaw talk about Shaw Carpet or Rich Santulli talk about NetJets. And the truth is, it is fun to listen to those people.

But one of the things we promise managers when they join up with us, too, is they that they don't have to listen to bankers, they don't have listen to investment analysts. They just get to run their businesses. They can devote a hundred percent of their time to it. And people like that, and they're more productive because of it.

I mean, we really place no impediments in the way of our managers doing what they do best and what they like to do best, which is run their businesses.

And frankly, a number of them have expressed to me that they're very happy because they existed in a different mode before. And in that mode, they would spend maybe 25 percent of their time on activities that they didn't enjoy and they didn't feel were very productive.

So we want to get across the information about our businesses to you. And believe me, when I write the report and Charlie looks at it, we say to ourselves, "Are we telling you what we would want to know about if our positions were reversed, if we were on the receiving end?" And we really try to put in the report everything that's germane to evaluation.

Now, if you have a market cap of 130 billion, you know, it's really not too important to get keen insights into some business that's making a relative small amount of money. But anything that counts — and really, you have to look at them in aggregates — we want to get across to you.

So, you know, it's — I'm very respectful of your suggestion. It's conceivable to do it.

The Washington Post has a shareholder day, because their annual meeting is turned into a farce often because it's largely dominated by people who are complaining about this story or that story. But the shareholder day is very useful and they do have their managers there and talk about it.

But I really think if we spend six hours here answering your questions about the business and we do a half-way decent job of writing the annual report, we should get across the essential information.

And we're really not trying to get across — we're not trying to talk to an audience that is trying to get some special insight into what next quarter or next year is going to look like.

We're really looking for owners who join us in what we regard as kind of a lifelong investment. And I would say that certainly analysts, like your group, have exactly the same objective we do and want to understand the business that way.

But my experience, you know, in talking to hundreds of them, is that there are relatively few that are actually thinking about, "What do we buy and put away forever?" Like, we'd buy a farm or an apartment house or something. So we'll consider it, but I don't want to make any promises.

11. Compensation plans: specific to the business, simple, and generous

WARREN BUFFETT: Go to number 4, please.

AUDIENCE MEMBER: Good morning, gentleman. My name is Matt Sauer and I'm from Durham, North Carolina.

Regarding compensation, you have commented along the lines of people willing to bet big on their (inaudible) usually have a lot of bet on.

A MidAmerican regulatory filing indicated some attractive prospective compensation possibilities for its senior executive team, subject, of course, to meeting profitability milestones.

Perhaps you might provide some details on the thought process that went into crafting that compensation structure, and in doing so, use this specific example as a reminder about Berkshire's compensation philosophy, related to pay for performance versus the more popular approaches.

If it's easier to figure out and administer, better for owners, and can still attract talented people, why don't more companies adopt such practices?

WARREN BUFFETT: Yeah, we — you could make a lot of money working for Berkshire. Not if you're chairman or vice chairman, but there's a chance to make a lot of money. But it will relate to performance. No one is going to make lots of money at Berkshire for average performance.

And you mentioned the MidAmerican situation. We've got some extraordinary management at MidAmerican. And it's — in terms of how that compensation arrangement was worked out, I was thinking one day about what would be appropriate for the two individuals who are key to the success of MidAmerican. And I took a yellow pad and I spent about three minutes sketching out a proposal.

And I went to Walter Scott, who is our partner in the business and now actually heads the comp committee. And I said, "Walter this is an idea I have, what do you think of it?" And he looked at it and he said, "It looks fine to me."

And we talked to the two managers about it and actually, as we presented it, we had it so that something over 50 percent went to the CEO, Dave Sokol and something under 50 percent went to the number two man, Greg Abel, who's enormously well named.

And when we gave it to David, he said, "Let's just" — he said, "I like it fine, but let's make it 50/50." That's the extent of it.

As you have commented, that's wildly different than the approach at companies. I mean, most companies go through very elaborate procedures in working out executive compensation. I don't think that Charlie and I have spent ever, maybe five minutes, on thinking about any.

We have an arrangement at See's Candy with Chuck Huggins. We worked it out in 1972. It's still in force now.

John Holland took over Fruit of the Loom a couple of years ago. I met with him for a couple of minutes, suggested something, takes up a paragraph or two. And that's what we'll have with John the rest of his life.

It's not highly complex. You have to understand the businesses. There is no one formula we could use at Berkshire that would fit across our businesses, that's asinine.

You don't want them complicated. We don't have anything that goes on for pages and pages. It's not needed. It establishes a relationship between us and the manager that's not good.

So all of our stuff is very, very simple.

At GEICO we have two variables and they're what count, you know. So we make — from Tony Nicely on down, we have everybody participating based on that. We worked that out whenever we took over at GEICO and it's worked fine since and it'll keep working.

But we do not bring in compensation consultants. We don't have a human relations department. We don't have — at the headquarters, as you could see, we don't have any human relations department. We don't have a legal department. We don't have a public relations department. We don't have an investor relations department.

We don't have those things because they make life way more complicated and everybody gets a vested interest in going to conferences and calling on other consultants and it takes on a life of its own.

In the typical large corporation, there's a comp committee. And, as I pointed out in the past, they don't put Dobermans on the comp committees, usually. They — they look for Chihuahuas that have been sedated and — (Laughter)

I've been on 19 boards. They put me on one committee once, and I was chairman and I got outvoted. Do you remember that, Charlie? (Laughs)

CHARLIE MUNGER: I certainly do.

WARREN BUFFETT: Yeah. The —

CHARLIE MUNGER: By two very fine guys.

WARREN BUFFETT: Yeah, terrific guys, actually. And they — you know, the nature of it is that now, particularly with Sarbanes-Oxley, there's lot of committee meetings. The directors meetings are filled up with process.

And you have on one side of the table, some people that usually are spending an hour or two and getting presented with a bunch of material by the human relations department and some outside consultants.

And I've never seen the head of a human relations department or a consultant come in and say, "This bozo you've got is only worth about half what you've been paying him." This just isn't going to happen.

So it's, you know — it's a situation where the intensity of interest on both sides is seldom equal. The directors are often dealing with something my friend Tom Murphy in the past has called, "play money," and the CEO is dealing with something very dear to his heart.

So you've got to expect a situation like that to get gamed over time. Not over time, promptly, actually.

And there is some change in that that's taking place. But it's not being — in large part, it's not being led by CEOs and it's difficult for directors to do — to get a lot done.

They get handed a sheet of paper that shows them comparables elsewhere, and everybody thinks their CEO is in the top 25 percent or something. And so there's a ratcheting effect that takes place.

And now stock options are coming out of favor, so restricted stock comes in. But the idea is to keep the pie very large for CEOs. And if I needed the money, I'd probably be doing the same thing.

Charlie?

CHARLIE MUNGER: Well, I would rather throw a viper down my shirtfront than hire a compensation consultant. (Laughter and applause)

WARREN BUFFETT: Tell me which kind of consultants you actually like, Charlie? (Laughter)

He's not going to answer that.

12. We don't think about investing "categories"

WARREN BUFFETT: We'll go to number 5. (Laughter)

AUDIENCE MEMBER: Warren and Charlie, good morning. My name is Mo Spence from Waterloo, Nebraska.

Years ago, you listed the four or five investment vehicles you considered appropriate for Berkshire, including, I believe, common stocks, long-term debt, and arbitrage opportunities.

In light of your comments in this year's annual report, I was wondering if you could review that list, in order of preference, and specifically comment on them, including the current environment for arbitrage.

WARREN BUFFETT: Yeah. Well, the items you name — and you could break that down by high-grade bonds, you know, versus junk bonds.

The items you mention are all alternatives. You know, Charlie and I sit around and think about what's the best thing to do with Berkshire's money. It's a fairly simple proposition.

And we have a number of things that we feel competent to make judgments on, and we have a number of things that we're not competent to make judgments on. So we narrow — we hope to narrow the field to investments that we think we can understand. And there are a reasonable number of those, although there are a lot that we can't understand.

Anything I would say today, you know, can change tomorrow. We don't think about the categories by themselves.

Now, in a period like summer to mid-fall of 2002, when junk bonds became very attractive, we bought a lot of them. But we didn't make some great decision to buy junk bonds, we just started seeing things, individual items, that started screaming at us, you know, "buy, buy, buy." And then that came to an end.

And so we don't go to the office in the morning thinking what category — how do we prioritize our categories. You know, we have an open mind and whatever we see that day that overcomes, or that crosses the threshold to where we take money out of short-term cash and move into it.

It could be arbitrage — it's unlikely to be arbitrage now, because that's a game that, to play on a scale that would have a meaningful effect at Berkshire, is hard to do.

I mean, take very big deals, and it's something we've done successfully in the past. We've made a lot of money over the years in arbitrage and quite consistently sometimes in the past.

But we don't — Charlie and I do not have a checklist that we talk about every day, or every month, or every year, in terms of prioritizing categories.

We just hope — I hope he gets a good idea, he hopes I get a good idea. And when we get one, we move in a big way.

They have to be big now and that's a limiting factor in terms of what's available for us.

As you know, if you read the annual report, you know, we took a significant position in currencies. We're buying viatical settlements, in terms of the transaction I mentioned a little earlier.

We're open to anything we can understand. Charlie?

CHARLIE MUNGER: Yeah, you really asked us to determine an order of precedency among two or three activities we don't have much interest in at the moment. And that's not something we spend a lot of time at.

In other words, we have all this cash because we don't much like any of those fields at the moment. And spending all the time thinking about orders of precedency among things you clearly are not going to do is pretty fruitless for us.

WARREN BUFFETT: Yeah, I thought I had a slide here but I don't. But it — when we were buying junk bonds in the summer to fall of 2002, we were literally buying securities — and we limited it to the kind of junk bonds we can understand, which is far from the whole universe — but we were literally buying things on a 30, 35, 40 percent yield to maturity basis.

Now, we buy those with a mental attitude of buying common stocks.

Interestingly enough, within 12 months, some of those same securities that were yielding 30 or 35 percent went to prices where they yielded only 6 percent. I mean, that is truly remarkable when you think about that happening in a country that was not in the throes of depression or anything.

I mean, prices do amazing things in securities markets. And when they do something that strikes us as amazing in our direction, you know, we will act.

But we do not know today what we're going to be doing tomorrow. We have — you know, we have some things — a few things we may be doing. They're likely — It's likely we're doing them tomorrow, but there's — we don't hold any committee meetings on this.

And there's, you know, this business where somebody says, "You should have 50 percent of your money in bonds and 35 percent, you know, in equities, and 15 —." We don't go through anything like that. I mean, we regard that as nonsense.

Any further thoughts, Charlie?

No further thoughts, evidently. (Laughter)

13. "Very dangerous to project out high growth rates"

WARREN BUFFETT: Microphone 6.

AUDIENCE MEMBER: Good morning, gentleman. My name is Tony Ado (PH) and I come from New Jersey.

Mr. Buffett, my question is on business valuation and growth. In one of your letters, you mentioned the discounting formula on earnings divided by the difference between the discount and the growth rate.

But if the growth rate is larger than the discount rate and if we use this formula, then we get a negative number. And one way around this — let's call it method A — is to have two growth stages, one with a high growth and the second stage with a low growth.

And the second way, method B, would be to estimate how much the earnings is on the third year for the company and then multiply this by the average price-to-earning ratio to get the price in the tenth year.

I don't know if you use the method A or method B, but if not, I would like to ask, Mr. Buffett, how do you estimate how much a company is worth if the growth rate is larger than the discount rate?

WARREN BUFFETT: Well, you put your finger on an interesting mathematical relationship. Because if you're using a present value discount formula and you put in a growth rate that is higher than the discount rate, as you have postulated, the answer, of course, will be infinity.

And there are a lot of managements around who like to think their stocks are worth infinity, but we — (laughs) — haven't found one yet.

That precise subject was covered in a paper called "The St. Petersburg Paradox" by a fellow named [David] Durand probably 30 years ago. And somewhere, we probably have a copy at our office. My guess, if you go to Google and you put in the name Durand and you put in St. Petersburg, you may be able to call up that article, although they aren't necessarily terrific on old articles.

So if you'd like it, we would — if you'll let somebody know in our office, we'll look around a little and see if we can find that.

It gets very dangerous to project out high growth rates because you get into this paradox. If you say the growth rate of a company is going to be 9 percent between now and judgment day and you use a 7 percent discount rate, it goes off, you know, you get into infinity. And that's where people get in a lot of trouble.

The idea of projecting out extremely high growth rates for very long periods of time has caused investors to lose, you know, very, very large sums of money.

There aren't many companies — just take a look at the Fortune 500, go back 50 years — they're commemorating that — and look at the companies that were there and how many have really maintained rates much above 10 percent. It's not an easy hurdle. And when you get up to 15, you know, you're in the atmosphere and rarified atmosphere.

So that's — there's a real danger in projecting out high growth rates. And Charlie and I will very seldom — virtually never — get up into high digits. You can lose a lot of money doing that.

You may miss an opportunity some time, but I haven't seen people who have been consistently successful doing that. And you do run into this paradox you mentioned.

Charlie?

CHARLIE MUNGER: Well, you're obviously right, when you get a mathematical result that is infinity, to back off and realize that can't happen. And, of course, what people do is they project that the growth rate will reduce and, indeed, eventually stop. And then you get more realistic numbers. What else could anyone do?

14. NYSE specialist system has "worked pretty well"

WARREN BUFFETT: OK, we'll go to microphone 7. I believe that's over here.

AUDIENCE MEMBER: Yes, My name is Jack Oneil (PH). I'm from New Brighton, Minnesota. Thank you for the opportunity to ask questions here and for the opportunity to learn from you and Charlie.

I had a two-part question and I'm striking the first part, which dealt with my concern over how long the country can continue with this ballooning national debt.

My second — my question then is, what is your opinion of the need for specialists on the New York Stock Exchange? Thank you.

WARREN BUFFETT: Charlie, you want to tackle that one? (Laughs)

CHARLIE MUNGER: Well, thank you, Warren. (Laughter)

Generally speaking, I think the specialist system has worked pretty well over the years. There may have been a few troubles lately, but averaged out, it's worked pretty well for a long time. And I'm not all that horrified that some people who stand there all day make a fair amount of money.

WARREN BUFFETT: Charlie actually had a specialist firm, you should know that. That's why I turned the question over to him, despite his snide remark. (Laughter)

How long were you and Jack [Wheeler] the specialists in General Motors on the Pacific Coast Stock Exchange?

CHARLIE MUNGER: About 13 years.

WARREN BUFFETT: Yeah —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: You're looking at an experienced specialist.

15. Buffett predicts "big problems" from derivatives

WARREN BUFFETT: Let's go to number 8.

AUDIENCE MEMBER: Good morning, gentleman. I'm Neil Steinhoff from Phoenix, Arizona.

Thanks for the tips on TIPS. Also thanks for the information in the newsletter — your annual letter — about the books. I particularly enjoyed "Bull!" by Maggie Mahar, I think it was.

I'm concerned about the future for a number of different reasons, in America. The debt, both accumulated by the government and personally, the stock buybacks, which are benefiting the top five executives, continues. The insanity of derivatives and the overpriced market with a P/E, which is also insane. Any comments?

WARREN BUFFETT: Well, which one do you want us to comment on? You only get one question. (Laughter)

AUDIENCE MEMBER: Derivatives.

WARREN BUFFETT: Derivatives.

Well, Charlie and I have expressed ourselves on derivatives. You know, we don't think the probability, in any given year, is necessarily very high, that derivatives will either lead to or greatly accentuate some financial trauma. But we think it's there.

And I think it's fascinating to look at something like Freddie Mac, where you had an institution that perhaps even hundreds of financial analysts were looking at — certainly many, many dozens of financial analysts were looking at. You had an oversight office. You had a creature that was created by Congress, presumably with committees that would be interested in their activities.

You had on the board two of the smartest and highest-grade people that you could have, in terms of fixed income markets, in Marty Leibowitz and Henry Kaufman, and you had a bunch of other very good directors, too.

And, with an auditor present, they managed to misstate earnings by some $6 billion in a fairly short period of time.

Now, all of that wasn't accounted for by derivatives, but a very large portion of it — 6 billion, that, you know, that is real money even — well, in any place. A large part of that was facilitated by activities and derivative instruments.

Now you can look at the Freddie Mac annual report for 2000, whatever it is, '2 or 2001. And you can read the footnotes and you can read the auditor's certificate. And you can look at bunch of high-class, very smart directors.

And you can be comforted by the fact that dozens of people in Wall Street, who are paid just to follow relatively few stocks, were studying this, and that they had conference calls all of the time.

And in the end, what happened? It was 6 billion. It probably could have been 12 billion if they'd wanted.

A lot of mischief can happen with derivatives. And as we've pointed out, Charlie and I have seen it happen.

When there's a derivative transaction, particularly a complicated one — the plain vanilla ones, probably people will not get in big trouble on — but when you have a complicated derivative transaction, and the trader at investment house A is on one side and a trader on investment house B is on the other side, and they record a transaction — which has to be a zero-sum game between the two of them — and both put on the books a profit that day — I've never seen one where they both put on a loss that day — it lends itself to mischief. And the scale is absolutely huge and getting larger all the time.

And I will tell you that I know the managements of some of the companies that have big derivative activities, and they do not have their minds around what is happening.

We didn't have our mind around what was happening at Gen Re Securities. We couldn't. We tried to get our mind around it. We couldn't do it. And that was far from, you know, the most extensive or complicated derivative operation around.

We had the same experience at Salomon. But whatever the figures were at Salomon, they would be a great multiple today. And there was a Sunday in 1991 when we were preparing — or we had the lawyers preparing — bankruptcy papers at Salomon.

And if the Treasury hadn't reversed itself, we would have found a judge some place in Manhattan. He probably would have been watching baseball, eating popcorn. And we would've walked up to his door and said, "You know, here is a situation with Salomon. There's these 1.2 trillion of derivative contracts that the guy on the other side thinks is good and they're not going to be any good," and a lot of other things, and, you know, "It's your baby."

A lot of things correlate in the securities world that people don't expect to correlate. And there are people following similar strategies all over the world, as happened when Long-Term Capital had its problems.

And the world — the financial world — operates on a hair trigger, to some extent. People want to jump the gun and move just ahead of the other fellow.

And when you get huge amounts of transactions, which many people only vaguely understand, you are creating a potential huge problem that may come about because of some other exogenous event that triggers defaults on a huge scale. And that can be very disruptive to financial markets.

So we think they're dangerous as used in society. We use them ourselves, incidentally. You know, we get them collaterized. We've made money off of them.

But I would predict that sometime, in the next 10 years, that you will have some very big problems that will either be caused by, or accentuated in a big way, by people's activities in derivatives.

Charlie?

CHARLIE MUNGER: Yeah, I think part of the trouble in — you were talking about — came because people didn't think enough about the consequences of the consequences.

That's a common error. You start trying to hedge against interest rate changes, which is a very complicated thing to do when you've got a mortgage portfolio where people have options to pay the mortgages off early.

And then, under the accounting conventions, the hedges started making the quarterly results lumpy instead of nice and regular, the way all the institutional analysts like them. So then they gave us another bunch of derivatives to smooth out the returns. Well, now you've morphed into lying.

Well, it's complicated enough to start with. But when you add lying to the process, it's a Mad Hatter's Tea-Party.

And yet, this happens with eminent directors of vast financial sophistication sitting on the board. It shows that the sophistication won't save you. Somebody has to have the common sense to say, "We're just not going there." It's too tough.

WARREN BUFFETT: Charlie was on the audit committee at Salomon and changed it into, you know, six and seven hours meetings. I think you found mismarks that were in the tens of millions of dollars on a single contract with a place with many — you know, tens of thousands of contracts. Isn't that correct?

CHARLIE MUNGER: I think it's fair to say that it was bonkers and that the accountants sold out.

WARREN BUFFETT: Uh-huh. (Laughter)

It's interesting stuff. You might — if you feel in kind of a nasty mood, you might go to a shareholders meeting of some company that has very large positions in derivatives and grill the CEO a little bit about some of the more esoteric transactions.

They get very, very complicated. They get mind-boggling, in terms of trying to figure out the consequences.

And the one thing you can be sure of is that the trader that puts them on will certainly want to mark them at a profit, either immediately or within a year or two, because he gets his bonus too often based on the figures for that year, and will be done in 20 years, because some of these are very long-dated. Will be gone — when the consequences fall to the firm.

Anytime you have incentives, with people who are quite smart, to mismark things, you're going to get mismarks, or temptations to take on risk in an inappropriate manner.

Originally with derivatives, the argument was made that it would disperse risk. That, you know, the Coca-Cola Company faced foreign exchange risk, or some bank faced, you know, interest rate risk.

And the theory was that you would use these derivatives to spread risk around the system. And indeed, there are many people that make that argument now.

I would say that that may work in that manner a great percentage of the time. But the time that counts is when the system has intensified risk and placed enormous credit risk on very, very few institutions.

Believe me, the Coca-Cola Company is in a better position to accept foreign exchange or interest rate risk in a year than some derivatives dealer who has tons of positions on.

And I think, actually, there is much more risk in the system because of derivatives than the proponents of derivatives would say has been dispersed because of the activities.

16. Bill Gates as next Berkshire chairman?

WARREN BUFFETT: Microphone 9, please?

AUDIENCE MEMBER: Good morning. Robert Piton (PH) from Chicago, Illinois. Thank you very much for your countless insights about investing, and life, for that matter.

My question has to do with Bill Gates. You've gone on record stating that Bill Gates is the smartest person you've probably met in your life. Charlie, sorry to break it to you.

WARREN BUFFETT: No, and I haven't said that quite — but you're close. (Laughs)

AUDIENCE MEMBER: I'm close. And you've also mentioned that he can do your job, but you probably could not do his.

WARREN BUFFETT: That's entirely correct.

AUDIENCE MEMBER: OK. So that being the case, given his aptitude, his accomplishments, his ability to keep great people together within Microsoft, would you consider having him become the future chairman of Berkshire in one of two ways.

Either a merger — and if a merger doesn't make sense because it's a technology company and you don't understand it, so you don't want anything to do with Microsoft.

With the second being he resign his post as chairman of Microsoft in order to keep the masterpiece that you've assembled together, as well as keep these very talented managers of all the Berkshire Hathaway companies together, with a leader that you so respect because of his accomplishments and aptitude.

WARREN BUFFETT: Did Bill put you up to this? (Laughter)

AUDIENCE MEMBER: He did not.

WARREN BUFFETT: No, I know that.

You know, it's not a crazy suggestion, but we've got a better answer.

Bill could do my job very well. And I could not do his job. But we also have at least four people within the Berkshire organization that, in many respects, could do my job better than I do. And probably in one or two respects, they might not be as good at certain parts of it. But they would be terrific successors.

We're more blessed in that situation than we've ever been in the history of Berkshire. If you go back 15 years, we did not have four.

And as we add businesses, it's not inconceivable that more potential future leaders come with those businesses. So we're well-equipped.

And we would — we will — barring something terribly unusual — we will have a leader that succeeds me that comes from within Berkshire and has been around for a long time.

One advantage of that — and this would not be necessarily a disadvantage if it were Bill — but one advantage to that is that we really like the culture at Berkshire. And having someone that has operated in that culture for a number of years, I think, is a plus.

Plus, you know, we've seen how they work and we know their pluses and minuses. We are very well-equipped now.

And Bill, I think — to the extent that he spends less time at Microsoft and he will probably be — you know, the Gates foundation will take up, perhaps, more of his time — I don't really think he is looking for my job, although he may salivate at the pay level that's available. (Laughter)

Charlie?

CHARLIE MUNGER: I've got nothing to add.

17. Reading list for improving investment knowledge

WARREN BUFFETT: OK, we'll go to number 10.

AUDIENCE MEMBER: My name is Oliver Graussa (PH) and I'm Vienna, Austria.

I have studied economics and I've read about 40 books about investing and want to be such a successful investor as you have been.

Mr. Buffett and Mr. Munger, when both of you were younger and had much less capital for investing, how many — which publications were the best to get a few excellent investment ideas to be so successful? And how many hours per week, on average, did you spend with reading about companies? Thank you.

WARREN BUFFETT: Well, when we were younger, we spent — probably Charlie, compared to now, spent a lot more time — I spent a fair amount more time — looking at companies.

But we would — if we were doing it over again, we would do it over again pretty much the same way.

We would look at everything in sight that we thought we could understand. And it — the world hasn't changed in that respect. There may be some more people doing it, but there are a lot more companies to look at now.

And we would — we would read everything in sight about the businesses and the industries we thought we could understand.

We would look for things that jumped out at us as being very cheap in relation to the value. And we would have one enormous advantage because we would be working with far less capital, which means the universe of potential ideas would be far greater.

But there's no — there's nothing different, in my view, about analyzing securities now than there was 50 years ago.

Charlie?

CHARLIE MUNGER: Yeah, we read a lot and we thought a lot. I don't know anybody who is wise who doesn't read a lot.

On the other hand, that alone won't do it. You have to have a temperament, really, which grabs the correct ideas and does something with those ideas. And I think most people who read a lot don't have the necessary temperament, and they grab the ideas or they're simply confused by the mass of material. And, of course, that won't work.

WARREN BUFFETT: Yeah, there's probably something — Phil Carret used to talk about having a "money mind," and I would call it a "business mind." And, you know, there are people that are better with, you know, identical IQs, that are better adapted for one than the other. And the temperament is all important.

I mean, if you can't control yourself, no matter what the intellect you bring to the process, you know, you're going to have disasters. And Charlie and have seen one after another that —

It's not a business that requires extraordinary intellect. It does require extraordinary discipline.

That shouldn't be so difficult. But as I look around the world sometimes, apparently it is quite difficult. I mean, the whole world went a little mad a few years back in terms of investments.

And you say to yourself, "How could that happen? Don't they learn anything for the earlier ones?" But, you know, what we learn from history is that people don't learn from history. And you certainly see that in financial markets all the time.

Incidentally, you mentioned books. Charlie, you didn't recommend any books this year?

CHARLIE MUNGER: Well, one book I really like I couldn't buy because it's published only in England. But it'll get here in due course. And that's called "Deep Simplicity" by John Gribbin. It's a perfectly marvelous book. And of course, that's a great title: "Deep Simplicity." That's what we're all looking for.

WARREN BUFFETT: I've been reading "A Short History of Nearly Everything." It's very impressive to — you know, to read about people pondering how to figure out the weight of the Earth or something in the 18th century.

And you would think that minds that would do that would do very well in financial matters. But, you know, if you remember, Isaac Newton spent a significant part of his life trying to turn lead into gold. And he might have made a good stockbroker. (Laughter)

But it didn't do much for him financially. Charlie knows more about Isaac than I do, so —

CHARLIE MUNGER: Well, and he lost an enormous —

WARREN BUFFETT: Yeah, in the bubble —

CHARLIE MUNGER: —chunk of his net worth in the South Sea Bubble. So he invested in an absolute crooked mania. And here was the smartest man in the world. So just IQ points alone won't do it.

18. Admiration for Treasury's crack down on tax shelters

WARREN BUFFETT: Microphone 11, please.

AUDIENCE MEMBER: My name is Martin Wiegand from Bethesda, Maryland. Thank you for hosting this wonderful, educational, and fun weekend. We —

WARREN BUFFETT: Well, thanks for coming —

AUDIENCE MEMBER: —appreciate it.

WARREN BUFFETT: —Martin, yeah. (Applause)

AUDIENCE MEMBER: In this year's annual report, you defended Berkshire's tax payment record against criticism from certain newspaper columnists and Assistant Secretary [for Tax Policy at the U.S. Treasury] Pamela Olson.

Compared to other large corporations, particularly insurance companies, does Berkshire pay its fair share so we can our Berkshire Activewear with the American flag on it with pride?

WARREN BUFFETT: Incidentally, Pamela Olson is here today. I don't know whether she can stand up. But I owe her an apology.

She's done a great job as a public servant and I teased her a little bit in the annual report. But she actually has worked actively at the Treasury in cracking down on tax shelters and some things that Charlie and I think shouldn't exist. So Pamela has my admiration. And, like I say, if she's here and can stand up, we'll give her hand. (Applause).

Some of the tax shelter proposals — I met with her yesterday — and she told me of some things that I've sort of seen myself. But some of the things that have been done and, in some cases, sponsored by the most prominent auditing firms, you know, are absolutely disgusting, and are the reason why, in my view at least, the middle class probably pays a lot more than they should be in terms of raising the total funds that are needed to sustain the government.

Berkshire, as we noted in the report, is a heavy contributor to the Treasury. As I mentioned, if only 540 entities in the country paid what we pay in income tax, no one else would have to pay anything, no Social Security, no nothing.

We have not — I mean, we may own tax-exempt bonds. We own dividends, which receive a dividend receive credit. But we pay on a very, very high percentage of our income — including capital gains — we pay at the full 34 percent corporate rate.

So go out and buy the Fruit of the Loom underwear with the flag on it, you're entitled to wear it. (Laughs)

Charlie?

CHARLIE MUNGER: I've got nothing to add. But you understate the evil that crept into our leading accounts — accounting firms — when they started selling these fraudulent tax shelters in exchange for contingent fees.

One of them actually explained to me that they were an ethical seller of fraudulent tax shelters. (Laughter)

He said, "The other firms just sold these to anybody. And we just sold them to our 20 most important clients so they were more likely to stay secret."

WARREN BUFFETT: Yeah. And of course, the lawyers would write the opinions so that, if they did get caught with these things that they hoped that no one even picked up because they were so obscure, convoluted, the lawyers wrote the opinions so that the — they could walk — you know, when the IRS came around, they could wave that letter and say, "Well, gee, we're sorry we made a mistake, but we did it on the advice of counsel and therefore you shouldn't assess fraud penalties or anything." I mean, they would — we don't want to leave the lawyers out of this, Charlie. (Laughs)

We had people come to our office. Not the auditing firm that we use, I want to make that clear. But we had people come to our office from the top auditing firms with these propositions which they said we had to sign away a given percentage of the amount we saved. And then they would give us these proprietary methods, you know, which would usually involve about 20 off-shore trusts and partnerships around the world and all kinds of things.

Many of — part of the design being to have so many entities involved so that the numbers that popped up here or there on the return, that no agent could figure out what the totality of the transaction was.

You know, it's — those are — the people who don't pay taxes because of that, increase the taxes of the people in this room. So we — I applaud Pamela for her efforts on that and a lot more are needed.

19. "If you're innumerate, you're going to be a klutz"

WARREN BUFFETT: We will go to number 12, please.

AUDIENCE MEMBER: Good morning. My name is Johann Freudenberg (PH) from Germany.

Mr. Munger, you said in a speech that scientific reality is often only revealed by math, as if math, it's a language of God. Could you elaborate on that, and especially tell us the reason why math often reflects reality? Thank you.

CHARLIE MUNGER: It's just the way it is. (Laughter)

If you — it's as though God made the world so that only people fluent in math could understand it.

I think you can handle an ordinary human activity pretty well. But if you want to understand, say, science, you can't do it without math. That's just the way it is. And in business, if you're innumerate, you're going to be a klutz.

WARREN BUFFETT: Keep talking, I'm chewing. (Laughter) We'll go back — go ahead.

CHARLIE MUNGER: The good thing about business is you don't have to know any high math.

WARREN BUFFETT: It may be a disadvantage to know high math, Charlie.

CHARLIE MUNGER: Yes, I think it is. Because you look for opportunities to use this marvelous, complicated tool. And by and large, that doesn't work nearly as well as just using the simple math.

WARREN BUFFETT: Yeah. When my mother sang me songs about compound interest, there really wasn't any need to go further. (Laughter)

20. Buffett's $10 billion Walmart mistake

WARREN BUFFETT: Let's go back to number 1.

AUDIENCE MEMBER: My name is David Farlow (PH) from Minnesota, Minneapolis. Thank you, Warren and Charlie.

A few minutes ago you mentioned the importance of learning from history. What have you learned from the investments you did not make over the last few years that you now regret refraining from?

WARREN BUFFETT: Well, the mistakes we made, and we made them — some of them big time — are of two kinds. One is when we didn't invest at all in something that we understood that was cheap, maybe because we weren't even working hard enough at looking at the whole list, or because, for one reason or another, we just didn't — we didn't take action.

And the second was starting in on something that could have been a very large investment and not maximizing it.

Charlie is a huge believer in the idea that you don't sit around sucking your thumb when you can — when something comes along that should be done that you pour into it.

And that's generally what we've tried to do. But there have been times — and it's usually happened when I've started buying something at X and it went up to X plus an eighth or some intolerable amount like that — and I quit or waited for it to come back. And we've missed, in some cases, billions of dollars of profit because of the fact that I'd gotten anchored, in effect, to some initial price when I could have paid more subsequently and it really was inconsequential.

CHARLIE MUNGER: Do you have anything worse to confess than Walmart?

WARREN BUFFETT: No, Walmart — I cost us about — it's up to 10 billion now. (Laughter)

I cost us about 10 billion. I set out to buy 100 million shares of Walmart, pre-split, at about 23. And Charlie said it didn't sound like the worst idea ever came up with, which is — from him, I mean, it was just ungodly praise. (Laughter)

And then, you know, we bought a little and then it moved up a little bit. And I thought, "Well, you know, maybe it will come back" or what —

Who knows what I thought? I mean, you know, only my psychiatrist can tell me. And that thumb sucking, reluctance to pay a little more — the current cost is in the area of 10 billion.

And there have been other examples, too. And there will probably be more examples in the future, unfortunately.

But that is — that's — on the other hand, it doesn't bother us. I mean, you know, it's maybe instructional to talk about it just a little and I'm glad to respond to the question.

But in the end, we're going to make a lot of mistakes at Berkshire. And we've made them in the past, we'll make them in the future.

You know, if every shot you hit in golf was a hole-in-one, it wouldn't be — you know, the game would soon lose interest. So you have to hit a few in the woods occasionally just to make it a little more interesting.

We'll try not to do that too often. But those will be the kind of mistakes we make. We probably won't make the kind of mistakes — although we have — we made one with Dexter Shoe — but we probably won't make the kind that cost us a ton of money. They'll be much more of omission than commission, I think, you'll find in the future.

Charlie, you want to add any more?

CHARLIE MUNGER: Yeah. At least we are constantly thinking about the past occasions when we blew opportunities. Since those don't hit financial reports, the opportunities you had but didn't accept, most people don't bother thinking about them very much. At least that is a mistake we don't make. We rub our own noses in our mistakes in blowing opportunities, as we just did.

21. Very hard to find a good, honest stock advisor

WARREN BUFFETT: OK, number 2.

AUDIENCE MEMBER: Warren and Charlie, my name is Peter Brotchie from Beverly, Massachusetts. And I would like to thank you both for helping me become a better businessman and a better investor. Perhaps more importantly, you have created, by example, a kind of true north on the moral compass for me to steer by.

While the education has been fantastic, I have found that the demands of owning a successful business and having a large family do not leave time to apply the research stance I have become so wonderfully accustomed to by being a member of this cult.

Please imagine, for a moment, that you are 30 years younger, and have only —

WARREN BUFFETT: I like him.

AUDIENCE MEMBER: — a few holes left in your investment punch card. If you were in my situation, to the extent that you would diversify your holdings beyond Berkshire Hathaway, given this environment, how would you choose the investment managers? Or as Charlie has just discussed when addressing foundations, would you hunt for two more great companies to invest in via common stocks?

WARREN BUFFETT: Charlie, why don't you take a swing at that?

CHARLIE MUNGER: Well, of course you're hunting, that's part of the fun of life. And — but I would say that the chief lesson would be that you're unlikely to find very many in a whole lifetime. And when you find one in which you really have thought it out and have confidence, for God's sakes, don't do it in a niggardly fashion.

The idea that very smart people with investment skills should have hugely diversified portfolios is madness. It's a very conventional madness. And it's taught in all the business schools. But they're wrong. (Applause)

WARREN BUFFETT: The question of finding other advisers is a tough one. I mean, when I wound up my partnership in 19 — at the end of 1969 — and I had all these partners that had counted on me and I was going to mail them back a lot of money, you know, I felt an obligation to at least suggest some alternatives for them.

And I recommended two people who I knew were exceptionally good and exceptionally honest. We put one of them on the board not long ago and reaffirmed it today — Sandy Gottesman. The other one was Bill Ruane.

Now, I'd been around the investment world for a long time at that point, and those were the two I knew, but they were more or less contemporaries of mine. And I'd gotten to know them over the years and I'd seen them for a long time.

So I not only knew their results, but I knew how they'd accomplished their results, which is terribly important. I don't know that generation of managers now. But the fact that, with the number of people I knew, that I could only come up with two, at a time when I was very active, says something about the difficulties of finding managers.

The one thing I can almost guarantee to you is that the promotional types going around to solicit the institutional investors are very unlikely to meet any long-term tests of ability, and sometimes, integrity.

It's not an easy job spotting an investor. I think it's probably easier, depending on the amount of time — you know, you mention having children and a business and the amount of time you can spend on. Every now and then you do — if you're conscious of the investment world and you have some kind of sort of grounding knowledge about what's going on, and you can see something, you know, as we did in junk bonds a couple of years ago, or as we did with all kinds of things, some years back, when stocks were cheaper.

You will occasionally see something that you should load up on. And, as Charlie says, that's what you really have to do. I mean, some of the people in this room loaded up on Berkshire many years ago. And the truth was, they didn't need diversification, you know. I loaded up on it. Charlie did. And you'll see opportunities occasionally but you're not going to see them every day or every week.

If you think you're going to see an opportunity every week, you're going to lose a lot of money because people will come around and tell you that they've got them, and they may not be quite as flagrant as that fellow we had in the movie — (laughs) — but they're a version of them.

Charlie?

CHARLIE MUNGER: The business of selecting investment managers was recently shown to be even harder than I had previously thought it was. A significant fraction of the institutional investment managers who run the nation's mutual funds actually accepted propositions to take bribes for betraying their own shareholders.

It was as if a man came to you and said, "I have a wonderful proposition. Why don't I kill your mother and we'll split the insurance money?" And it was that ridiculous. And yet, a significant number of the people said, "Gee, I would like some insurance money." And they just went right ahead.

WARREN BUFFETT: And they were already rich beforehand.

CHARLIE MUNGER: Yes. And they've destroyed themselves, many of them, by making this insane decision. And I think many of them will probably think the outcome is unjust.

WARREN BUFFETT: And the —

CHARLIE MUNGER: I mean the downfall they've had.

WARREN BUFFETT: And the interesting thing about it, of course, is that here is a huge industry that — where the people who weren't doing it have a great interest in having that reputation of the industry not get stained. And a number of them had to know what was going on.

I mean, this was — I don't — it's hard for me to imagine that people at most large mutual funds, even the ones that didn't — that are mutual fund management companies — even the ones that weren't engaging in the activities mentioned weren't aware of it. I mean, you just — if you're in an industry like that, you're going to hear what's going on.

And the Investment Company Institute was busy patting itself on the back, you know, at one meeting after another and becoming very cozy with legislators.

And there wasn't one thing done until a whistleblower when to [New York State Attorney General] Eliot Spitzer and he got active in a very strong way with a very limited staff.

And he uncovered, and put on the front pages, what was taking place. But the industry itself, with hundreds and hundreds and hundreds of people that most have known what was going on — and it went on for a long time. Never said a word. It's — you know, it makes you wonder a little bit.

22. Asset allocation models are "pure nonsense"

WARREN BUFFETT: Number 3?

AUDIENCE MEMBER: Hi, I'm Bob Klein (PH) from Los Angeles.

You've touched on the issue of asset allocation — capital allocation — in response to previous questions. But I wonder if you could elaborate from a risk management perspective. Wall Street and financial planning firms charge a lot of money for their asset allocation models, say, 50 percent stocks, 40 percent bonds, et cetera.

I know you take a more opportunistic approach to building your portfolio and managing risk, as you mentioned by — as you illustrated — by your junk bond example.

And so I just want you to hammer out how you use price and value as a tool of risk management and asset allocation as opposed to coming at it with a pre-conceived idea of how much should be allocated to each asset class.

WARREN BUFFETT: Yeah, we think the best way to minimize risk is to think. (Laughter)

And the idea that you have — you know, you say, "I've got 60 percent in stocks and 40 percent in bonds," and then have a big announcement, now we're moving it to 65/35, as some strategists or whatever they call them in Wall Street do.

I mean, that has to be pure nonsense. I mean, 60/40 or 65/30 — it just doesn't make any sense.

What you ought to do is have — your default position is always short-term instruments. And whenever you see anything intelligent to do, you should do it. And you shouldn't be trying to match up with some goal like that.

I found it entertaining — I was just reading yesterday in an article, I think it was, about the two fellows at Google and all of the problems they're going to have because they're each going to get a few billion dollars. I mean, it was — I want to send a sympathy card. I almost went down to Hallmark store because this article went on — they've got this terrible problem and that terrible problem and they're going to need lawyers, and they're going to need financial — they don't need anybody.

Those guys are smarter than the people that are coming to them. And they do not have a big problem, and they are very capable of thinking it through themselves.

The people that have the problem are the people who want to sell their services to them and are going to have to convince them that they have a problem.

But so much of what you see when you talk about asset allocation — it's just merchandising. It's a way to make you think that if you don't know how to determine whether it should be 60/40 or 65/35, that you need these people. And you don't need them at all in investing.

Most of the professionals that tell you that you're going to get in great trouble unless you listen to them and sign up for their services, you know, they're good at selling, but —

It's what my brother-in-law — former brother-in-law — that worked at the stockyards used to say was that people would bring in cattle or something. And I'd say to him, you know, "How do get the farmer to employ you to sell to Swift or Armour or Cudahy instead of the guy right next to you. I mean, you know, a cow is a cow and Armour's going to buy it the same way."

And he gave me this disgusted look and he said, "Warren, it's not how you sell them, it's how you tell them." Well, there's a lot of that in Wall Street.

Charlie?

CHARLIE MUNGER: Yeah, people have always had this craving to know the future. You know, the king used to hire the magician or the forecaster and he'd look in sheep guts or something for an answer as to how to handle the next war. And so there's always been a market for people who purported to know the future based on their expertise.

And there's a lot of that still going on. It's just as crazy as when the king was hiring the forecaster who looked at the sheep guts.

And people have an economic incentive to sell some nostrum. It can be sold over and over and over again.

The really interesting figures are when you combine the underperformance of the market, say, by the mutual fund industry, which is probably a couple of points per annum. And that understates it.

Now, if you take all of the investors in the mutual funds who are constantly whipsawing from one fund to another by a bunch of brokers who want commissions, now you take a sub-normal performance and it goes on another three or four percentages points due to the shuffling of the mutual fund investments.

So the poor guy in the general public is getting a terrible result from contacting the experts. And these guys are hitting the Scout troop and the Community Chest drive and are locally reputable people.

I think it's disgusting. It's much better to make a living by being part of system that delivers value to the people who are buying the product. But nobody refrains from creating gambling casinos or something, on my theory.

If it'll work to make money, why, we tend to do it in this country.

23. Workers' compensation insurance fraud

WARREN BUFFETT: Microphone 4.

AUDIENCE MEMBER: Good morning Mr. Buffett and Mr. Munger. My name is Steven West and I am a framed art manufacturer in Morganton, North Carolina.

I feel especially tied to Berkshire Hathaway as I am both a vendor to Nebraska Furniture Mart, Star Furniture, and RC Willey, and also a customer of Larson Jewel.

My question relates to workers' compensation fraud being committed by workers' compensation carriers on manufacturers such as myself, a scandal which I believe is far greater than the scandals that have been mentioned heretofore at this meeting.

As an example, in 1998, when I was trying to figure out why my experience mods were going way out of whack, I received a loss run and I believe, mistakenly, also a check run from my insurance carrier.

It was shocking. Four losses for $152,000 they claimed to the state of North Carolina actually amounted to less than $6,000. And one claim, which they claim they spent $70,072 on, they actually only spent $86.88.

Now naturally, this threw my company into the high-risk pool. It's cost me hundreds of thousands of dollars.

And my question is, are they trying to pull the same stunt on Berkshire Hathaway companies, especially in labor intensive operations, such as Dairy Queen. Because I have not, in the intervening years, been able to get one single copy of a negotiated check out of these insurance company. They will not give it up, even under subpoena, and their behavior is entirely consistent with criminal fraud.

Now, my question relating to the Berkshire Hathaway problems — or companies — is, are your managers attuned to this and are they receiving the actual copies of the negotiated checks that the insurance companies claim that they're spending to settle workers' compensation injury cases? Thank you.

WARREN BUFFETT: Yup. Well, I would say that there's plenty of fraud in various aspects of insurance.

In auto insurance, for example, I mean, obviously, we have fraud units, but I know you're directing your question more to the insurance carriers than actually what takes place with policy holders and doctors and lawyers and various other parties.

But we find that for every dollar we spend on fraud prevention or detection, I think we get back well over $10.

In the comp field, workers comp, you know — we have lost more money in workers' compensation insurance, I would guess — I may be wrong on this, but I would guess than just about any line.

Not necessarily as a percentage of premiums, but in terms of aggregate dollars. It's been a very tough period.

So from the standpoint of — we have one small workers' compensation direct operation in California called Cypress. And then Gen Re had — has written a lot of workers' comp reinsurance and it's been a bit of a blood bath. The rates have not covered the losses.

And I would say that there is a fair amount of fraud that enters into the losses we've experienced, or at least the industry's experienced, particularly at the direct level.

But I — in terms of your dispute with an insurance company, I don't know what company that would be, but I would say that most — many companies that have been in the workers' compensation business, particularly in California in recent years, wish they hadn't been in the business. I mean, they have not been making a lot of money off of defrauding policy holders that I know about.

But Charlie, do you have anything to say on that?

CHARLIE MUNGER: Well, the experience may be related. If a company gets into a lot of trouble from fraud practiced on it by lawyers, doctors, and claimants, and its own affairs are disrupted by fear and agony, that company is likely to start behaving badly with its own policy holders in order to lay the troubles off on somebody. I think that's just human nature.

But I don't think the main fraud in workman's comp is by the carriers against the small businessmen. It's by the claimants, the attorneys, and the doctors, against the whole system. (Applause)

WARREN BUFFETT: That really would be our experience.

As a sidelight, I noticed you were from Morganton, North Carolina. We have a business there, Carolina Shoe. We make work boots. And I give a talk at University of North Carolina some time ago. In fact, I think they have a tape of it still.

And afterwards — I had mentioned in the talk that we had this business in Morganton. And one of students came up to me afterwards. And there were a number of them, and I shook his hand and, making idle conversation, I said, "Where are you from?" And he said, "I'm from Morganton."

And I said, "Oh," I said, "Do you know Carolina Shoe?" And he thought a second, he said, "I don't know her, but I think I know her family." (Laughter)

Never forgotten that fellow.

24. Utility law repeal would help MidAmerican, but no bonanza

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Good morning. Andrew Sole from New York City.

I just want to preface my question by saying that I have a deep admiration and affection for both of you men. And in that spirit, I had got a Golden Retriever puppy a few months ago, and he's been proudly named "Munger."

WARREN BUFFETT: Is he housebroken? (Laughter)

AUDIENCE MEMBER: And Charlie, you'd be very proud. He's just like you. I bring him to Central Park and hundreds of women flock over to pet him.

CHARLIE MUNGER: Really?

WARREN BUFFETT: He's well-named. He's well named. (Laughter)

AUDIENCE MEMBER: That's serious, but this is also serious.

My question has to do with the Public Utility Holdings Company Act, which obviously affects MidAmerica's businesses.

You've spoken that, if it were repealed, you'd be able to commit billions of dollars into the energy infrastructure for the country.

And despite the fact that there was a massive blackout in this country over the last summer, the act has not been repealed. And I'm curious as to what effect it might have if PUHCA wasn't repealed for MidAmerica.

WARREN BUFFETT: Yeah. The Public Utility Holding Company Act was passed in 1935. It was a reaction, and a justified reaction, to some real wild antics that had taken place in the '20s in the public utility field that were most dramatic in the case of Sam Insull, but occurred with a lot of other companies, Associated Gas and Electric and various other companies.

And there was pyramiding of the utility capital structure. And there were a lot of things that were wrong that were addressed in that act. And in our view, that act is long outmoded. And I think that — I mean, the SEC, which has responsibility for administering it, I think there's a lot of feeling there that it's long been unneeded.

And I think that there've been various energy bills that have included the repeal of it. But there was no energy bill passed in the last year. So we live with the Public Utility Holding Company Act. And it does restrict what we do.

It's an interesting question, though, if it were repealed, whether that necessarily would open up lots of opportunities. Because if it were repealed, it's quite conceivable that a number of other companies would also be competing with us, in terms of possibly buying utilities that might have been difficult for us to acquire, or for them to acquire, back when the law was in existence.

So I don't want you to think that, if it gets repealed, that Berkshire Hathaway is necessarily worth a lot more money.

But I do think it should be — I mean, I think it's logical. It's — there are lots of — there's plenty of appropriate regulation in the public utility field and there are advantages to having strong companies like Berkshire Hathaway pouring money — energy requires enormous sums of money. And to the extent we can use capital advantageously in that business, we're ready to do it. And it should not be impeded by the act.

If I had to bet, that act will probably go off the books at some time. But it doesn't seem to be, you know, in the immediate future. It will not necessarily mean we get a lot richer.

Charlie?

CHARLIE MUNGER: Yeah, but if we had a wonderful opportunity in the field now, we would find a way to do it. Probably through MidAmerican, right?

WARREN BUFFETT: Well, we'd find a way to do it. Yeah.

There's been nothing that's been presented to us that we couldn't get done so far. Now it might involve a more awkward structure, but we have not — you know, there's been nothing that we wish we could have done and when we got to the finish line, or a yard from the finish line, we said, "Well, we can't do this because of the Public Utility Holding Company Act."

Now, there might have been other things presented if that act hadn't been on the books.

But it will be no bonanza for us at all if it goes away. It may make life simpler on some very large transaction.

25. Berkshire real estate business will grow

WARREN BUFFETT: Number 7? I'm sorry, number 6. I skipped 6. Number 6.

AUDIENCE MEMBER: Good morning. My name is Andy Lewis Charles from Miami. I think I speak for everyone when I wish both of you gentleman continued health. I would wish you continued wealth, but I think you have that covered.

WARREN BUFFETT: We could use more. (Laughter)

Of each.

AUDIENCE MEMBER: Speaking of MidAmerican Energy, a unit company underneath it, HomeServices, I see as a great opportunity. I would love to see and hear your thoughts about the future growth potential for it, especially against large consolidators like Cendant Corporation. Thank you.

WARREN BUFFETT: Yeah, HomeServices will grow. HomeServices, as you know, owns a number — I can't recall how many, but probably in the area of 15 or 16 maybe — controls a number of local real estate firms. And they retain all of their local identity.

In that way, it's somewhat akin to the whole Berkshire Hathaway model, where we leave our subsidiary companies quite autonomous and they operate as if they were — the managers operate as if they own them themselves.

Well, HomeServices is somewhat along the same line in that we have no national identity, where Cendant works under a couple of big names.

We've acquired one company in North Carolina here in the last month or 6 weeks, Prudential of North Carolina. And we will end up — unquestionably, in my view — we'll end up buying either a few or a whole lot of additional companies over the next 10 years.

We will — we've got great management. We like the business. We hear about opportunities from time to time.

Last year, you know, we participated in roughly $50 billion of transactions. And I think — I'm really vague on this one, but — I better not give you a percentage of the national total that is, but it's a very small percentage. It's a lot of transactions, a couple hundred-thousand transactions.

We're very big in Southern California, for example. We're very big in Minnesota. We're very big in Iowa. Very big right here in Omaha and in Lincoln. But there's an awful lot of places where we aren't at all.

We like to buy leading firms as we go around. And we sometimes like to buy more than one in a community.

It's a good business. It's a very cyclical business. Right now, it's very good. We will go through periods in the next five years. I'm sure we'll go through a period where it's very slow. But we'll keep buying. We'll buy when business is slow, we'll buy when business is good, depending on the price of the institution and the kind of business we're buying.

I don't know how big it can become. It will become bigger than it is now. Relative to Berkshire's total market value, it may not be that — a huge factor. But it's conceivable as we buy more operations, we'll find other things to do with them, too.

I mean, the purchase of a home is a big deal to people. You know, often they're buying furniture at the same time and maybe we can make a suggestion or two.

Charlie?

CHARLIE MUNGER: I've got nothing to add about that business.

26. Charity program reluctantly dropped after anti-abortion boycott

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Good morning. I'm Jim Hayes (PH) from Alexandria, Virginia.

I hate to beat a dead horse, but I really like the charitable plan. Suppose you brought it back and then personally opted out and then we floated you a bonus equal to what you might otherwise be entitled. Would you consider that?

WARREN BUFFETT: Are you talking about renewing the shareholder-designated contribution program?

CHARLIE MUNGER: Yeah.

AUDIENCE MEMBER: Yes. And then personally opting out, and then we could have a shareholders' vote to grant you an option bonus or some kind of tax-advantaged bonus.

WARREN BUFFETT: Yeah, I think that might get a little complicated.

Additionally, I wasn't the only one giving money at all, nor was Charlie, to organizations, primarily pro-choice organizations, in fact over — I don't know of any other than pro-choice organizations — that the people that were causing harm to the Pampered Chef representatives. We had dozens and dozens, maybe even hundreds, giving money on both sides of the issue.

I mean, if you looked at one class — well, the largest classification of gifts went to churches. Probably the largest classification in that, I'm (inaudible) positive, were Catholic churches.

And we had people giving money to everything in the world, which is exactly the way we wanted it. I mean, whatever — it's the shareholders' money.

So even if you had the two of us opt out, we would have organizations that would get violent about the fact that some money was going to pro-choice organizations. And rather than take it out on us, whom they can't hurt, they've taken it out on some very innocent people.

And neither Charlie nor I like the idea of somebody — you know, some woman that's developed a living, you know, in Dubuque, Iowa or in Casper, Wyoming, having her livelihood destroyed because of what we're doing.

So reluctantly, we gave up the practice. I mean, we — actually, I received a letter one time from somebody — some organization was monitoring — said they didn't give — they didn't care if we were giving $10 million to pro-life organizations and $1 to pro-choice organizations, they were still going to boycott our people.

Well, boycotts don't bother me. We had some of that right along, always on a small scale. But — because they can't — they basically can't hurt us in any significant way.

But they can hurt individuals very badly and we're not going to have something around Berkshire that's hurting a bunch of people that have devoted their lives to working with us. So we reluctantly gave it up.

Charlie?

CHARLIE MUNGER: Well, as I said, it's a dead horse and I miss it, too.

27. Buffett family and Berkshire managers will protect the company

WARREN BUFFETT: Number 8, please.

AUDIENCE MEMBER: Good morning. I'm Jay Leiber (PH) from Houston, Texas.

Mr. Buffett, since I'm older than you and maybe even as old, or older, than Charlie, I feel like I can ask this question. And I'll ask it as delicately as possible.

When the time comes that you, I, and Charlie have gone to that big stock market in the sky, I understand that you planned — or at least, I have read — that you plan to give the bulk of your Berkshire Hathaway stock to your charitable foundation, along with your 30 percent of the votes of the company.

If this is correct — and if it's not correct, this question is moot — but if so, what assurance do the Berkshire Hathaway shareholders have that the company will continue to be run as honestly and straightforward as it is now, such as only 15.8 employees or so at headquarters and no —

WARREN BUFFETT: Yeah, the —

AUDIENCE MEMBER: — huge salaries or other ridiculous giveaways to dilute and weaken the equity of the shareholders at that time.

WARREN BUFFETT: Well, for a short while there'll only be 14.8, actually. (Laughter)

But it's a good question — a very good question. Since you're older than I, apparently, I hope we don't go at the same time. The —

There's one slight twist to the estate plans we have. If I die first, all of my Berkshire goes to my wife. And if we died simultaneously, it would all go to the foundation.

But all of the stock will end up in the foundation. In fact, if I died first, she might put my stock in the foundation before her death, but that would be up to her. But it will end up in the foundation — all of the stock.

As you mention, it has 30-odd percent of the votes, although under the tax law, once it's in the foundation, within five years, it would have to either convert to be some of it — it would have to get down to 20 percent of the vote. That's required under foundation law.

In terms of how it would be run in the future, I think it has a far better chance than any company — any major company I know in the country — of maintaining the culture, because it has — it will have people running it who have grown up in the culture.

Earlier, it was — the criticism was made about my wife and my son being on the board, but they are guardians of the culture. They are not there to profit themselves, they are there to profit as the shareholders profit, but also to keep the company in the same way as previously.

One great example of that, of course, has been at Walmart where, when Sam Walton died, a not too dissimilar amount of stock was left among the family. And essentially the Walton family has, in my opinion, done a magnificent job, not only of selecting successors to run the place, but having successors who, if anything, reinforced the culture of Walmart. And it's been an enormously successful arrangement.

The Waltons are there, in case anything goes wrong, to make a change if needed, but they're not there to run the business. And that's exactly the pattern that we hope to have at Berkshire. And I think we have it.

I think I — you know, I can't give you a hundred percent guarantee, but I would far rather bet on the integrity of the family that succeeds me, plus the managers that succeed me, at Berkshire remaining true than I would any other company in — for a long, long time — any other company I can think of.

Charlie?

CHARLIE MUNGER: Well, I would have a reason to fret about this subject, just as you would. And I, of course, have known the members of the Buffett family that would be here after Warren is gone for decades. Don't worry about it. You should be so lucky. (Laughter and applause)

WARREN BUFFETT: It's a question we don't wish to have an instant answer for, though, however. (Laughter)

28. Profits as GDP percentage won't be moved by technology

WARREN BUFFETT: Number 9, please.

AUDIENCE MEMBER: Good morning. James Easterlin (PH) from Durham, North Carolina.

My question — statement is, you have often written in reference to average corporate profitability remaining fairly consistent in the long run, such that return on equities are in the 12 percent range for U.S. companies, and after-tax profits as a percentage of GDP is sticky in the 4 to 6 1/2 percent range.

And the question is, given the advances in technology that brought the inventory-to-sales ratios down to historic lows, given the widespread adoption of the EVA principles by companies, might you think that might change over time?

WARREN BUFFETT: Yeah, I don't think any of the factors that you mentioned will act to move corporate profitability out of the range that has historically existed.

It's going to bob around, obviously, some, but I certainly don't think EVA will do a thing for American corporations in terms of making them receive a greater share of GDP in profits.

Technology, that's just as likely to reduce profits as to increase profits. I mean, as the economic machine of the United States works better and better over time, the main beneficiaries are going to be consumers.

If you took whoever you think is the best business manager in the United States and you put a clone of that person in charge of each one of the Fortune 500, the profits of the Fortune 500 would not necessarily go up, because there's this competitive nature to capitalism where the improvement you get one day, your competitor gets the next day.

And it very much tends to work to the benefit of consumers but not to increase overall profitability.

We see that in the industries we're in. Every — we were in the textile business for a long time and various new products — various new machinery — would come along and it would promise to deliver a 40 percent internal rate of return and get rid of 43 employees or something like that.

And, you know, we just did one after another of those, and when we got all through we didn't make any money, because the other guy was doing the same thing.

And I liken it to everybody at a parade — you know, a huge crowd watching it and somebody stands up on tiptoes and, you know, 10 seconds later, everybody in the crowd is up on tiptoes and they're not seeing any better and their legs hurt. Well, that was the textile business.

And there's an awful lot of self-neutralizing things in capitalism. So I don't really expect any of the factors you named, or any other factors that I can think of, that will move profits up as a percentage of GDP.

And indeed, I think that if you're looking at GDP as being the national pie and profits being what investors get out of it, and the rest belonging to people who are out there working for a living every day, I don't think the relative — the proportions — are inappropriate.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

29. Method for estimating a company's future growth and establishing a margin of safety

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Good morning. I'm Marc Rabinov from Melbourne, Australia.

Mr. Buffett and Mr. Munger, I'd like to ask you, when you assess a business and derive its intrinsic value, how do you estimate the future growth of the business, and how do you decide what margin of safety to use? Thank you.

WARREN BUFFETT: It was the future growth and what, Charlie?

CHARLIE MUNGER: Well — I have difficulty understanding that question fully. He's talking about how do we combine our estimates of future growth with our passion for having a margin of safety. Surely, you can handle that. (Laughter)

WARREN BUFFETT: Well, I can certainly handle it as well as you can. (Laughter)

Every time he laterals them off to me, you know, he calls those audibles. (Laughter)

You calculate — I think you take all of the variables and calculate them reasonably conservatively. But you don't try and put too much windage in at every level.

And then when you get all through, you apply the margin of safety. So I would say, don't focus too much on taking it on each variable in terms of the discount rate and the growth rate and so on. But try to be as realistic as you can on those numbers, but with any errors being on the conservative side. And then when you get all through, you apply the margin of safety.

Ben Graham had a very simple formula he used for just the most obvious situations, which was to take working capital — net working capital — and try and buy it at a third off working capital. And overall, that worked for him. But that method sort of ran out of steam when the sub-working capital stocks disappeared.

But it's the same thing we do in insurance. I mean, if we're trying to figure out what we should charge for, we'll just say, the chances of a 6.0 earthquake in California, well, we know that in the last century, I think that there have been 26 or so 6.0 or greater quakes in California.

And let's forget about whether they occur in remote areas, let's just say we were writing a policy that paid off on a 6.0 or greater quake in California, regardless of whether it occurred in a desert and did no damage or anything.

Well, we would look at the history and we'd say, "Well, there've been 26 in the last century." And we would probably assume a little higher number in the next century, that'd just be our nature. But we wouldn't assume 50. If we did, we wouldn't write any business.

So we would — we might assume a little higher. I would, if I was pricing it myself, I'd probably say, "Well, I'll assume there are going to be 30, or maybe 32, or something like that."

Then when I get all through, I'll want to price the — I'll want to put a premium on it that now puts in a margin of safety. In other words, if I figured the proper rate for 32 is a million dollars, I would probably want to charge something more than a million dollars to build in that margin of safety.

But I don't want to hit it at — I want to be conservative at all the levels and then I want to have that significant margin of safety at the end.

And I guess that, as I understand the question, that'd be my answer. And Charlie, do you want to add to that?

CHARLIE MUNGER: Yeah, that book, "Deep Simplicity," that I recommended to you says that you can predict out of those 26 earthquakes how the size will be likely to be allocated.

In other words, there's a standard power law that will tell you the likelihood of earthquakes of varying sizes. And of course the big earthquakes are way less likely than the small ones.

So you count the math and you know the applicable power law and you guess as to how much damage is going to — it's not that difficult.

WARREN BUFFETT: It becomes more difficult if somebody said they really want protect against a 9.0 or something like that. You know, is it one in 300 years? Is it one in a thousand years? You know, when you get really off the data points.

But that is not what you're looking at in investments. You don't want to look at the things that are that — you don't want to come up with the companies where you make the assumptions that get that extreme.

And you don't have to, that's the beauty about investments. You only have to look at the ones that you feel capable of evaluating and you skip all rest.

30. No single formula for regulatory impact on businesses

WARREN BUFFETT: Number 11?

AUDIENCE MEMBER: Good afternoon. It's James Tarkenton of Durham, North Carolina.

Current examples, including discussion of media ownership rules, FCC regulation of the telecom industry, and proposed oversight changes for mortgage giants Fannie Mae and Freddie Mac are all examples of the legislative, regulatory, and lobbying process as an influence in shaping and reshaping economic moats.

We would be interested in your comments on these and other examples of how competitive advantages are shaped by government.

In general, how do you incorporate the impact of regulation on the size and ferocity of economic moats for various businesses?

WARREN BUFFETT: Well, that varies enormously by the business. I mean, there're some businesses that we think that it's not a very big factor, and there's other businesses we're in — the energy business, the insurance business — where regulatory change could have a huge impact.

You know, we don't have any one-size-fits-all type arrangement. We just try to think intelligently about any business we're in. And if it's — when we bought GEICO in 1995, or bought that last half of it or whichever year it was, the question, you know, whether the regulatory climate would change in some major way, you nationalize auto-insurance — well, all of those things go through our mind and we evaluate them.

But there is no — there's no formula. You know, if we're — if we're in furniture retailing, you know, that is not something we're going to worry about. We're going to worry about plenty of things, in terms of competition, but there are different variables that apply with different intensity to each business we're in. And it's up to Charlie and me to try and think about any of the variables that might hit those businesses, and to weigh them appropriately, and to crank that into our evaluation.

Charlie?

CHARLIE MUNGER: I think it would be fair to say that in our early days, we tended to overestimate the difficulties from regulation. We refrained from buying television station stocks for a long, long time because it seemed like such a peculiar asset when anybody could just ask to have your license jerked away from you each year and they could ask a government agency to do it. And — but it turned out, the way the system evolved, that almost never happened.

WARREN BUFFETT: Yeah, Tom Murphy figured that one out before we did. (Laughs)

CHARLIE MUNGER: Yeah, and we had it — we were slow on the learning curve. Murphy was way better at it than we were.

31. Buy Berkshire or low-cost index fund?

WARREN BUFFETT: Microphone 12, please.

AUDIENCE MEMBER: Hello, gentleman. My name is Vivian Pine and I'm from Tarzana, California.

And my question is, for a new investor buying stocks today, would you recommend that they buy a low-cost S&P index fund or Berkshire Hathaway, and why?

WARREN BUFFETT: Well, we never recommend buying or selling Berkshire. But I would say that, among the various propositions offered you, a very low-cost index fund where you don't put all your money in at one time.

I mean, if you accumulate a low-cost index fund over 10 years with fairly regular sums, I think you will probably do better than 90 percent of the people around you that take up investing at a similar time.

Charlie?

CHARLIE MUNGER: I would agree with that, totally. It's awkward for us sitting here at these annual meetings where we have a sampling of some of the most honorable and skillful stockbrokers around who've done a wonderful job for their own clients and families. But the stockbroking fraternity, in toto, can be guaranteed to do so poorly that the index fund is a better option.

32. Leverage can prevent you from playing out a winning hand

WARREN BUFFETT: We'll go to number 1 again.

AUDIENCE MEMBER: John Bailey from Boston.

As of last week, my house is almost totally covered with Benjamin Moore now. (Laughter)

But more seriously, you spent a fair amount of time talking about the low-probability transformative events. I recall a discussion on the probability of a nuclear event not occurring in any given year for, say, 50 years, at which point it begins to look like, over the time period, it's pretty darn likely and therefore the expected value is a pretty big negative.

There are some other things that could be happening that somebody might expect. For instance, perhaps there is, in fact, a ceiling on consumer debt coverage ratios. If they quit falling, there — that could be a big change.

If you even listen to the United States Geological Survey, they're now saying that sometime in the next 50 years, there could be a fall in the production of oil.

And so, I'd like you to address how you conceive of the portfolio of businesses in the context of these possible transformative events, especially given that over this same time period of maybe the next 50 years, at some point, you're not going to be able to personally revise the portfolio.

WARREN BUFFETT: Yeah, I think it's a fair statement that over the next 50 years at some point, Charlie and I will not personally be able to — (laughs) — participate in portfolio revisions. The —

Well, you're quite correct that people tend to underestimate low-probability events when they haven't happened recently and overestimate them when they have happened recently.

That is the nature of the human animal. You know, Noah ran into that some years back. But he looked pretty good after 40 days. The —

What you mention on the nuclear question, it's a matter — you can do the math easily. What you don't know is whether you're using the right assumptions. But it —

For example, if there is a 10 percent chance in any given year of a major nuclear event, the chance that you'll get through 50 years without it happening, if the 10 percent is correct, is a half of 1 percent.

I mean, 99 1/2 percent of the time a 10 percent event per year will catch up with you in 50 years. If you can reduce that to 1 percent, there's a 60 percent chance you get through the next 50 years without it happening.

That's a good argument for trying to reduce the chances of it happening.

In terms of our businesses, I think Charlie and I are — I mean, we think about low-probability events. In fact, in insurance, we probably think about low-probability events more than most people who have been insurance executives throughout their years. It's just our nature to think about that sort of thing.

But I would say, if you talk about transforming events, or really talk about major events that could have huge consequences that are low probability, they're more likely to be in the financial arena than in the natural phenomena arena. But we'll think about them in both cases.

But we do spend a lot of time thinking about things that can go wrong in a very big and very unexpected way.

And financial markets are — they have vulnerabilities to that, you know, we try to think of and we try to build in ways to protect us against it and perhaps even build in some capabilities where we think we might profit in a huge way from it.

Charlie?

CHARLIE MUNGER: Yeah, that temporary collapse in the junk bonds, where they got down, many of them, to 35 and 40 percent yields, that's a strange thing. And to have all those things pop back — you know, quadrupling in a short time. There was absolute chaos at the bottom tick of that.

And that isn't as much chaos as you could have. And of course, it can happen in common stocks instead of junk bonds.

So I think if you're talking about the next 50 years, we all have to conduct ourselves so that we — it won't be all that awful if a real financial crunch of some kind could come along. Either inflationary or a typical deflationary crunch of the time [kind] that people used to have a great many decades ago.

WARREN BUFFETT: Probably the most dramatic way in which we are — give evidence of our — of your worries, is we just don't believe in a lot of leverage. I mean, you could have thought junk bonds were wonderful at 15 percent because they eventually did go to 6 percent, you would have made a lot of money.

But if you owed a lot of money against them in between, you know, you wouldn't have been around for the party at the end.

So we believe almost anything can happen in financial markets. And the only way smart people can get clobbered, really, is through leverage. If you can hold them, you have no real problems.

So we have a great aversion to leverage and we would predict that a very high percentage of the smart people operating in Wall Street, at one time or another, are likely to get clobbered through the use of leverage.

It's the one thing that forces you — it's the one thing that ends — or can prevent you from playing out your hand. And all of the hands we enter into look pretty good to us. But you do have to be able to play them out.

And the fascinating thing to me is that — just take the junk bond situation. In 2002, you had people with terrific IQ — tens of thousands of them operating in Wall Street. You had the — money was available. They all had a desire to make money.

And then you see these extraordinary things happen in markets and you say to yourself, you know, can these be the same individuals that two years later or two years earlier were buying these things at prices that were double or triple or quadruple what they sunk to in between? And did they all go on vacation? You know, did they lose their ability to raise money?

No, the money was — you know, Wall Street was awash in money, and it was awash in talent, and yet you get these absolutely extraordinary swings.

I mean, it doesn’t happen with apartment houses in Omaha or, you know, with McDonald’s franchises or farms or something. But it’s just astounding what can happen in the marketable securities department.

And the big thing you want to do is, at a minimum, you want to protect yourself against that sort of insanity wiping you out.

And better yet, you want to be prepared to take advantage of it when I happens.

Now it’s about noon, so we will come back and begin at microphone 2 about, say, a quarter of one.

Afternoon Session - 2004 Meeting

1. Difficulties of judging whether a company has ethics

(Note: Video recording begins with meeting already in progress.)

AUDIENCE MEMBER: After reading this story on Enron, I would like to ask you the following question.

How does an entry-level employee in a large company find out if her employer operates with a long-term perspective, and with honesty and integrity?

WARREN BUFFETT: Well, that's a very good question. I'm not sure I'm going to have an equally good answer. It —

You know, you pick up signals — or frequently, you can pick up some signals — about what is going on at the top of a business if you're at a lower level. But I would say it would be very easy to be fooled on that subject.

Charlie and I would tend to be looking at things that they do in public in relation to their investors and the promises they make, and all of that sort of thing. But I think that might be tough for people, and it wouldn't always give you a great guide.

I've — we've been suspicious of companies, for example, that place a whole lot of emphasis on the price of their stock.

I mean, when we see the price of a stock posted in the lobby of the headquarters or something, you know, things like that make us nervous. But I'm not so sure that's, you know, that that would be enormously helpful.

So I guess you just have to sort of pick up from coworkers, publications, pronouncements of the leaders, the sort of culture that was being presented to them and the world, and, you know, you might get suspicious about it.

But I don't think I have a really good answer for that, do you Charlie?

CHARLIE MUNGER: No, it's obviously easy when you've got a caricature of a person like Bernie Ebbers or Kenny Lay. I think it's easy to say that you've got almost a psychopath — (laughter) — in charge.

But what fools you is a place like Royal Dutch. If I'd been asked to guess —

WARREN BUFFETT: Ah!

CHARLIE MUNGER: — major companies with sound, long-term cultures, and a good engineering values, and so forth, Royal Dutch would have been near the top of my list.

And to have the oil reserves phonied for years, and internal reports of people who were tired of lying.

If it can happen at Royal Dutch, believe me, it can happen a lot of other places.

WARREN BUFFETT: Yeah, Charlie and I would not have spotted it at Royal Dutch by any of the means that we normally use.

In fact, we — as Charlie said, we might have used that as an example of some place that was almost certainly above reproach. And then you do read the emails and all that.

CHARLIE MUNGER: But we don't learn, because I would still expect that Exxon's figures were fair.

WARREN BUFFETT: Yeah.

I think you — what was — what transpired in the 1990s, you know, was this gradual — and later on, not so gradual — embracing at the top of the feeling that anything goes.

You know, I don't — I'm not going to speculate as to the motives at the top of Shell.

But there was so much going on where people saw the fellows — in most cases fellows, unfortunately — that were at their clubs, that they saw at other corporate meetings, were respected business leaders, they saw just one after another that were really cutting corners in one way or another.

And, you know, situational ethics can take over in that. People do, I think, they sink faster to a lower prevailing morality than they rise to a higher prevailing morality.

But they do move in the direction of what they perceive to be the prevailing morality of those around them, in many cases. And certainly the corporate world in the late 1990s, particularly, it was extreme on that.

2. Congress shouldn't make (immoral) accounting rules

And that leads me into — I ran into a friend at the lunch break who's involved in these matters. And he suggested, and I'm delighted to put in a plug to encourage all of you to write your congressman and senators to give your views on whether stock options should be expensed, or whether indeed, whether Congress has got any business legislating on the question of what proper accounting is.

It was a disgrace some 10 years ago when the United States Senate essentially threatened the accounting standards board with extinction and bludgeoned Arthur Levitt, then running the SEC, at the behest of a lot of rich contributors, to declare that — to override the accounting standards board's pronouncement that options should be treated as expense.

And it was — and I think in a very significant way, it accelerated the "anything goes" mentality of 1990s.

At that point, when Congress says it's more important to have stock prices go up than it is to tell the truth, and they voted 88 to 9 in order to do it, as I remember, I think there was a shift in morality among many corporate executives.

You may remember that the FASB then backed off, but still said that expensing was preferable. And having said it was preferable, 498 out of the 500 companies in the S&P took the less preferable method.

All of the big auditing firms at that time endorsed their big clients' views, in order to report higher earnings. Now, all four accounting firms say you should count them as expenses.

Well, they're right, now, but it just shows what was going on in that period when, on a question of accounting principles, and when really nothing has changed, when what were then five — the Big Five —have shifted 100 percent to where the Big Four are now, and, now, they say options should be expensed.

So, if you are inclined to write your congressman or senator, tell him you really think the FASB knows more about accounting than they do. And I think you'll be right.

If you want to have some fun, go to Google and type in two words. Type in the word "Indiana," and type in the word "pi," that's the mathematical symbol pi. And when you do that, you'll see a number of stories come up.

And they relayed how in 1897, at the instigation of one legislator who was responding to a constituent, the House in Indiana voted almost unanimously, it may have even been unanimously, it says what it was on Google, to change the value of pi. (Laughter)

I'm, you know, I'm not making this up. It's checkable.

And it seems that there was a fellow that thought he'd discovered some new relationship between circumference and diameter, and area, and a few things. And it came out to 3.20 if you worked through his formula.

And he offered to give this royalty-free, as he put it, to the State of Indiana to teach its children so that they would have not only the truth, but they'd have an easier number to work with than the long decimal that heretofore had been thought of as pi.

Well, that passed the Indiana legislature. And it passed the House. By the time it got to the Senate, there were a few people that were still clinging to the old values who managed to shoot it down.

But I would submit that in the — in 1993, that the U.S. Senate cleansed the record of the Indiana legislature by outdoing them in attempting to change the rules on something, on a subject, they knew nothing about.

And I think some of the excesses of the 1990s that followed came about through the fact that they knew 88 senators were willing to declare the world was flat if constituents who had contributed enough money to them wanted it thus.

Let's — we pause now, go back to our schedule here.

Number 3. Oh, Charlie, do you have anything to say about the Indiana legislature?

CHARLIE MUNGER: Well, I — the current members of Congress that want to retain the former abusive accounting, which are probably a majority of the House of Representatives, are way worse than the people who wanted to round pi to an even number.

Those people were stupid. (Laughter)

These people are mostly not stupid, but dishonorable. I mean, they know it's wrong, and they want to do it anyway. (Applause)

3. "Too many conflicts" for a Berkshire fund management company

WARREN BUFFETT: Let's go to number 3.

AUDIENCE MEMBER: Hi, my name is Nate Anthony (PH), from Hinsdale, Illinois.

First, I would like to venture a response to an earlier question about the future of Berkshire.

I believe it is our responsibility as shareholders to think for ourselves and ensure that Berkshire is run as respectably in the future it has been until now.

You both have had a lot to say, both today and in the past, about how mutual funds should be run. But to my knowledge, we do not directly have a fund management business.

What do you think about putting your words in action, and offering to have a Berkshire company manage the assets of funds where the directors are dissatisfied with present management?

WARREN BUFFETT: Yeah, the problem would be, there would be too many conflicts.

You know, we're managing so much of our own money at Berkshire that to take on the responsibility for managing another group of people to whom we would owe our best efforts, and handling that situation of wearing two hats ethically, I wouldn't know how to do it.

I certainly wouldn't want to start a fund management company and be prorating all purchases between Berkshire and that fund management company, or the funds that it managed.

I — we've thought about it plenty. I mean, we've had all kinds of propositions put to us.

And obviously, we could sell it big time. But when we got through selling it, then we'd have the problem of administering it fairly. And I don't know how we would do it. Charlie, do you?

CHARLIE MUNGER: No, that's why we don't do it. But — (laughter) — I must say it's an attitude that doesn't seem to bother many other people. (Laughter)

4. New Omaha convention center allows more people to attend

WARREN BUFFETT: Microphone 4, please.

AUDIENCE MEMBER: Norman Rentrop from Bonn, Germany.

Two thanks and one question. My thanks go to both of you for allowing us investors to participate on equal terms with you.

No management fees, no performance fees, no transaction fees. (Applause)

My thanks also go to the people of Omaha for building this very fine new convention center. (Applause)

WARREN BUFFETT: Our thanks, too.

I'll interrupt you for just one second. We wouldn't be able to hold this meeting if we'd been limited to the facilities we had last year.

Last year we had the biggest facility in town. And I was told that we have at least 19,500 people here. And that would have been many, many thousands beyond what we could have had last year. And this is, — (applause) — this facility really does the job.

Incidentally it's known as the Qwest Center. If you read about it in the paper, they have a — they seem to have some unwritten rule — or maybe it's a written rule — that they can't use the name. So you will not see that name in the paper for reasons that absolutely baffle me.

But this is the Qwest Center, and they've done a wonderful job with it. And Omaha has 19,500 people here today that otherwise might have to go to Kansas City. So, thank you for thanking them, and now, your question, please. (Applause)

5. "I'm the only one that can double-cross you"

AUDIENCE MEMBER: My question is your outlook on buying companies. You have taught us when stocks are priced high, and companies are priced low, then buy companies.

In the 1960s and '70s, we did see the rise of the conglomerates. Then came in the pure industry plays. Now, we see a huge amount of money in private equity. And somehow private equity is competing for buying companies.

So my question is, what is your outlook on the future of the buyout and the buying company industry?

WARREN BUFFETT: Yeah, you're absolutely correct that the private equity funds are a form of competition with Berkshire in buying businesses.

We don't really seek to buy businesses cheap, because you're not going to get the chance to do that. We haven't been able to do that.

We do get occasional chances to buy them at what we would regard as fair value. You'll never buy companies as cheap as stocks sometimes get. I mean, sometimes stocks sell for very low valuations compared to intrinsic value.

Businesses just don't do it. I mean, the reason is the prices of stocks, like those junk bonds we talked about earlier, are set in an auction market, and that market can do extreme things. But businesses are sold in a negotiated transaction, and that doesn't get as extreme.

Nevertheless, our preference — our strong preference — is that we would rather buy businesses at fair prices than stocks even a little cheaper. And the private equity funds are our competition.

On the other hand, we have bought a reasonable number of businesses in recent years, and we'll buy more in the future.

If somebody wants what we are offering, you know, we are somewhat one of a kind, in that we can — we will buy a business, and the people that sold it to us, if they built that business, are really able to run it as if it's their own indefinitely in the future. So they —

If they have a tax reason, if they have a family situation, or whatever, where they want to sell some business they love, and they don't want to auction it off like a piece of meat, and they don't want some guy buying it and then leveraging it up, and then reselling a couple years after changing the accounting or something of the sort, they come to us.

And they know they'll get the result they want. And that happens periodically.

It doesn't enable us to buy super bargains or anything like that. It just doesn't work that way. But it does let us put the money to work at a sensible rate.

There will be more people like that. Unfortunately, we need big businesses, and, you know, they don't come along every day. But as I've said, when they — if you find that kind of owner —

If I owned a business that was big, and maybe my father had started, my grandfather had started, and I worked a long time for it but for one reason or another I had to monetize it, you know, I would sell to Berkshire.

It's very simple, because I wouldn't regard the carving up of it to get perhaps the highest — a higher price — which might or not — might not be higher — but I wouldn't regard that as the ultimate goal in life.

I think it's kind of crazy, you know, to spend — I think it'd be kind of silly to auction off your daughter to whatever, you know, whatever man is willing to pay the most for her. And I feel the same way about a business you've created lovingly over decades, and decades, and decades.

And we will buy some more. It's a matter of luck whether it happens in any given quarter, or even any given year.

But there's really no one else can quite make the promises that we can make. I mean, the degree of ownership that I have in Berkshire, and the way I've got it set up for the future, where none has to be sold, you know, my promises will probably be about as good as you can get in that arena.

Most big companies simply can't do that. If their board of directors, you know, decides they wanted to have a pure play, as you put it, in something. You know, what can be done about it?

I tell perspective sellers basically, "I'm the only one that can double-cross you." I mean — and I can double-cross them. I mean, if I, the next day, want to pull something on them, I — it's not contractual, what I've said to them, in all probability.

But nobody else can. We're not going to get some management consultants in, and they say you ought to rearrange the business, or we're not going to get Wall Street dictating to us.

And that's, I think, a significant advantage over time. I think it'll enable us to buy businesses, but we do have a lot of competition, as you point out.

Charlie?

CHARLIE MUNGER: Yeah, it's been interesting, though, that we've had this private equity competition for a long time, and one way or another we've managed to buy a few things. (Laughter)

6. David Sokol defends MidAmerican's environmental record

WARREN BUFFETT: OK, we'll go to number 5.

AUDIENCE MEMBER: Hello, my name is Dan Cunningham, and I'm from Boston, Massachusetts, home of the 2004 world champion Boston Red Sox. (Applause and laughter)

Thank you, Warren and Charlie, for providing this forum, and teaching over the years. It's much appreciated.

In a recent New York Times magazine cover story titled, "Up in Smoke," David Sokol, who runs Berkshire's MidAmerican Energy business was cited as a prominent CEO actively working to roll back the United States Clean Air Act, which 80 percent of Americans view as crucial to our public health.

MidAmerican, itself, was cited as a major mercury polluter, among other things.

With this in mind, could you see a role for a type of independent oversight committee charged with the purpose of auditing for shareholders the social responsibility of Berkshire's businesses?

This committee would monitor costs that Berkshire's businesses incur for our society, but do not show up anywhere in an income statement. Maybe in Berkshire's case, this would be a fraction of a person instead of a committee. Thank you.

WARREN BUFFETT: Yeah. Is Dave here? I can't, it's hard for me to see here. Do you see Dave? Marc [Hamburg], is David here?

We'll go to a — yeah, he might —

I'd like to have David respond to that, because, you know, I have seen MidAmerican actually lauded in many — a great many respects.

I did not see that particular article, but I know that if there were anything being done, that had been judged wrong, I would have heard about it. So maybe David can address that, if he will.

Well, he can — there's a mic. Either come up here, or go to the microphone that's nearest.

DAVID SOKOL: Yeah, Warren, this is David.

WARREN BUFFETT: Yeah, OK, uh-huh.

DAVID SOKOL: The article actually does not criticize MidAmerican for any air emissions. It criticized me for two years ago being a "Ranger" in President [George W.] Bush's election.

For what it's worth, I'm no longer a Ranger, but that was the — the focus of the article was energy CEOs trying to influence legislation.

That's not why I was a Ranger, and frankly, MidAmerican's environmental policies, I think, rank among the best in the industry.

WARREN BUFFETT: Thanks, David. Yeah, I've never seen any criticism of MidAmerican. And matter of fact — (applause) — David, could you tell them what happened with that J.D. Edwards study just recently?

DAVID SOKOL: Yeah, we were ranked nationally number two in the country for environmental reliability, availability, and customer satisfaction — number one in the Midwest out of 55 utility companies.

WARREN BUFFETT: Thanks, Dave. (Applause)

7. U.S. has "certainly benefited enormously" by immigration

WARREN BUFFETT: Number 6, please.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. My name is Van Argyrakis. I'm from Omaha.

Many U.S. multi-national corporations depend on the importation of foreign workers.

What is your opinion on the current state of U.S. immigration law as it applies to the employment of highly-skilled permanent workers?

WARREN BUFFETT: Charlie, you want to comment on that?

CHARLIE MUNGER: Well, of course, that's a subject on which reasonable minds disagree.

My personal view is that I'm almost always glad to have very talented people come into the United States, and I'm almost never pleased when the very bottom of the mental barrel comes in. (Laughter)

WARREN BUFFETT: Yeah. We may differ just a bit on that one. (Laughter)

The — this country has certainly benefited enormously over the decades, you know, by immigration.

We started out with 4 million people in 1790. China had 290 million at that time, just about what we have now. Europe had well over 75 million.

So you had 70 times as many people in China. You had, probably, 20 times as many people in Europe. We had the same degree of intelligence in China, or in Europe, as we had here. We had similar natural resources. And now this country has well over 30 percent of the GDP of the world.

So it's a pretty remarkable story. And how to attribute — or how to quantify the various components that entered into that is very difficult, but we've certainly been a country characterized by lots of immigration.

And whether that is responsible in any way for the incredible record of this country, I don't know. But I suspect that it was. And I think what Charlie would like to do is perhaps be the admitting officer. And — (laughs) — it would work —

CHARLIE MUNGER: You're right.

WARREN BUFFETT: It would work pretty well if Charlie was, but in the absence of that I think — I don't think, net, this country has been hurt by immigration over time.

8. Why we don't split Berkshire's stock

WARREN BUFFETT: Number 7?

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. I would like to thank you for being here.

Well, my question pertains to price discovery and liquidity. It is a common perception that, unless there is adequate liquidity, price discovery is hurt.

Now if liquidity helps price discovery, then does it make sense to split the stock of a company which has a low liquidity problem? As a corollary, why do you consider stock splits and bonus issues to be bad for shareholders in the long run? Thank you.

WARREN BUFFETT: Stock splits, and what else Charlie?

CHARLIE MUNGER: Bonus issues.

WARREN BUFFETT: And what's the relation, I don't get it.

CHARLIE MUNGER: He didn't indicate a relation —

WARREN BUFFETT: Oh.

CHARLIE MUNGER: He just asked you to describe —

WARREN BUFFETT: It's just two —

CHARLIE MUNGER: — what's wrong with both.

WARREN BUFFETT: It's two questions, then. (Laughter)

Yeah, well, our — we have explained how we think about stock splits. There's no religious view against them. We don't think companies that do them are evil or anything of the sort.

We do think we've got the best group of shareholders in the world, and I think that a meeting like this, to some extent, is evidence of it.

We've got people that are more in sync, I think, with the policies of the company. We certainly have people who are more long-term in their view of Berkshire — or their intentions — regarding Berkshire.

I think we have people that understand their investment in Berkshire better than — well, really better than other large American corporation. We've got the lowest turnover of any large American corporation. Now, why is that?

Well, people can buy stock in any company they want to. I mean, you could have bought stock in Berkshire, or something else. But there's this self-selection process of who comes in, and there's a self-selection process of the people that just say, you know, that company doesn't interest me.

And I would say that people who say they aren't interested in a stock that sells in the thousands of dollars a share simply because it sells in the thousands of dollars a share, are not — would not as a group be as intelligent, and informed, and long-term in their outlook, and as in sync with the policies of management, as this group.

It's not a killer of a thing, obviously. But it's a sign — it's a symptom — of people with a somewhat different attitude toward the stocks they own. Now, somebody is going to —

If we have a million and a half Class A equivalent shares — we have a little more than that — outstanding, somebody's going to own them all. So it's just a question of who is attracted and who is repelled to your — from your shares.

And I think not splitting, and some other things we do at Berkshire — a number of other things we do at Berkshire — has attracted a group of shareholders that really come the closest to an investment-oriented group, as is almost possible in a widely traded, widely available company.

And we like the group we've got. We're not looking for the people who think it would be a more attractive stock if, instead of selling at 90,000 a share, it sold at $9 a share. Nothing wrong with those people, but they are —

If we were choosing partners, we would choose the group we have over the people who think a $9 stock is a wonderful thing.

Charlie?

9. Munger: liquidity is not a "great contributor to capitalism"

CHARLIE MUNGER: Yeah, and on the second part of that question, I think the notion, which is taught in so much of modern academia, that liquidity is this — of tradable common stock — is a great contributor to capitalism — I think that is mostly twaddle.

The GNP of the United States grew at very good rates long before we had highly-liquid markets for common stock.

I don't know where people got that silly notion. I think the liquidity gives us these crazy booms, which have many problems as well as virtues.

And in England, if you'll remember, after the South Sea Bubble, England banned tradable common stocks for decades. It was absolutely illegal to have a company so widely held you got a liquid market in the shares, and England did fine during that period when you didn't have a stock market.

So, if you think that liquidity is a great contributor to civilization, why then you probably believe that all the real estate in America, which is relatively illiquid, hasn't been developed properly.

WARREN BUFFETT: The kings actually commented on the perversions brought about by liquidity. But of course, the truth is that Berkshire trades on average $50 million or so of stock a day. So there's very few people that are going to have any problem with Berkshire, the liquidity in the stock.

CHARLIE MUNGER: But we're trying to create more of them.

WARREN BUFFETT: Uh-huh.

CHARLIE MUNGER: More people who have this big liquidity problem, because they own so much stock.

10. Buffett's moral distinction between owning a company or a stock

WARREN BUFFETT: Let's go on to number 8, please.

AUDIENCE MEMBER: Hello, there. This is Michael Angelo (PH) from San Francisco.

My general question is about how ethical concerns enter into your asset allocation decisions.

So, for example, I think there's some strong arguments that can be made that, say, Classic Coke should never be part of anyone's diet.

If such an argument could be made, and you were convinced of it, would that change the way that you viewed Coca-Cola Company as part of your portfolio?

WARREN BUFFETT: Well, I think that's a hypothetical that simply wouldn't happen. I mean, I've been drinking five of them a day, you know, and maybe it's the combination of that and peanut brittle, you know, that does the job. But I just feel terrific. The — (Laughter and applause)

We passed one time on the chance to buy an extraordinarily profitable company, because Charlie and I met the people that ran it. And they were perfectly decent people, too.

And we went down in the lobby of the hotel that we met them in, and we just decided that in the end we didn't want to be involved in that.

On the other hand, I would have bought stock, as a publicly traded stock, in the same company. Charlie will give you his view on that later.

So, I do not have a problem buying stock in companies — marketable securities — the bonds of companies in the market — that engage in activities that I wouldn't probably endorse myself.

I would have trouble owning outright, and actually directing the activities, of some of those companies.

But, you know, the — any major retailer in this country is — virtually — is going to be selling cigarettes, for example. And if they're not declared illegal, it does not bother me to own — it would not bother me to own those retailers outright — or it does not bother me to own the stock.

CHARLIE MUNGER: Yeah, but you wouldn't buy a company that made the tobacco and concocted the advertisements.

WARREN BUFFETT: No, we — and, you know, I can't tell you perfectly why that, I mean, I can't tell you that's the perfect line, or I can't tell you precisely why that's where I draw it. But I will tell you that is where I draw it.

We would not be in the manufacture of it, but I — we owned stock at one time in R.J. Reynolds. Before it had the LBO, we owned bonds in it. And, you know, I would still be doing it if I liked either the bonds or the stock.

We would not buy the manufacturer. And like I say, we walked on one that — and we went down to the hotel to talk about it though, too. (Laughs)

So we'd have to say that we were thinking about it, but we decided not to do it.

Charlie?

CHARLIE MUNGER: We didn't think very long. The — (Laughter)

We don't claim to have some kind of perfect morals. You can draw these lines where you wish. But at least we've got a huge area of things which is perfectly legal to do, that we think beneath us. So we won't do them.

And we see more and more in America, a culture where just anything that's unlikely to send you to prison, which looks like it'll make money, is OK. And that is a very bad development.

WARREN BUFFETT: Yeah, but I think it's a little crazy myself — (applause) — to say that it's terrible if people eat hamburgers, or eat — or drink Coca-Cola, or eat candy, or anything like that, because they're likely to gain weight. That is a perfectly optional decision.

And who knows whether somebody has lived a happier life, that lives to 75, and they're overweight condition causes them to die a little sooner than if they lived to 85 and lived on carrots and broccoli, you know, has lived a better life. I know which one I prefer. (Laughter)

11. Give Buffett a salary bump for his retirement

WARREN BUFFETT: OK, number 9, please.

AUDIENCE MEMBER: Hi, Mr. Buffett. I'm Allan Maxwell. My wife and I are shareholders from Omaha. I'm going to keep things simple so you can understand them.

WARREN BUFFETT: Good. (Laughter)

Allan's a friend of mine, so he can get away with that.

AUDIENCE MEMBER: Thank you, Colonel.

Excluding the Buffett's stake, I'm going to combine A and B shares. And there are approximately 1 million A shares outstanding, correct?

WARREN BUFFETT: That'd be about right, uh-huh .

AUDIENCE MEMBER: OK, about. Your salary is approximately — or is — $100,000 a year.

WARREN BUFFETT: It's been stuck there for a while. We'll talk about the board. (Laughter)

AUDIENCE MEMBER: Well, you'll be happy with my question.

WARREN BUFFETT: You can make it a motion —

AUDIENCE MEMBER: In other words —

WARREN BUFFETT: — if you're heading where I think you are. (Laughter)

AUDIENCE MEMBER: In other words, we're paying you 10 cents a share to manage a $90,000 investment. That's remarkable in today's corporate culture. Thank you, Mr. Buffett, thank you. (Applause)

WARREN BUFFETT: Yeah, thanks. Allan, thank you. But I have to tell you, as I did last year, I would pay to have this job. I mean, it doesn't get any better than this.

AUDIENCE MEMBER: Well, rather than you doing something for us, I would like to suggest that we, the shareholders, do something for you. As a shareholder, I would be willing to pay you 25 cents an A share. (Laughter)

That way you could save a little extra money for your retirement. (Laughter)

Would you support such an idea?

WARREN BUFFETT: Allan, I'm getting Social Security now. (Laughter)

And that really pretty well takes care of things. My family would go crazy if I made any more money. (Laughter)

AUDIENCE MEMBER: This would help you —

WARREN BUFFETT: But I appreciate the offer, however.

AUDIENCE MEMBER: My heart's with you, thank you.

WARREN BUFFETT: OK, thanks, Allan. (Applause)

12. Why Berkshire's insurance companies never have layoffs

WARREN BUFFETT: Let's go to number 10, and see if we can get 50 cents. (Laughter)

AUDIENCE MEMBER: How about a dollar? (Laughter)

David Winters, Mountain Lakes, New Jersey. Thank you, Warren and Charlie, for a fabulous weekend and for the discussion about governance in the mutual fund industry in the shareholder letter.

Specifically, have you altered the compensation potential for the insurance underwriters to make sure, as Charlie has described, the incentive-caused bias creates an environment that encourages writing new policies that, when the tide goes out again in the property and casualty business, Berkshire Hathaway minimizes losses, maximizes float, while compensating underwriters for not writing business?

WARREN BUFFETT: Well, thank you, that feeds into an interesting set of slides I've got, if I can find them here to tell the projector what to put up, because that's a very important point you raise.

I mean, we are very big in insurance, and having the wrong incentives in place could be very harmful.

So let's put up a couple of slides. Let's put up slide number one, if we would, please.

Slide number one is the situation at Berkshire, and Shirley, I'll give you one of these, but that's the situation at Berkshire shortly before we bought National Indemnity.

There's our balance sheet there. And as you'll notice, we just had a few million dollars extra. We had about $20 million tied up in the textile business.

And then I heard that Jack Ringwalt wanted to sell his company. Some of you here in the audience know him. He — for 15 minutes every year, Jack would feel like selling his company. He would get mad at something or other.

And so my friend Charlie Heider knew Jack pretty well, and I'd said to Charlie, "Charlie, next time Jack is in heat, have him, you know, get him over here." (Laughter)

And so Jack, early in 1967, came by 11:30, 11:45 in the morning, and said he'd had it with insurance, and with the insurance regulators and everything, he'd like to sell. So we bought it.

Now, we bought, that was the — made a major — that's when we really embarked on what has happened subsequently.

As you can see from that slide, the following year the textile business made all of $55,000. So sticking with textiles would not have been a great idea. We spent $8 1/2 million to buy National Indemnity.

Now, on the next slide, slide two, you will see a record like has never been, I don't think there's another insurance company in the world that has a record like this. That's the premium volume of National Indemnity's traditional business.

And you will see a company that went from 79 million in that first year of premiums — if you go all the way back to the time we bought it — it was 16 million, but by 1980 we were up to 79 million.

And you will see that in what was known as the "hard market" of the mid-'80s, we got up to 366 million.

And then we took it down — not intentionally, but just because the business became less attractive — all the way from 366 million down to 55 million. And now the market became more attractive in the last few years, and it soared up to almost $600 million.

I don't think there's a public company in America that would feel they could survive a record of volume going down like that, year after year after year after year.

But that was the culture of National Indemnity. It was the culture started by Jack Ringwalt, and it was the culture all the way through several other managers, Phil Liesche, and Rolly [Roland] Miller, to Don Wurster, who has done a fabulous job. And we don't worry about premium volume.

But if you're not going to worry about premium volume, then you have to take a look at slide three. Because if the silent message had gone out to our employees that unless you write a lot of business, you're going to lose your job, they would have written a lot of business. You could —

National Indemnity can write a billion dollars' worth of business in any month it wanted to, all it has to do is offer silly prices. If you offer a silly price, brokers will find you in the middle of the ocean at four in the morning. I mean, you cannot afford to do that.

So what we have always told people in our insurance businesses generally, specifically at National Indemnity, is that if they write no business, their job is not in jeopardy.

We cannot afford to have our unspoken message to employees, that you write business, or your job, or the guy sitting next to you's, you know, may be lost.

So when we bulged up to 366 million, we — employment went up modestly, and when we went all the way down, you'll see it trickle downward, but that was all by attrition. We never had a layoff during that period. Other people would have, but we didn't.

And now we're going back up some, and we'll go back down again at some time in the future.

Now, if you go to the next slide, you'll see that that created an expense ratio that went up dramatically, up as high as 41 percent in 1999, as volume shrunk back. And when we were writing a lot of business, our expense ratio was as low as 25.9.

Now, some companies would feel that was intolerable, but what we feel is intolerable is writing bad business. And again, we can take an expense ratio that's out of line, but we can't afford to write bad business. For one thing, if you get a culture of writing bad business, it's almost important to get rid of.

So we would rather suffer of having too much overhead, than we would want to teach our employees that to retain their jobs, they needed to write any damn thing that came along, because that's a very hard habit to get rid of once you get hooked on it.

Now, move on to slide number five, you will see what the result has been of that policy. And it's been that we had a few years, bad years, in the early '80s — that's what led to that hard market. But even with a high expense ratio, you'll see that we made money underwriting in virtually every year.

You'll see the year 2001 at 108.4, but that will, in my view, that will come down. I think that will turn out to be quite a good year. These are the — that year is not fully developed yet.

Now, you'll see in 1980 — in '86 — we had this incredible year, when we wrote at 69.3, that's a 30 percent underwriting margin. And the nice thing about it is, we did it with the most volume we ever had to that point, 366 million.

So we coined money when we wrote huge amounts of business, and we made a little money when we wrote small amounts of business.

So it's absolutely imperative in our view, and I think we're almost the only insurance company like this — certainly public — in the world that sends the absolutely unequivocal message to the people that are associated with us, that they will never be laid off because of lack of volume, and therefore, we don't want them to write one bit of bad business.

And we'll make mistakes, and we'll have a high expense ratio when business is slow, but we'll win the game. And that's what National Indemnity has done over a period of time.

National Indemnity was a no-name company 30 years ago operating through a general agency system which everybody said was obsolete.

It had no patents, no real estate, no copyrights, no nothing, that distinguished it, essentially, from other insurance — dozens of other insurance companies could do the same thing. But they have a record almost like no one else's because they had discipline. You know, they really knew what they were about.

And they've stayed with that. In fact they've intensified it over time. And their record has left, you know, other people in the dust.

It wouldn't be a record you would point to Wall Street, you know, if you went to Wall Street with that record alone in 1990 or 1995, they'd say, "What's wrong with you?"

But the answer's nothing's wrong with it. And you put your finger on having the incentives in place to write the right kind of business for the shareholders at Berkshire. And we try to think those things through.

I mean, you can't run a — you can't run an auto company without having layoffs. You know, you can't run a steel company that's this way. But this is the right way to run an insurance company.

And that's why these cookie-cutter approaches to employment practices, or bonuses, and all that are nonsense. You have to think through the situation that faces you in a given industry with its given competitive conditions, and its own economic characteristics.

Charlie, you want to comment on that?

CHARLIE MUNGER: Well, the main thing is that practically nobody else does it. And yet to me it's obvious it's the way to go.

There's a lot in Berkshire that is like that. It's just a little different from the way other people do it, partly the luxury of having a controlling shareholder of strong opinions.

That accounts for this. It would be hard for a committee, including a lot of employees, to come up with these decisions.

13. "PetroChina was both cheaper and had less risk"

WARREN BUFFETT: We go to number 11. (Applause)

AUDIENCE MEMBER: Good afternoon, my name is Andy Peake, and I'm from Weston, Connecticut.

As a keen China watcher, I was very interested in your PetroChina investment.

Could you please tell us more about your thought process on investing in a complicated, opaque country like China, and PetroChina?

WARREN BUFFETT: Yeah, PetroChina itself is not a complicated or opaque company. You know, the country, you know, has obviously, different characteristics in many respects than the United States.

But the company is very similar to big oil companies in the world. I — and I — PetroChina may have been the fourth largest — fourth most profitable — oil company in the world last year. I may be wrong on that.

But they produce 80 or 85 percent as much crude daily as Exxon does, as I remember. And it's a big, big company. And it's not complicated.

I mean, you know, obviously, a company with half a million employees, and all of that. But a big integrated oil company, it's fairly easy to get your mind around the economic characteristics that will exist in the business.

And in terms of being opaque, actually their annual report may well tell you more about that business, you know, than you will find from reading the reports of other oil giants.

And they do one thing that I particularly like, which other oil companies don't, at least to my knowledge, is that they tell you they will pay out X percent, I think it's 45 percent of their earnings, absent some change in policy.

But I like the idea of knowing in a big enterprise like that that 45 percent of what they earn is going to come to Berkshire, and the remainder will be plowed back.

It was bought not because it was in China, but it was bought simply because it was very, very cheap in relation to earnings, in relation to reserves, in relation to daily oil production, and relation to refining capacity.

Whatever metric you wanted to use, it was far cheaper than Exxon, or BP, or Shell, or companies like that.

Now, you can say it should be cheaper, because you don't what'll happen with it 90 percent owned by the government in China, and that's obviously a factor that what — you stick in valuation. But I did not think that was a factor that accounted for the huge differential in the price at which it could be bought.

And, you know, so far it looks OK on that basis.

We weren't — we aren't there because it's China, but we're not avoiding it because it's China, either. We just — we stick in a fairly appropriate number.

But if you read the annual report of PetroChina, I think that there's no — you will have as good an understanding of the company as you would if you read the annual report of any of the other big oil majors.

And then you would factor in your own thinking about whether there could be some huge disruption in Chinese-American relationships or something of the sort, where you would lose for reasons other than what happened in terms of world oil prices, and that sort of thing. But we're happy with it.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

If a thing is cheap enough, obviously you can afford a little more country risk, or regulatory risk, or whatever. This is not complicated.

WARREN BUFFETT: Yeah, you can — Yukos, as you know, is a very big Russian oil company. And in evaluating Russia versus China, in terms of country risk, you know, you can make your own judgments.

But in our view, something like PetroChina was both cheaper and had less risk. But other people might see that differently.

14. Dubious asbestos claims are taking compensation from true victims

WARREN BUFFETT: We'll go to number 12.

AUDIENCE MEMBER: Good afternoon, gentlemen. My name is Hugh Stephenson. I'm a shareholder from Atlanta, Georgia. This question is for both of you.

If you would both comment on the subject of tort reform, specifically asbestos tort. And if you could construct an optimal solution, how would you construct it, balancing the interest of legitimate plaintiffs versus the attorneys, versus the opportunists?

WARREN BUFFETT: OK, Charlie's the lawyer, so he's going to get to answer this one.

CHARLIE MUNGER: As a matter of fact, that is an easy question.

What's happened in asbestos is that a given group of people get mesothelioma, that came — which is a terrible form of lung cancer that kills people — really only from asbestos. And those people got it from somebody's asbestos. And that's one group of claimants.

Then there's another group of claimants, and these are people who've smoked two packs a day of cigarettes most of their lives, and they've got one little spot here or there, in an elderly lung.

And God knows what the spot is, but an enterprising lawyer can get an enterprising physician, who just happens to find that every damn spot in any lung must be asbestos-caused.

And once you've got one expert witness whom you can bribe, in effect, to say that, you've got a claim that can be filed.

And so you get millions of claims on behalf of people who have no symptoms, and who say that I'm worried about getting cancer from this spot that my attorney's doctor says was caused as asbestos.

There isn't enough in the companies that made the asbestos to pay off everybody. And what happens is that a huge percentage of the money does not go to the people that got the cancer, or another group of people who got terrible lung impairment that is obvious.

But that's another small group relative to these people who just have one little spot and are — and now say they are worried about getting cancer.

And they can file those cases where they say they're worried in some state, usually a southern state, where they've got a jury pool that just hates all big corporations.

And so you've got an industry — and of course the lawyers who are representing the people that aren't hurt are really stealing money from the people who are hurt.

And the guy who gets mesothelioma doesn't get as much as he should. And all these other people are getting money they're not entitled to.

It's a bonkers system. But with federalism the way it is, there's just no way to stop it.

And the United States courts — United States Supreme Court — refused to enter it, and just grab hold and make a decision. And so it just goes on, and on, and on, and the claims come in.

I think the Manville Trust had more new claims come in last year than in any year in history.

WARREN BUFFETT: That's correct.

CHARLIE MUNGER: And they have mined and sold asbestos for the last time, what 35 years ago, or —?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And it just never stops.

The people who are trying to buy these people off, it's like trying to douse a fire by pouring gasoline on it, because word processing machines can grind out these phony claims, and the doctors can ground up — grind out these phony opinions.

And so, a huge proportion of all the money that's available to pay people who've suffered from asbestos goes to lawyers, experts, doctors, contingent fees to the lawyers, defense lawyers.

I think — is it something like 20, 25 percent of the money is flowing through to people who were injured? So it's a total national disgrace.

The only people who have the power to fix it would either be the Supreme Court of the United States or Congress.

The Supreme Court — some people would say rightly, other people would say in too chicken a fashion — ducked the issue. That means the only party that has the power to fix it is Congress. And Congress so far, given the politics, has not fixed it.

Once you get wrongdoers so rich, they get this enormous political power to prevent change in the laws that are enriching them.

I mean, it means that we should all be more vigilant about stepping on these wrongs when they're small. Because when they get large, they're very hard to stop.

But it would be easy to fix this. The right way to fix it, we just are not going to pay off on these tiny claims.

WARREN BUFFETT: But Johns Manville — we own Johns Manville. They went bankrupt. They were the first, at least big one, that asbestos took into bankruptcy, and probably on the history of things, they somewhat deserved it, I think, Charlie. Isn't that right?

CHARLIE MUNGER: Their behavior was among the worst in the history of American corporations.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: They knew this stuff was causing terrible injury, and they deliberately covered it up, time after time, and year after year, to make more money. There's no doubt about the guilt of the original management at Johns Manville.

WARREN BUFFETT: So they went bankrupt in the early '80s, and out of that bankruptcy was formed something, as Charlie mentioned, called the Manville Personal Injury Trust. We've got — have no connection with that.

I mean, this is a new company that we bought a few years ago, and this company has no connection with that except the historical — history.

The — but the Manville Personal Injury Trust was established, and had over time — had a couple billion dollars in it.

And as Charlie said, last year — it's been around now for almost, I would say, close to 20 years — and last year they had a record number of claims introduced.

They didn't have a record number because of the incidents of asbestos compared to the ones that were prevailing at the time it was established, or something of the sort. It's just that it's become a honey pot.

And as a result, the Mansville Personal Injury Trust is now paying out five percent because their 2 billion will only go so far. They're paying five percent of claims.

So as Charlie says, the guy that's got a — that has really been drastically injured by asbestos gets this tiny fraction, and the tens of thousands of claimants for whom it's a gleam in the eye, or rather a gleam in their lawyer's eye, perhaps, also get their five percent.

And it's, you know, it's not the right way to do it, but it's very hard to correct.

We've observed the asbestos legislation over the — proposed legislation — over the last year. And in the end, what they came up with, we did not support because it didn't get the answer that's needed.

And it was Charlie's and, you know, my view that the Supreme Court, when they ducked it, I mean, they left open a can of worms which will be around for decades, and decades, and decades. And the right people will not get compensated.

CHARLIE MUNGER: And those of you who want to be cynical ought to look into it, and see the perjury.

What's happened, of course, is that all the really horrible people pretty well are broke and gone, and maybe there's some money left in a trust here or there. But by and large, there isn't enough money.

But now, there're, like, three solvent people left. And you've got some little spot, or something or other. And by a strange coincidence, every one of those people can only remember three names of products that —

WARREN BUFFETT: Might've caused it?

CHARLIE MUNGER: — somehow saw, that might've caused it. And it's an amazing coincidence, the three that are left solvent are the only names he can remember.

And so you — it's obvious you have a vast amount of perjury being suborned by practicing lawyers. It's not a pretty picture.

15. Dividends vs stock buybacks

WARREN BUFFETT: OK, let's go to microphone 1.

AUDIENCE MEMBER: Hi, my name's Charlie Rice, and I'm a stockholder in from St. Louis, Missouri.

I'd appreciate hearing your comments on publicly-held companies using their cash for dividends versus stock buybacks?

WARREN BUFFETT: Well, we — the equation is pretty simple, but the practice doesn't necessarily follow logic. The —

It's obviously — as long as you're telling the truth to your shareholders about what's going on so that you aren't manipulating the stock downward or something — when a stock can be bought well below its business value, that probably is the best use of cash.

It's something The Washington Post did on a huge scale back in the 1970s. Teledyne may have bought 90 percent, or something, or close to it, of their stock back.

And that was the reason a very significant percentage of companies bought stock back in the past, because they actually thought it was selling for less than it was worth.

Like I say, that that can be abused if you do various things to bury your stock in one way or another, but that wasn't the usual case.

Stock repurchases were relatively unpopular in those days. They've become quite popular now.

And to the extent that I've been around a good number of them, and been able to pick up on what I thought was the underlying rationale, if not the professed rationale, you know, I think it's often done for people that are hoping that it causes their stock price not to go down, and their — and often done at prices that don't really make a lot of sense for continuing shareholders.

If we wanted to return a bunch of cash to shareholders, we would — if our stock was undervalued — we would go to the shareholders, and say, "We think it's cheap, and we think that this cash can be better used by you than by us.

"And we will, therefore, have — be repurchasing at what we think is a discount intrinsic value." And the people that remain will be better off, and the people that get out will get out at a little bit better price than they would otherwise.

In terms of dividends, you get into an expectational situation. And for most companies that follow a — that pay a cash dividend — it doesn't make sense to bounce around the dividend from year to year, although private companies frequently do that.

And we do it ourselves with our subsidiaries. They — some subsidiary can pay us a lot of money one year, and not so much money the next year.

But with public companies, people do — a lot of people do buy stocks to obtain dividends, and they hope for regularity, and that there's a signally aspect to it and everything.

So I would say that once you establish a dividend policy with a public company, you should think a long time before you change that policy in a material way.

But I think the best use of cash, if you don't have a good use for it in the business, if the stock is underpriced, is to repurchase it. And if it's overpriced, you got no business buying in a single share. But a lot of companies do it.

Charlie?

CHARLIE MUNGER: Yeah, dividends are a very interesting subject. If you count the unnecessary stock trading, and the cost of investment advice, and the cost of making a lot of errors, and the trading costs in and out, I don't think we'd be too extreme to say that now the total amount that's paid out in dividends is roughly equal to the amount that is wasted in all this trading and investment advice.

So that the net dividends that come to the shareholders are approximately zero. This is a very peculiar way to run a republic. And very few people comment about it.

WARREN BUFFETT: Yeah, actually I did in an article, some time ago in Fortune. The frictional costs to American shareholders in sort of changing chairs for all American business as a whole, those frictional costs, are probably not much different than the entire amount paid out by American corporations.

So — but getting to the individual corporation level, a company that expects to regularly earn more than it can profitably employ in its business, should be paying out dividends.

Take a subsidiary of ours like See's Candy. We would love to expand See's Candy to double or triple its present size, but it doesn't work. We've tried it a lot of different ways. So it should be paying out its earnings.

If it was a public company, and it was at one time, you know, you could argue that something approaching a 100 percent payout would make sense there.

But most managements worrying about earnings falling off at some time in the future would rather establish a lower level, and therefore, ensure regularity of dividends by going with a conservative level. I — you know, we —

It's obviously something we think about at Berkshire when we have 30-odd billion dollars around. If we can't figure out a way to employ that over time, you know, it's a mistake to keep it in corporate form.

But we have this expectation, and I think it's a reasonable expectation, that we get the — put it to work.

If we ever came to a different conclusion, if our stock — we thought our stock was significantly undervalued, we'd probably figure in terms of disbursing it through repurchases, particularly where now dividends and capitals gains are neutral for individuals.

And if our stock was not underpriced, and we fell, we would probably do something by a dividend.

It's not going to happen soon, however. (Laughs)

16. GEICO and Dell: the low cost is going to win

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Good afternoon. My name is J.P., as in justice of peace, or Jell-O pudding.

My last name is Tan, as in suntan. I flew in from the suntan city of Orlando, Florida where an elderly man told me, "J.P. Tan stands for just 'perfect tan.'"

Mr. Buffett, allow me to give you a big thank you before I ask my question. Some time ago I sent you my business analysis of your investment in Scott Fetzer Company.

I was not sure if you even bothered to read it. Yet you were very kind to write me that my analysis of Scott Fetzer Company is very much on the money.

You also invited me to my first annual meeting where I had the privilege of meeting Mr. Andrew Kilpatrick, who was kind enough to include my analysis of Scott Fetzer Company in his book, "Of Permanent Value: The Story of Warren Buffett." I want to thank you for making this possible.

Here comes my question. Mr. Buffett, you have said that the nine most important words ever written about investing are these nine words: "Investment is most intelligent when it is most businesslike."

Mary Buffett said that you have built your entire business success upon these nine words. Investment is most intelligent when it is most businesslike.

For this reason, I started businesslike.com, looking up to guide GEICO and Dell as direct marketing models, since they have the lowest cost structure.

Please kindly share with us in elaborate details the direct marketing methods of GEICO and your friend, Michael Dell? (Laughter)

WARREN BUFFETT (to Munger): What?

CHARLIE MUNGER: He wants you to analyze the marketing methods of GEICO — the direct-marketing methods of GEICO — and Dell.

WARREN BUFFETT: Yeah, well, I'm not as familiar with Dell as I am with GEICO.

The idea of direct marketing in auto insurance at GEICO came from Leo Goodwin, who — and his wife Lillian — who had come from USAA.

And USAA was set up some years — and GEICO was set up in 1936 — USAA was set up, I believe, in the early '20s, because military personnel moved around a lot, and they had trouble getting auto insurance. And a great organization was established.

Leo Goodwin took that idea, and decided to broaden it beyond the officer ranks of the military. And first went to government employees generally, and now that's been extended dramatically over the years to the American public as a whole. It's a better system.

You know, if you go back a hundred years, auto insurance when the auto first came in, was sold by the casualty affiliates of the big fire companies. That's where — that — in the 1800s, the major insurance companies were fire companies, and casualty insurance was something that came along later.

And it was sold through a system whereby the agent got large commissions, where there was sort of cartel-like rates established through something called a "bureau." And that system prevailed for several decades.

And then State Farm came along, formed in the early 1920s. A farmer from Merna, Illinois in his 40s. No background in insurance, no capital, but he came in with the idea of having a captive insurance — agency force. And that brought down costs somewhat.

And State Farm, in time, became the largest auto insurer in the country. And Allstate, which followed that system, became the second largest. And that was a better system, a better mouse trap.

And then USAA, followed by Leo Goodwin at GEICO, came along what a direct-marketing operation that bypassed the agent and brought down costs further.

Now, every American family, virtually, wants to have a car. They don't want to have insurance, but they can't drive their car without insurance. So they're a buying a product they really don't like very well. It cost them a significant part of their family budget. And cost, therefore, becomes very important.

It’s not a luxury item, it’s a mandatory item, virtually. And saving significant money makes a real difference in a lot of household budgets. So the low cost is going to win.

And our direct operation — Progressive has a wonderful direct operation competing with us — we’re the two that will be slugging it out over the years — is a better system, and better systems win over time.

Now, I — again, I’m not that familiar with Dell, but I have the impression that Dell is a very low-cost operation, enormously efficient. You know, very low amounts of inventory.

And, you know, I would hate to compete with them. The — if they can — if they turn out a decent competitive product at the best price, you know, that system will win.

You know, Charlie is a director of Costco, and Costco and Walmart figured out ways to do things at lesser costs that people needed — where people spent money in big quantity. And those two companies are winning.

So, we have a terrific marketing operation, and a terrific insurance operation in GEICO. And in my view it will grow very, very substantially.

And we have a very tough competitor in Progressive, because they’ve seen how well our model works, and they, in effect, have shifted over. I mean, they’re not totally shifted over, but they’ve moved towards a direct operation, and away from an agency operation.

It’s always a good idea to go with a low-cost producer over time. I mean, you could mess it up in other ways, but being a low-cost producer of something that’s essential to people, it’s going to be a very good business usually.

Charlie?

CHARLIE MUNGER: Yeah, you’ve chosen a wonderful field. And if you fail in it, it’s your own fault. (Laughter)

WARREN BUFFETT: I should say also that that — those nine words, they came from Ben Graham, they didn’t come from me. But Ben said those, and they are very important words, although they tie in with some others that he said. But they are very important words.

CHARLIE MUNGER: Warren, I want make an apology, too, because last night I said that some of our modern business tycoons — and I remembered particularly Armand Hammer — were the type that, when they were talking, they were lying. And when they were quiet they were stealing. (Laughter)

And some people got the impression that that was my witticism. That was said a great many decades ago about one of the robber barons.

WARREN BUFFETT: Well, if we start confessing here to the number of quotations we've stolen, we'll be here all afternoon. (Laughter)

17. Praise for Google's co-founders and their owner's manual

WARREN BUFFETT: So let's go on to microphone 3.

AUDIENCE MEMBER: Good afternoon. My name is Matt Lynch, and I'm from Palo Alto, California.

Mr. Buffett, a couple of times today you alluded to Google and its co-founders.

I was hoping you could share with us your thoughts and reactions to the owner's manual the co-founders included in Google's S-1 filed last week, especially in light of the similarities and differences between it and that of Berkshire Hathaway?

WARREN BUFFETT: Well, that's a real softball for me. The obviously —

AUDIENCE MEMBER: You're welcome.

WARREN BUFFETT: I'm very pleased that the Google — the fellows at Google decided — and they say they, it was, I think they used the word "inspired" by the Berkshire Owner's Manual.

And, you know, it obviously pleases us enormously that other people think that it's a good idea to talk to their owners — or in their case, their prospective owners — in a very straight-forward manner.

If you buy into Google, having read their owner's manual, you know, you will — I think you'll know the kind of people you're associating with. You'll know what they will do and won't do.

It's the kind of thing that one person would say to another if you were setting up a partnership. And were — you said, you know, "I'd like you to join me in a partnership. I need your money. And here's the way we're going to do business."

And I think more companies — obviously, I think more companies ought to do it.

It's been simple for us at Berkshire. We've had these principles in mind for a long time. And we really want people to understand those principles before they join with us.

And the Google fellows, in a very straightforward manner, you know, I liked their prose. You know, it doesn't mean I agree with every idea they have, but, you know, I do know what ideas they do have. And I hope more companies sign on for that sort of thing.

Charlie?

CHARLIE MUNGER: Well, you know, most of the world does not, in any way, imitate Berkshire Hathaway. This is a quirky few. It may look — there may be 19,500 of you that came — but it's still a quirky few by the standards of the country.

And what's interesting about Google is those two guys who created that are two of the smartest young men in the whole country. And it's much more fun to be copied by people that smart, than — (Laughter)

WARREN BUFFETT: Hey, we even think they are smarter than we thought they were last week. (Laughter)

CHARLIE MUNGER: And we now think they're a lot smarter, yeah. (Laughter)

WARREN BUFFETT: It's going to be a lot of fun to watch that. I — and my guess is that their annual reports are going to make very good reading. They're actually going to alternate the two of them in writing the reports. And I think you'll know a lot about them, and a lot about their business if you read it.

Although they had an interesting — as I remember, they had an interesting sentence of two in there, which I admired also, where they said that, you know, certain of the things that might affect their business prospects really would be better left unsaid, in terms of competition, and so on. And if so, they weren't going to tell you. (Laughter)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: I kind of enjoyed that.

18. Buffett doesn't see big changes for how homes are sold

WARREN BUFFETT: Number 4, please.

AUDIENCE MEMBER: Thanks, Warren, thanks. My question — my name is Chad Bliss (PH), Lincoln, Nebraska.

My question pertains to MidAmerican Energy and the Home Service division. You said earlier that you would continue buying, you know, companies in the real estate industry.

Given the growth in "for sale by owners," discount brokers, also maybe even banks now, do you think the current business model of home services is sustainable, or do you think commissions need to be lowered?

WARREN BUFFETT: Yeah, I really do think it's sustainable. It's a good question. In fact, I forget where I saw the article a few weeks ago, maybe in the Sunday New York Times, about Barry Diller's interest, I think through Lending Tree, on the internet.

And there've been a lot of real estate sales-related operations that have been on the internet. And the internet is a threat to any business, including real estate brokerage.

But, you know, when I think about the process of buying a home, and the degree of personal involvement involved in that, you know, the "for sale by owner." They call them FSBOs in the business.

I remember talking with my friend, Chuck Peterson about that 50 years ago, and FSBOs were with us then, and FSBOs are with us now.

But my guess is that a very significant percentage of home transactions 30 years from now will be done through a pipeline, and through a distribution mechanism, or brokerage mechanism, like exists now.

I do not see it changing dramatically, although there are people that are going to try and change it dramatically. So you've got competitors. But I love the idea of expanding Home Services.

Charlie?

CHARLIE MUNGER: Well, you tried to change it once yourself dramatically, right here in Omaha, and you fell on your ass. (Laughter)

He tried to —

WARREN BUFFETT: His memory's better than mine.

CHARLIE MUNGER: He tried to take away the — a good part of the home advertising business from the World-Herald to, you know, your then-little newspaper —

WARREN BUFFETT: Oh, right, it was very thin, yeah. (Laughs)

CHARLIE MUNGER: Yeah, yeah. And it didn't work worth a damn.

WARREN BUFFETT: Yeah. (Laughter)

And that's the last time I call on him. The — (Laughter)

19. Remembering Phil Fisher

WARREN BUFFETT: Let's go to number 5.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, I'm Tim Medley from Jackson, Mississippi.

Recently Mr. Philip Fisher died.

At this meeting many years ago, you, Mr. Buffett, mentioned your fondness for chapters 8 and 20 of "The Intelligent Investor," the first edition of "Security Analysis," and you said, "Phil Fisher's first two books."

And you Mr. Munger, have also been complimentary of Mr. Fisher's writings and investment approach.

I wonder if the two of you would tell us of your experiences with Mr. Fisher, the circumstances of your meeting, et cetera.

And did his writings, or your discussions with him, start you thinking about the idea of the great business, or the franchise company, or was it simply an affirmation of thoughts which you had already begun to have? And anything else you would like to say about Mr. Fisher.

WARREN BUFFETT: Yeah, Phil Fisher was a great man. He died maybe a month ago, or thereabouts, and well into his 90s.

His first book, and I believe it was "Common Stocks and Uncommon Profits," it was written in 1958. And the second book was written a few years later, those two books were terrific books.

And as with Ben Graham, you could really get it all by reading the books. I met Phil Fisher just once, and it was great. I enjoyed it, I loved it. He was nice to me.

But similarly, actually, to my experiences with Ben Graham, I worked for him, I took his class and everything else — it was in the books.

I mean, they were such good writers, and their thoughts were so clear, that you didn't need to meet them personally. I enjoyed meeting them personally, obviously. But they got it across in words.

And the only time I met Phil was some time after that 1962 book, or whatever it was, '61 or '62. And I was in San Francisco, I think it was in the Russ Building, I may be wrong on that. And I just went there.

I used to do that all the time when I was younger. I'd go to New York, and I'd just drop in on all kinds of people. And I guess they thought because I was from Omaha that, you know, one time and they'd be rid of me. So — (Laughs)

And I would usually get in to see them. And Phil — I did that with Phil. And he was extraordinarily nice to me. But it wasn't that I gained new ideas though, however, by meeting him, because I'd already read it in his books.

And Charlie actually, I met Charlie in 1959, and Charlie was sort of preaching the Fisher doctrine, also, to me. Little different form, but his ideas paralleled those of Phil. So I was sort of getting it from both sides. It made a lot of sense to me. I don't know what Charlie's experiences were with Phil.

CHARLIE MUNGER: Well, I always like it when somebody who's attractive to me, agrees with me. And therefore, I've got very fond memories of Phil Fisher.

The basic idea of that it was hard to find good stocks, and it was hard to find good investments, and that you wanted to be in good investments. And therefore, you just find a few of them that you knew a lot about, and concentrate on those, it seemed to me such an obviously good idea.

And indeed, it's proved to be an obviously good idea. Yet, 98 percent of the investing world doesn't follow it. That's been good for us. It's been good for you.

20. "No single yardstick" for compensation and incentive systems

WARREN BUFFETT: We'll go to number 6, please.

AUDIENCE MEMBER: Good afternoon, my name is Stan Leopard, and I'm from Menlo Park, California. I'm very pleased to be here, Warren and Charlie.

I first heard about you, Warren, in the late '80s, and began reading your writings. Unfortunately I didn't invest until the late '90s.

You have shaped my business thinking, and as I listen to you, and as I continue to read what you write, and the things you recommend to read, it continues to shape my thinking.

My question's about compensation. And I've seen your writing, and I heard the earlier comments today. And they still leave me, as a guy who is a business owner, not quite sure how to act to design compensation for managers.

For most of my career, I've been the senior manager in my businesses, but now I'm in a situation where I'm looking to own a majority interest of businesses that I don't manage every day directly, and I'm very concerned with this compensation issue.

When I think about things, like, return on equity, or growth, or risk, or like that, but if you could speak a little more towards the specific of how you approach the getting it to the right things to measure and incent, I'd appreciate that.

WARREN BUFFETT: Yeah. It's a very good question, and it's — you know, there is no formula that applies across all industries or businesses.

You take something like return on equity. You know, if you pay way too much for the business that you buy, the person who runs it is going to get a lousy return on your equity.

And they may get a good return on the tangible assets employed in the business, but your purchase price may defeat them, in terms of earning good returns.

If you base the — on earnings on tangible equity, you know, there are businesses like a network television station where, you know, if you have an idiot nephew, you can put him in charge, and they'll earn huge returns on equity as long as they manage to stay away from the office. So it's —

And there are other businesses where you have to be a genius to earn 7 or 8 percent returns on equities. So there is no single yardstick.

To have a fair compensation system, both you and the manager have to really understand the economics of the business. In some businesses, the amount of capital employed is all-important. In some businesses, the amount of capital employed doesn't mean anything.

So we have certain businesses where we have charges for capital and all of that, and where we have other businesses where that would just be an exercise to go through, and it wouldn't really change any results, anyway.

We have a great preference for making them simple. I mean, we concentrate on the variables that count to us, and then we try to put that against the backdrop of the competitive nature, or the economic — the true economics — of the business they're in, and really reward where they're adding value, even if that value is from a very low base in a lousy business. And we make it — the base — very high if they're in a very easy business.

And it hasn't been a problem. But I would say it would've been an enormous problem if we'd brought in some compensation consultants, because they would have wanted something that would spread across the whole group, and it would have had all kinds of variables.

And they particularly would've wanted something that would've to come in every year and redo in some way, so that they would have a continuing stream of income.

You know, if I knew what kind of a business you were looking at it, it's easier to talk about what kind of a system to have.

If you had a group of television stations, just to pick an example — let's say they were network television stations, all of a reasonable size.

You know, you would probably figure that a chimpanzee could run the place, and have 35 percent pretax margins. And you might want to pay for performance above some number like that.

But there's — it's silly to have something that starts at 10 percent or 15 percent, when you do that. And a lousy manager will always suggest an arrangement like that.

Charlie and I have seen all kinds of compensation arrangements where, basically, you get paid for showing up. But they try to make it look, by constructing some mathematics around it, like, you really had to achieve something.

But in the end, if you get a great manager, you want to pay him very well.

You know, we've got great managers, for example, at a place like MidAmerican. And somebody mentioned that there's a big carrot out there for them if they achieve the results that we've set out. And that'll be a check I'll be very happy to write.

Charlie?

CHARLIE MUNGER: Yeah, if you want to read one book that will demonstrate really shrewd compensation systems in a whole chain of small businesses, read the autobiography of Les Schwab, who had a bunch of tire shops — has a bunch of tire shops — all over the Northwest.

And he made a huge fortune in one of the world's really difficult businesses by having shrewd systems. And he can tell you a lot better than we can.

WARREN BUFFETT: Yeah, and he worked that out himself. I mean, it's an interesting book, and, you know, selling tires, how do you make any money doing that? And —

CHARLIE MUNGER: Hundreds of millions selling tires.

WARREN BUFFETT: Yeah, yeah. It's a — and people like Sam Walton. I mean, the compensation system, I will guarantee you, at Walmart, or Charlie's involved in Costco, they're going to be rational because you had very rational people running them.

And they wanted to get the best — they wanted to attract good managers, and they wanted to get the best out of them. And they had no use in paying for mediocrity.

But that does require a knowledge of the business. I mean, you don't want to let — if you don't understand a business, you know, you're going to have a problem with both the manager and the consultant in terms of getting film-flamed on how you pay people.

21. Easier to find bargains among stocks than IPOs

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Good day. My name is Martin Krawitz. I'm a shareholder from Sydney, Australia. (Applause)

And thank you so much for some of your wonderful hospitality here. We've had a chance to get on some of Omaha's 65 golf courses, and it's just great being in the second-best country in the world. (Laughter)

My question to you, sir, is regarding two IPOs. We had one of the authors about a book on yourself visit us in Sydney last year, and apparently you dislike IPOs.

My question is, there are some really poor businesses that try and get passed off, but there are some good ones. There's some government privatizations, or decentralizations, the demographics of baby boomers, and we have some friends wanted to exit some really good businesses.

Could we as investors, and Berkshire Hathaway, not apply some of your disciplines to look at investing in some of these?

And finally, would your answer be different in its applicability to Berkshire Hathaway as a company, as opposed to us as investors? Thank you, sir.

WARREN BUFFETT: Charlie?

CHARLIE MUNGER: Well, the first question, is it entirely possible that you could use our mental models to find good things to buy among IPOs, the answer is sure.

There are a zillion IPOs every year. And buried in those IPOs, I'm sure there are a few cinches that a really intelligent person could find and pounce on. So, welcome. On the —

But the average person buying IPOs is going to get creamed.

So if you're talented enough, why sure, that will work. The second question, I forget.

WARREN BUFFETT: About the government offering (inaudible).

CHARLIE MUNGER: About government spin-offs?

WARREN BUFFETT: Give him the spotlight again. There he is.

CHARLIE MUNGER: What was the second question?

AUDIENCE MEMBER: It was just would the attitude of Berkshire Hathaway be different if it was opposed to investors?

WARREN BUFFETT: Oh.

AUDIENCE MEMBER: Thank you.

CHARLIE MUNGER: Yeah, because the IPOs are normally small enough, so that they won't work for us, or they're high tech, where we couldn't understand them. And so, by and large, if Warren is looking at them, why, I don't know about it. (Laughter)

WARREN BUFFETT: Yeah, I mentioned earlier how you — an auction market, prevailing in the stock market, will offer up extraordinary bargains sometimes, because somebody will sell a half a percent, or one percent of a company at a price that may be a quarter of what it's worth, whereas in negotiated deals, you don't get that.

An IPO situation more closely approximates a negotiated deal. I mean, the seller decides when to come to market in most cases. And they don't pick a time necessarily that's good for you. So, it has —

I think it's way less likely that, in scanning a list of a hundred securities that are trading in the auction market, well, in the — a hundred IPOs, if you scan a hundred IPOs, you're going to come up with something cheaper than scanning a hundred companies that are already trading in the auction market.

It is more of a negotiated sale. And negotiated transactions are very hard to get bargains. If you take the houses in Omaha, you know, somebody that lives next door to somebody who sold their house for 80,000 or — dollars, and their house is more or less comparable, they're not going to sell it for 50.

It just doesn't happen. People are — it's too important an asset, and they're cognizant of what it brings — what is being brought for similar properties. That's what happens in negotiated sales.

Now if, on the other hand, there were some — a whole bunch of entities that owned one percent of each house in Omaha, and you had an auction market on those one percentage points, they might sell at damn near anything. And occasionally, they sell at crazy prices.

So you're way — in my view — you're way more likely to get incredible bargains in the — in an auction market. It's just the nature of things.

And the IPO is closer — sometimes there will be IPOs in terrible markets, and they may come very cheap. But by and large, that is not when IPOs come. They come when the seller thinks that the market is ready for them.

And they come with an informed seller thinking it's a pretty good time to go public. And, you know, you'll make better buys, in my view, in an auction market.

22. Buffett and Munger don't shop at Whole Foods

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Good afternoon Mr. Buffett, Mr. Munger. My name is Mark Stender (PH) from San Francisco.

My question involves, if you live in California, which I understand you do some time of the year, it's almost mandatory that you shop at Whole Foods Markets.

They sell a lot of organic foods there. And I was wondering if anyone ever tried to feed you organic food, or organic food stock?

WARREN BUFFETT: I've never been near the place, but — (laughter) — Charlie, who I've never thought of as a health nut, but he may have some comment to make on this, being a Californian.

CHARLIE MUNGER: No, my idea of a good place to shop is Costco. (Laughter)

Costco has these heavily marbled filet steaks in the — (laughter) — finest grade. And the idea of eating a little whole grain whatever and washing it down with some carrot juice has just never appealed to me. (Laughter)

WARREN BUFFETT: We don't have a lot of arguments between the two of us about where to eat. (Laughter)

23. American business "has never let investors down"

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: Hello, thank you. I'm Sherman Silber from St. Louis. I'm a fertility doctor in St. Louis. We kind of view ourselves as the Berkshire Hathaway of infertility treatment.

We don't know anything, really, about business. We're doctors and scientists.

And so, first I'd just like to say, I really appreciate the people that you have on your board, and would like to keep it that way. Because we do know a lot about character, and I'm happy to have our savings safe with you and the people of character that represent the company. (Applause)

I just had an opportunity a couple of weeks ago, I was talking to one of the former managers of the Fidelity Magellan Fund, managed huge amounts of money, and he never really met you. And I was saying, I may have a chance to ask Warren Buffett and Charlie Munger a question. What would that question be? I wanted to have some idea of something intelligent I could ask business-wise.

And he thought if he had the opportunity to talk to you, the best thing is to give you what would sound like a softball question, because you could maybe bring more profoundness to this than we hear, usually. What —

In view of the Iraq war, consumer debt that's increasing, declining job growth, declining pay in the jobs that are growing, prospects of increased interest rates, he has this view that the next five to 10 years are going to be very difficult.

What would your view be about this — the investment future — for the next five to 10 years, in view of all these negative factors going on?

CHARLIE MUNGER: That's too soft for me. I think Warren should take that. (Laughter)

WARREN BUFFETT: Well, I would say that at any given point in history, including when stocks were their cheapest, you could find an equally impressive number of negative factors.

I mean, you can — you could've sat down in 1974 when stocks were screaming bargains, and you could've written down all kinds of things that would've caused you to say, you know, the future is just going to be terrible.

And similarly, at the top, you know, or anytime, you can write down a large list of things that would be quite on the bullish side.

We don't pay — we really don't pay any attention to that sort of thing. I mean, we have —

You might say that our underlying premise — and I think it's a pretty sound underlying premise — is that this country will do very well, and in particularly, it will do well for business. Business has done very well.

You know, the Dow went from 66 to 10,000-plus in the hundred years of the 20th century. And we had two world wars, and nuclear bombs, and flu epidemics, and you name it, Cold War.

There's always — there are always — there's always problems in the future, there are always opportunities in the future. And in this country the opportunities have won out over the problems over time.

And I think they will continue to do so, absent weapons of mass destruction, which is another question. And business won't make much difference if anything really drastic happens along that line. So we don't — I don't —

I can't remember any discussions Charlie and I have had, ever, going back to 1959, that where we would've come to the conclusion at the end of them that we would've passed on a great business opportunity — a business to buy — because of external conditions.

Nor did we ever buy anything that we thought was mediocre simply because we thought the world was going to be wonderful. The —

It won't be the American economy, in my view, that does in investors over a five, or 10, or 20-year period. It will be the investors themselves.

If you look at the record of the 20th century, you'd say how can anybody have missed, you know, in owning equities during that time? And yet, you know, we had all kinds of people wiped out, you know, in the '29-'32 period. We had all kinds of things that were bad.

But if you had just owned stocks right straight through, didn't leverage them, you know, you would — you'd have gotten a perfectly decent return.

So we are unaffected, in essence, by the variables you mentioned. Just show us a good business tomorrow, and we'll jump at the hook.

Charlie?

CHARLIE MUNGER: Yeah, I think, but it's also true that both of us have said at various times over the last three years that we wouldn't be at all surprised if professionally invested money in America had a pretty modest result over a fairly extended period in the future, compared to the very dramatically high returns that it had achieved up to about three years ago.

And so far that's been proved out to be pretty much right.

WARREN BUFFETT: Yeah, our —

CHARLIE MUNGER: Certain stretches are easier than other stretches.

WARREN BUFFETT: Yeah, our expectations were more modest than most people's a few years ago. We didn't say the world was coming to an end or anything. We just said that people have gone crazy in certain sectors.

And that anybody that thought that you could, you know, sit at home and day trade, and make double-digit returns over time, or do anything, or that you were entitled to that, you know, by just sticking a little money in your 401(k) or something, was really living in a fool's paradise.

But that was never accompanied by any predictions of disaster for the American economy as a whole, or for American business as a whole. It's —

People get crazy notions from time to time in financial markets. I commented on this earlier, but they just believe things that there's — it's hard to understand how they can believe.

Now, to some extent they get sold that by other people. But American business, really, has never let investors down as a group, but investors have done themselves in quite frequently.

24. "Demented" derivatives aren't like insurance

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Sam Kidston, from Cambridge, Massachusetts.

I'd like you to ask to discuss the similars and differences between what you do in your reinsurance operations, and what Gen Re did in its securities division, as it would seem that reinsurance is often a form of weather derivative.

I would also like to ask you, why you are so comfortable writing what appears to be one type of derivative, and so uncomfortable writing another? Thank you.

WARREN BUFFETT: Yeah, the derivatives contracts that Gen Re wrote in Gen Re Securities, I would say bore very little relation to the insurance businesses we see.

I mean, we are insuring against events that people either can't or aren't willing to take on the risk themselves.

In the derivatives business, a lot of that was speculative activity of one sort or another. The more complex the arrangements were, the easier it was to claim that large profits were being made, when maybe large losses really awaited you over time.

They were created transactions without much economic necessity. In a great many cases, they were just facilitating speculation.

Insurance deals with taking on risks that people incur in their business or personal life, that they don't want to bear themselves, or that they're unable to bear themselves. There was very little connection between the business. I think that in going into the business, they dreamt up a lot of reasons for it.

You know, they said they're both in the risk business, and their clients were going to demand it and everything.

But when people want to go into a business, they always dream up reasons. In our view, it made no sense whatsoever. And I really see very little connection between them.

Do you, Charlie?

CHARLIE MUNGER: They're radically different. The derivatives business is chock full of clauses saying that if one party's credit gets downgraded by a rating agency, they have to start posting collateral. And that's just like a margin account.

And when you sign pieces of paper like that, you can go absolutely broke, into default and catastrophe, and having other people liquidating your positions under distress conditions, et cetera, et cetera. So there's a lot of irresponsible mechanics.

In attempting to protect themselves, they've introduced this enormous instability into the system, through all these clauses about collateral posting. And nobody seems to recognize what a disaster of a system they've created in an attempt to make each party feel safer.

It's a demented system. And you don't get properly paid in most cases for playing the game. And therefore, we're not in it.

WARREN BUFFETT: Absent the ability to raise new capital at the time, and who knows whether that would've been — they'd been able to or not — Gen Re, which had been rated triple-A — it still is because Berkshire's involved — but it had been rated triple-A — could well have run into really terrible financial difficulty post-September 11th, particularly if they'd fully recognized the liabilities that they'd already incurred, but not fully recognized, at that time.

Because their capital would've shrunk, they would've had way more in equities, which would have shrunk further. And who knows how far, you know, at the time, how far it would have gone?

Plus they would have had, in my view, they would have been downgraded quite significantly, and that might well have triggered things in their derivatives activities, which would have required coming up with loads of cash.

It was not built to last. And it is now built to last. But I would say that that threat exists with other financial institutions as well.

But I think many of the CEOs — or some of them anyway, I should say — don't really fully comprehend that.

When you get margin calls for huge amounts of money, you know, it only has to be one day when you can't meet it. That almost happened.

If you go back to October of 1987, there was a large wire transfer that didn't make it to the — for a while — it didn't make it to the clearing house at the — in Chicago. And that came close to halting the whole system at the time, and we were very close to closing the exchange.

And a lot of things would have unraveled. The money finally showed up. But it's dangerous to have a system where people are depending on billions of dollars coming in from other people.

Well, we had that on Salomon, on that Sunday in 1991.

If Salomon had gone bankrupt, the next day you would have had people on the other side of 1.2 trillion of notional amount of — something like that — of derivatives, who would have had a contract with a party where they would have been dealing with a bankruptcy court.

You would have had all kinds of security settlements that wouldn't necessarily have settled. You would have all kinds of confusion.

And believe me, it would have been huge at that time, between what was going on in Japan, what was going on in the U.K., and what was going on in the United States, because the accounts were all intermingled.

As a matter of fact, Salomon was a — was banking — was running a bank in Germany where — which took on large amounts of deposits from individuals, and just loaned it all to Salomon.

So it would have had a receivable from a bankrupt company and owed money to I don't know how many German depositors. There are all kinds of things that would have come out at that time. And who knows what the effect would be on the system?

You don't need to put more and more of those kind of linkages and strains on an economic system that already is pretty damn leveraged.

Charlie, got any further thoughts? We love talking about disasters, so don't stop us. (Laughs)

25. Salomon and Robert Maxwell, "The Bouncing Czech"

CHARLIE MUNGER: It's simply amazing what goes in these seemingly rational places. Salomon was at least as disciplined, and honorable, and rational as the other leading investment banks.

And yet, toward the end of our pleasant period, Salomon was begging for new investment banking business from [Robert] Maxwell. And his nickname was "The Bouncing Czech." (Laughter)

Now, and of course it wasn't very much after that that he committed suicide after massive embezzlements of pension funds, and a huge collapse.

Now, you'd think if a guy's nickname was "The Bouncing Czech," you wouldn't be madly seeking his investment banking business. But all the leading investment banks were.

WARREN BUFFETT: Yeah, I'm fuzzy it on now, but actually the morning, or the day he was discovered to be bobbing around in the ocean, the —

I think at Salomon, we had transferred a bunch of money to somebody over in Germany or Switzerland, and we were supposed to get some more money back that afternoon.

This is basically correct — I may be a little bit off on the details — but the money that got sent, got sent. But the money was to be received, did not get received. And then we went over to England and tried to collect it from his sons, and we got stiff-armed in one way or another.

I mean, we got what we deserved, frankly, in a transaction like that. But to the investment banker involved, his earnings that year was — were going to be affected in a significant way by whether he wrote a ticket or two more with Maxwell. And, you know, in the end, that carried the day.

And it's very hard to control people when their income depends on bringing in dubious people into the door. They care enormously about it, and you've got this big system that doesn't quite pick up on it.

And Charlie's mentioned before, you know, one of the underwriting clients that came forth, that Salomon took on, that professed to be doing wonderful things with money, and it turned out to be a huge fraud.

Well, it's tough to stop. You've got dozens and dozens of people running around out there all thinking about how big their bonus is going to be at the end of the year. And, you know, they are not inclined to run morality checks on who they do business with.

CHARLIE MUNGER: That was a wonderful experience. Warren and I, and Lou Simpson are all directors of a company, and we are by far the biggest shareholder. And we all said we should not be doing business with this guy. This is a very dangerous transaction.

And they told us it had been approved by the underwriting committee. And of course that settled matters. And —

WARREN BUFFETT: This guy had a neon sign that sign that said "Crook" on him, as far as we were concerned.

CHARLIE MUNGER: And he was waving it vigorously, yeah. (Buffett laughs)

But it had been through the underwriting committee. They — the transaction closed, but not financially. I mean, they had the underwriting, but they hadn't had the financial closing.

WARREN BUFFETT: Yeah, they caught him on the way to the bank. (Laughs)

CHARLIE MUNGER: You're right, they pulled back just from the edge of the precipice, from this big, fraudulent — and of course they got egg all over their faces.

That phrase reminds me of one of the leading lawyers of yore, and he said, "Captain of my soul," he says, "Or captain of my fate," he says, "Hell, I don't even pull an oar."

I mean, here we are — (laughs) — with all three of us on the board, you know, the biggest shareholder, and we can't even stop one stupid little underwriting.

WARREN BUFFETT: He did go to jail, though, I think, didn't he?

CHARLIE MUNGER: Yes.

WARREN BUFFETT: He claimed, incidentally, to be a huge shareholder of Berkshire Hathaway. And had made all this money. And I went to the shareholder's list, and admittedly he could have it in a street name someplace.

But it was a big quantity, he claimed. Though we — I couldn't find any record in any place. But he did have some kind of a little from an accounting firm that —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — was backing him up. Didn't back him up all the way, though, it turned out. (Laughs)

26. Hedge funds are a fad with huge fees

WARREN BUFFETT: Number 11, please.

AUDIENCE MEMBER: Good afternoon, I'm Manuel Fernandez, from Mexico City, Mexico. And I want to thank you for your valuable lessons on how to be good partners, you — and for exporting some good ideas and principles to the world for free.

My simple question is, do you think it makes sense for individual investors to invest a part of their capital in hedge funds, or a fund of hedge funds, somewhat like the $600 million investment Berkshire made in Value Capital?

WARREN BUFFETT: Yeah, I would say that people that are now investing in hedge funds, in aggregate, are going to be disappointed.

You don't get smarter because you're running something called a hedge fund, or something called private equity, or something, you know, called anything — an LBO fund.

But what you do gain periodically is the ability to merchandise those things. I mean, there are fads in Wall Street, and Wall Street will sell what it can sell, just remember that. You know, that may be as good as what the fellow quoted up in the upper levels there.

And the hedge fund right now is in the midst of a fad. It's distinguished not by the ability to make more money. It's distinguished by the extraordinary amount of fees that are collected.

And believe me, if the world on $600 billion of money, is paying 2 percent fees, and a percentage of the profits, and the losers go out of existence, and the winners continue for a while, and take money off the table, it is not going to be a great experience, in aggregate, for investors.

Obviously, there are a few smart, honest people out there running funds, and they can — they will do quite well. But if you buy them across the board, in my view, you're going to get a bad result.

Charlie?

CHARLIE MUNGER: Yeah, why would you want to invest with a guy whose basic thought process runs something like this, "If a second layer of fees on top of a first layer of substantial fees is good for an investor, then a third layer of fees must be better yet?" (Laughter)

Why would you invest with somebody with a proposition like that?

WARREN BUFFETT: It — just the idea of taking two percent, you know, plus percentages on top of that, that reflects — you know, it may be what the traffic can bear, you know, Collis P. Huntington style, but that reflects an attitude toward people that we tend to regard as partners, investors — I just think it's a basically unfair type of arrangement.

And I don't like getting in — in general, I think it's a mistake to get in with people who propose unfair arrangements.

You know, in effect they're getting — probably getting four times standard fees to begin with. And then on top of that, they say we want part of the action. And I would guess in many of those cases, that they don't have all of their own money in the fund themselves. Maybe they have a substantial sum outside.

Charlie and I both run — ran — partnerships in the '60s, and '50s with me, and into the '70s with him, that would generally be classified as hedge funds. They had the compensation arrangement somewhat similar, although not like they are now. And we did some —

They had some similarities, but I don't think we had quite the attitude toward the people who were trying to — that were asking to join us — that the present managers have. It's —

As Charlie said, the fund-to-funds type stuff, I mean, it's really sort of unbelievable just piling on layer after layer on costs. It doesn't make the companies that are underlying these stocks they buy any better. I mean, it —

And believe me, people don't become a genius just because you walk into some office, and it says "hedge funds" on the door. I mean they are — what they may be very good at is marketing. In fact, if they're good at marketing, they don't have to be good at anything else.

27. Basic principles and "uncommon sense"

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: My name's Arturo Brulenborg (PH). I'm from Washington, D.C. I'll be graduating from Harvard College in June and beginning a career in value investing, so I sure hope we're all right in thinking that this century will be just as good as the last for value investors.

You've been doing this since you were my age, if not younger. So I'm wondering what habit, or habits have contributed most to your ability to continue learning and improving your investment decisions in a changing business and financial environment?

WARREN BUFFETT: I would say that, at least in my case, I haven't been continually learning, in terms of the basic principles. You always learn a little more about given techniques, or we learn — you know, I learn more about some industries over time, and therefore, maybe I've widened the universe in which I can operate, although more funds narrows it back down, unfortunately.

But I know more about businesses than I knew 20 years ago, or 40 years ago. I haven't really changed the principles.

The last change — the basic principles are still Ben Graham. They were affected in a significant way by Charlie and Phil Fisher, in terms of looking at the better businesses. But they — but I didn't leave any of — I didn't leave Graham behind on that.

And I really haven't learned any new fundamental principles. But I may have learned a little bit more about how business operates over time.

And there's really nothing — I mean, you ought to get an investment framework that comes straight from, in my view, from "The Intelligent Investor," and from Phil Fisher, more from "The Intelligent Investor," actually.

And then I think you ought to learn everything you can about industries and businesses that — where you think you have the ability to get your mind around them if you work at them. And with that arsenal, you'll do very well, and if you've got the temperament for the business.

Charlie?

CHARLIE MUNGER: Yeah, well, of course I've watched Warren all these decades, and he's learned a hell of a lot, even the last 20 or 30 years. So it's a game of continuing to learn. And he can denigrate this little frou-frou that enables him to pick the biggest oil company in China, or this or that.

But those basic principles alone, that he knew a long time ago, wouldn't have given him the ability to make the recent investment decisions as well as he's made them. It's a life-long game, and it you don't keep learning, other people will pass you by.

WARREN BUFFETT: I would say temperament, though, still is the most important, wouldn't you, Charlie?

CHARLIE MUNGER: Yes, of course.

WARREN BUFFETT: Yeah, yeah.

CHARLIE MUNGER: But temperament alone won't do it.

WARREN BUFFETT: No, temperament alone won't do it.

CHARLIE MUNGER: You have to have the temperament, and the right basic idea. And then you have to keep at it with a lot of curiosity for a long, long time.

WARREN BUFFETT: But you don't have to be blindingly, and have any blinding insights, or have a high IQ to look at a PetroChina for example, and —

CHARLIE MUNGER: No.

WARREN BUFFETT: You know, it, I mean, it's a — when you get, you know, a company that is doing 2 1/2 million barrels a day, that's 3 1/2 percent of the — or 3 percent — of the world's oil production.

You know, and they're selling based on U.S. prices using WTI — you know, as West Texas Intermediate — as a base price, and where they have a significant part of the marketing and refining in a country, the tax rate's 30 percent.

They say they're going to pay out 45 percent to you in dividends. Don't have unusual amounts of leverage.

If you're buying something like that at well under half what — or maybe a third — of what comparable oil companies are selling for, that's not high-level stuff.

I mean, you have to read some — you have to be willing to read the reports. But I enjoy doing that. But you wouldn't say that requires any high-level insights or anything, Charlie?

CHARLIE MUNGER: Well, when you were buying that block of stock, nobody else to speak of was buying. So —

WARREN BUFFETT: Thank heavens.

CHARLIE MUNGER: The insights can't have been all that common.

No, I think that takes a certain amount of what an old Omaha friend used to call "uncommon sense." He used to say, "There is no common sense. When people say common sense, they mean uncommon sense."

Part of it, I think, is being able to tune out folly as distinguished from recognizing wisdom. And if you just got whole categories of things you just bat away, so your brain isn't cluttered with them, then you're better able to pick up a few sensible things to do.

WARREN BUFFETT: Yeah, we don't consider many stupid things. You know, we get rid of them fast.

And in fact, people get irritated with us, because they'll call us, and when they're in the middle of the first sentence, we'll just tell them "forget it." You know, and we don't — we can see it coming.

And, you know, that's the way, actually, the mind works. There was a great article in The New Yorker magazine 30 years ago or so — little more than that. It was when the Fischer-Spassky chess matches were going on. And it got into this speculation of would the humans be able to take on computers in chess.

And, you know, here were these computers doing hundreds of thousands of calculations a second. And they said, "How can the human mind, when all you're really looking at is the future, you know, the results from various moves in the future, how can a human mind deal with a computer that's thinking it at speeds that are unbelievable?"

And of course, they examined the subject some. And a mind, like — well, in fact, all minds, but some much better than others — but a Fischer or Spassky, essentially, was eliminating about 99.99 percent of the possibilities without even thinking about it.

So it wasn't that they could outthink the computer in terms of speed, but they had this ability in what you might call grouping, or exclusion, where, essentially, they just got right down to the few possibilities out of the zillions of possibilities that really had any chance of success.

And getting rid of the nonsense, I mean, just figuring that, you know, people start calling you and say, "I've got this great, wonderful idea." Don't spend 10 minutes, you know, once you know in the first sentence that it isn't a great, wonderful idea.

Don't be polite, go through the whole process. And Charlie and I pretty good at that. We can hang up very fast, right? (Laughter)

CHARLIE MUNGER: Well, there you have it. All you've got to do is go at it in the way that Vasily Smyslov did when he was the world champion, and — of chess — and just do the same thing in investments. (Laughter)

28. Estimating intrinsic value

WARREN BUFFETT: OK, microphone 1. (Laughs)

AUDIENCE MEMBER: Good afternoon, Mr. Buffett, Mr. Munger. My name is Richard Azar. I'm from Trinidad in the West Indies.

You guys have been very generous with your intellect over the years. It's been a huge help to me in my personal and financial life.

I wondered if it was appropriate for me to describe the methodology in which I'm trying to determine the range of Berkshire's intrinsic value, and if you can guide me on if my methodology is flawed, or is reasonably accurate.

WARREN BUFFETT: If it doesn't take too long, we'll be glad to, although I think I know the answer already. (Laughs)

AUDIENCE MEMBER: OK. We ended 2003 with about 5.422 billion of operating earnings. I estimated our look-through earnings to be approximately 915 million. So in total, that was about 6.337 billion of estimated look-through earnings.

I knew that we spent a billion-two on CAPEX, and our net depreciation on tangible assets was 829 million. So, there was a difference there of 173 million. And we spent more on CAPEX over the appreciation, over the last few years.

But in extrapolating out 20 years, I thought I might be kidding myself to ascertaining the differences between CAPEX and depreciation. And I'm using look-through earnings as a rough proxy for distributable earnings.

And I've assumed that Berkshire can grow its look-through earnings at 15 percent per annum, from years one to five, and at 10 percent per annum, from years six to 20. And the business will stop growing after year 20, resulting in a 7 percent coupon from year 21 onwards.

I discounted the cumulative flows in years one to 20 by 7 percent, and I discounted the terminal value by 7 percent. I added the two together, to get what I thought was the intrinsic value of Berkshire's cash stream.

I knocked off 103 billion of liabilities and minority interests. I divided by 1,537,000 shares, to arrive at what I thought was a conservative calculation of the range of Berkshire's intrinsic value.

Am I off the mark, or is that the sort of methodology you might use yourself?

WARREN BUFFETT: Well — (Laughter and applause) — well, you've done your homework. (Laughter)

The line of thinking is correct, it just depends on what variables you plug in. And we might have different ideas on variables, and neither one of us knows.

But the approach, in general, the approach of trying to figure out distributable cash over a period of time. The business today is worth, the present value at some number — you're using 7 percent, but the question of what number to use —

But it's worth the present value of all the cash it can distribute between now and Judgment Day. And if cash can be retained, and it's at a rate higher — it produces — at a rate higher than your discount rate, obviously, you'll get some benefit from that retention.

But, you know, I would say that your assumptions about CAPEX, and related to depreciation, I would expect CAPEX to be, on average, a little more than depreciation unless we run into highly inflationary times.

But of course, we have to keep buying businesses, and using the capital in the business that we retain. If we retain those earnings, we have to use that to buy more businesses. And then the question is, what kind of returns can we expect on those?

I don't quarrel with the approach you're using, but, you know, everybody has to do their own equation and plug in some numbers.

And I think we might settle for lower numbers on earnings gains than you postulated because we're very large, and it's — it gets harder all the time to deploy the kind of funds that keep flowing into Omaha.

Charlie?

CHARLIE MUNGER: Yeah, and you shouldn't necessarily get overly excited about last year, as Warren said, that was a very unusual year when everything worked together pretty darn well.

WARREN BUFFETT: Except interest rates on —

CHARLIE MUNGER: Yeah, well, but a lot worked together very well.

The interesting thing about Berkshire's present valuation is how much cash, and cash equivalents it has to do something.

And that is a very interesting question. How well are we going to do with this massive amount of investable cash and cash equivalents?

WARREN BUFFETT: Yeah, we should be out working now. I mean — (laughter) — that is the test.

I mean, we've got a bunch of good businesses. We've got a lot of money that we'd like to use to buy more good businesses. We may get lucky and deploy that quite rapidly. We may wait a long time.

Cash may pile up faster than we can use it, in which case we'll have to rethink the whole game.

But our hope is — and so far we feel OK about what's happened in that — our hope is that we can deploy the money that flows in at — in businesses that come close to being as good as the ones that we've bought over the years.

29. Timing of Berkshire earning reports

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Hi, Mr. Buffett, Mr. Munger, Whitney Tilson, a shareholder from New York City.

It's past three o'clock, and we've heard almost nothing about how these great businesses are doing right now, or at least in the first quarter.

And I recall at last year's annual meeting, you took the fairly unusual step, at least from my recollection, of putting up slides and actually giving us a preview of how phenomenally the businesses were doing.

And I can imagine that if you had the wind to your back a year ago, the situations in the first quarter of this year, you must really, really have the wind at your back. And I was wondering if you can share with us what you can?

WARREN BUFFETT: Well, we can't give you the speed of the wind.

The — we're going to have the 10-Q out when, Marc? Well, it's going to be out in a few days.

And if we throw out any numbers now, or make any commentary, we'd have to put that up on the website, and perhaps even try to cover the nuances in my voice. So I think you'll just have to wait a few days, and they'll go up, the figures will go up, at that time.

And if there are any surprises, they will be surprises then, and everybody will get them at the same time.

Incidentally, we're going to have a little more trouble in the next year or two, because the —

We like to publish everything — all the figures — or anything important if we can do it — we like to do that on Friday night after the close, or Saturday morning, so that everybody has an opportunity to look at them, and have a maximum amount of time to digest them before trading begins.

And the SEC is shortening up reporting times so that we're going to be scrambling just to meet whatever day of the month it is that recording requirements are met. And so we may not —

We won't have the luxury — although we'll try to do it when we can — we won't have the luxury of picking the Saturday before the due date, and targeting that as our release date.

You know, when we had 45 days, or what was it, yeah, 45 days to report, we could pick the Saturday before the 45 days.

If that gets down to 30 days, you know, if the 30th day is on a Tuesday, we're going to be hard put probably to get it done by that Tuesday. So we'll obviously put it out after the close, so people have between four o'clock and the next morning to digest it.

But we won't be able to follow the procedure that we've followed to date, which we regard as the best procedure of all, giving people close to two days to digest whatever is in the figures.

But I can't help you, Whitney, on how the first quarter looks. And Charlie, I don't think you'll want to add anything on that, will you? (Laughs)

30. Advice to young people: avoid credit card debt and hang out with people better than you

WARREN BUFFETT: OK, number 3.

AUDIENCE MEMBER: Hello, Mr. Buffett, and Mr. Munger. My name is Justin Fong. I am 14 years old, from California. This is my fourth consecutive meeting attendance.

I read in a book that you prefer talking to young people about life and financial concepts because we still have time to implement them. Can you please share some of the concepts with us? Thank you.

WARREN BUFFETT: I didn't catch the last part.

CHARLIE MUNGER: I didn't. It's something about sharing concepts. You want to repeat it?

AUDIENCE MEMBER: Can you please share the life and financial concepts that you prefer talking to young people about?

CHARLIE MUNGER: Share — he wants to know your life concepts, and financial concepts, that are useful to young people.

WARREN BUFFETT: (Laughs) — well, that's a fairly broad question. But I think the financial concepts, you know, we've obviously spelled out in the reports. Charlie's probably better on the life concepts than I am.

It is true, that I do believe in spending the time that I spend giving talks, or answering questions, doing it with young people. I do, I'm sure, well over a dozen a year.

And I just think that, obviously, young people are more receptive to change, or to actually at even forming habits that are going to be useful in life.

And I think that people underestimate — until they get older — they underestimate just how important habits are, and how difficult they are to change when you're 45 or 50, and how important it is that you form the right ones when you're young.

But Charlie, what do you have to say on that?

CHARLIE MUNGER: Well, all the trite stuff is what works. I mean, you avoid doing the really dumb things, like, racing moving trains to the crossing — (laughter) — experimenting with cocaine — (laughter) — risking getting AIDS or other unfortunate ailments.

There are just a lot of standard things that take people down. And you just give those a wide berth.

And then you want to develop a good character, and good mental habits, and you want to learn from your mistakes, every single one, as you go along. It's pretty obvious, isn't it? (Laughter)

WARREN BUFFETT: Yeah, we would say even though we issue lots of credit cards and everything, we'd say, probably, if I had one piece of advice to give to young people, you know, across the board, it would be just to don't get in debt. It —

The game plays a lot easier if you're a little bit ahead of the game than if you're behind the game. And Ben Franklin said that long ago in better terms, which Charlie can recite.

But there's a real difference. I get letters every day from people that are in all kinds of financial trouble. And often it's health related, which is tragic. But very often it's — it relates to debt. I mean, they get behind the game, and they're never going to catch up.

And often — it may surprise you — but often, I write these people — they're very decent people, they've just made mistakes — and I just tell them the best course is bankruptcy.

I mean, they are not going to catch up. And they should start all over again, and they should never look at a credit card the rest of their life.

And — but it would have been better if they'd gotten that advice a little earlier. But it's very tempting to spend more than you earn. I mean, I — you know, it's very understandable. But it's not a good idea.

CHARLIE MUNGER: And of course you particularly want to avoid evil, or seriously irrational people, particularly if they are attractive members of the opposite sex. That can — (Laughter)

WARREN BUFFETT: Charlie knows more about this —

CHARLIE MUNGER: It can lead to a lot of trouble.

WARREN BUFFETT: The expert. The — yeah, the — you know —

It's better to hang out with people better than you. I found that very easy to do over the years. (Laughs)

But if you're picking associates, pick out those whose behavior is somewhat better than yours, and you'll drift in that direction.

And similarly if you hang out with a bad bunch, you're very likely to find your own behavior worse over time.

But all — like Charlie says, the trite advice which Ben Franklin was handing out a few hundred years ago, really works.

You know, just — we've said it, but look at the people you like to associate with. You know, what qualities do they have that you can have if you want to?

Look at the people that you can't stand to be around. What qualities do you have that they have? Can you get rid of them? You can do all of that a young age. It gets harder as you go along. It's not very complicated.

CHARLIE MUNGER: And my final word of advice would be, if this gives you a little temporary unpopularity in your peer group, the hell with them. (Laughter and applause)

WARREN BUFFETT: And as advice a little more applicable to me and Charlie, I was reading about a woman that was 103, and they said, "What do you like about being 103?" And she says, "No peer pressure." (Laughter)

31. Buffett: Major commodity markets aren't rigged

WARREN BUFFETT: We'll go to number 4.

AUDIENCE MEMBER: Good afternoon. My name is Mike McGowan. I'm from Pasadena, California.

Everything you just said seems to apply to precious metals, specifically silver —

WARREN BUFFETT: Applies to what? I'm sorry I missed that.

AUDIENCE MEMBER: Precious metals.

WARREN BUFFETT: Oh, sure.

AUDIENCE MEMBER: Specifically, silver. As I recall, Berkshire Hathaway bought 129 1/2 million ounces of silver. And at the time, you said supply/demand fundamentals were good, you saw inflation kicking back, and lots of other reasons. I'm assuming you still own at least 90 million ounces of that.

The problem would be the pricing mechanism. Apparently the COMEX, or at least certain of the managers of the silver price on the COMEX, are in debt. The New York banks and financial institutions are short 400-plus million ounces. And it doesn't look as if they really want the price to go anywhere.

So given that Berkshire has all of this silver, do you see the price of silver actually trading in a free market at some point, or would you look at shares instead of the physical metal?

And otherwise, we're kind of at the point, I guess, where John Maynard Keynes said, "The market can remain irrational a lot longer than we can remain solvent."

WARREN BUFFETT: The — we have no comment at all to make on our present position in silver, if any, we may — we could own more, we could own the same, we could own less, we could own none. So — and we won't comment.

We commented one time because the Bank of England asked us to comment. And since it was the only time the Bank of England had ever talked to me, I felt quite flattered. (Laughter) The —

But I would say this. I would disagree very much with your thoughts that the market is in some way rigged, or something of the sort. The — there's —

I find that most of the people that write — or many of the people that write — on gold and silver tend to have various theories, some of which are conspiratorial, and there's always, you know, the selling forwards is doing this and that to the market, or that somebody's short.

You know, the answer is that there's plenty of silver above ground. Whether there's more or less than there was a few years ago, in terms of the supply-demand since then, I'm not a hundred percent sure. It's tough to figure out what goes on in China in a lot of things.

But I — there's nothing flawed, in my view, about the market for silver, or copper, or gold, or really any commodity that I can think of that trades in real quantity.

Charlie?

CHARLIE MUNGER: Yeah, I think it also should be pointed out that you're asking for the opinions of people who have not particularly distinguished themselves in this arena. (Laughter)

WARREN BUFFETT: He was pointing at me. (Laughter)

With good reason.

32. Buffett doesn't see Wells Fargo as a "big player" in derivatives

WARREN BUFFETT: We'll go to number 5.

AUDIENCE MEMBER: Good afternoon, Travis Keith (PH), from Dallas, Texas.

The OCC's quarterly report on bank derivatives shows that Wells Fargo has one of the largest derivatives portfolios of any U.S. bank.

In spite of your high-profile criticism of derivatives, Berkshire added to its position in Wells Fargo last year.

What about Wells Fargo's derivatives portfolio did you find less objectionable, and what disclosure did you examine in considering the risks of Wells Fargo's derivatives portfolio?

WARREN BUFFETT: I don't have their report here, but without looking at it, I would be willing to bet that JPMorgan Chase has a derivatives portfolio that's far, far greater than Wells.

I do not think of Wells, and I may be wrong, I do not think of Wells as being a big player.

Now, all the big banks have various derivative positions. But I do not — I don't think of Wells as being a big player in the derivative game. And I — you can't —

There is no perfect measurement of the size of a derivative position. I mean, you hear all these huge numbers thrown around, and they sound great, but they tend to exaggerate things in a huge — in a very dramatic way, in terms of trillions of this or that. But so —

You know, there can be — you could talk about a billion dollar notional amount of one kind of derivative, and it could have less danger in it than a $50 million position of — in some other type.

But I really don't think you'll find that Wells, particularly compared to a JPMorgan Chase, or a Citibank, or something of the sort, is a really big derivatives player.

And Charlie and I — at least I — and think Charlie'll agree — Wells, I think, is an extraordinarily well-managed bank.

I disagree with them violently on expensing of stock options. I mean, Dick Kovacevich, who runs that, and I would have entirely different opinion. He's written about it in the last couple of annual reports. And much as I — and I really admire the management. I think he's done a great job — but much as I admire the management, I voted the other — our Berkshire stock — the other way, and for expensing options. And I noticed that 57 percent of the stock at this meeting just the other day voted to expense options.

But even though I disagree with him on that particular accounting point, Wells has a — an absolutely terrific record. Dick is a terrific businessperson.

And I think in terms of taking risk, or handling the risk that he necessarily takes, I think that I would rank him very way up there in terms of bank managers.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

33. Leverage is the biggest danger to investors

WARREN BUFFETT: OK, we're going to take one more from number 6.

AUDIENCE MEMBER: Thank you very much, Mr. Munger and Mr. Buffett.

My question regards — well, I'm Michael Stofski (PH) from New York.

My question regards financial institutions and the potential of collapses.

And how is Berkshire protected, and how can the individual investor protect themselves against potential bank failures, stock brokerage failures, and things like that?

WARREN BUFFETT: Well, I think as a depositor with large banks, or as somebody that leaves their securities with large brokerage firms, I really don't think you to worry very much.

We have a "too big to fail" doctrine operating in this country, relative to what you might call the innocent parties in big financial institution failures. We don't have it in respect to the equity holders, nor should we have it.

But I would not — I don't worry about leaving my securities — my personal securities — or for that matter, Berkshire securities — with the large securities firms. I don't worry about my bank accounts at big banks, so —

CHARLIE MUNGER: But you're talking cash accounts?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: Yeah, cash accounts.

CHARLIE MUNGER: Not margin.

WARREN BUFFETT: Yeah. And the — but if you, in terms of owning the equities of companies like that, or in terms of the fallout, the big thing that will —

Really, the only way a smart person that's reasonably disciplined in how they look at investments can get in trouble is through leverage. I mean, if somebody else can pull the plug on you during the worst moment of some kind of general financial disaster, you go broke. And Charlie and I both have friends that have — where that's happened to them.

But absent leverage, and absent just kind of going crazy in terms of valuation on things, the world won't hurt you over time in securities.

And, I mean, you won't be subject to the financial cataclysms that — they don't need to do you in. If you have any more money during periods like that, you buy.

Berkshire, I think, is in an extraordinarily strong position in respect to any kind of a financial cataclysm. I think we would be definitely the last man standing, and then some.

And while we don't go around, you know, like undertakers looking for a plague or anything like that, you know, we would probably do very, very well in the end.

And that's happened a couple of times, actually, in the past, where we've had cash, and we've had courage when the world was panicking, and it's — we've done reasonably well during that period.

And we've never gotten hurt by what was happening in the world around us, at least in the last 30 or 40 years.

Charlie?

CHARLIE MUNGER: Well, I think that’s plainly right.

Morning Session - 2005 Meeting

1. Welcome

WARREN BUFFETT: Morning. I'm Warren, he's Charlie. We work together. We really don't have any choice because he can hear and I can see. (Laughter)

I want to first thank a few people. That cartoon was done by Andy Heyward who's done them now for a number of years. Andy writes them. He goes around the country and gets voices dubbed in. It's a labor of love. We don't pay him a dime. He comes up with the ideas every year. He's just a terrific guy.

He's unable to be here today because his daughter is having a Bat Mitzvah. But he's a very, very creative fellow.

He did something a few years ago called "Liberty's Kids." And if you have a child or a grandchild that wants to learn American history around the time of the Revolution, it's a magnificent series.

I think it's maybe as many as 40 or so half-hour segments and it's appeared on public broadcasting. It will be appearing again. You can get it and video form.

And, like I say, it's just a wonderful way to — I've watched a number of segments myself. It's a wonderful way to get American history.

The only flaw in it is that the part of Ben Franklin is handled by [former CBS News anchor] Walter Cronkite, and Charlie is thinking of suing. A little bit upsetting when Charlie is available.

Incidentally, we have "Poor Charlie's Almanack" next door in the exhibition hall. And it's an absolutely terrific book that Peter Kaufman has put together. And I think it's going to be a seller, a huge seller, long after most books have been forgotten.

It's Charlie at his best. And Charlie's at his best most of the time, but it's a real gem.

I want to thank Kelly Muchemore, who puts all of this together. I don't give it a thought. Kelly takes charge of this. She works with over 200 people from our various companies that come in and help make this a success. She does it flawlessly.

As I mentioned in the annual report, Kelly's getting married in October. So this is just a warmup. I mean, we're expecting a much bigger event than this come October.

2. Where daughter Suze draws the line

WARREN BUFFETT: I want to thank my daughter Suze, who does millions of things for me. She puts together that movie.

She does draw the line, occasionally.

A few years ago — we have a dinner at [Omaha steakhouse] Gorat's the day after the meeting. And we were in having — the whole family was there — having dinner. The place was packed and there was a big line that had formed outside.

Be sure not to go to Gorat's unless you have a reservation tomorrow, because they're sold out.

But the big line had formed and it started raining cats and dogs. And the waitress came to me. We were eating. Waitress said, "I got to tell you," she said. "It's raining like crazy outside and there's a long line and [Walt Disney CEO] Michael Eisner is standing out there getting soaked."

So I turn to Suze — and Michael and Jane [Eisner] are friends of my mine, good friends — and I said to Suze, "Why don't you go out there and help them out before they get drenched."

And she looked at me and said, "I waited in line at Disneyland." (Laughter)

That seems to strike a responsive chord.

3. Day's agenda

WARREN BUFFETT: We've flipped things this year. We're going to have the business session at about 3:15.

The plan is to have questions and answers. We have 12 microphones here.

We have an overflow room that's filled also, so we got another few thousand people there.

We'll break at noon and when we break at noon — and anybody that's been in the overflow room that wants to come in here, they'll be, I'm sure, plenty of seats in the afternoon session.

We will start the questioning as soon as I get through with a few preliminary remarks. We'll go to noon. We'll take a break, you'll have lunch.

Many people find that it helps the digestion to shop while you eat. And we have thoughtfully arranged a few things next door that you can participate in while you eat your lunch. Even if it doesn't help your digestion, it will help my digestion if you shop during that period.

4. Buffett on what he won't talk about

WARREN BUFFETT: During the question period, we can talk about anything that's on your mind. Just, there's 2 1/2 subjects that we can't talk about.

We can't talk about last year's Nebraska football season. We'll correct that next year. But that's off limits.

We can't talk about what we're buying and selling. I wish we were doing more of it, but we're doing a little, and I'll make reference to something on that a little later.

And finally, in connection with the investigation into the insurance industry practices that's taking place, there are broad aspects of it we can talk about.

I can't talk about anything that I or other people associated with Berkshire have disclosed to the investigators.

And there's a very simple reason for that: to protect the integrity of any investigation like this, they do not, the investigators, do not want one witness talking with other witnesses, because people could tailor their stories or do various things.

And so, witnesses are not supposed to talk to each other and, of course, if you talk — we don't do that.

And then beyond that, if we were to talk in a public forum, that could be a way of signaling people as to what you've said and then they could adapt accordingly.

So investigators, one thing they like to do, is they like to work fast if they can because they don't want people collaborating on stories .

And they — and to protect the integrity of the investigation, we won't get into anything that's specific to something that I or people associated with Berkshire may have told the authorities.

But there may be some broader questions that that we can talk about.

5. Preliminary Q1 earnings

WARREN BUFFETT: I can give you a little preliminary view of the first quarter with certain caveats attached. These figures — our 10-K — or 10-Q — will be filed in the end of next week.

And I caution you that, particularly in insurance underwriting, it's been a better quarter than — considerably better quarter — than I would normally anticipate.

One of the reasons for that is that our business actually does have some — the insurance business has some — seasonal aspect.

Now, it doesn't have a seasonal aspect, particularly, at GEICO or at National Indemnity primary business.

But when you get into writing catastrophe business, and we're a big writer of catastrophe business, the third quarter — the biggest risk we write in big cat area is hurricanes. And those are concentrated — they're actually concentrated in the month of September.

In this part of the world, 50 percent of the hurricanes, roughly, occur in September and about maybe 17 and-a-half percent in October and August, and the balance, maybe, in November and July.

But there's a concentration in the third quarter. So when we write an earthquake — I mean when we write a hurricane policy, for example — we may be required to bring the earnings in monthly on the premiums. But all of the risk really occurs — or a very great percentage of it — late in the third quarter, and we don't have any risk in the first quarter of hurricanes.

So we earn some premium during that quarter that really has no loss exposure. And then we get that in spades come September.

Even allowing for that we had an unusually good quarter. And I would still stick by the prediction I made in the annual report where I said that if we don't have any really mega catastrophes, I think we've got a decent chance of our float costing us zero or less this year, which means, in effect, we have 45 billion or so of free money.

In the first quarter, our insurance underwriting income — and all of these figures are pretax — our insurance underwriting income came to almost $500 million, which was about 200 million better than a year ago.

And GEICO had a very good quarter for growth. We added 245,000 policyholders, which is almost 4 percent, in one quarter to our base.

We were helped very much by this huge reception we're getting in New Jersey, because we weren't in there a year ago, so we're getting very good-sized gains there.

We're not getting 4 percent in a quarter from around the country, but the boost from New Jersey took us up to that.

And GEICO actually wrote at a 13 percent underwriting profit in the first quarter, which is considerably better than we expect over the full year. And we've reduced rates some places. And it's been an extraordinary period for auto insurers, generally.

But all of our companies in the insurance business did well in the first quarter.

Our investment income was up something over 100 million pretax.

Our finance business income was up, maybe, $50 million pretax. MidAmerican was about the same.

And all of our other businesses, combined, were up about — close to $50 million pretax, led by Johns Manville, had the biggest increase. That businesses is very strong, currently.

So if you take all of our businesses before investment gains, which I want to explain, if you take them all before investment gains, our pretax earnings were up 400 million or a little more.

Now, investment gains or losses: we don’t give a thought as to the timing of those. We take all investment actions based on what we think makes the most economic sense, and whether it results in a gain or a loss for quarter is just totally meaningless to us.

A further complicating factor, slightly complicating factor, is that certain unrealized investment gains or losses go through the income statement, whereas others don’t. That’s just the way the accounting rules are.

Our foreign exchange contracts are valued at market, really, every day, but you see it at quarter end.

And those foreign exchange contracts, which total about 21 billion now, a little more than 21 billion, had a mark-to-market loss of a little over 300 million in the first quarter.

And they bob up and down. I mean, sometimes they bob as much as 200 million or more in a single day.

And those mark-to-market quotations run through our profit and loss statement. Whereas if we own some Coca-Cola stock and it goes up or down, that does not run through our income statement. But with foreign exchange contracts, it does.

So there’s a $310 million mark- to-market — it shows as realized, it actually isn’t — investment loss on that.

And overall, the investment losses, including that 310, came to about 120. In other words, there was 190 million, or something like that, in other gains.

As I say, that means — at least to us — that means nothing.

And to underscore that point, if later in the year the Procter and Gamble-Gillette merger takes place, we are required under accounting rules, when we exchange our Gillette for Procter and Gamble stock, we are required under accounting rules to show that as a realized gain. Now that will show up as, probably, four-and-a-fraction billion dollars.

We haven’t realized any gain at that time, in my view. I mean, we’ve just swapped our Gillette stock for Procter and Gamble stock, which we expect to hold for a very long time.

So it's no different, in our view, than if we'd kept our Gillette stock. But the accounting rules will require that.

So if in the third quarter of this year the P&G-Gillette merger goes through, you will see this very large supposed capital gain recorded in our figures at that time.

And I want to assure you that it's meaningless and you should ignore that as having any significance, in terms of Berkshire's performance.

So, first quarter has gone by. We've got a good start on operating earnings this year. We won't earn at the rate of the first quarter throughout the year, in my view. I think it would be very unlikely, in terms of operating earnings. But the businesses are performing, generally, very well.

6. Insurance acquisition coming

WARREN BUFFETT: One other thing I should mention, and then we'll get on to the questions, that we can't announce the name, because it isn't quite complete in terms of the other party, but we will probably announce, very soon, an acquisition that is a little less — somewhat less — than a billion dollars, so it's a huge deal, in reference to Berkshire's size

But it is in the insurance field. I mean, we love the insurance business. It's been very good to us. We have some terrific managers in that field.

You'll see it in the first quarter figures, but you'll also see how we feel about the business by the fact that this acquisition, which I would say is almost certain to go through, will probably get announced in the next few weeks.

We're looking for bigger acquisitions. We would love to buy something that cost us 5 or $10 billion. Our check would clear, I assure you.

I think we ended the quarter with about 44 billion of cash, not counting the cash in the finance operations. So, at the moment, we've got more money than brains and hope to do something about that.

7. Q&A begins

WARREN BUFFETT: Now we're going to go around the hall here. We've got 12 microphones and — get oriented here — and we'll turn the spotlight on the microphone that is live.

People can line up to get their questions asked. I think we've got two microphones, also, in the overflow room.

And like I say, after lunch everybody should come in here because there's enough people that get so enthralled with shopping that they don't return. They'd rather shop than listen to me and Charlie, and we'll have plenty of seats for everybody in this main hall after lunch.

And so, with that, let's go to — have I forgotten anything, Charlie?

CHARLIE MUNGER: No.

WARREN BUFFETT: OK. (Laughter)

That may be the last you hear from him. You never can tell.

8. What Buffett looks for in managers

WARREN BUFFETT: We'll go to microphone number 1, please.

AUDIENCE MEMBER: Simon Denison-Smith from London.

You talk a lot about the importance of selecting terrific managers.

I'd just like to understand what your three most important criteria are for selecting them, and how quickly you can assess that.

WARREN BUFFETT: Yeah. I'll give you two different answers.

The most important factor, subject to this one caveat I'm going to give in a second, is a passion for their business.

We are frequently buying businesses from people who we wish to have continue manage than them and where we are, in effect, monetizing a lifetime of work for them.

I mean, they've built this business over the years. They're already rich but they may not be rich in the liquid sense. They may have all their money, or a good bit of it, tied up in the business, so they're monetizing it. They may be doing it for estate reasons or tax reasons or family reasons, whatever.

But we really want to buy from somebody who doesn't want to sell. And they certainly don't want to leave the business.

So we are looking for people that have a passion that extends beyond their paycheck every week or every month for their business.

Because if we hand somebody a hundred million or a billion dollars for their business, they have no financial need to work. They have to want to work. And we can't stand there with a whip. We don't have any contracts at Berkshire. They don't work, as far as I'm concerned.

So we hope that they love their business and then we do everything possible to avoid extinguishing, or in any way dampening, that love.

I tell students that what we're looking for when we hire somebody, beyond this passion, we're looking for intelligence. We're looking for energy. And we're looking for integrity.

And we tell them, if they don't have the last, the first two will kill you.

Because if you hire somebody without integrity, you really want them to be dumb and lazy, don't you? I mean, the last thing in the world you want is that they are smart energetic. So we look for those qualities.

But, we have generally — when we buy businesses, it's clear to us that those businesses are coming with managers with those qualities in them. Then we need to look into their eyes and say, do they love the money or do they love the business?

And if they love — there's nothing wrong with liking the money. But if — what it's really all about is that they built this business so they can sell out and cash their chips and go someplace else, we have a problem, because right now we only have 16 people at headquarters and we don't have anybody to go out and run those businesses.

So we — it's necessary that they have this passion and then it's necessary that we do nothing to, in effect, dampen that passion. Charlie?

CHARLIE MUNGER: Yeah. The interesting thing is how well it's worked over a great many decades and how few people copy it. (Laughter and applause)

9. Buffett on beer industry and its history

WARREN BUFFETT: Go to microphone 2, please.

AUDIENCE MEMBER: Good morning, Warren and Charlie. My name is Walter Chang and I'm from Houston, Texas.

Can you describe how you made your investment decision to invest in Anheuser-Busch and how you estimated its intrinsic value? How long did it take you to make this decision?

And is Budweiser inevitable, like Coca-Cola?

WARREN BUFFETT: I'm still drinking Coca-Cola.

The meeting might get a little exciting if I we were drinking Bud here. (Laughter)

We don’t get into much in the way of description of things we might be buying or selling, but the decision takes about two seconds.

But I bought 100 shares of Anheuser about — I haven’t looked it up — but I would say, maybe, 25 years ago when I bought 100 shares of a whole lot of other things .

And I do that so I can get the reports promptly and directly. You can get them to your brokerage firm, but I’ve found that it’s a little more reliable to put the stock in a direct name.

So I’ve been reading the reports for at least 25 years and I observe, just generally, consumer habits, and at a point — currently, the beer industry sales are very flat.

Wine and spirits have gained in that general category at the expense of beer. So if you look at the industry figures, they’re not going anywhere.

Miller’s has been rejuvenated to some degree. So Anheuser, which has had a string of earnings gains that have been quite substantial over the years and market share gains, is experiencing, as they’ve described — and they just had a conference call the other day — is experiencing very flat earnings, having to spend more money to maintain share, in some cases, having promotional pricing.

So they are going through a period that is certainly less fun for them than was the case a few years ago.

And it’s a fairly easy-to-understand product and consumer behavior is fairly easy to understand. It’s a very, very — exceptionally strong business.

In fact, what’s happened in the beer industry over the last 50 years has been fascinating to me and to Charlie because this is a brewing town that we grew up in, and Charlie knew the members of the Storz family, a number of them, well.

Storz had over 50 percent of the Omaha market in beer post-World War II and then basically disappeared as the national brands took over. So it’s an interesting phenomenon.

Beer business is not going to grow significantly in the U.S.

Worldwide, beer is popular in a great many places, and Anheuser will have a very strong position in it. But I would not expect the earnings to do much for some time, but that’s fine with us.

Charlie?

CHARLIE MUNGER: Yeah. At our scale of operation now, if we're ever going to buy into a terribly well-regarded company, we almost need a little patch of unpleasantness. (Laughter)

WARREN BUFFETT: That's been the best time to buy Berkshire, incidentally, too. I mean, we do —

What we're looking for is businesses with a durable competitive advantage. I don't think there's any question that Anheuser has a very, very strong consumer position. Now, as I said, Miller has been rejuvenated to some degree.

But the other thing about it is, of course, in beer you do not see the prevalence of private labels or generic products that you see in a great many consumer products that are being — that had strong positions over the years, that are being attacked . That's a small plus.

But beer consumption per capita is going no place. And there's nothing that will change that.

Interestingly enough, the average person in this climate drinks about 64 ounces of liquid a year. And I think it's roughly 27 percent of that will be carbonated soft drinks.

So almost — and, of course, of that Coca-Cola will be about — Coca-Cola products — will be 40-odd percent.

So, of the 64 ounces of liquid that Americans are drinking every day, you can figure something like 11 ounces of that, man, woman, and child, will be a Coca-Cola product.

Beer, as I remember — I could be wrong on this — but I think beer is about 10 percent of all liquids. So, one out of every 10 ounces that's consumed by Americans of any kind of liquid is, I believe, is beer.

Coffee, incidentally, despite what you read about — you know, the popularity of Starbucks, which is very real, of course, — but coffee has just gone down and down and down over the last 30 or 40 years.

Charlie, you have any thoughts about your consumption habits? That you can talk about? (Laughter)

CHARLIE MUNGER: Well, there are people here that may remember Metz beer.

In this country, we had more breweries — there were hundreds — and small places would have two or three brands. And this trend toward concentration into a few giants is, I think, permanent.

WARREN BUFFETT: Yes. Schlitz was number one, as I remember, after World War II, for a while. I think Anheuser was number four at that time.

There's an interesting book, if you're a beer enthusiast, it came out a few years — a few months — ago, maybe a little longer than that, by a Wall Street Journal reporter that sort of toured the country sampling beers. I don't know how it affected his writing. But it's a pretty good book, if you like reading about the history of beer.

10. Competition from hedge funds

WARREN BUFFETT: Let's go to number 3.

AUDIENCE MEMBER: Greetings from Bonn, Germany. I'm (inaudible). Thank you for another great year added to your track record of investing. And thank you again for allowing us to be partners at these favorable terms.

This year, I want to ask you another question about how you see Berkshire positioned versus others.

Last year, I asked you how you see the increased competition for buying companies through the rise of the private equity industry and how that affects Berkshire's ability to buy great businesses at fair prices, and you basically said that there are still enough business owners who would rather sell to Berkshire versus a private equity fund.

This year, I would like to hear your views on the hedge fund industry.

We see hedge funds going into all investment strategies. We know that you have spoken about the fees of the hedge fund industries, but I would like to hear from you how you see Berkshire positioned.

Are returns in strategies like merger arbitrage, like convertible bonds — are returns going down because of the increased competition? And are there other factors where Berkshire can be unique versus the hedge funds?

WARREN BUFFETT: Well, that's a great question. It's the $64 question.

There's no doubt about it that there is far more money looking at deals now than five years ago, and they're willing to pay out more for the good, but mundane, businesses that we've been successful at buying in the past.

And you mentioned the private equity firms and they're bigger than ever.

The hedge funds have gotten into the game, to some degree. And if someone is auctioning off a business today — this has changed just very slightly in the last four or five weeks because of some change in the junk bond market, but not in any significant degree — there were people lined up to bid on almost anything.

In fact, you have private equity firms selling their businesses to other private equity firms.

And there are a lot of companies that are being sold, that are being sold to someone who's buying them to resell in a fairly short period of time.

We can't compete in that field and that's, you know, that's a source of distress to us. But that's the way it is.

We will — it won't go on forever, in our view. We still occasionally, as this deal I mentioned to you, the party on the other side and we just — we made a deal that did not go through an auction process. And we see that occasionally, but we don't see it anything like we saw it four or five years ago.

So, in terms of the near-term outlook for Berkshire, in terms of doing what it's important that we do, do successfully, which is buy businesses and keep adding to this collection, we are not positioned favorably at all for that.

And we do find it extraordinary, both Charlie and I have over the decades, just how fast things can change.

There have been at least three times, maybe more, where it's looked to me in my own career, where it looked like there was so much money sloshing around that it would be impossible to do intelligent things with money.

And I actually terminated a partnership back at the end of 1969 because I felt that that the money was coming out, you know, of the woodwork. There were all kinds of people that wanted to use it and compete, and I just didn't feel we could do intelligent things.

Within four years, I saw the greatest opportunities that I've ever seen in my lifetime. And we've had several experiences like that.

You know, in 1998, when Long-Term Capital Management got in trouble in the fall of 1998 and other things were happening, you had incredible opportunities available in the investment world.

Now, people were just as smart then. They had all these people with 150 IQs running around, and they actually had money. But the world became paralyzed for a short period.

And you literally had so-called "on- the-run" Governments, which were the most recent issue, and "off-the-run" Governments, which were issued by the same government, the United States government, payable in dollars. You had a 30-basis point differential between the 30-year and the 29-and-a-half year.

Both bonds issued by the U.S. government, you know, one a half-year shorter. Both quite liquid, but the "on-the-run" being more liquid. And a 30-basis point differential in yield means about a three-point difference in price.

Well, you wouldn't believe that could happen in the United States of America in 1998, but it did happen.

And I think I have a slide here. Mark, if it — if we can put that up — that shows what high-yield bonds —the situation in those, just really less than three years ago.

In the fall of — yeah, there it is —I n the fall of 19 — in the fall of 2002, you had all these high IQ people in the financial world. You had lots of money.

And I don't know how easy it is to read those figures, but you'll see that a bunch of high-yield bonds — this actually is a table that involves a friend of mine, but we were doing pretty much the same thing.

And you can see that he was buying bonds at anywhere from a 25 percent to 60 or 70 percent yield basis, and within 12 or 14 months had sold these same bonds on a 6 percent yield basis.

You don't need to do that very many times in a lifetime.

But that was two-and-a-half years ago after all these people had graduated with MBAs, and studied modern finance theory, and had money coming out of their ears, and all had a desire to make money, and yet conditions like that could exist.

We bought about seven billion of junk bonds during that period, because it was a fairly short period.

But things do happen that change the landscape dramatically, I mean really dramatically, in financial markets from time to time.

But right now, we are positioned very badly in terms of buying businesses, and it's a big negative.

And your Berkshire stock will not do as well under these conditions as it would do if the conditions of five years ago or 20 years ago existed.

And I don't have any magic solution for that except just to tell you what the facts are.

Charlie?

CHARLIE MUNGER: Yeah. A lot of the buying by private equity funds in both real estate and stocks, and for companies, is fee-motivated.

In other words, the investment manager will rationalize any price paid because he likes the extra fees for managing the extra assets.

I have a friend that tried to buy warehouses with a lot of family money and he just stopped. Whatever he bid was always topped by some professional manager, managing other people's money on a fee basis.

So this is a very peculiar era where all these asset classes have been driven to very high valuations, by all historical standards.

Some investment operations are very ethical in this (inaubible).

I think Howard Marks is here today. He sent a lot of money back, and stopped soliciting money from his clients in certain activities where the opportunities went away.

That's the right way to behave, but it's not normal.

WARREN BUFFETT: Yeah, I don't think he'll mind — I didn't know Howard was here today — but those actually are Howard's figures for one of his funds.

And like I say, we were doing similar things. We didn't know it at the time but we found out we had some similar positions later on.

About five or six years ago, when the terms of these deals were somewhat different, I actually had a fellow call me, whose name most of you would recognize, and he started asking me questions about the reinsurance business because he was in — he said he was thinking about buying a given company, which got sold, and he didn't really know much about the business, but that unless he spent these x dollars, he was going to have to give it back to his investors in a few months because the term of the initial sign up period expired at that point, and any unexpended funds were to be returned.

And he was going to get 2 percent a year on those funds regardless of how they did. So he was looking at businesses that he didn't understand with the hope that he can place the money.

Charlie and I are at a disadvantage in buying businesses because we have almost all of our net worth in the downside as well as the upside.

You know, if we had a 2 percent fee and 20 percent of the profits and a goodbye kiss for the losses, you know, that's a different equation than exists at Berkshire.

We run it as if it's 100 percent our money, which it is close to 100 percent of our net worth.

And we will own the downside. And we don't get paid for spending the money, we get paid for making money.

And it's tough — competing right now is tough and likely to be relatively futile, although we have one or two things that could happen that could involve the expenditure of real money.

CHARLIE MUNGER: I don't think any of the businesses that have sold to us over the years, which are run by the kind of people we like being associated with, would have wanted to sell to a hedge fund.

So there exists a class of assets out there that doesn't want to deal with hedge funds or private equity funds.

Thank God. (Laughter)

WARREN BUFFETT: Yeah, we've seen no deal anybody else has made the last year that we wish we had made.

Now that was not the case 15 or 20 years ago when there used to be plenty of deals made with other people that we would have liked to have made if they'd come to us .

But I have seen nothing that — I've seen nothing that if it sold for 10 percent less than the advertised price that we would have had any interest in buying. So we are in a different world right now.

11. Buffett's early interest in stocks

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: I'm Dudley Shorter (PH) from Council Bluffs, Iowa.

When you were younger, what first sparked your interest in investing, and what advice would you give a younger person if they wanted to invest in the stock market? Thank you.

WARREN BUFFETT: Well, I'm not exactly — I got interested probably when I was, maybe, seven or thereabouts. I wasted my time before that. (Laughter)

It's a little like W.C. Fields. When he inherited some money, somebody asked him what he did with it and he said he spent half of it on whiskey and the rest he wasted. (Laughter)

So there I was, dawdling around. But I got — my dad [Howard H. Buffett] was in the business, so I would go down to his office, and I would see these interesting books, and I would read them and I would go down — he was on the fourth floor of what's now known as the Omaha Building at 17th and Farnam, and on the second floor was Harris Supplement Company, and they had a board, and I would go down there.

The market was open on Saturdays in those days, so I could — for two hours — so I could go down on Saturday, and I saw all these interesting things going across the tape.

And I just read a lot. I probably took every book in the Omaha Public Library, every book they had on investing — or the stock market — basically.

I was very interested in the New York Stock Exchange. I thought maybe I'd want to become a specialist when I grew up and maybe I still will.

But the — I took all the books out. I read them. And finally, when I was 11, I bought three shares of stock and I didn't know — I was fascinated by the subject.

My dad got elected to Congress, so now the library became even bigger, and I took all the books I could out of there on markets. And I used a chart and do all that sort of thing.

And then, finally, I read [Benjamin] Graham's book when I was at the University of Nebraska, "The Intelligent Investor," when I was 19, and that just changed my whole framework.

But the advice I would give is to read everything in sight.

And to start very young. It's a huge advantage in almost any field to start young.

If that's where your interest lies, and you start young, and you read a lot, you're going to you're going to do well.

I mean there are no secrets in this business that only the priesthood knows. I mean, you know, we do not go into temples and look at tablets that are only available to those who have passed earlier tests or anything.

It's all out there in black and white. It's a simple business.

It's not — it requires qualities of temperament way more than it requires qualities of intellect. I mean, if you've got more than 125 IQ, you can throw away the rest of the points or give them to your other members of the family or do something because you don't need it in investing.

But you do need a certain temperament that enables you to think for yourself. And then you have to develop a framework — and I developed it from reading Ben Graham, I didn't come up with it myself — very simple framework.

And then you have to look for opportunities that fit within that framework as you go through life, and you can't do something every day. You know, you can learn every day, but you can't act every day.

And I talked about reading the annual reports of Anheuser-Busch for 25 years, but I've read the reports of Coca-Cola and Gillette and all kinds of companies long before we invested in them.

And if you enjoy the game, you know, you'll find that like playing bridge or playing baseball or whatever, if you don't enjoy it you probably won't do well on it.

But I would advise you to start early. Read everything in sight. Look for the successful framework that's been successful for people, and there's nothing like Graham's, in my view, and you'll have a lot of fun and you'll probably make a lot of money.

Charlie?

CHARLIE MUNGER: Well, I'm at a little disadvantage here. Warren has made himself into kind of a dean of investors, starting as a boy, and he has a greater respect for the process than I do.

I have a good bit of [economist John Maynard] Keynes' attitude that money management is sort of a low calling, compared to being a surgeon or a lot of other things.

12. CEOs should know more about investing

CHARLIE MUNGER: I think the corporate types — the corporate managers — ought to study investing better because they'd be better managers.

And I think that everyone who thinks through the investment process learns more about how the world really works. And I think that's very worth having.

But I do not like as big a percentage of GDP as we now have going to money management and its attendant frictions.

And I don't like the percentage of the nation's brainpower that is now in all of these different forms of highly-compensated money management.

I don't think it's a good thing for the country, and I hate the fact that we've contributed to it by our own predilections.

WARREN BUFFETT: Charlie is only sitting up here next to me as part of his outreach program, actually. (Laughter)

Please don't take any pictures that you could blackmail him with, being associated with me.

Charlie made a very good point there about how managers would do better if they understood investments.

I find it absolutely fascinating, and I've seen this throughout my life, I've seen it close up.

I will have friends who are CEOs of companies and they'll have somebody else handle their money.

If you say to them, you know, should you buy Coca-Cola or Gillette or something like that, they'll say that's much too tough. I don't understand that sort of thing. What do I know about investing?

And then some investment banker walks in the next day with the idea they buy a $3 billion company, which is just buying a lot of shares of stock in one company, and they'll run through some little two-hour presentation and turn it over to a strategic planning group and think that they are then the ones that should make that decision as to whether to buy multibillion-dollar businesses when they really don't feel they're qualified to make $10,000 decisions with their own money.

And it's extraordinary what you see in corporate America and the acquisition activity.

It's a little like they say about making sausage and making laws, it's better unobserved.

Charlie, you have any further thoughts on that? You've seen a lot of it with me. (Laughs)

CHARLIE MUNGER: Well, I do think that the present era has no comparable precedent in the past history of capitalism.

I think we have a higher percentage of the attention of our intelligent classes into buying little pieces of paper and getting — trying to get rich doing it, and in promotional activities with big profit sharing fees.

I can recall no past era which had a similar concentration of this type of activity. Can you, Warren?

WARREN BUFFETT: No, but I think you would say, probably, too, that we've seen sort of baby versions of this, something subsequently happened, that —

CHARLIE MUNGER: Oh, yes. If you want to talk about what are the future implications, a lot that I see now kind of reminds me of Sodom and Gomorrah, and —

WARREN BUFFETT: We weren't there, incidentally. I mean — (Laughter)

CHARLIE MUNGER: No, but there's a published account. (Laughter)

And I think when you get as much sort of regrettable activity going on and sort of feeding on itself in frenzies of envy and imitation, that — it has happened in the past that there came bad consequences.

13. PetroChina investment

WARREN BUFFETT: On that cheery note, we'll move to number 5.

AUDIENCE MEMBER: Good morning. My name is Molly Fanner (PH). I'm 11-years-old and I'm from Long Island, New York.

I have two questions today and I have put them in the form of a poem.

Mr. Buffett, Mr. Munger, to get here we had to fly.

I came to hear your thoughts if PetroChina was at an all-time high.

My second regards a job that I know is just right for me.

To be a See's Candy taster, my sisters and I would work for free.

(Laughter)

WARREN BUFFETT: Well, if you come up front, I'll put you to work.

AUDIENCE MEMBER: Borsheims was for my mom.

And my father loves his stock.

I have a future tasting chocolate.

This weekend has really rocked.

Thank you very much.

And really, what is your view on PetroChina? (Laughter)

WARREN BUFFETT: If you come up at the break, Charlie and I will have taken all the pieces out of here that we like best, and you will get the rest. (Laughter)

Charlie, do you have anything to add to that?

CHARLIE MUNGER: She wants to know what you think about PetroChina. (Laughter)

WARREN BUFFETT: It's funny. I saw her out there in the shopping area and I knew that she had PetroChina on her mind. (Laughter)

We bought PetroChina a few years ago, again, after reading the annual report. And fortunately it was in English.

It was the first stock — Chinese stock — and really the last.

I mean, it won't necessarily be the last, but it's the only one that we've owned so far. We put about $400 million into it.

At the time, and still, it produces about 3 percent of the world's oil, which is a lot of oil. It produces, probably, 80 percent or so as much as Exxon Mobil will produce. And it's a huge company.

Last year it earned $12 billion. Now, if you look at the Fortune 500 list, my guess is you won't find more than about five companies in the United States that earn $12 billion or more. So it's a major company.

At the time we bought it, the total market value was 35 billion. So we bought it at about three times what it earned last year. It does not have unusual amounts of leverage.

It — in the annual report, they say something which very, very few companies do say, but which I think is actually fairly important. They say they will pay out about 45 percent of the amount they earn.

So, if you can buy it at three-times earnings, what turned out to be three times earnings, and you get 45 percent of 33 percent, you know, you're getting a 15 percent yield on your — cash yield — on your investment.

It's a very good annual report. Chinese government owns 90 percent of the company. We own 1.3 percent. If we vote with them, the two of us control the business. (Laughter)

It's a thought that hasn't occurred to them, but I'll keep pointing it out. (Laughter)

But it's, you know, it's a very major business and a very, very attractive — at what was a very attractive price.

Unfortunately, the government shares and our shares have the same economic interest but they are classified differently, so that the government's 90 percent are called one thing and the 10 percent with the public are called A-shares.

And we have to report in Hong Kong when we own 10 percent of a company — or we did then — 10 percent of a company shares, so unfortunately the 10 percent applied only to the 10 percent of A-shares and so we had to reveal our ownership when we only had 1 percent of the economic interest in the company.

So, we would have bought more but the price jumped up, and we are happy to have our 1.3 percent or whatever it is, and we think that they've done a good job in running the business.

They've got large gas reserves, which they're starting to develop now.

But it's a very major enterprise. Employs almost 500,000 people.

And the interesting thing was, a few years ago relatively few people in the investment world probably even thought about the fact that PetroChina was over there and was a much larger business than most of the — well, just about any oil company in the world, except for BP and Exxon Mobil.

Charlie, do you have thoughts?

CHARLIE MUNGER: Yeah. It would be nice if this sort of thing happened all the time, but that hasn't been true in recent years.

WARREN BUFFETT: But we never — I should emphasize — I mean, the annual report of PetroChina, which, like I say, it's easy to read. Understandable. They declare their policies. Anybody could get it. You can read it.

We did not — we did not go over and — we never had any contact with the management before we bought the stock. We'd never attended an investor presentation or anything of the sort.

I mean, it's right there in black and white, in a report that anybody can get.

And we just sit in the office and read those things, and we were able to put 400 million out that's now worth about a billion-two or something like that.

It was interesting. At the time — I think I'm right on this — at the time, Yukos, which is the big oil company in Russia, was probably far better known among the investment community in the United States than PetroChina.

And I compared the two. At the time, thought to myself, would I rather have the money in Russia or in China? PetroChina, in my view, was far cheaper. And I felt that the economic climate was likely to be better in China, you know.

Would I have — if it had been selling at the same multiple as a U.S. domestic company, would I have regarded it as more attractive? No.

I mean, there's some disadvantages, always, to being in a culture that you don't perfectly understand, or where tax laws can change, your ownership rules can change.

But the discount at which PetroChina was selling, compared to other international oil companies, was, in my view at the time, ridiculous. So, that's why we bought it.

And we will have the candy available for you at the break.

14. Profit margins squeezed by rising commodity prices

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Good morning, gentlemen. My name is Matt Sauer (PH) and I'm from Durham, North Carolina.

Many businesses are reporting rising costs and surcharges on such inputs as fuel, metals, and wood. They are often unable to pass along these costs to their consumers.

If commodities stabilize at price levels above those of the past decade, will corporate margins be compromised into the future?

WARREN BUFFETT: Well, it's a great question. I would say that that would depend very much on the industry you're talking about.

But, in our carpet business [Shaw Industries], for example, we've just been hit time after time, as I mentioned in the annual report, with raw material increases, because there's a big petroleum derivative factor there.

And we have lagged in terms of being able to put through those increases to our customers, simply because we want to protect the Nebraska Furniture Marts, or those that have ordered, for a reasonable period of time. And that squeezed margins in carpet.

We use lots of natural gas at Johns Manville, use lots of natural gas at Acme Brick, and that's tended to squeeze margins some.

I think, over time — I think there has been a lot more inflation in these basic materials. Steel has been off the chart.

I think, over time the businesses with strong competitive positions manage to pass through increases in raw material costs, just as they passed through increases in labor costs.

But you get these temporary situations where, sometimes, the costs are increasing faster.

I don't think — I don't think the American industry — I mean, a higher cost for oil, when we import 10 million barrels a day or more of oil, if we're paying $20-or-so more per barrel than we were a year or two ago, that's $200 million a day, is a tax, but it's more of a tax on the American consumer, probably, than on American business. The American business will probably be able to pass through most of those raw material cost increases.

It is worth pointing out that corporate profits, as a percentage of GDP, are right at the all-time high, leaving out a few aberrational periods.

And I would — you know, if I had to bet on the direction of corporate profits, as a percentage of GDP, over the next five years, I would bet they would go down somewhat. But that's because they're right at this very high level.

Interestingly enough, while corporate profits, as a percentage of GDP, are at this very high level, corporate taxes, as a percentage of total taxes raised in America, are very close to an all-time low.

So, American businesses managed to pull off a situation where they're making extremely good profits and paying a very small percentage of the total tax bill, as measured in this country historically.

And I'm not sure whether that could, or should, or will continue, but it's a very, very favorable period right now for corporate America.

But that's nothing to get bullish about, because you might expect something of a reversion to the mean.

Charlie?

CHARLIE MUNGER: Well, I can't add to that but I can restate it.

It's hard to know just which companies can pass through the increases in costs that come from higher commodity prices. And it's also important to know.

WARREN BUFFETT: We like buying businesses where we feel that there's some untapped pricing power.

We haven't been able to do much of that lately. But back in 1972, when we bought See's Candy, I think it was either — was it $1.95 a pound?

CHARLIE MUNGER: Something like that.

WARREN BUFFETT: Yeah. And they were selling 16 million pounds of candy a year, making four million pretax, with about 25 million purchase price, which I would have very foolishly refused to budge on, and in history have cost us a lot of money.

But one of the questions we asked ourselves, and we thought the answer was obvious, was, you know, if we raised the price 10 cents a pound, would sales fall off a cliff?

And of course, the answer, in our view at least, was that no, there was some untapped pricing power in the product.

And it’s not a great business when you have to have a prayer session before you raise your prices a penny. I mean, you were in a tough business then.

And I would say you can almost measure the strength of a business over time by the agony they go through in determining whether a price increase can be sustained.

And frankly, a good example of that is the newspaper business right now. Because 30 years ago, when the — whatever the local daily would be had an absolute lock on the economics of the community, because it had the megaphone through which merchants had to talk if they were going to get their message across to their audience — at that time, rate increases, both circulation and advertising, were something that were almost a big yawn to most publishers.

They did it annually. They did not worry about the fact that Sears or Walmart or Penney’s or whomever would pull their advertising. They did not worry that people would drop their subscriptions to the paper.

And they went merrily along, increasing prices, and they increased them when newsprint went up and they increased them when newsprint went down, and it worked.

And you got these very fat profit margins. And it looked like about as strong a business as you can imagine.

Now publishers find themselves in a position where they agonize over rate increases, both in advertising and in circulation, because they’re worried about driving away advertisers into other media.

And they’re worried about people, when they get a 20 cent increase, you know, per month, or whatever it may be, in their circulation prices, deciding, well, I think I’ll just drop it. And when they drop it they don’t usually take it up again.

So, that world has changed. And you could recognize the change in that world, simply, if you could get inside the mind of the publisher, in terms of how they felt about price increases.

You can learn a lot about — you learn a lot about the durability of the economics of a business by observing the behavior of — the price behavior.

I mean, you’re seeing that — talk about the beer business. Beer has moved up in price every year, but there have been some rollbacks in certain areas in the last year, which means that, you know, it’s getting a little bit more difficult to increase prices, even though they increase them at rates below inflation.

And those are not — that's not a good economic sign.

Charlie?

CHARLIE MUNGER: I have nothing to add to that.

15. Tax rate not a factor in Berkshire dividend calculus

WARREN BUFFETT: OK, we'll go to number 7.

AUDIENCE MEMBER: My name is Pete Banner (PH) from Boulder, Colorado.

First of all, Mr. Buffett, Mr. Munger, we shareholders consider you our heroes. We appreciate and very much value who you are and what you do in the world. So, thank you.

WARREN BUFFETT: Well, thank you, Pete.

And I will say in return that we think we've got the best group of shareholders in the world. And to some extent, it's evidenced by the fact we have the lowest turnover, and, I think, the most knowledgeable group, incidentally, too, of shareholders.

So, with that our mutual love affair can go on. (Laughter)

AUDIENCE MEMBER: Thank you very much.

Secondly, with taxes as they are today, 15 percent on dividends, how do you feel about declaring a dividend?

WARREN BUFFETT: Oh, you were setting me up. (Laughter)

No, there's no question about the fact that dividends are lightly treated now for taxation purposes.

But we have always said, and it's been true, that if there were no tax on dividends, to this point at least, we would have followed an identical dividend policy, because the test with us is whether we think we can retain a dollar, and in turn — and have it worth, in present value terms, more than a dollar.

If we can't do that, we should distribute any money that we can't — we can't utilize on that basis.

Now, when the cash piles up, like currently — it has currently — you can say it's pretty dumb to hold, you know, billions of dollars at — last year the rates were less than 1 percent after-tax — and, you know, what are you doing for shareholders with that?

And I would say that the burden of proof will certainly shift if, within a few years, we can't use a lot more money intelligently than we are now.

But, if we were — at the time at which we feel that the present value of the earnings we retain is not greater than a dollar comes, and it could come, and it's more likely to come when you get large like we are, then we should have a — not only a, you know, dividend policy that's X percent of earnings, we should pay out very substantial sums.

The test is whether the money can be used effectively within the business. So far, it has been.

That doesn't mean it was yesterday or the day before, but so far, it's produced more than a dollar's worth of market value for every dollar retained.

But that will be discussed — our directors meet Monday — that will be discussed then, and you are certainly — if we sit here a couple of years from now and we have not successfully deployed more cash, then I think that the burden of proof has shifted dramatically to us to explain why we would be retaining earnings at that point.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that, too.

16. U.S. trade deficit's economic threat

WARREN BUFFETT: Number 8?

AUDIENCE MEMBER: My name is Ola Larson (PH), from Salt Lake City, originally from Sweden.

I read your annual report where you mentioned how the current account deficit, or a trade deficit, has to eventually come to an end.

And in the report, you were reluctant to give views, a forecast of how this would come down from $2 billion a day.

Would you, nevertheless, be willing to share some thought on what — how it might come down, if you have any views on this?

WARREN BUFFETT: Well, that really is the $64 question, because, we are, in my view — and Charlie doesn't — he's not as on board on this as I am, so it's important that you listen to him on this, too.

The — it does seem to me that a $618 billion trade deficit and a larger current account deficit, rich as we are, strong as this country is, that something will happen that will change that in a major way at some point, and that the longer that it goes before changing, the more likely it is that something fairly significant happens.

But most economists — most observers — would still say that some kind of a soft landing is possible. Or they would say it's likely. They never, to my mind, they never quite explain, you know, what the soft landing is.

They just say it's, you know, it's likely to be a soft landing but it could be something different but we still think it will be a soft landing.

But I don't know what a soft landing is, exactly, in the sense of how the numbers come down quite significantly, and if they don't come down, the current account surplus — or deficit — means that we are transferring more and more wealth abroad and that we will, in addition to our trade deficit, we will, at some point, have a very significant deficit in terms of the net investment position that the rest of the world holds on us. So it becomes a compounding effect.

I do recommend — there was an op-ed piece in The Washington Post on April 10 by [former Federal Reserve Chairman] Paul Volcker, and he has expressed himself some on this, and he gets into the question of whether it can be a soft landing or not. But I think he certainly expresses some real apprehension about whether a soft landing will be the likely result.

In the kind of world we live in, with so much of the assets of the world, whether they be foreign exchange or whether contracts or whether they be stocks or bonds or junk bonds or whatever, I think as high a percentage is on what I would call a hair trigger now as has ever existed.

In other words, I think there are more people that go to bed at night with a position in foreign exchange, or bonds, or a carry trade, or stocks, or whatever, that some event that could happen overnight would cause them to want to change that position in the next 24 hours. I think that's the highest, perhaps in history.

Somebody [economist Thomas Friedman] has referred to it as the "electronic herd," that it's out there.

I mean people can with — they can give vent to decisions involving billions and billions and billions of dollars, you know, with the press of a key, virtually. And that electric — I think that electronic herd is at an all-time high.

I think that some exogenous event — it was almost Long-Term Capital Management in 1998 — but some exogenous event — and we will have them — will cause it — I think it could very well cause some kind of stampede by that herd.

You can't get rid — if you're the rest of the world — you can't get rid of dollars.

I mean, if you're sitting in Japan, China, or someplace, and you own a lot of U.S. government bonds, if you sell them to somebody in the United States you get U.S. dollars. So you still have U.S. assets. If you sell them to somebody in France, you've now got euros but they've got the [debt.]

You can't you can't get rid of those assets. But you can have people trying to head for the door very quickly with them, under certain circumstances.

Volcker said, in this thing, he said in the second paragraph, "Yet, under the placid surface there are disturbing trends: huge imbalances, disequilibria, risks — call them what you will. Altogether the circumstances seem to me as dangerous and intractable," and I emphasize intractable, "as any I can remember, and I can remember quite a lot."

Well, Paul Volcker can remember quite a lot.

And I agree with that. I don't — I have no idea — I have no idea on timing, whatsoever. In economics, it's far easier to tell what will happen than when it will happen.

I mean, you can see bubbles develop and things, but you do not know how big the bubble will get. For example, you know, this happened five years ago in the market.

So you — predicting timing is — I've just never been successful at it nor do I try to do it.

Predicting what will happen, I think, is a much easier sort of thing. And I would say that what is going on, in terms of trade policy, is going to have very important consequences.

It was not addressed in the last presidential campaign by either candidate in any meaningful way at all.

Now, I'm not sure if, you know, you were standing up in front of the American people, and somebody is giving you three minutes to explain this whole situation, when 90 percent of your audience couldn't define current account, you know, it's not an easy game. But it's an important one.

Now, Charlie is less enthusiastic about our foreign exchange position, somewhat, than I am, so I want to yield the floor here for a significant period of time while he gives you the other view.

CHARLIE MUNGER: Well, I'm, if anything, a little more repelled than you are by the lack of virtue in the way our nation uses consumer credit and the way we run the public finances.

And I have a feeling that eventually a lack of virtue is going to hurt one.

Where we differ is that I agree with [18th century Scottish economist] Adam Smith that a great civilization has a lot of ruin in that, meaning it will bear a lot of abuse.

And so I think there are dangers in the current situation that make it unwise for anybody to swing for the fences. But I don't think that we have a certainty that the system won't stand a lot more of the kind of abuse it's getting now.

WARREN BUFFETT: What do you think the end will be?

CHARLIE MUNGER: Bad. (Laughter)

WARREN BUFFETT: I knew I could count on him. (Laughs)

No, we are truly, in this country, like an incredibly, I mean incredibly, rich family that owns, we'll say metaphorically, millions of acres of land. They can't see, they can't travel to the outer reaches of their domain.

But, nevertheless, they sit on the front porch and wait for the produce to come in from this vast holding, and when they get it all they still want to consume about 6 percent more than everything that's been produced on the farm.

And they have the ability to do that by simply selling off a little piece of the farm every day, and every year, that they can't even see. So they don't feel any poorer at the end of the day or the end of the year, because it's still, as far as their eyesight can see, they own everything that God ever created.

And they can sell that little piece or they can mortgage it. They can send IOUs to these people that are giving them the extra goods to consume.

And we are very, very, very rich family. And we produce a whole lot and we consume a little bit more than we produce.

And we trade away a little bit of the farm or put a little bit of a mortgage on every day and the rest of the world is happy to take a little piece of our farm or take a mortgage on it because it's such a terrific asset and we've behaved so well over the years.

And so they're willing to work a little harder to send us something so that we can consume a little bit more than we produce.

It's been going on a while. It's accelerated a lot in the last few years. And more and more the rest of the world is owning part of us and we're going to have to service that ownership, either through interest if they took it in IOUs, or in some other way.

And it can go on a long time. But if it goes on a long time, the world will own a good bit of us and our children will be paying, one way or another, for the fact that we got to consume more than we produced.

It could happen — you could have — you've obviously had some less interest in the rest of the world accepting dollars by the fact that the dollar has declined somewhat in value in the last few years.

In other words, the investment in us is always going to be equal to the overconsumption. I mean, it's an equation.

But if people get a little less excited about one — enthused about one side of the equation — it reflects itself in the pricing mechanism.

And the world has demonstrated a diminishing enthusiasm for dollars in the last few years as they get flooded with them. We send $2 billion out every day, whether we like it or not and whether they like it or not.

Now, the question is, does that reach some tipping point at some point or does some exogenous event come about that causes people to want to rush for exits? Who knows?

I have a hard time thinking of any outcome from this that involves an appreciating dollar, but, as Charlie will point out in just a second, there have been times when we've been surprised.

Charlie?

CHARLIE MUNGER: Yeah, the counter-argument is that, what does it matter if the foreigners own 10 percent more of the United States, if, at that time, the total wealth of the United States is 30 percent higher than it is now.

And so, people who have that point of view just roll with it.

And some of them think that if we didn't manufacture anything in the United States and just sat here running hedge funds, we would have a wonderful economy because it comports with Republican principles.

WARREN BUFFETT: We could cut each other's hair, too, actually, I mean —

But back in the late 18th century, obviously, the idea of taxation without representation caused a certain amount of trouble, and ownership of the rest of the world — by the rest of the world of this country would be seen as a form of taxation, I think, 20 years from now, by the people who resided here.

If we — if, instead of fighting the Revolutionary War, we'd simply made a deal with England and said we'll give you three percent or five percent of our national product forever and you let us be free and we'll just mail it — send the royalty over every day — that might have looked like a good alternative to war in, you know, in 1776.

But I don't think that subsequent generations would have reacted well. I mean, something would have happened over time.

And I have a feeling that the idea of America paying tribute to the rest of the world because of the overconsumption patterns of a previous generation seems to be — I don't think that's a particularly stable scenario.

But that's why we have only 21 billion in foreign exchange contracts.

Charlie might have a little less, or maybe none, if he were running it entirely, and I might have somewhat more, if I didn't know I'd have him sitting up here next to me next year. (Laughs)

17. Housing market bubbles and irrationality

WARREN BUFFETT: Let's go to number 9.

AUDIENCE MEMBER: Hello. My name is Johann Freudenberg (PH) from Germany.

What do you think would be the consequences of a strong decline of the housing market for sales of carpet retailers and manufacturers? Thank you.

WARREN BUFFETT: Well, if there's a strong decline in the housing market, my guess is that whatever we lose in carpet we'll be making up for somewhere else, because it would — a lot of the psychological well-being, as well as the financial well-being, of the American people is tied up with the fact — or comes from the fact that they feel so good about what has happened with their home ownership over the years. And with many people it's been, by far, the best-behaving asset that they've had.

So, if there is indeed some kind of a bubble and it's pricked at some point, my guess is that we would feel that in various ways in our operating businesses, but that in terms of what we could do with our capital, the net effect to Berkshire might well be quite positive.

We're not big on macro forecasts. I mean, this foreign exchange thing is quite different than what we've done over time and the way we've made money.

So, we are — it isn't like we've got some great track record predicting macro factors and have made a lot of money doing that.

We've made money by looking at things like PetroChina, or whatever it may be, and just deciding that here is a very good business that's selling at a very cheap price.

Certainly at the high end of the real estate market in some areas, I mean, you've seen some extraordinary movement.

And I've referred to this before, but 25 years ago or so we saw the same thing in farmland in Nebraska and Iowa and surrounding areas. We had people running from cash — "cash is trash" — and people wouldn't, you know — they were worried about the fact that inflation was out of control in the late '70s, and before [former Federal Reserve Chairman Paul] Volcker did his stuff, people were fleeing from cash.

And one of the ways they gave vent to that fear was to rush into farmland. There was a farm about 30 miles north of here that sold for about $2000 an acre in, roughly, 1980. And a few years later, I bought it from the FDIC for $600 an acre.

And you can say, how can you go crazy about farmland? It's going to produce about 45 bushels an acre of soybeans, about 120 bushels an acre of corn. And there's no way you could dream about a tripling, or the internet causing, you know, cornmeals to go up or something of the sort.

But people went crazy on it. And the consequences were huge, in terms of banks failing, lots of banks failing in this area, banks that had gone through the Great Depression. But the people went — they just want a little crazy.

People go crazy in economics, periodically, in all different kinds of ways.

And, you know, you had the Resolution Trust Corp. come out of the savings and loan nuttiness that took place in real estate, where they finance everything that was put before them.

And, you know, I will not — I don't know where we stand in terms of the residential housing cycle in that it has different behavior characteristics, simply because people live in the houses in many, a great many cases. So it will not behave, necessarily, the same as other markets.

But when you get prices increasing at far, far greater rates than construction costs or inflationary factors, sometimes there can be some pretty serious consequences.

Charlie?

CHARLIE MUNGER: Yeah. It's — in a place like Omaha, there's not much of a housing price bubble, is there, Warren?

WARREN BUFFETT: No, there's not been a bubble, but I would say that residential real estate, probably, has increased in price at a rate quite a bit faster than the general inflation rate.

CHARLIE MUNGER: Yeah, but if you get to Laguna, California or Montecito, California, or the better suburbs of Washington, D.C., you have a real asset price bubble.

I have a relative that, to move to a good school district in the suburbs of Virginia, she had to pay four times as much as she can get from selling her nice Omaha house.

WARREN BUFFETT: Yeah. Well, I sold —

CHARLIE MUNGER: So that's a price bubble.

WARREN BUFFETT: I sold a house a few months ago in Laguna for $3 1/2 million. Now it sold the first day, so I probably listed it too cheap. So don't count on me for residential real estate advice.

But that house, the physical house, would probably cost a half a million or thereabouts. So, in effect, the land went for $3 million, implicitly, and the land is probably on the area of 2000 square feet, which is a little less than one-twentieth of an acre. Now, you've got streets and all that sort of thing involved.

But basically, I think that land sold for about $60 million an acre, which that fellow that you saw in the farm outfit in the movie finds like — sounds like a pretty, pretty fancy price for almost any kind of land.

Charlie, you've witnessed it firsthand, though, out there.

CHARLIE MUNGER: Well, yeah. There's — one of the Berkshire directors lives adjacent to what I regard as a pretty modest little house, which sold for $27 million recently.

Now these are houses that look right at the ocean, and there isn't a great deal of available shoreline in California, and there are a lot of people.

But you have some very extreme housing-price bubbles going on. And you would think there might be a real possibility that it could go in the other direction someday.

WARREN BUFFETT: At $27 million, I'd rather stare at my bath tub. (Laughter)

18. Catastrophe insurance: "everything correlates"

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: David Winters, Mountain Lakes, New Jersey.

How do you try to manage risk at Gen Re and National Indemnity to be comfortable and maximize returns? Especially, how do you prevent a catastrophic loss or unexpected correlation? Thank you.

WARREN BUFFETT: Yeah, well, that's a very good question because we are doing things in different parts of our insurance operation where there is correlation.

And there's not only correlation among the insurance risks.

I mean, just, you know, take a major, really major, earthquake in California, in the wrong place. There have been about 25 6.0s or larger in the last hundred years, but most of them don't occur where a lot of people are.

But if you get the wrong one in the wrong place, it would not only hit National Indemnity and General Re, as you mention, but it might very well have a severe effect on See's Candy. It might very well have a severe effect on Wells Fargo.

We don't own Freddie [Mac] or Fannie [Mae] now, but we owned Freddie at one time. It could have had a severe effect on Freddie. It can have all kinds of secondary and tertiary effects that you might not think of initially.

So, we find when there's trouble, everything correlates. And it's — part of my job is to have at least a general idea of the sort of risk that the various enterprises might be running operationally, and then integrate that into my own notion of the risk that we run, in terms of investments, in terms of all kinds of things. And, you know, that is my job.

The most likely mega-cat, at any time, is a hurricane. But we have more exposure to that.

On the other hand, if you're talking 25 billion and up, maybe 100 billion and up, insured catastrophes, you know, a quake might be just as likely as some Force 5 hurricane that would come in at the wrong place.

But that — my job is to think absolutely in terms of worst case. And to know enough about what's going on, in both investments and operations, to make sure that no matter what happens, you know, I don't lose sleep that night, you know, over what can, you know, whether there's a 9.0 quake someplace or whether there's a Force 5 hurricane that actually goes up the East Coast and enters at places that very seldom does it enter.

Long Island, for example: huge amount of exposure. How often is Long Island going to, you know, really have a major hurricane? Not very often. I think there was one back in the '30s, but there were potato fields there in the '30s and now there's all kinds of insured value.

Everything will — everything that can happen, will happen.

I mean, in terms of our — what we know of history in this country, last three or four-hundred years, and then with the most severe quake, by far, was at New Madrid, Missouri.

And who would have guessed, you know, that that quake would happen? And there were two subsequent quakes that were far enough apart so that didn't exactly seem like aftershocks.

All three of those were higher than 8 on the Richter scale. Nobody thinks about that, but they've had them in Charleston, South Carolina.

They've had, I mean, it's — you will see things, maybe not in your lifetime, but if you take the centuries, some extraordinary things can happen. And it's Berkshire's job to be prepared, absolutely, for the very worst.

And, by and large, I would think hurricanes and quakes are the biggest thing now, but a few years ago we did not have nuclear, chemical, and biological risks excluded in policies, and we had huge exposure, subsequently gotten rid of.

But we take on large risks. I'll give you a couple of examples.

Just the other day — and nobody else will write this stuff, basically, because they would want to reinsure it with somebody else and they're not set up to do it — but one large airport, one large international airport, came to us and we wrote a policy for $500 million, excess of 2 1/2 billion, from any action that was not caused by nuclear, chemical, or biological sources.

So, if that airport is taken out in some way, but not by nuclear, chemical, or biological activities, the first 2 1/2 billion, somebody else worries about, and we get the next half-billion. There's a — sublimit is only a billion-six can be counted for business interruption. So you would need — and that airport would have to be out for a couple of years to have a billion-six of business interruption. So you need 900 million of physical damage on top of that.

But somebody is willing to buy that policy and there is a real risk.

We insured the NCAA Final Four down in St. Louis against being canceled, not postponed, or having the games, those final four games, moved to another city. But if it was canceled totally, and again, not through nuclear, chemical, or biological, we would have paid $75 million. Same thing at the Grammys.

I mean, we take on risks that very few people want to write. But in the end, we're willing to lose a lot of money in one day, but we're not willing to do anything that causes us any discomfort, in terms of writing checks the following morning.

Incidentally, while I'm on the nuclear — while we're talking about the pleasant subjects — I recommended in the annual report that book, "Nuclear Terrorism."

And if you go to lastbestchance.org, you can obtain, or will soon be able to obtain, a tape, free, that the Nuclear Threat Initiative has sponsored, which has a dramatization of something that is now fictional, but it's not fanciful. It's something that could happen, and which the Nuclear Threat Initiative is working to minimize the chances of.

And on that program, in addition to this dramatization of what could happen in that field, you have [former Senator] Sam Nunn and Senator [Richard] Lugar with [NBC News anchor] Tom Brokaw, discussing the subject.

It's an important subject. It didn't get a lot of attention, again, in this last campaign, although I think both candidates fully recognize the importance.

But we would regard ourselves as vulnerable to extinction, as a company, if we did not have nuclear, chemical, and biological risks excluded from virtually all of our policies, although we intentionally take on the risk periodically, but only in an amount that we feel we can handle.

We do not write it and give it away for free. And we do not want to write it promiscuously, because there could be events happen that would make it impossible for our checks to clear the next day, and we're not going to get ourselves in that position.

Charlie?

CHARLIE MUNGER: Yeah. We're likely to do better than most other people in dealing with what concerns you. We care more about it, that kind of correlation.

We just naturally have minds that think about tidal waves in California, where they've never had one in modern California civilization.

Can you imagine what a 60-foot tidal wave would do in California? There's nothing physically impossible in having a 60-foot tidal wave in an earthquake zone, which California is in. But it's never happened in modern history. But it's the kind of thing that we do think about.

And you think any other company has as much, as rigorous, nuclear and so on, exclusion as we do?

WARREN BUFFETT: Well, nobody's attacked it any more vigorously than we've attacked, I would say.

I mean, what you have here is, individually, we probably worry more about the downside than that just about any manager you can find. And collectively, you know, it's Armageddon around here every day. (Laughs)

But that's — you know, we care about that. We've never used a lot of borrowed money. Back when I started out, I mean, I had $10,000. But I just didn't want to borrow any significant amount of money.

There's no reason to. You know, we're living fine. We were living fine when I had $10,000.

And the idea that you risk what you need and is important to you for something that you don't need and it is unimportant, is just craziness. And we try to run Berkshire that way.

And you know, I had a 98- year-old aunt, my Aunt Katie [Buffett], that died last year. She had everything she had in Berkshire.

And the idea that I should be doing something to try and add a few dollars to my net worth, or a few percentage points to the record, and be risking the fact that she would go back to Social Security, is, you know — I just think that's kind of crazy for a manager.

But, you know, maybe if I had a two-and-twenty percent arrangement with my Aunt Katie, I'd be — differently, but I hope not. (Laughs)

19. Public education reform

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: Hello. My name is Martin Wiegand from Chevy Chase, Maryland.

On behalf of the assembled shareholders, we appreciate you and the Berkshire staff hosting this weekend and would like to thank you for building this community of shareholders.

WARREN BUFFETT: Martin, thank you. (Applause)

I should point out that I dated Martin's aunt, but she only went out with me once. Maybe you could explain that, Martin. (Laughs)

AUDIENCE MEMBER: New board member Bill Gates has been talking about education reform in America, and columnist George Will quoted you in an article about Patrick Byrne's efforts to reform education in America.

Could you share with us some of your thoughts about these two efforts, or your efforts, to reform education? Thank you.

WARREN BUFFETT: Well, interestingly enough, we just dedicated a school here in Omaha yesterday which is named after my Aunt Alice, who taught in the Omaha public schools.

And we've — I think we've maintained quite an excellent public school system in Omaha. We also have an outstanding parochial school system here.

You know, it takes the interests of parents and, frankly, it takes the interests of the well-to-do in the school system to keep a first-class school system.

I've said that, to some extent, a public — a good public school system is a lot like virginity. It can be preserved but not restored.

In Omaha, we preserved it, but you preserve it by having the parents interested and involved in the public school system.

And Patrick's got an ingenious idea to make sure that more of the money goes to teaching and less to administration and overhead.

There's a variety of ideas around about how to correct a system where it's broken. And Charlie, as a big Ben Franklin enthusiast, has always said that an ounce of prevention is worth a pound of cure, and I think we've been spending that ounce of prevention, or providing it, here in Omaha.

I think it's a — you know, Charlie will have a lot more to say on this.

I admire the fact that people like Patrick and Bill Gates and a lot of other people, John Walton and Teddy Forstmann, all kinds of people — Bob Wilmers, up in Buffalo — are attacking the problem.

It's probably the — next to the nuclear, chemical, and biological problem — I mean, it's the number one problem of the country is making sure that the educational system is the best in the world.

We've got the resources and we're not providing it, we're not delivering it.

So, it's very complicated when you operate through thousands and thousands of school districts and you work with many, many unions, and you've had, to a great extent in many areas, the rich opt out of the system and set up a separate system.

You know, I am not as concerned about the public golf courses in Omaha as I might be if I played them every day instead of playing at a country club.

And if you have a two-tier school system, one for the rich and one for the poor, it's going to be hard to pass bond issues that benefit the people that don't have the money to send their kids to private schools.

I'm a big believer in the public school system, though, in terms of equality of opportunity in this country. (Applause)

Charlie's thought about education. He's actually come close to running a school. Cares about it enormously, so I'll turn it over to him.

CHARLIE MUNGER: Well I learned something rather interesting about Omaha public schools on my way to this meeting.

I stopped to sign some books in a warehouse in South Omaha, and one of the very nice people in the warehouse was married to an eighth grade teacher in the Omaha public schools. And we got to talking about "No Child Left Behind."

And he said his wife, this eighth grade teacher, had a very interesting system. For the numerous children who couldn't read, she records "books on tape," speaking slowly in her own voice.

And when some children are reading the books, other children are listening to the tapes, and that way the children who listen to the tapes are not left out when they ask questions about what went on in the books

Well, this is "No Child Left Behind," in a sense, but it's also a failure, in a sense. And I think it's very hard for a civilization to fix the situation once somebody is in the eighth grade and can't read.

So I think there's a lot of failure, even in relatively advantaged places like Omaha. And it's very serious failure. We never should have allowed it to happen.

WARREN BUFFETT: Yep. My friend Bill Ruane, who is here — I believe he's here — is doing something extraordinary, in terms of a program he has teaching kids to read. In fact, journalists who are here should seek out Bill and learn something about the story of what he's done in the last 10 years, in terms of moving reading abilities, and kids' enthusiasm for reading, which is more important because it's, you know — I talked about our managers and the important thing is that they have a passion for their business.

Well, passion for reading can be developed and Bill has shown that in programs that he — I think he first started them in Harlem. He sort of adopted a block up there and went from there. And he would be a very interesting fellow to get some views from on this subject.

You know, we've had this great success story in this country and a lot of it is because of people have had something closer to equality of opportunity in the United States than they've had in most parts of the world.

And you do not have equality of opportunity when my kids get to go to some school where I can attract outstanding teachers and where they're in the company of other kids that are also motivated and they're getting encouraged at home and all sorts of other things, and somebody else, who is born into a less advantageous family, really doesn't have a chance.

They go into something that's close, maybe, to an armed camp where the teachers are just sort of pushing them through. And there's no stimulus from the other kids except to do things that are counter to the interests of society.

And that just isn't a situation that really should be allowed to exist in a country where the GDP is almost $40,000 per capita

20. Bill Gates tops Churchill, Jesus, and Napoleon in survey

WARREN BUFFETT: Let's go on to number 12.

Oh, incidentally, I have to make one —

It was mentioned about Bill Gates being a director and I did — I got a little survey here that came out. Pricewaterhouse and the Financial Times cooperated on the survey.

And they asked CEOs around the world to choose — if they could pick anybody to choose from history or today to join their company's board, who would they choose?

And I'm happy to report that Bill came in number two. And, actually, number three was Winston Churchill. [Auto executive] Carlos Ghosn came in fourth. Jesus Christ came in fifth. Napoleon Bonaparte was sixth. And I won't give you the rest of the list but —

CHARLIE MUNGER: Who was one?

WARREN BUFFETT: Well, one was [former General Electric CEO] Jack Welch. I knew you'd ask. (Laughs)

But we didn't ask Jack, we asked Bill.

So, actually, I thought this quite an interesting list because I think many of the CEOs of the world would prefer people that are dead to be on their board. (Laughter and applause)

VOICE: It's too funny.

21. Zero-down mortgages fueling housing price bubble

WARREN BUFFETT: Now let's see. Where were we? We were going to number 12.

AUDIENCE MEMBER: Hello, my name is Robert Piton (PH) from Chicago, Illinois.

And on that note, maybe a merger of some sorts between Berkshire and Microsoft is in the works.

WARREN BUFFETT: I keep hinting but it doesn't do any good. (Laughs)

AUIDENCE MEMBER: The question that I have is, do you think the shift in the banking system during the '90s to finance home purchases with zero percent down impacted the overall savings rate, as home purchases are the largest investment most people make, and the overall rise of home prices driven by these marginal buyers?

If so, how would you suggest that we correct the problem.

WARREN BUFFETT: Yeah. Of course, any time a home is constructed, it represents somebody's savings.

I mean, the home buyer may buy it for nothing down, but that means he's borrowing 100 percent of the mortgage through a mortgage that somebody else has saved somewhere, maybe intermediated three or four times or something of the sort.

But home construction comes about through savings.

Now there's no question that terms have become easier and easier, and I've talked to certain mortgage bankers about this subject, but terms have become easier and easier as prices have increased.

Now, that is absolutely counter to, you know, how people think about lending in general. Generally, the more the asset class becomes inflated, the less a prudent banker will lend.

But of course, in this country, now you have mortgages intermediated in a way that the person buying the mortgage, in the case of — I'm thinking of Freddie [Mac] and Fannie [Mae] and other forms like that, so we're talking about the lower-priced houses — but the mortgage buyer does not need to care about what kind of mortgage — what kind of a financial transaction the purchase is.

All they have to do is look at the guarantee, and they look at that rather than whether somebody's put any money down, or anything of the sort.

So I think you've had easy financing facilitating a boom in real estate prices, even at the higher levels. And I think that that that, which has occurred in other asset classes in the past — I mean, that farm bubble I talked about was facilitated by the fact that banks in small towns, who generally had been very conservative in lending, went crazy around 1980 and they lent amounts that the farm itself could never repay.

They started saying a farm was an asset appreciation investment, not an income investment.

And once you talk about something that's an asset appreciation investment, ignoring the underlying economics of what you're lending on, you're really talking about the bigger-fool game.

You're saying, you know, this is a silly price but there'll be a bigger fool that comes along. And that actually can be a profitable game for a while. But it's nothing that bankers should engage in.

So I would say that easy lending, obviously, does contribute to, overall in the country, to a lower savings rate. But, in effect, somebody has to save for somebody else to borrow.

And what is happening now is the rest of the world is saving. So then in the U.S. — in global terms, I'm talking — but the rest of the world is saving.

And they're sending us $2 billion — I mean, we're sending them, in effect, claims for ownership of $2 billion — they're investing $2 billion a day in the United States.

But they — a lot of economists will say, well, that's what's really going on. The world loves our assets so much and they have so much confidence in America that the present current account deficit is driven by the fact they want to invest.

I don't believe that at all. I think it's just silly, frankly, to make that argument. They are investing because they have to, because of our consumption habits, and not because they want to. And I think the declining dollar is evidence of that.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that. It's obvious that the easy lending on houses causes more houses to be built and causes housing prices to be higher, probably, in the new field.

Eventually, of course, if you construct enough of new anything, you can have a countervailing effect.

If you build way too many houses, you'd eventually cause a price decline

WARREN BUFFETT: I'll give you a fanciful illustration.

Let's just assume that Omaha had a totally constant population. No one was allowed to leave. No one entered. Birth rate equals death rate, all of that sort of thing.

So the population was constant, and nobody could build any more houses. We just passed a city ordinance to that effect.

But every year, everybody sold their house to their neighbor. So, first year, everybody sold their $100,000 house to their neighbor, and they both switched houses, and that was fine.

And then the next year, they agreed we were going to do it at 150,000. And you'd say, well, how could that be?

Well, we would all go to Freddie or Fannie and get our mortgages guaranteed for a larger amount, and somebody in New York or Tokyo or someplace would buy the Freddie or Fannie paper.

And we'd have an influx of $50,000 per household. We'd all have the same number of houses. We'd all be living one house to a family. And we'd have marked up our houses, and we now have a bigger mortgage, but we'd have $50,000 more of income that year, just to service a little higher mortgage.

And we'd do the same thing the following year for 200,000, and so on.

Now, that would be very transparent, and people might catch on to the fact there was something funny going on in Omaha.

But you can have an accidental aggregation of behavior that somewhat leads to the same effect.

I mean, if you keep marking up something, and in the process, the payment for the marked up price comes from someone else who feels they are bearing no risk because they've got the government guarantee in between, the money can just flood in and everybody feels very happy for a long time.

And we don't have anything like the fanciful thing I've set forth, in terms of Omaha. But we have certain aspects of that, I think, going on in the economy.

Charlie, would you — I'm throwing this one at you. Would you agree or not?

CHARLIE MUNGER: Yeah, I do agree with that.

You have varied Ponzi effects in various parts of any modern economy. And they're very important and they're very little studied in economics.

22. "Not enthused" about gold

WARREN BUFFETT: Let's try number 13. I think, maybe, that's in the other room and we'll see whether we get a response and if not we'll —

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger My name is Martin O'Leary (PH) and I'm from Austin, Texas.

Mr. Buffett, given your past essays concerning the U.S. dollar and foreign exchange forward contract holdings that you have, and many countries' economic policies that have a tendency to debase their currencies, do you think that gold can be considered a viable investment alternative to paper currencies?

WARREN BUFFETT: Yeah, we're not enthused about gold.

People, historically, have felt that was the first refuge from a currency that was going to be — decline in value.

But, you know, so is a barrel of oil. So is an acre of land. So is a piece of Coca-Cola. So is See's Candy.

See's candy — if the dollar goes down 50 percent, we will be selling See's candy for double the present price. We'll be getting the same real price for See's candy.

People will work the same number of minutes or hours per week in order to buy a pound or two-pound box of the candy.

So we would much prefer a — some asset that is going to be useful whether the currency is worth what it is today, or 10 percent of what it is today, or whether people are using seashells in order to transact business.

Because people will go on eating and they'll go on drinking and doing various things. And their preferences will translate, in real dollars, into more or less the same economics for us.

And we would not trade the ownership of those kind of assets for us for a hunk of yellow metal, which has very little real utility except for people who are looking to flee from the dollar and, in our view, really haven't thought through the consequences of what fleeing would — where they should flee.

Charlie?

CHARLIE MUNGER: Yeah. If you have the opportunities of Berkshire Hathaway, averaged out, gold is a dumb investment.

WARREN BUFFETT: My dad [Howard G. Buffett] was a huge gold enthusiast. So I sat around the dinner table — my two sisters are here, too. They will testify to it.

We sat around listening to the virtues of gold, and that was in, we'll say, 1940. And gold, at that time, was $35 an ounce. And we would've had some storage and insurance costs.

And, you know, here it is, 65 years later. World wars, nuclear bombs, all kinds of things. And the compound rate from $35 to a little over $400, less those expenses, is not something that causes me to salivate.

23. The danger of earnings expectations

WARREN BUFFETT: Number 14.

Do we have a second microphone in the overflow room? Oh, there's only one in there. OK, then we'll go back to number one.

AUDIENCE MEMBER: Andrew Noble (PH) from England.

Apart from the catastrophic insurance events or Armageddon scenarios that you've been talking about earlier, in relation to the operations of Berkshire Hathaway, what are your greatest fears?

WARREN BUFFETT: Well, the greatest, I would say — we don't worry about the economics of the businesses we have.

We've got a very diverse group. By and large, they're very good businesses. By and large, they're run by some of the best managers in the country. But we worry about something going wrong.

I mean, you know, you heard about the Salomon [Brothers] thing in the movie. And, I mean, we've got 180,000 people out there, and I'll guarantee you something is going wrong someplace, as we talk. That's just the nature of it.

But, what you hope is that it's relatively unimportant or that we catch it. And — but that's, you know, that is something that we know will happen.

We try to have a culture that minimizes that. And I think we do have a culture that minimizes that.

We — it's very important, in our view, to have the right incentives. And many places, we think, have incentives that aren't so good.

I mean, when I get on an airplane, and we own the company, like NetJets, the last thing in the world I want to tell the pilot is that I'm running late and I hope we can get to New York a little faster.

I mean, that is dumb, to incent a pilot, who may be worried that, you know, somehow you affect his job or something, to get in a hurry about the takeoff or the checklist or whatever it may be.

And companies do that time after time in their compensation plans or things that they incent people, in our view at least, some of the wrong things.

That doesn't mean nothing wrong will happen under any circumstances. But you should not have a system that causes people to, for example, worry about quarterly earnings.

None of our — our managers do not submit budgets into Omaha. I have no idea what we're going to earn next quarter.

And I have no implicit body language out there, or anything of the sort, to our managers that I'm hoping to earn X dollars per share in the quarter.

Because in the insurance business particularly, you can report any numbers, basically, that you want to, if you write long-tail business for a short period of time.

And, you know, we've got 45 billion of loss reserves. Well, who knows whether the right figure is 45 billion or 46 or 44?

And if the desire is to report some given number in a given quarter, instead of saying 45 billion, you say 44-and-three-quarters billion, or something of the sort.

So we have no incentives, in terms of how people are paid, or in terms of the fact they just don't want to let me down.

Let's assume at the start of the year I asked everybody to submit budgets and then I went on Wall Street and preached a bunch of numbers.

Even if their compensation didn't depend on it, the managers would feel, you know, we don't want to let Warren down on this. So, you know, we'll take an optimistic view of reserves, and that's easy to do, at the end of the quarter and we won't let him down and then he won't look like a jerk in front of Wall Street.

So we try to avoid that sort of thing. But even then, that is what we worry about.

We don't worry about this place making money. I mean, we'll make money. And if we don't, it's my fault. That's not that's not the problem.

The problem right now, in addition to the one we just talked about, the problem is deploying capital, and that's my job, too.

And, you know, I haven't done a very good job of that recently, but with a little luck, you know, we will — and a different kind of market situation — we will get a chance to do that.

Charlie?

CHARLIE MUNGER: Yeah. Well, if you stop to think about it, the history of much of which we don't like in modern corporate capitalism comes from an unreasonable expectation, communicated from headquarters, that earnings have to go up with no volatility and great regularity — corporate earnings, I mean.

That kind of an expectation from headquarters is not just the kissing cousin of evil. It's the blood brother of evil.

And we just don't need that blood brother in our headquarters.

WARREN BUFFETT: Businesses do not meet expectations quarter after quarter and year after year. It just isn't in the nature of running businesses.

And, in our view, people that predict precisely what the future will be are either kidding investors, or they're kidding themselves, or they're kidding both.

Charlie and I have been around the culture, sometimes on the board, where the ego of the CEO became very involved in meeting predictions which were impossible, really, over time.

And everybody in the organization knew, because they were very public about it, what these predictions were and they knew that their CEO was going to look bad if they weren't met. And that can lead to a lot of bad things.

You get enough bad things, anyway, I mean. But setting up a system that either exerts financial or psychological pressure on the people around you to do things that they probably really don't even want to do, in order to avoid disappointing you, I mean, I just think that that's — it's a terrible mistake. And, you know, we'll try to avoid it.

24. We look for managers with great track records

(Gap in video recording resumes in middle of question)

AUDIENCE MEMBER: — quality is largely innate.

So if these characteristics are inherent and you were to attempt to consistently identify future great managers or entrepreneurs before there's a track record, how would you go about doing it?

And in particular, could there be a way to know that — before someone's made a lot of money, before they built the business that they love and feel passionate about, that they will develop those types of qualities later in life?

WARREN BUFFETT: That's a terrific question. And we have dodged it, largely, over the years by actually buying businesses from people where we've seen the record.

In other words, I'm not sure I can go — in fact, I'm quite sure I can't go — to an MBA class of 50 and sit down and talk with each one, examine their grades, examine their extracurricular activities, and whatever, talk to their parents, I'm not sure I could rank those 50 very well in terms of their potential for future business success. And, of course, some of it would depend on what areas they entered into in business.

So, I think it's tough. I think it's tough to go out to the practice tee, where people are not actually hitting balls but just taking practice swings, and say which one is, you know, is a 2 handicap and which one's a 15 handicap, and which ones, you know, can make it on the tour

I think I can tell a little bit, maybe, but not — but it's very hard to calibrate.

And I don't think we've had much success, but we also haven't tried very much, to identify people before they've had a record, to try and identify the ones that are superstars.

Instead, we've taken the easy way, and we go — and if somebody comes to us with a business that's done phenomenally for 10 or 15 or 20 years, or maybe for 50 years, and we've seen how — what their batting average is — we've actually seen they batted .350, or whatever it may be, in the major leagues. And we just make the assumption that we won't screw it up by hiring them.

And we also make the assumption that they'll live to be 100 or 120 or something and we buy the business.

And that's far easier — it is far easier to tell the great baseball batters after you've seen a couple seasons of their batting than it is to go to a college — in college baseball teams or high school baseball teams — and pick out the superstars.

The one interesting thing, and I wish I could remember where I saw this study and it may not even be a valid study, but I do remember seeing something many, many years ago where they tried to correlate business success with various variables.

And they took grades in school and whether they got MBAs and all that sort of thing, and they found that the best correlation was with the age at which they started their own business first.

The people that got very interested in starting a lemonade stands, or whatever, tended to have better — it tended to correlate better with business success than other variables.

We have found ourselves — we've got a lot of MBAs running businesses for us, but they ran them for a long time before we hired them or before we made the deal. And we've got others that never set foot in a business school.

And I do think there's a lot to wiring. I think there's also a lot to working with the wiring you have and developing it over time.

I don't think that it's all innate, and I don't think you can't improve. I know you can improve on what you're given at birth, but I do think an awful lot of it is wiring, more so than I would have thought 30 or 40 years ago.

I've certainly seen it in business. I can — there are people, no formal business train — Charlie never went to business school, I mean, but he thought about it. I mean, I never heard him — Charlie say anything dumb about business yet, except when he disagrees with me. (Laughs)

The truth is I've never heard him say anything dumb about business, period.

And there are other people. I've never heard [GEICO CEO] Tony Nicely say anything dumb about business, ever.

They just — they're wired so that they — that the, you know — it doesn't flicker. I mean, they get the answers. It doesn't mean they can — you know, they'd be a great ballroom dancer or a great baseball player, you know, or a great politician, but they are wired for business.

Charlie?

CHARLIE MUNGER: Yeah. Part of it is intelligence and part of it is temperament.

I don't know if Bill Ginn is in the audience, but by the time I was 14 years of age, I knew Bill Ginn would be rich.

He was a classmate of mine in high school, and a very intelligent man, and he wanted to be rich. And he was sensible in the way he handled life.

I think sensible people with the right temperament and the right intelligence, if they live long enough in our system, will get rich. But temperament is, I think to some extent, inherited, too. Don't you?

WARREN BUFFETT: Yeah.

His daughter, incidentally, is a partner with my daughter in a knit shop, which I hope you patronize while you're — (Laughs)

We've united the Ginn and the Buffett family. (Laughs)

Charlie, when did you first think business was something of interest to you?

CHARLIE MUNGER: Very early. (Laughter)

I loved games of chance and I love trying to learn how to win at them.

WARREN BUFFETT: Yeah. It's interesting for me, you know, simply to think about the question of whether the Final Four of the NCAA will be will be canceled, as opposed to postponed or transferred in locale, and decide if we're going to pay out $75 million the next day if it is canceled, and how much we want to receive in today to take care of that.

And that probably wouldn't interest — all kinds of people that wouldn't be interesting to. And since my dad wouldn't let me become a bookmaker, I went into investments. (Laughter)

25. Cologne Re stake

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Good morning. Jens (PH) from Germany.

After buying almost all of Cologne Re, how happy are you about the progress, and what are the plans for the remaining minority shareholders?

WARREN BUFFETT: Yeah. General Re, at the time we bought it in 1998, owned something in the 80s of Cologne Re, a large German company that they bought this 80-odd percent in, a few years earlier.

It's actually slightly more complicated than that because there was an arrangement where a certain purchase was deferred, but as a practical matter they owned in the 80s.

Right now, Gen Re owns about 91 percent of Cologne Re.

That's a subject that, obviously, it's not pressing with us, because we've owned it for seven years without taking our interest up, except periodically through small purchases.

And there's no particular reason to — why 100 would be better than 91 percent.

But if the price is attractive and shares are offered to us, we will always contemplate buying it. But it's not key to any strategy.

26. Munger defends AIG

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: I'm Christian Tukenberger (PH) from Switzerland, Europe.

What do you think of the two insurance — reinsurance, AIG and Converium, from Switzerland? Thank you.

WARREN BUFFETT: Well, I'm going to give you a chance at a second question because I don't really think I should comment on AIG.

There's, you know, they have said that they're going to have their 10-K. They hope to have it by, I guess, today.

I haven't received any late word whether it's been filed but they have — there'll be more disclosure on the situation at AIG, and I really don't know anything about what will be in that statement, and I'll just — I'll wait to read it. I'll read it with interest. But I — I have no particular insights on that.

Converium has had troubles in the United States, has been announced, but they also raised additional money. But again, I don't really have any specific commentary on those two companies.

Charlie?

CHARLIE MUNGER: Well, I'll be bold enough to make one comment about AIG. (Laughter)

I think whatever comes along, people are going to find that a lot that was very right was done over the years by AIG. There's a lot of ability in that place.

WARREN BUFFETT: Oh yeah. Extraordinary. I mean, Hank Greenberg was — he was the number one man in insurance. I mean, he developed an extraordinary company, in his lifetime.

It wasn't that much when it was handed to him. And he became the most important factor, I would say, by some margin, in the property-casualty business.

But in terms of evaluating where it stands now and what will be revealed when the 10-K comes out, I just have no idea.

27. Fannie Mae, Freddie Mac, and the home mortgage mess

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Good morning. My name's Mike Nolan. I'm here from Montclair, New Jersey with my 18-year-old son Brian, who's experiencing his first Berkshire annual meeting.

My question, and you touched on it a little bit in a couple of earlier questions, deals with the current regulatory environment in Washington, which appears to be growing much more negative on Fannie Mae, Freddie Mac, Farmer Mac, and so forth.

What might the implications for the U.S. consumer specifically, and the U.S. economy generally, be if the GSEs are effectively bridled or significantly restricted from their past charters?

Could this prick what you earlier referred, and some private economists are calling, a real estate bubble and what will be the fallout?

WARREN BUFFETT: Yeah. The GSEs, in effect, expanded their original charter and reason for being.

The thought, originally, was that they would guarantee mortgages and they had this very limited, I think, two-and-a-quarter billion dollar line of credit from the Treasury.

But they were they were brought in, to an extent, to do what FHA and VA had done for mortgages in their arena, was to give people confidence in borrowing money — or in lending money — far away from their own geographical location.

I mean, when the local — when I borrowed money on my house in 19 — bought it 1958 — I mean, I went down to see Mr. Brownlee (PH) at the Occidental Building and Loan, and he, you know, he knew something about me, and he knew something about my parents, and he knew where the house was and all of that.

But as the mortgage market became more institutionalized and it became more — the source of funds became geographically far more distant from the user of the funds, in order to have a market in which — which would be efficient, the GSEs were a very logical development.

And the GSEs came in, Freddie and Fannie, and the idea was that for a fee, which used to average about 25 basis points, they would guarantee these mortgages so somebody living 3000 miles away could buy them through securities and not worry about the individual property.

And then, the portfolio operations developed over the following years and, of course, they enabled the GSEs to earn high rates of return on capital, because, in effect, the GSEs were looked at as government guaranteed so that people would lend them money without worrying about the degree of leverage employed.

And, in effect, the GSEs became huge — they hugely developed what might be called the carry trade, using the government's credit, in effect, and the spread between what they paid on their money and what they got on mortgages.

So that became the dominant source of their earnings. They got very carried away with delivering promised rates of growth.

I remember reading in the Freddie Mac report some years ago, where they talked about delivering in the mid-teens or low-teens or something like that.

And I thought to myself, you know, that this is madness, because you can't do that when you're running a big carry trade operation. Interest rate — the slope of the curve will develop.

There's no way to lend money for 30 years to somebody who can pay you off 30 seconds later, to actually match assets and liabilities in a way that's risk-free.

The only way you could do it would be to issue a 30-year bond of your own, which you could call 30 seconds later, and people don't buy those bonds.

So, as a practical matter, you could not perfectly handle the risk of significant interest rate changes.

But the GSEs got caught up with delivering increasing earnings all the time to Wall Street.

So they first enlarged their portfolios and later, as we've seen, they got involved in some accounting shenanigans, which really sort of boggle the mind when you think of two of the most important institutions in the country, with all kinds of financial experts on the board and top-named auditors and everything, and turning out that billions and billions and billions of dollars were misreported.

It shows you what can happen in a system.

Now Congress is reacting, administration is reacting, [Federal Reserve Chairman] Alan Greenspan is reacting, in terms of saying that, you know, what have we created?

What is this — the situation where these two companies have a trillion-and-a half or more of mortgages they own, and people really think the federal government is on the hook, and the federal government does — wants to say it isn't on the hook.

But the truth is, it is on the hook. And institutions worldwide own the credit — own the securities — based on this implied promise. And it was all being done just because, basically, these companies wanted earnings per share to go up.

Now, they say they did it to maintain an orderly market, and all that stuff, in the mortgages. But they were really set up to guarantee mortgage credit.

And there's going to be reaction in Congress. It will be a huge fight.

Both of those institutions have been heavy supporters of various legislators over the years. They've got lots of clout. Not as much clout as they had a year ago, but they've got lots of clout in Congress.

And on the other hand, people have lost faith, to some degree, in what they've done.

And they've also seen that the consequences of the government issuing a blank check to two institutions that are trying to produce annual gains in earnings per share of 15 percent, and doing it by accounting means when they ran out of the ability to do it by other means.

So it's something that Congress should be giving a lot of attention to. They can't cut them off, in my view and, I think, most people's view. They can't say get rid of your portfolios or anything like that.

So my guess is that some kind of a curtailment comes in, some kind of tougher accounting requirements come in, sometimes it may be tougher capital ratios. And that over a long period of time, the government tries to figure out something that sort of eases them out of this position, where they were basically backing two entities that, at times, acted like the two biggest hedge funds in history.

Charlie?

CHARLIE MUNGER: Yeah. Well, he was asking, partly, is what happens if the government reins these two institutions in and forces a big reduction in asset base.

WARREN BUFFETT: I don't think they'll — I don't think the government is going to do something worse, they sell off hundreds of billions of dollars of mortgages, at all.

But if they curtail it — let's just say they say that from now on you got to operate in a runoff mode for a few years. There are plenty of people out there to buy mortgages.

They're already buying the securities of Fannie Mae and Freddie that are financing the mortgages. So it isn't like Fannie and Freddie, independently, were coming up with the funds to finance these mortgages.

They got them from somebody else and that somebody else can leave Freddie and Fannie out of the picture and buy the mortgages through some other form.

It would not be the end of the world, at all, if Freddie and Fannie no longer had new portfolio purchases. I don't think it would change things in any significant way, in terms of the cost of homeownership or anything else.

How about you, Charlie?

CHARLIE MUNGER: Well, I agree. I don't think it would have enormous macro effects if future growth were curtailed.

I do think a lot of the troubles that came, came from a large use of derivative books, and from Fannie and Freddie both believing a lot of silver-tongue salesmanship from derivative traders.

And, as many of you know, I think there is much wrong with derivative accounting and derivative trading operations in the United States, and I don't think the full penalties have yet been paid.

WARREN BUFFETT: When you can have a $5 billion mismark in one direction at one of these — and bear in mind these are among the most scrutinized companies in the world, and with outstanding people on their boards, in terms of financial expertise — if you can have a $5 billion mismark in one direction, while at the same time the other one has a 9 billion mismark in the other direction, you know, I would say we've come a long way from Jimmy Stewart and "It's a Wonderful Life." (Laughs)

CHARLIE MUNGER: Yeah.

28. UK reporting requirements are a deterrent

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Hi, this is Peter Webb from London, U.K.

The question I wanted to ask you: I've been an investor for many years and done very well following a similar sort of style to yourself. So thank you for that.

The big question I have is —

WARREN BUFFETT: Would you want to quantify that? You can always send us a check. (Laughs)

AUDIENCE MEMBER: But if there's a deal to be had, maybe we can speak afterwards.

WARREN BUFFETT: OK. (Laughs)

AUIDENCE MEMBER: The question that I have for yourself and Charlie is, over the time I've bought many different companies in the U.K. and Europe, and I've seen many American value funds buying the same companies, but I see very little activity from Berkshire and its subsidiaries.

And I didn't know whether that was a reflection on your views on U.K., Europe, and the world. Whether you just see a lack of investment opportunity? Is it outside your sphere of competence? Or is there some other reason that I see less activity from you in Europe?

WARREN BUFFETT: Yeah, it's a good question. We own, of course, as you know, 80 percent or so of MidAmerican Energy, which has a very large business in the U.K., but that's an operating business.

As you know, in the U.K. there's a rule that requires reporting when you own three percent of a company's stock. And actually, there's some conditions under which the ownership will be reported even sooner than that three percent.

There's a provision that — I think if there is an inquiry or anything, that it has to be responded to.

So, if you take a company with a market cap of, you know, £5 billion, if we bought £150 million of it, we would have to report, and that tends to mess up subsequent purchases.

So, we bought stock — we own stock in Diageo, which was Guinness at the time. We've owned stock in some other U.K. companies.

But we've thought twice before going over three percent, because of the reporting requirements, and then we'd have to report if we were selling, and all of that.

So that's a deterrent, but it's not an overwhelming deterrent. And if we, you know, if we get a chance to buy a significant piece of something that we think is cheap, particularly if we could buy it in one purchase. But there's a lot of special rules that kick in, over in the U.K., that do not in the United States.

Incidentally, there was something in the Journal the other day that said that we had to report if we bought over five percent of a company within 10 business days in the U.S.

That is not true. That was a mistake in the report. But it is the case in the U.K. that at 3 percent, reporting is triggered.

But there — we would feel very comfortable with lots of U.K. businesses. And, you know, they'd have — it'd be the same criteria we applied over here: a durable competitive advantage, and a management that we like and trust, and a reasonable price.

And we have seen some of those. There was an insurance company in the U.K., a year or so back, that I would very much have liked to have bought, but we couldn't come to terms on price.

But we have no bias whatsoever against buying businesses in the U.K. And as I say, we've — at Yorkshire and Northern Electric, you know, we have a business that, shows in our report, made close to $300 million after-tax.

And actually, considering my views on currency, you know, I would have — I'd give a slight edge to buying something where the earnings would be in sterling in the future, rather than in dollars.

Charlie?

CHARLIE MUNGER: Well, I regard it as kind of amusing that we ended up preferring the currencies of Europe when it's so much more socialized than the United States is. That's a queer occurrence.

WARREN BUFFETT: You actually prefer them or not, Charlie? (Laughs)

CHARLIE MUNGER: Well, certainly in recent — over a considerable period of recent months — we've actually preferred the currencies of socialized Europe to our own currency.

I just regard that as an odd occurrence for both of us. That wouldn't have happened.

WARREN BUFFETT: No. Up till three years ago, if I came back from Europe and I had a euro in my pocket I couldn't wait to run to the bank or someplace. I was afraid it would depreciate before I could get rid of it. But I changed my views a few years ago.

We hope to buy businesses, and stocks, other places in the world. And Charlie mentions the difference in political climate.

One thing: you read about slow growth in Europe and Japan and all those, and it's true. But usually — but the growth figures that you see are usually not on a per capita basis. And since the population of Europe has been, generally, very little changed, whereas the population of the United States grows one or one- and-a-half percent a year, if you look at growth figures in the United States and somebody says three- and-a-fraction percent, that's not on a per capita basis.

I mean, you've got to — you have to deflate that by the growth in population. Whereas, if you read about the growth in Europe, generally, you're dealing with a population base that hasn't changed.

So the differences in growth rate on a per capita basis are not as wide as the headlines would suggest.

29. Legal liability for someone else's accounting?

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Gentlemen, my name's Mike McCloskey. I'm from Toronto, Canada.

My question is: what obligation does a financial intermediary, or a party to a transaction, have to ensure that the other party to the transaction properly accounts for it.

WARREN BUFFETT: Well, that question may come up in a very real sense. (Laughs)

But, you know, we have lots of reinsurance transactions, obviously. Banks have lots of transactions with people.

Certainly, if you knowingly are doing something that causes a company that are participating in it, you know, you may have very serious obligations on that.

But on the other hand, if you're — I mean, we reinsure hundreds of companies. They have legal departments. They have auditors.

And there could be somebody out there today — well, they could be doing anything with their accounting. It probably wouldn't be limited to the contract they had with us. It might well be other things.

But it really gets down to whether there's knowing participation, I would say. Isn't that right, Charlie?

CHARLIE MUNGER: Well, as you say, it's a subject rife with ambiguities and different issues.

You have had some bartender liability, if you serve a drink to somebody that's already inebriated, why, some people say the bartender is liable.

On the other hand, radio stations are allowed, in America, to sell advertising time to people that use it for perfectly obvious fraud, and nobody ever sues the radio station.

It's very hard to predict what things are going to get legally shifted around so a supplier gets liability for its customer's behavior.

30. Invest in yourself and ignore asset allocation

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: My name is (UNINTEL). I live in Sacramento, California.

My question is related to the issue of U.S. trade deficit again and its implications on the future value of the dollar.

Do you think an individual or a business owner here in U.S. should be concerned about the purchasing power of his future dollar earnings or savings, and diversify his or her investments in non-dollar-based securities?

WARREN BUFFETT: I think it's very tough for individuals to either select individual stocks, select individual times to enter the market, select currencies.

I mean, I just think that's a game that they tend to get interested in at the wrong time. There's some adverse selection, in terms of when people who do not follow stocks carefully get interested in stocks.

I think that, you know, the best investment you can have, for most people, is in your own abilities.

I mean, when I talk to students, you know, I would pay a student — in many cases, I would be glad to, you know, pay them $100,000, cash up front, for 10 percent of all their future earnings.

So, I'm willing to pay 100,000 for 10 percent of them, I'm valuing the whole person at a million dollars, just capital value standing there in front of me.

And those — anything you do to develop your own abilities is probably going to be — or your own business — is probably going to be more productive for you than starting to think about individually making commitments into foreign exchange.

If you have a good business in this country earning money in dollars, you'll do ok. I mean, you may live in a world 20 years from now where a couple percent of the GDP is going to service the debts and the ownership that we've created now by running these deficits.

But you'll do fine in America. So, I wouldn't worry about that much.

Charlie?

CHARLIE MUNGER: Well, if you look at Berkshire, you will find that it really doesn't do much of conventional asset allocation to categories.

We are looking for opportunities and we don't much care what category they're in, and we certainly don't want to have our search for opportunities governed by some predetermined artificial bunch of categories.

In this sense, we're totally out of step with modern investment management, but we think they're wrong.

WARREN BUFFETT: Yeah. And incidentally, we have 80 percent of our money, or more — well over 80 percent — tied to this country and to the dollar. So it's not like, you know, we've left the country or anything of the sort.

CHARLIE MUNGER: When have you done a big asset allocation strategy?

WARREN BUFFETT: Never.

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: Yeah.

We end up with peculiar asset mixes. I mean, if the junk bond thing had gone on a little longer, instead of having 7 billion in there, we might have had 30 billion in.

But we were doing that simply based on the fact that it was screaming at us.

And we do the same thing with equities. I mean, back — for many years, we had more than the net worth of Berkshire in equity positions. But they were cheap.

CHARLIE MUNGER: And I want you to remember one of my favorite sayings as you do this asset allocation. "If a thing's not worth doing at all, it's not worth doing well." (Laughter)

WARREN BUFFETT: You can see why Ben Franklin turned the mantle over to Charlie. (Laughter)

31. Lunch break

WARREN BUFFETT: We're going to take a break now, so you can all go out there and enjoy yourself in the adjoining room, and have lunch, and we'll be back here at 12:45.

And those in the other room might come back to this area because I think we'll have enough seats for everybody after lunch.

Afternoon Session - 2005 Meeting

1. Q&A resumes

WARREN BUFFETT: OK, we're going to start in just a minute or two, if you have a chance to sit down.

OK, let's go to station 9. And I've — I'll — we will go till 3 o'clock. We'll break until 3:15, when we'll convene the business meeting. No one has submitted any proposals for that meeting, so it may be relatively short.

At 4 o'clock, Charlie and I will meet in another room here — I'm not sure where — with any of those of you from outside North America that are here. We would like to especially thank you for coming this long distance.

2. We'll "do pretty well" when inflation is high

WARREN BUFFETT: So, with that, we'll go to area 9.

AUDIENCE MEMBER: Good afternoon. My name is Ken Goldberg from Sharon, Massachusetts — Massachusetts, having the distinction of being the birthplace of Benjamin Franklin.

And, thanks to New Jersey, the only state in the Union where one cannot buy GEICO auto insurance. (Laughter)

Earlier this morning, you discussed policies that have eroded, and that threaten to continue to erode, the U.S. dollar.

In some of your earlier letters to shareholders, you warned about the dangers of inflation and cautioned that shareholders should fully take inflation into account when evaluating the performance of a business.

To what degree do you expect a large decline in the value of the dollar to trigger inflation that would adversely impact Berkshire's equity holdings and its businesses?

And to what extent should we calibrate Berkshire's overall performance against the backdrop of a weakening dollar?

WARREN BUFFETT: Well, we think, by and large, we have businesses that will do pretty well in inflation. But inflation destroys value, but it destroys it very unequally.

The best business to have during inflation is one that retains its earning power in real dollars without commensurate investment to, in effect, fund the inflation-produced nominal growth.

The worst kind of business is where you have to keep putting more and more money into a lousy business.

In effect, the airlines have been hurt by inflation over the last 40 years, because now they have to put a whole lot of money in a lousy investment, which is a plane, compared to 30 or 40 years ago.

And they have to stay in the game. They have to keep buying new planes. And the new planes cost far more now, and the returns continue to be inadequate.

So the best protection is a very good business that does not require big capital investment.

And, you know, the best investment at all — of all — I mean, if you're the leading brain surgeon in town or the leading lawyer in town or the — whatever it may be — you don't have to keep re-educating yourself to be that in current terms.

You bought your expertise when you went to medical school or law school in old dollars, and you don't have to keep reinvesting. And you retain your earning power in current dollars.

We — Charlie and I are always suspicious that inflation will regain some of the momentum it had a couple of decades ago. We always think it's in sort of remission.

We thought the talk about deflation was total nonsense. And certainly, the trade picture is one that you would think would accentuate any inflationary trends that might otherwise be experienced. I mean, obviously, the price of oil in euros has gone up far less than the price has gone up in dollars.

And you and I are buying gasoline in dollars, so we have seen a bigger increase in our fuel costs because of the decline of the dollar than we would've seen if we lived in Europe, or some other — or Australia, for that matter.

So, it's — inflation is always a factor in calculating the kind of investment, the kind of business, that we want to buy. But it doesn't — it isn't like it crowds out all other factors. I mean, it's always been with us. We'll think about it always.

See's Candy has done fine during an inflationary period because it does not have huge capital investments that have to be made in current dollars.

Other businesses we have, you know, if we're — the public utility business, for example — it costs a lot more money to maintain capital expenditures now in dollar terms than it would've 30 years ago.

So you have to keep putting more and more money into a public utility. And you'd better hope that the rate of return allowed is commensurate in times of high inflation the same way that it might have been in low inflation with a lower rate of return.

Charlie?

CHARLIE MUNGER: Yeah. Well, so far, the facts that are driving the dollar down in relation to other currencies have been restraining inflation in the United States.

In other words, it's the competitive export advantages of the other people that are — that have so far restrained inflation here. So, it's —

WARREN BUFFETT: Yeah, you're paying less for shoes. You know, we got killed in the — in parts of our shoe business.

And 30 years ago, of the billion-plus pairs of shoes used in the United States, a very high percentage were made here. And now, virtually none are. But if they were all being made here, you would be paying more for shoes. There's no question about that.

CHARLIE MUNGER: Yeah.

3. Buffett: Don't bet against America

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: I'm a physician from St. Louis. And I want to thank you and everyone here, because I'm one of these doctors that really doesn't know anything about money or finance. The money comes in, but I don't know what to do with it.

I'm not able to really evaluate the financial strength of a company, but I can evaluate the ethical strength of a company. And that's why I feel real comfortable — I think most of us here — having our savings in Berkshire Hathaway. And the —

WARREN BUFFETT: Thank you. (Applause)

AUDIENCE MEMBER: This question has probably been asked in different ways already, but several years ago, a fellow I know who was — had been manager of Magellan Fund — warned that we were going to have a terrible decade or so in the stock market because of all the things people have brought up so far.

The increasing interest rates, and runaway spending, and decreasing dollar, and stagflation may be right around the corner, Social Security problems.

And even what Charlie Munger referred to, is that most of our best and brightest graduates, I find, are going into money management rather than — they're not becoming doctors or molecular biologists or Ph.D.s in chemical engineering.

And so, in view of the fact that a year or two ago, people — there was still an ebullience of emotion about the stock market going up and making everyone rich just by having their money in the stock market — it seems like that ebulliences dropped, and I'm hearing, in anticipation of a bear market.

And you wrote, I think several years ago, that it's hard to make money in a bull market. And the real opportunities come in a bear market.

So, I'm wondering if you would give us a clue as to what your strategies are going to be, if it's really true that the market gets dismal over the next few years.

WARREN BUFFETT: Well, if the market gets cheaper, we will have many more opportunities to do intelligent things with money. Now whether we will blow on the money in the meantime or something is another question.

But, you know, we are going to be buying things — one thing or another — operating businesses, stocks, high-yield bonds, whatever — we're going to be buying things for as long as I live, just like I'm going to be buying groceries —

CHARLIE MUNGER: Longer than that, Warren.

WARREN BUFFETT: Yeah. (Laughter)

Yeah. Charlie's just waiting to take over after I'm — (Laughter)

And I'm going to be buying groceries the rest of life. Now, would I rather have grocery prices go up or down if I'm going to be buying groceries tomorrow and next week and next month and next year? And the answer is obviously, if I'm a net buyer, I would — I will do better if prices are lower.

We have no — we're not good at forecasting markets. I mean, we, in a general way, knew that we were getting enormous bargains in the mid-'70s. We knew that the market went crazy to some extent in the late '90s.

But we don't have much — we don't spend any time — Charlie and I spend no time — thinking or talking about what the stock market is going to do, because we don't know.

We do know, sometimes, that we're getting very good value for our money when we buy some stocks or some bonds, as it may be. But we are not operating on the basis of any kind of macro forecast about stocks.

And there’s always a list of reasons — you gave a few — there’s always a list of reasons why the country will have problems tomorrow. But there’s always a list of opportunities which don’t get mentioned quite as often.

So, we don’t sit down and make a list of the bad things that are happening in the economy and the good things that are happening, and therefore expecting the stock market —

It might not — it doesn’t behave that way even if you could correctly forecast some of the bad things or good things.

Overall, I’m an enormous bull on the country. I mean, over time — I mean, this is the most remarkable success story in the history of the world, if you think about it. I mean, in 1790 we had less than four million people in this country.

We had — there were 290 million people in China. There were 100 million people in Europe. You know, and they all had the same intellect we had. They’re in the same general climate. They had lots of natural resources.

And 215 years later, those 3.9 million people, I think, actually, you know, have 30 percent or so of the world’s GDP. So, it does not make sense to bet against America.

That doesn’t mean all our policies are smart or anything, but I would not — I do not get pessimistic on the country. You know, I worry about the — I mean, the big worry is what can be done by either terrorists or governments that have access to nuclear, chemical, or biological weapons.

But, in terms of the basic economics of the country, your children are going to live better than you live. And your grandchildren are going to live better than your children live. And we do not focus on macro factors.

Charlie?

CHARLIE MUNGER: Well, I agree with you that the economics of the country are probably going to increase for a considerable period ahead. But I suspect that, in very important ways, we are at or near the apex of a great civilization. (Laughter)

WARREN BUFFETT: You heard it here first, folks. (Laughter)

If you leave the NCB — nuclear, chemical, biological — out of it, I do not feel that way. But, you’ll get to see which one of us is right 20 or 30 years from now.

It — I have seen more people pass up opportunities because they get focused on a single economic variable or a single problem that the country faces, and they forget about the good things.

I mean, if you can buy very good businesses at attractive prices, it's crazy to say, "I think I'll sit this out because it might get a little cheaper next year," or something of the sort, and because the world's going to go to hell.

We just — we've never operated that — we've never decided not to buy a business we liked because of a macro view. Have we?

CHARLIE MUNGER: Not yet.

WARREN BUFFETT: OK. (Laughter)

It's hard to get him to really agree with you. (Laughter)

I've been working on it for years.

4. GM and Ford haunted by past commitments

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: Hello. My name is Randall Bellows. I'm from Chicago. And many years ago, Lauren, my wife, did a portrait of you drinking a can of Coke. Next year I'll bring one, drinking a can of Bud.

WARREN BUFFETT: I think you'd better stick with Coke. (Laughs)

AUDIENCE MEMBER: Oh, OK. I would like you to speculate on a couple of questions.

The first is, given the competitive disadvantage of General Motors and Ford with their huge health care liability costs for their employees and retirees, what do you think might happen there? Do you think there might be a bankruptcy to get rid of the liabilities or a government bailout?

And along that line, Charlie, you spoke several years ago about tort issues.

Do you feel there's anything coming in the way of asbestos reform or correction for those issues and the insurance companies that have been paying those billions? Thank you.

WARREN BUFFETT: Well, I would say that Rick Wagoner at General Motors and Bill Ford at Ford, both have been handed, by managers of the past, extremely difficult hands to play.

They're not the consequences of their own doing at all, but they have walked into what people call legacy situations.

But they have inherited a cost structure brought about by contracts that were put in place, maybe decades ago, that make it very difficult for them to be competitive in today's world.

I mean, just imagine if Ford or General Motors had signed contracts that made them pay several thousand dollars a ton more for steel than their competitors did. I mean, it would — people would immediately feel that was untenable.

So, General Motors and Ford are in the position of having commitments, which are, in strong contractual terms, to pay sums for retired, particularly, workers in both the annuity field and in the health field that are staggeringly high compared to some of their competitors.

And their competitors can buy steel at the same price, and they can buy aluminum at the same price, they can buy rubber at the same price.

And when you get all through with it, if they have huge advantages on the health care and the annuity side, it's not going to be a fair fight.

And those contracts, to some day — to some extent — go back to when General Motors had, for example, 50 percent-plus of the U.S. auto market. And now it has 25 percent. But I think even if it had 50 percent today it would be having trouble.

So, it's a very, very tough situation. I'm not sure what I would do if you put me in charge of — I mean, as Bill Buckley said many years ago when he ran for mayor of New York, they said, "What's the first thing you're going to do if you get elected?" He said, "I'll ask for a recount." (Laughter)

Well, that's a little the way I would feel if I got elected CEO of General Motors.

From the standpoint of the UAW, you know, they have a contract, they made a deal. And they've got $90 billion in the pension fund.

It's kind of interesting. The pension fund of General Motors possesses roughly $90 billion. The health care fund has a little more, too, another 20-some billion as I remember.

The whole equity of General Motors is selling for about 14 billion. So after all these years, there's 90 billion set aside for the retirees, and there's 14 billion of equity value that's been heading south for the owners.

And, it would seem that if General Motors had a steel contract that called for — let's say there's a ton of steel in every car — and I'm not saying there is — and if they were paying $2,000 a ton over market — or what their competitors were paying — people would say that that is not a viable situation for the long term.

But they're in a similar situation because the contracts they voluntarily signed.

And part of the reason they signed those — and undoubtedly — was that they bore no accounting consequences at the time.

It's a terrible mistake for managers not to think in terms of reality rather than the accounting numbers.

But back in the '60s, you did not have to account for pensions on an accrual basis. And up till the '90s, you didn't have to account for health care — or the late '80s, whenever it was — on an accrual basis.

And so people said, "Well, if we don't have to count it, it isn't real." Well, believe me, it's real. And the managers today are facing the consequences of that.

So, you know, they've got very tough hands to play.

And, you know, I read about it in the papers. I don't know what's going on there necessarily, but something will have to — in my view — something will have to give in that matter.

And before you answer the asbestos thing, Charlie, what do you think about them?

CHARLIE MUNGER: Warren gave a very optimistic prognosis — (laughter) — in my view.

I think — just because it hasn't happened yet doesn't mean that the problem isn't real.

If you jump out of the window on the 42nd floor, and you're still doing fine on the way down as you pass the 20th — (laughter) — it doesn't mean you don't have a serious problem. (Laughter)

If I were the governor of Michigan, or the president of the United States, or a director of General Motors or Ford, or a family member of Ford, I would want to address the problem right now.

I do not think it's getting better or that Yehuda is going to come over the mountain with a magic wand and make it go away. I think it would be better faced.

WARREN BUFFETT: You want to try the asbestos? (Laughter)

Give us another cheery — (Laughter)

Around the office he's known as Pollyanna. (Laughter)

5. Munger: "Terrible" and "gutless" behavior led to asbestos problem

CHARLIE MUNGER: Well, the asbestos thing has involved terrible behavior by some lying doctors, terrible behavior by a bunch of lawyers who suborned perjury, and gutless behavior by certain important courts, and even more gutless behavior by politicians who take care of themselves first, naturally.

And it's — these are the forces that are bearing on the problem. It's obviously not going to be handled very well. So, it's a perfectly terrible situation. You keep hoping that it will be so obviously bad that it will finally be addressed.

Some of that happened in California. The workmen's comp system in California had immense fraud in it, particularly egregious fraud by lots of doctors and lots of lawyers and lots of claimants. And it was so awful that it affected the whole employment prospects in California.

And with the [California Governor Arnold] Schwarzenegger revolution, that was partly corrected — I would say maybe 15 percent corrected. And, but it took —

WARREN BUFFETT: Five hundred pushups, Charlie.

CHARLIE MUNGER: What?

WARREN BUFFETT: Five hundred pushups unless it's 100 percent. (Laughter)

CHARLIE MUNGER: So, I think that if it gets bad enough, there is some possibility there will be more correction.

In a sense, it's totally crazy for a court system to be paying tons of money to people that have smoked two packs of cigarettes all their life and have one little spot on a lung that no honest doctor would know what the hell it caused.

And they aren't yet sick, and they're nearly dead anyway from their other behaviors and longevity.

And it's just, it never should have been allowed.

But once you get a powerful political force, even judges fear consequences. And it's very easy just to drift along with an evil system.

Luckily, we aren't using this particular — there are two kinds of asbestos, one of which is virtually harmless and the other which caused all this damage. And we stopped using the damaging asbestos.

And eventually the asbestos problem will go away. But how many people it will leave in some kind of financial wreckage before the storm is over, I can't tell.

I don't think the last Indian has bit the dust, do you, Warren?

WARREN BUFFETT: No, I'm — no.

CHARLIE MUNGER: I think the — but the behavior is so terrible. It's that kind of behavior that makes me talk about apexes of the civilization.

6. Our successors will provide the "same wonderful lack of oversight"

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: Now, Mr. Buffett and Mr. Munger, my name is Marc Rabinov from Melbourne, Australia.

I think it's rare for diverse collections of businesses to be successful. And I believe an important part of Berkshire's success has been your skillful oversight of the wholly-owned subsidiaries.

My question is, what advice would you give to your successor in managing our diverse portfolio of businesses?

WARREN BUFFETT: Yeah, well, it's a very good point that Charlie and I have been known to rail a bit about companies that go and buy this business and that business. And, of course, that's exactly what we've done ourselves over the years.

I think the motivations have been somewhat different, perhaps, than in many of the cases. And then I think the way we've approached it has been different.

We've — we have been reasonably successful although we've had some notable failures. But we've been reasonably successful in creating a climate where the people who built the businesses continue to run them with the same enthusiasm and energy after they sell to us that they possessed early on.

And I think that you can find all kinds of illustrations in the histories of businesses that are diversified. I mean, Gillette bought 20-some businesses. I remember, back in the '60s, Coke bought all kinds of businesses.

And certainly the cigarette companies did, all kinds of people. The oil companies for a while were doing it. And generally, the experiences were not very good when they got outside of their own fields.

But I think when those companies bought businesses, they really thought they were going to take them over and run them themselves. And Charlie and I are under no illusions that we can run the businesses that we buy as well as, or nearly as well as, the people that have been running them over time.

And, we don't have group vice presidents that — in Omaha — we don't have a whole bunch of directives going out. We don't have companies that were run one way and then we're going to run them entirely differently, and have them reporting in all kinds of special ways to us, and have a human relations department and a public relations department, then the legal department — all kinds of things in Omaha — telling them how to run their businesses.

We think that destroys — can destroy — many good businesses — certainly can destroy the incentive of the people that have already gotten rich to stay around and make us rich in turn. So, I think that has been an important difference.

I think it's been demonstrated well enough to all of those around Berkshire that it's been a very good place, generally, I think, for people, in terms of how they feel about working there. And I think they recognize it works.

So, the successor, to me, will come from within Berkshire. They will have seen how it worked. They will believe in it. They will be surrounded by people who have worked in this manner. And I don't think it will be the most difficult job in the world to keep that engine going down the tracks at 90 miles an hour.

I mean, it isn't like they have to create the system. They will inherit a system.

And I would be amazed if any of the three successors that we will talk about with the directors on Monday, if any of them would not recognize the inherent special values in the system as it now works and take up one of these other models that clearly has been disastrous for one company after another that's diversified.

Charlie?

CHARLIE MUNGER: Yeah. I don't agree with you that the success at Berkshire has come from our oversight of the subsidiary —

WARREN BUFFETT: No.

CHARLIE MUNGER: — companies. It's come from our lack of oversight of the subsidiary companies. And I think our successors will be able to provide the same wonderful lack of oversight — (laughter) — that we have provided.

And if you're not going to use a lot of oversight, you've got to be very careful in what you bring into your corporate family. And you've got to be very careful in treating, honorably and well, the people who are running the businesses over which you're not giving any oversight to speak of.

And I think our system is — it's very different from a General Electric system. And I think their system works very well for them, but I don't think it's the only system in the world that works in corporate capitalism. And I think the Berkshire system will work very well after we're gone.

WARREN BUFFETT: It's a very simple system. I mean, GE works exceptionally well. But when I go back to some of the conglomerates — and that's not a term that I shrink from, but most people do because they think it brings down their P/E or something — but we are a conglomerate. And I hope we become more of a conglomerate.

The — we don't — we haven't succeeded because we had great complicated systems or some magic formulas we apply or anything. We've succeeded because we don't have — we have simplicity itself.

We take people that know how to play their game very well, and we let them play the game. And it's just worked in one field after another. And every now and then we make a mistake. And we'll — you know, there'll be more mistakes made.

But overwhelmingly, it works. And it doesn't require some great business insight or anything like that, in terms of whoever's running this place, to keep that kind of machine in motion. I mean, it is not complicated.

The bigger worry would be that the culture would get tampered with in some way and people would try to oversteer, basically.

But that won't happen. Our board won't let it happen. And the ownership won't let it happen.

And I think we've got something that'll work for a very, very, very long time. And that's why I'm comfortable with the fact that every share I have will go to a foundation that I care about having — getting good financial results in the future.

And I'm quite happy to have them have 100 percent of their money in Berkshire.

7. Berkshire's best-ever investments: GEICO and Ajit Jain

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: Jonathan Mills (PH) from London, England.

What has been the single best investment of your careers? And why do you consider it to be the best, excluding Berkshire Hathaway itself?

WARREN BUFFETT: Yeah, well probably the best investment, if you're talking about business, was getting Charlie as a partner. And he works cheap, too. (Laughs)

The — we've had — you can't measure it by dollar terms because, obviously, we're doing bigger things now than early on.

I mean, See's was an enormously important part of our success. It doesn't contribute a huge percentage of our net income now, but it provided income that let us buy other things in the past. It taught us a lot of lessons about business, all kinds of things.

So, we've — probably, in terms of what it's done already and where it's going to go over time, probably the single best investment was the first half of GEICO, which we purchased for $40 million. Now the second half cost us 2 billion. I'm glad I didn't buy it in thirds. (Laughter)

But, you know, that 40 million will — for half the company — will turn out very well.

But GEICO — some of our businesses have growth potential, some don't. And we don't require growth potential as part of a business.

If a business makes good money and we can use it to buy other businesses, one of the advantages of the Berkshire system is we have a tax efficient and kind of frictionless way of moving money to the best opportunities. And GEICO, internally, has still enormous possibilities for growth.

Incidentally, we've — you know, I watched that movie and I kept touting the American Express card. But here is our GEICO card, which I'm sure all of you are eligible for.

And I don't advise people using credit cards to revolve. But the truth is that people do, so use a GEICO card if you're going to behave in — if you're going to charge anything.

I still advise you to pay off your account before it starts revolving. And I think it's a terrible mistake for people to get hooked on revolving credit at high interest rates.

And I — that's the first thing I tell students is that, if they don't remember anything else I say, just, you know, don't fool around with charge cards and run up balances that keep getting larger and larger.

But GEICO — GEICO has well over six million customers now. As was mentioned, we entered New Jersey last year. We're adding very rapidly there. It's a great, great business model.

And it's run by a superb human being and businessman, Tony Nicely. And I think it's got a huge potential. But I love them all.

CHARLIE MUNGER: Well, but GEICO, after all, cost $2 billion for the second half and —

WARREN BUFFETT: Right.

CHARLIE MUNGER: — a significant number of tens of millions for the first half.

Now the search expenses that brought us Ajit Jain, now there was an investment that really paid a dividend. I can think of no higher return investment that we've ever made that was better than that one. (Applause)

And I think that's a good life lesson. In other words, getting the right people into your system can frequently be more important than anything else.

8. NYSE should not being trying to earn a profit

WARREN BUFFETT: OK. Let's try number 2.

AUDIENCE MEMBER: I'm Maggie Gilliam (PH) from New York City.

As someone who visited the New York Stock Exchange at a very early age and have been touting its merits over the years, could you comment a little bit about what you think of the shenanigans going on currently?

WARREN BUFFETT: Well —

CHARLIE MUNGER: Where?

WARREN BUFFETT: At the exchange.

CHARLIE MUNGER: Oh.

Warren, you're so good at this. (Laughter)

WARREN BUFFETT: You mean at shenanigans or —

I personally think it would be better if the New York Stock Exchange remained as a neutral — and it's not strictly a non-profit, it'll earn some money — but as a not-for-big-profit, we'll put it, institution.

I mean, the exchange has done a very good job over centuries. It's one of the most important institutions in the world. And the enemy of investment performance is activity. And the creator of profit in a profit-minded exchange is activity.

So, I personally would rather not have an exchange which is trying to increase its earnings per share annually, and thereby wanting to encourage people to trade more actively and create more income for itself.

That will not be, in my view, good for the American investor. So, I think that the exchange of yesterday may be better for the American investor than what looks like it may be the exchange of the tomorrow.

Now there may be all kinds of reasons that are — people find compelling why they want to turn it into a for-profit exchange.

But I know the American investor will not be better off if volume doubles on the New York Stock Exchange.

And I know that the New York Stock Exchange as a for-profit institution would be trying to figure out ways to have that volume increase and to perhaps even charge more money one way or the other.

I mean, you know, the profit of an exchange, the profit of the people working on them, in a sense that's the frictional cost of capitalism. That's coming out of the earnings of the businesses.

And, you know, IBM or General Motors or General Electric will not earn more money because their stock turns over more frequently.

But a for-profit exchange will earn more money. And I do not like the idea of the exchange getting on the side that's against the long-term interest of investors.

Charlie?

CHARLIE MUNGER: Well, I feel, on this one, the same as you do with — much more strongly.

I think we have lost our way when people like the governors of the stock exchange and the CEO fail to realize that they had a duty to the rest of us to act as exemplars, there was — of the right behaviors.

Once your activity is that freighted with public significance, I think you've got a duty to create the right appearances. You have a duty as an exemplar.

I mean, you do not want your first grade school teacher to be fornicating on the floor or drinking booze in the classroom or —

And similarly, you — I don't think you want your stock exchange to be all over the headlines with wretched excess. And I certainly don't think you want to turn the major stock exchange of the country into even more of a casino than it is already.

I think we have totally lost our way on this stuff. And I agree with Warren that it ought to be — (applause) — a public institution that cares deeply about its duties as exemplar.

WARREN BUFFETT: I wish I'd gone to first grade where he did. (Laughter)

CHARLIE MUNGER: I didn't hear that.

WARREN BUFFETT: I said I wish I'd gone to first grade where you did.

9. Buffett (D) and Munger (R) both endorse Social Security

WARREN BUFFETT: Number 3. (Laughter)

AUDIENCE MEMBER: Good afternoon, gentlemen. My name is Glen Strong (PH). I'm from Canton, Ohio. I want to extend a warm thank you to Warren's daughter, Susan, for the fine introduction that she provided for this gathering.

WARREN BUFFETT: Thank you. (Applause)

AUDIENCE MEMBER: Also, a special thank you to your wife, Susan. I thank her for the contributions that she made to the company and for the outstanding example that she obviously set for her husband and the many people that she must have come into contact with. (Applause)

Today, I'm asking for your opinion on Social Security. Shall we call it the government-sponsored Ponzi scheme for retirees?

I am interested in your views on private accounts, age adjustments for retirees, and tax adjustments for the employees. What would you promote if you were in the Oval Office? Thank you.

WARREN BUFFETT: Yeah, the Social Security was introduced in the, what, '36 or '37. My grandfather used to have Charlie bring two pennies to work at the Buffett & Son Grocery Store on Saturday in order to pay his share of Social Security.

Didn't want Charlie getting any false ideas that there was a free lunch in this world. And he gave him a half-hour lecture on the evils of socialism. So, we've had a lot of exposure to Social Security, the various arguments on it.

It was proposed, of course, as insurance, because basically that was the only way [President Franklin] Roosevelt could get it passed. The idea of transfer payments did not — would not have washed in the '30s, certainly.

You know, and I think the first woman that received a Social Security check paid in a total of $22 or something and got 2,400. So, it wasn't insurance. It wasn't insurance at all.

And the transfer payment by the people who are in their productive years to the people who are past their productive years — and we'll get into definitial require — terms as to whether it's 65 or 67 now, you're past productive years — but essentially it's a transfer payment.

I basically believe that anything that would take Social Security payments below their present guaranteed level is a mistake.

I think that in this country — extraordinarily rich country — that the people in their productive years can take care of those outside in both areas, even though the ratio of productive to non-productive has changed and is changing.

But we take care of our young. And a rich country takes care of its young and it takes care of its old.

And incidentally, taking care of its young, when we educate five children in the family, we don't expect that family to pay, you know, five times the tax or something like that.

We recognize that in taking care of the young, that it should not be based on a per capita basis or based on the size of the family. We provide good school — we try to provide good schools — and health and everything for the young overall as part of our overall responsibility.

I believe that a rich country should be doing the same for the older people. There are — you know, Charlie and I came into this world wired in a way that enables us to get very, very, very rich — rich far beyond any possible needs that we could have. And not everybody's wired the same way.

Now if you come into this world wired with an I.Q. of 85 or something of the sort, or disabled or whatever it may be, you know, you are not going to do as well in a market economy, remotely as well, as we do.

But you still provide much of what makes Charlie and I very rich. And, you know, and when it comes to fighting in Iraq or something of the sort, you know, then that becomes an equal opportunity type thing. But when it comes to making a lot of money, it's not equal opportunity in this country.

So I believe that a rich country like ours should not give lower benefits than what takes place now. And I certainly don't think that — and we've got all kinds of mechanisms for saving that are extremely good.

We have 401(k)s in the country. We have taxes on dividends and capital gains at 15 percent, so the money I earn gets taxed at a lower rate than the money that a receptionist in our office may earn.

And I would not be doing so well if I were stuck over in Bangladesh or someplace. So this society is providing huge benefits to me that other societies would not.

And I think that the obligation for the people who do well in this society is to provide a reasonable level of sustenance for those beyond their productive years.

We've got the capability to do it. You know, right now we quit taxing for Social Security at $90,000. But — and that means that everybody in my office is paying — or most of them — are paying 12.4 — 12.2 or 12.4 percent, counting what the company contributes, toward this.

People talk about double taxation of dividends; they're getting taxed for Social Security and they're getting taxed for income on their income. And they're paying a higher rate, or an equal rate overall, in many cases, to the same rate — compared to the rate that I pay. And I think that's sort of nonsense in this society.

So, I don't want to do anything — anything — that hurts the level of the bottom 20 or 30 percent, in terms of their income.

I see people living with fear about health care or living with fear about running out of money in their old age. And I think a society should try to minimize the fear that their inhabitants experience.

And that doesn't mean just fear of getting mugged or something. It means fear that the last 25 years of their life, they're not going to have much income.

So, I would — and the degree to which the administration or other people are worrying about the deficit in Social Security 25 years out, when they have a $500 billion deficit excluding the Social Security surplus now, I mean, just strikes me as nonsense. (Applause)

Here we are deploring something that's going to happen in 20 years that's a fraction of what is happening right now while they're cheering, you know, basically, and talking about further favoritism in the tax laws.

So, I have great trouble with people that say, you know, that this system can't sustain — right now, 4 and a fraction percent of our GDP goes to Social Security.

Fifty years from now, 6 percent — no, 6 and a fraction percent — well, believe me, our GDP will be far larger 50 years from now. And going from 4 percent to 6 percent does not strike me as a terrible prospect.

If you ask me what I would do to change it now, I would means test it. I would lift the $90,000 way up. In fact, I might apply it, you know, on all income. Then you'd really get people's attention.

But — and I would gradually — and we're in the process of doing this — but I would certainly increase the retirement age. I mean, the world in 2005 is much different than the world in 1937, in terms of longevity prospects and the ability to function productively.

Charlie, what do you say?

CHARLIE MUNGER: Well, that's the view from Berkshire's Democratic chairman. (Laughter and applause)

And the odd part of Berkshire on this issue is that the right-wing Republican who is speaking feels more strongly than Warren that the Republicans are out of their cotton-picking minds to be — (applause) — taking on this issue right now.

I do not — If the country is going to get richer at 1 or 2 percent per annum for a long time ahead, and it's going to have more old people who are living longer and spending money on medical care, the idea that eventually a higher share of GDP would be going through Social Security to retirees and so on than we now have is not anathema to me.

It's exactly — it's an exactly logical way to be spending money under different circumstances.

And if the government runs out a little short of money as it gets more Social Security obligations, I see nothing wrong with having some consumption taxes or whatever to pay in a reasonable way for what is a very reasonable expenditure.

Social Security is very successful. Apart from the disability element, which is relatively small, there's practically no fraud. It's hard to fake being dead. (Laughter)

And furthermore, it's a reward for work. All kinds of people are working in this country because they want to eventually qualify for Social Security, just as many people are doing dangerous military service because they want the pension that will come eventually.

So, Social Security is a very capitalistic institution with profoundly good effects. It's one of the most successful things the government has ever done in terms of efficiency and good effects.

And a Republican administration that may shortly have to do something really unpleasant, like face down North Korea or Iran over atom bombs, is wasting its good will over some twaddle that a bunch of economists that haven't thought it through properly devoutly believe? It's a very sad occurrence. (Applause)

10. Don't blame the ratings agencies

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Thank you. Bill Ackman from New York, New York.

Four of the handful of triple-A rated companies — AIG, Fannie Mae, Freddie Mac and MBIA — are under formal investigation for accounting shenanigans and are in the process of restating their financials.

Like Charlie said before, I think of a triple-A rated company as an exemplar, a company that should behave with the highest accounting and ethical standards.

My questions this leads me to are, how can investors comfortably invest in any financial service company when even — when a decent percentage of the triple-A rated companies have false and misleading financials?

And I guess the follow-up question is, why don't the rating agencies do some independent due diligence from an accounting standpoint so that they can help serve as a watch on this issue?

WARREN BUFFETT: Well, financial companies are more difficult to analyze than many companies.

I mean, the — it is more — if you take the insurance business, you know, the biggest single element that is very difficult to evaluate, even if you own the company, is the loss and loss adjustment expense reserve.

And that has a huge impact on reported earnings of any given period. And the shorter the period, the more the impact can be from just small changes in assumptions.

You know, we carry, we'll say 45 billion of loss reserves. But, you know, if I had to bet my life on whether 45 billion turned out to be a little over or a little under, I mean, it'd be a — I'd think a long time.

And you could just as easily have a figure of 45 1/2 billion or 44 1/2 billion. And if you were concerned about reporting given earnings in a given period, that would be an easy game to play.

In a bank, you know, it basically is whether the loans are any good. And I've been on the boards of banks. And that's — you know, I've gotten surprises. It's tough to tell.

It's — financial companies — if you're analyzing something like WD-40, you know, or See's Candy, or our brick business, or whatever, you know, they may have good or bad prospects but you're not likely to be fooling yourself much about what's going on currently. But with financial institutions, it's much tougher.

Then you add — throw in derivatives on top of it, and, you know, it's — no one probably knows, you know, perfectly, what some of the — or even within a reasonable range — the exact condition of some of the biggest, you know, banks in the world.

And — but that brings you back to the due diligence question of the agencies. You had very high-grade, very smart — financially smart — people on the boards of both Freddie and Fannie. And yet, you know, one was five billion and one was apparently nine billion.

Those are big numbers. And I don't think those people were negligent. And it's just, it's very, very tough to know precisely what's going on in a financial institution.

Charlie and I were directors of Salomon [Brothers]. And Charlie was on the audit committee. And I forget the size of a few of those things that you found. But, you know, what wasn't found — and that doesn't mean that people below are crooks or anything like that.

It just means that it's very tough with thousands and thousands and thousands of complicated transactions, sometimes involving — the computations involving — multiple variables, it can be very hard to figure out where things stand at any given moment.

And, of course, when the numbers get huge on both sides, and you get small changes in these huge numbers, they have this incredible effect on quarterly or yearly figures because it all comes lumped in — those adjustments — come lumped in a short period of time.

So I just think you have to accept the fact that insurance, banking, finance companies — we've seen all kinds of finance company — both frauds and just big mistakes over time — of just one after another over the years.

And the — it's just a more dangerous field to analyze. It doesn't mean you can't make money in it. We've made a lot of money on it. But it's difficult.

Now, obviously a GEICO, where you're insuring pretty much the same thing — auto drivers — and you get — your statistics are much more valid in something like that than they will be if you're taking something that — like asbestos liability — you're subject to far greater errors in estimation.

Doesn't mean that people aren't operating in good faith. But, you know, I would take — just take the asbestos estimates of the 20 largest insurance companies. I will bet you they're way off, but I don't know in which direction. And that's sort of the nature of financial companies.

I wouldn't fault the rating agencies in terms of not being able to dig into the financials and find things that —

You know, all of the companies that you've talked about have had big name auditors. And our auditors at Berkshire, how many hours did they spend last year?

You know, I don't know whether — what it would be, probably 60, 70,000 hours. And I'm sure at other — you know, if you take major banks, they're spending more than that. But, you know, can they be certain of the numbers? I doubt it.

Charlie?

CHARLIE MUNGER: Yeah. Warren is obviously correct that where you've got complexity, which by its very nature provides better opportunities to be mistaken and not have it come to notice, or to be fraudulent and have it not be found out, you're going to get more fraud and mistakes than you are if you're selling a business where you shovel sand out of the river and sell it by the truckload.

And just as a business that sells natural gas is going to have more explosions than a business that sells sand, a business like these major financial institutions, by its nature, is going to have way more problems.

And that will always be true. And it's true when the financial institutions are owned by governments.

In fact, some of the worst financial reporting in the world is done by governments and governments — institutions like government banks in China, et cetera.

So, if you don't like the lack of perfect accounting in financial institutions, you're in the wrong world.

11. We like our stocks but aren't buying more now

WARREN BUFFETT: Number 5?

AUDIENCE MEMBER: Good afternoon, Mr. Buffett, Mr. Munger. Thank you very much for your wisdom and all your investment advice. I'm Adrian Sherr (PH) and I'm from Hong Kong.

Back in the old days in Hong Kong when somebody turned 100, they got to have tea at Buckingham Palace with the queen. I don't know what you have here in America, but I hope that in 2030 we come back to watch you do 50 pushups at the White House. (Laughter)

CHARLIE MUNGER: It's not the way to bet.

WARREN BUFFETT: Will you settle for 10? (Laughter)

AUDIENCE MEMBER: My question comes in two parts.

Firstly, in 1968-69, you liquidated all your partnerships. And I guess, aside from your holdings in Berkshire Hathaway, you got completely out of the market and stayed out.

In 2000-2001, you mentioned to us that in the coming decade the markets would go, at best, nowhere.

However, despite $50 billion in cash, you and therefore us, remain substantially invested in the market.

So my first question was, how and why is the investment climate different today than in 1968-69 that makes you comfortable remaining substantially invested?

WARREN BUFFETT: Yeah, well, we do own certain securities which we wouldn't — we probably wouldn't — buy at these prices. Some of them we would. Some of them we wouldn't.

We're not unhappy with anything we own. We're not happy with putting more money in, so we're in a zone in some of those securities that — where we wouldn't buy and we wouldn't sell.

Now part of it — that decision relates to the kind of quantities that we deal in. I mean, if we owned 100 shares of each one of the stocks that we own, you know, many billions of dollars' worth, it would be an easier decision to go in and out.

But we would face significant costs — including taxes, but on top of taxes — in trying to go in and out of the big positions we have. And basically we like the businesses.

So, we are not unhappy. We may feel like we wouldn't want to buy more here. But we are not unhappy about being in the businesses in which we have big equity holdings.

Now notwithstanding all of that, a lower percentage of our intrinsic value is represented by the common stocks we own than just about at any time of our history, with the exception of a couple — well, the period right there at the end of 1969 when we liquidated the partnership.

So, we have not made any big statement by purchases of stocks or the ownership of stocks that says we — in any way — says that we think that this is a particularly attractive time to own them.

But we are not unhappy with Coca-Cola. We are not unhappy with American Express. We are not unhappy with — we are not unhappy with Wells Fargo or Moody's. Those are very, very good businesses that we own.

Would we be buying them at today's prices if we, you know — well, the answer is we're not. You know, we've got money. And we may buy more later on. We're more likely to buy more later on than to sell those sort of investments.

But there is a zone, which because of size, because of taxes, where we would neither be a buyer nor a seller.

And we do not see lots of attractive stocks, but we also don't think that there's as much silliness in the market, by far, as there was 5 years ago roughly.

Charlie?

CHARLIE MUNGER: Yeah. One of the things that's interesting about Berkshire lately is that if you take the last four or five things we did in the stock market, with a goodly number of millions, but — billions, really — but small in relation to Berkshire's overall size — our record is much like it used to be in some of the best days.

Where we were able to move around with small amounts of money, the results were quite respectable. But where we were facing the problems of being enormously rich the way we were prevented from the nimble moneymaking record of the past, I don't think that's a permanent state of affairs, but it's never going away either. But it —

WARREN BUFFETT: Explain that one. (Laughter)

CHARLIE MUNGER: Well, I mean, it's that I think we may be able to deploy large amounts —

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: — of money eventually at very satisfactory rates. Whereas in recent times, we have deployed small amounts of money at very satisfactory rates.

And better small than nil. And small is still billions. (Laughter)

12. "I don't see gold as a store of value"

WARREN BUFFETT: Number 6. (Laughter)

AUDIENCE MEMBER: Good afternoon. My name is Mike McGowan (PH) and I'm from Pasadena, California.

I had a pretty good question on Prop 13, but after watching the movie I don't think I'll ask it.

WARREN BUFFETT: Good. (Laughter)

AUDIENCE MEMBER: What I'd like to ask about, I guess, is one quibble and then a question. The question being about financial education, or a study of financial history, that might help people in handling these markets or in — just dealing with investing at or near the apex of Western civilization.

When you mentioned your dad's lectures about "buy gold" back in the 1930s, and then saying, "Well, 60 years later, it hasn't done very well," gold was pretty much pegged at a set price back in the '30s for years and they didn't really let it loose until 1971.

And then it caught up. And then it's kind of bounced around. If you looked at gold maybe now, and derivatives and real estate bubbles and lots of other things, maybe gold wouldn't be such a bad investment, looked at in current terms.

So, my question would be, do you consider that you have some sort of an obligation or duty as financial exemplars to maybe pay a little attention to that classical kind of gold is the benchmark or the bedrock of a financial system, to some extent?

And that it might be nice to talk about it, in your — at least your annual letter to your stockholders — about how people might protect themselves in what's a fairly bubbleous kind of environment from, really, the decline in purchasing power or problems caused by the financial domination that we have today? Thanks.

WARREN BUFFETT: Yeah. I would say that gold would be way down on my list as a store of value. I mean, I would much prefer owning a hundred acres of land near here in Nebraska, or an apartment house, or an index fund.

Gold, we'll say, was freed up 30-odd years ago. But it adjusted to a market that still, if you go back to 1900, you know, you were talking $20 gold. Well, you take 20 to 400 in a hundred years.

The Dow went from 60 to, what, 12- or 13,000 — 12,000 or whatever it might have been — in that same period, and paid you dividends during the time you owned it.

It was 66, I think, at the start of the century. And I forget where it ended, but it's 11- or 12,000. And like I say, it was paying you something every quarter during that period.

And if you owned gold, you paid $20 in 1900 or thereabouts. And then you — we'll say you had $400 a hundred years later. And in the meantime, you paid insurance and perhaps some storage cost.

It really is not — it's not a store of value. And it's — I'm not arguing for paper money, but if you're worried about paper money —

And I think, you know, it makes a lot of sense to worry about paper money over long periods of time — but it's just about — you know, it's just about the last thing I would want to own under those circumstances.

You know, it has — a farm has utility, an apartment house has utility, a business, you know, will produce earnings. And some businesses will produce them in real terms as they go along.

You know, I'd rather have the ability to sell people a pound of candy 20 years from now. And if they're dealing in seashells, I'll get an appropriate number of seashells instead of paper money for it.

But I — it — I just don't — I don't see gold as a store of value. And it's — the truth is, it hasn't worked very well.

But forget about whether it's worked well the last hundred years or the last 50 years or the last 10 years, I see no reason, you know, why it would work well in the future.

I forget whether we're turning about three- or four-thousand tons of gold a year. And, you know, we take it out of the ground in South Africa and we put it in the ground at Fort Knox or someplace, you know, or in the New York Fed. I mean, and it doesn't do much along the way, for anybody.

So, I —

Charlie, how do you feel about gold?

CHARLIE MUNGER: Well, I think gold was — and similar items — that was a great thing to have if you were a well-to-do Jewish family in Vienna in 1935, because you had hazards where that gold had enormous utility to you. But for Berkshire Hathaway sitting here in 2005, it just doesn't interest us at all.

13. No stock bubble right now, but no bargains, either

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: My name is Al Henderson (PH) from Minnesota. I'd like to thank you both of you for being yourselves and doing so much for all of us and to help enrich ourselves and everyone else.

My question I have is — actually, you already referred to it — that you devote very little time to looking at the total market and look for individual opportunities most.

But I was wondering, in the past you made some excellent presentation on points to consider in projecting reasonable 10-year returns for the stock market and had to devise reduced expectations.

Where do we stand now on your stock market and economic measurements and expected 10-year returns?

WARREN BUFFETT: Yeah. Every now and then — I mean, and I agree — very infrequently, you probably can say something intelligent about markets as a whole.

I mean, that you do see circumstances that are extreme enough that you can make a statement that is likely to look reasonably intelligent five or 10 years later.

And I've seen a few of those times in my lifetime. I mean, I — and I've spoken out a couple of times. And I did in '69 and '74 and a few times. Most of the time, you know, you're in some in between zone.

Obviously, you get more for your money in equities now than you got, say, in the summer of 1999, which is when I delivered a talk out of Sun Valley that later got turned into an article for Fortune.

But that was an — I spoke out then because it was extreme. I mean, I knew in a general way that I was going to be right, particularly in certain aspects of the market, but I didn't know when, and then I didn't know how right or anything of the sort. And you could've done the same thing in the other direction back in the mid-'70s.

I think that if you had to make a choice between owning long-term bonds, which are now yielding — the Treasury — only a little over 4 1/2 percent, or owning equities for the next 20 years, and you couldn't make — change that decision, I would certainly prefer equities.

But I think people that have expectations that they can earn more than 6 or 7 percent in equities, and certainly when they start expecting double digits, I think the degree to what they have expectations, they can do that or that they can find somebody else to do it for them, I think they're making a big mistake.

But 6 or 7 percent is not the end of the world at all. In fact, it — and it gets treated better tax-wise right now than it has almost any — well, really anytime in my lifetime.

So — I don't think we're in bubble-type, at all, valuations in equities. And I don't think we're anywhere close to — remotely close to bargain valuations. And I don't think it's an extreme enough period that you can speak out in some very definitive way about the outlook.

But if you told me I had to go away for 20 years and choose between what's obtainable in an index fund of equities or be committed to long-term bonds, I would rather take equities.

But I think you will get a chance to do something that is more screamingly intelligent in not too many years — and maybe a lot shorter — than the alternatives that you're offered now.

Charlie?

CHARLIE MUNGER: Well, I can't improve on that at all.

14. "Bubble valuation problems" for real estate

WARREN BUFFETT: Well then we'll go to number 8. (Laughter)

AUDIENCE MEMBER: Hello. My name is Hamid Rezapour. I'm from Orinda, California. I had a question about real estate.

And I know this question was asked in previous shareholder meetings about, "How come Berkshire doesn't invest in real estate?" And I believe the answer was that, "We like operating business." So I want to make my question a little bit more specific towards commercial real estate.

So, considering the characteristics of larger-size commercial real estate investments like REITs that can have the behavior and financial returns of an operating business, why not invest in real estate?

Is it because you just don't like the returns? Or the business is just not attractive?

WARREN BUFFETT: Yeah, well, Charlie got his start in real estate. Right, Charlie?

CHARLIE MUNGER: Yeah. I would say, number one, that in a corporation like Berkshire, that's taxable under subchapter C of the Internal Revenue Code, owning real estate is grossly disadvantaged compared to owning it directly by individuals such as yourself. That's number one.

And number two, real estate — investment real estate — is having bubble valuation problems of its own right now.

All my rich friends who own real estate are selling their worst properties. And they're getting bids that come in higher than their highest expectations. And people are competing to take these things off their hands.

I do not find it exciting. And it certainly doesn't fit Berkshire. Name me a lot of C corporations that have been passive holders in real estate and have done well over a whole lot of years. It's almost a null class.

WARREN BUFFETT: Yeah, Charlie and I — I mean, both — more Charlie than I — we've had certain personal real estate investments over time. And it — you know, it's a field that, in general, we understand.

We don't bring that much special to the game, but we understand it. We've made money in it.

And actually, at the time that the NASDAQ about hit its high, REITs were quite cheap in my view. And I have less than 1 percent of my net worth outside of Berkshire, but basically I had that portion all in REITs. They were all small ones at that time.

And — but they were selling at discounts. At that time they were selling at discounts to the values of properties. And those values of properties were much more conservatively figured than today.

Today, you have very fancy prices on real estate. And on top of that, you have the REITs often selling at a premium, though. So, I regard REITs as quite unattractive now, certainly compared to five or six years ago. But that's a group of —

CHARLIE MUNGER: That's for an individual, you regard them as unattractive?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And for a corporation, that much more so?

WARREN BUFFETT: Yeah, right. Right. It — the situation changed dramatically from five or six years ago. I mean, the stock market, in many respects, from the 1999-2000 period, is down significantly. REITs are up significantly.

REITs were very unpopular five or six years ago. Now they're popular.

It's better to pay attention to something that is being scorned than something that's being championed. And there's really been a big change in the REIT situation in the last five or six years.

CHARLIE MUNGER: And the REITs have phony accounting.

WARREN BUFFETT: Otherwise, we love them.

CHARLIE MUNGER: Yeah. (Laughter)

WARREN BUFFETT: You don't want to bring up anything in these meetings. (Laughter)

15. Global prosperity helps the U.S.

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: Good afternoon. My name is Carlos Lock (PH). I'm from Lawrence, Kansas.

The U.S. has had a dominant role in the world economy for about a hundred years. This dominance resembles that of an economic monopoly.

Would you say that the U.S. is a quote- unquote, "a castle with a moat?" And if so, how can we make the moat any bigger? Thank you.

WARREN BUFFETT: Yeah, well, the U.S. has been pretty remarkable, as I indicated in my earlier comment. I mean, you know, essentially, the same population pool pretty much, and they've garnered over this 215-year period, a remarkable share of the world's wealth.

And it's an interesting question as to just why this group of people here have been able to do so much better than the rest of the world, considering we're not any smarter or anything of the sort.

It's not an economic castle anymore. I wouldn't call it that.

What we do is no secret. And I think that the relative importance of America — I mean, we have been a dominant factor in the world, and post-World War II — and I think it will decline somewhat, although I'm not an alarmist on that.

But I think to some extent, the rest of the world, or much of the rest — or some of the rest of the world — is catching on and adopting, you know, sort of best practices, as they say in industry.

And our castle will grow in size, but there will be more castles around it. And I basically think that's a very good thing for the world.

I think the more prosperous, generally, the rest of the world is, you know, the better, generally, it will be for us. And, you know, I've talked about our trade problems. The more trade we have, the better.

We had 1.1 trillion of real trade last year in the country. We would've — with the world — and then we had another 600 billion — 6/10ths of a trillion — that, unilaterally, we bought.

Well, I would love to see the 1.1 trillion grow and grow and grow. It'd be good for us and good for the rest of the world. But I don't think that our prosperity will come — in the future will come at the expense of the rest of the world at all.

I do think that there were parts of the world that will grow economically from a lower base, but much faster than the U.S. And basically, I think that's a good thing.

I mean, there are six billion people in this world, and a lot of them don't live very well. And I would hope that 20 or 50 years from now that it's a higher percentage of them would live well and that — but I don't think it comes out of our hide at all.

Charlie?

CHARLIE MUNGER: Well, I don't think it comes out of our hide in that sense, but if we are now the richest and most powerful nation in the world and 50 or a hundred years from now we're a poor third to some country in Asia, sure, we're richer, but it's a peculiar type of richness where you've lost your relative position in the world.

It's not all — I think if I had to bet, I would bet that the part of the world that does best is Asia, in terms of percentage gains per annum.

And I think it might do amazingly well if it doesn't blow up in some way. And if it does amazingly well, it will eventually be a much richer place than ours.

WARREN BUFFETT: Mm-hmm.

16. "Unwise" economic policies, but no "Armageddon"

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Good afternoon, gentlemen. I'm Thorsten Kramer (PH) from Cologne, Germany.

You've criticized the extraordinary large stake that the financial sector in the United States is currently representing in relation to GDP, which is also reflected in a total credit volume exceeding GDP by roughly 250 percent, significantly up from the level we've seen a decade ago.

A current account deficit and budget deficit running at 6 percent of GDP, in combination with a still accommodating easy money policy, and high asset prices, will have to be consolidated sooner or later.

How do you think the adjustment will take place? What are your two most likely scenarios how these huge imbalances might be consolidated? And is the dollar devaluation scenario your most favorite one?

WARREN BUFFETT: Well, as I said earlier, I don't see how the situation resolves itself with a stronger dollar.

Most people still seem fairly sanguine about the fact that there won't be anything terribly bumpy about it, that there'll be this so-called soft landing.

And I don't know whether that'll be the case or not. But I would say that we're running the risk of having markets that could get chaotic if certain events converged, superimposed upon those factors that you just listed.

But I don't — I'm not an Armageddon type at all on the economy. I mean, the things you named are important factors.

I think that absent something happening in the terrorism field, I think that, you know, the citizens of the United States, on balance, will be living better ten years from now than now, and 20 years from now than now.

But I do think that we're following policies that are unwise. But we've done that plenty of times over history. I mean, [investor] Peter Lynch has always said, you know, "Buy a business that's so good that an idiot can run it, because sooner or later one will." (Laughter)

We've got a country that's so good that we can have policies that are counterproductive — (applause) — and we'll still come out OK.

Just think of what we've had over the years. I mean, you know, Warren Harding, Chester Arthur?

I mean, we've had a lot of things in this country. We had the Civil War. We had all kinds of things over the years.

But the society has marched forward, with some fits and starts, but still at a very significant clip.

The real GDP per capita is seven times, in the U.S., what it was a hundred years ago. Just think of that. One century in the human pageant, and a sevenfold increase in GDP per capita. It's remarkable.

So, I acknowledge, you know, consumer debt doing what it's done and the trade deficit being what it is. And I think that those things — particularly the trade deficit — should be addressed, and promptly. But I don't think they pull down the whole place.

They may create, you know, very severe dislocations in financial markets from time to time. But that's been the history of this country. I mean, we have had very dramatic things happen in financial markets over the years. And the country survives despite that.

And sometimes there's great opportunity in those dislocations. There's likely to be.

So I'm not pessimistic about the U.S. at all. You know, I can't imagine anyplace that I would rather be.

But whether — when you say the two most likely outcomes, I think the eventual outcome is that the country does fine. But I think a — there's a significant possibility that you do have some chaotic financial markets at one time or another. But we've had them historically.

Charlie?

CHARLIE MUNGER: Yeah, we don't have any great record as macroeconomic predictors. And I don't see any reason why we should really start now.

Obviously, there are more chances for convulsion now. I mean, everybody from [former Federal Reserve Chairman] Paul Volcker on has looked at the current figures and said we could have some kind of convulsion as a consequence of (inaudible). Apart from knowing that, we have no contribution to make.

WARREN BUFFETT: Yeah, I do think, as I mentioned earlier, that far greater sums, relatively, in one asset class after another, are held by people who — where it's really on a hair-trigger type mechanism.

So, the creation of lots of new financial instruments, the piling up of huge amounts by intermediaries or agency activities in terms of money management, I think they lend themselves to more explosive outcomes on any given day than might have been the case some years back when I was selling utility stocks to people, a hundred shares at a time in Omaha.

I mean, those — that money was not on a hair-trigger basis. But as you turn it over to fund managers who think their job is to beat the S&P in — on a short-term basis — you are getting very short time horizons on huge amounts of money.

And those people may think they are operating independently in one sense. But they're responding to the same stimuli. And they can, as they did in the fall of 1998, they can all head for the exits — or try to head for the exits — at one time.

And the thing about financial instruments is there is no exit. I mean, the only way that you get rid of a financial — the only way you leave your seat in a burning theatre in financial markets is to find somebody else to take the seat. And that is not always easy.

CHARLIE MUNGER: I think it —

WARREN BUFFETT: However — go ahead.

CHARLIE MUNGER: — I think it's also true that the amount of credit being used, not only by hedge funds but by ordinary investors, is way heavier than most people realize.

It wasn't even controversial in this country when we came to introduce single-stock futures and what — you know, commonly traded puts and calls.

And ordinary people got in trouble. If I'd been running the country, I never would have allowed that. I don't know what good it does for the country to have a wonderful — a lot of trading in puts and calls.

One of my children knew a nice man who had a $2 1/2 million house and $5 million worth of wonderful securities.

But he couldn't live as comfortably — he never worked — as he liked to live on the income from his $5 million of securities. And he got in the habit of picking up easy money with the credit systems of the world. He kept selling naked puts secured by his account, including puts on a whole lot of internet stocks.

And in due time, he didn't have the $5 million of securities, and he didn't have the house, and he now works in a restaurant.

That kind of self-destruction wasn't possible before we created all these wonderful trading opportunities involving credit.

It was not a smart thing for this country to do, to legalize gambling everywhere and to bring it in a more facile form into our investment practices. (Applause)

WARREN BUFFETT: Is there anyone we've forgotten to offend? I mean, we — (Laughter)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — we don't want to miss anyone. (Laughter)

17. Why Berkshire's board is better

WARREN BUFFETT: Number 11, please.

AUDIENCE MEMBER: Good afternoon, Mr. Chairman, Mr. Vice Chairman. My name is Andy Peake. I'm from Weston, Connecticut.

Recently, we've seen a number of corporate boards take forceful action — Hewlett-Packard and Boeing, for example. We have also seen board members from WorldCom pay large amounts to personally settle lawsuits.

Today we see Morgan Stanley embroiled in a bitter battle, largely based on divergent views of how to govern the firm.

What responsibilities do directors have in this new environment? And what do you look for in your directors?

WARREN BUFFETT: Charlie, why don't you take that one first?

CHARLIE MUNGER: Well, we are completely out of step with modern practices with directors.

The modern practice is to have one from each diversity category, and to have a whole lot of people who need, more or less, the 100,000 or $200,000 per year that they're paid for being a director. And people think this makes the system better.

At Berkshire, all the directors are rich and they own a lot of stock in Berkshire. And they're all very smart. And they don't get any liability insurance provided by Berkshire.

So, we've been waiting for our system to spread, but it — we seem to be losing. (Laughter)

WARREN BUFFETT: Yeah, it's a tough job, at times, to be a director.

The real problem that you can face, and may often face, is when you're dealing with mediocrity.

I mean, if you have a baseball team and you have a .240 hitter in the majors, a .240 hitter in the majors is still a pretty good baseball player. But if your job is to have a winning team, you get rid of him. And you find somebody that can bat .280 or .290 and field just as well.

In business, the tough part is to get rid of something a notch or two above mediocrity, but not the best one that could be found.

And when people meet every couple of months, and they come from different parts of the country, and they have the normal social instincts — they don't like to have rump meetings or to sort of talk behind people's backs — it's very difficult for a group, and particularly if it's a group like Charlie described where a significant number of them, the directors' fees they earn are important to their well-being, and they like — they'd love to be recommended for another board and add another $100,000 a year to their income.

It's very difficult for somebody to lead a charge and all of a sudden start at the meeting or trying to arrange a rump meeting of some sort to say, you know, "We really think this guy at the head of the table's no good."

And changing — dealing with mediocrity is — or, like I say, a notch above it, is a difficult problem if you're a board member.

And we believe that, you know, independence is — it's a state of mind. I mean, it — and it's a willingness, but not the eagerness, to challenge the ideas of others.

And to — if you see a merger that doesn't make sense — and Charlie and I have seen a lot of them, and we've been on the boards, and sometimes we've spoken up and sometimes we haven't spoken up — to be able to — you know, you can — the group around you, in terms of social behavior, can only tolerate a certain amount of obnoxiousness on the part of yourself.

You have to sort of ration it out. And so you save yourself for big ones. And then, it's not necessarily an easy equation.

And certainly, I would say, of the things I've seen proposed in the way of major acquisitions and — a significant percentage of them I wouldn't do myself. But would I overrule somebody else?

I wouldn't get the votes probably anyway. And it's a very difficult thing to do. You could occasionally fire a bullet if you think it's important enough, and usually it doesn't do any good.

So, I — we have a group that has — every one of them has significant money invested in Berkshire. They all bought it in the market just like you did. I mean, nobody — I mean, I've been on all these boards and they keep handing me things.

And, you know, I had shares of this one and that one are given to me, or options or whatever, matching charitable contributions, all kinds of things.

But we have real owners on our board. And what they make for being board members is really inconsequential, as I get reminded occasionally — (laughter) — compared to their investment. And they're friends of mine.

They're smart. They're very smart. I mean, they are hand-picked, in terms of business brainpower and quality of a human being. And I really think that, you know, we have the best board in the country.

But the people that want — who make their evaluations by checklist, you know, whether — either in terms of diversity or in terms of supposed independence — although I don't know how anybody that's getting half their income from board memberships can be independent — you know, we don't — we may not stack up so well.

But it's the kind of board that I want to have, knowing that if I die tonight that virtually everything I have goes to a foundation. I want that foundation to have as much money over the years to spend as possible.

And there's no group of people I'd rather have in charge of the decision subsequent to my death than the people that we've got on our —

18. Short gap due to tape change at time of recording

Text on screen: "Tape Change"

19. Gates is smart but we must stock to our "circle of competence"

WARREN BUFFETT: (Laughter) No, the answer is that Charlie and I, in managing Berkshire, try to do things — put money in things — that we understand.

And when I mean understand, I mean, that we — where we think we know, in a reasonable way, what the economics will look like in five or 10 or 20 years.

And Bill [Gates] is a lot smarter about a whole lot of things than I am. But it's still Charlie and I that have the responsibility for managing the money.

And we'll stick in what we consider to be our circle of competence. And the fact that somebody else's circle is wider or different, you know, that's the way the world is.

I'll listen to any idea Bill has. Believe me, I will listen to him. I mean, he is a — he's not only a smart manager, but he's a smart investor. And I think, actually our ideas on investment overlap to quite an extent.

But I still wish I'd bought a little Microsoft when I first met him. (Laughs)

Charlie?

20. If corporate directors need the money, they're not independent

CHARLIE MUNGER: I think what has happened at Berkshire is just wonderfully for the good. And I do think we have a perfectly marvelous board. What makes me sad, as I said earlier, is I don't see more of the same practice followed elsewhere.

A director getting $150,000 a year from a company, who needs it, is not an independent director. That director automatically becomes an inside director. And so it's a typical government intervention. It's just — it says it's doing one thing and it does another.

WARREN BUFFETT: Yeah, I have never — I've been on 19 boards — I have never seen a director, where the directors' fees were important to them, object to an acquisition proposal, object to a compensation arrangement of the CEO. It's just never happened, you know — in my experience.

And you know, they do not — they frequently do not — behave as they would if they owned the place. And basically we want people that behave as if they own the place.

CHARLIE MUNGER: The correct system is the Elihu Root system. Elihu Root, who had three different cabinet appointments, if I remember right, said no man was fit to hold public office who wasn't perfectly willing to leave it at any time.

And if Elihu Root didn't approve of something the government asked him to do, he could always go back and be the most sought after lawyer in the world. He had an identity to go back to and he didn't need the government's salary.

And I think that ought to be more the test in corporate directorships. Is a man really fit to make tough calls who isn't perfectly willing to leave the office at any time? My answer is no.

WARREN BUFFETT: Yeah, we have one of our directors who was — who's been removed twice from compensation committees of other corporations because he had the temerity to actually question whether the compensation arrangement being suggested was the appropriate one.

I mean, it — the — it's not — being put on the comp committee of American corporations, as I've said, they're not — they're looking for Chihuahuas, and not Great Danes and Dobermans and —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: Yeah. And I hope I'm not insulting any of my friends that are on comp committees. (Laughs)

CHARLIE MUNGER: You're insulting the dogs. (Laughter and applause)

21. Why we keep companies despite disappointing results

WARREN BUFFETT: OK, number 1. (Laughter)

AUDIENCE MEMBER: Hello. I'm Rory Johnson (PH). I'm from Suffolk in the U.K.

Do you have, or are there, any appropriate criteria, beyond purely financial returns, in assessing the success or otherwise of your investments?

WARREN BUFFETT: Well, I would say that the financial returns, achieved in a way that we want them to be achieved, are the determinant of whether we've made an intelligent commitment.

Now, we don't get rid of companies that don't meet our original expectations. There's a section in the back of our annual report on the economic principles. And I forget which one it is. It's toward the end.

But we say that Charlie and I have this quirk, which business schools would teach is a mistake, in that if we have a business that's underperforming and we could sell it and put — and achieve greater returns someplace else, we don't do it.

We say that if a business is going to permanently lose money, we'll get rid of it. If it has major labor problems over a period of time, we might get rid of it. But we are not going to engage in what we call gin-rummy type management where we pick up one card and discard another.

And so we will not — if a business has been disappointing to us, but we like the people there and we're not having — not because of labor problems — and we're not going to have to put money in incessantly, we will stay with it when business school theory and management theory would say get rid of it and do something else.

We don't disagree with the people that do it that way. It's just that we don't want to live our lives that way. And if we owned 100 percent of Berkshire we wouldn't do it that way.

And we don't — we just — we want the shareholders to know that we have this mindset that may produce slightly suboptimal returns because of our attitude. But that's the way we're going to play it, and we tell people ahead of time that that's the way we're going to play it.

We like being associated with the managers that we are, even the ones that are in — facing headwinds. I mean, but in a sense you almost identify more with the ones that are facing headwinds because they're doing a hell of a job under very tough conditions.

And every business decision or investment decision isn't going to work out perfectly. And some businesses are going to run into unexpected surprises.

But the people that have gone in with us have stuck with us in times like that. And our attitude is we'll stick with them.

So to the — I would say that how the people behave with us after we buy the business is an important part of how we feel about, you know, the whole relationship as well as the returns achieved.

Charlie?

22. Moral distinction between buying a stock and a company

CHARLIE MUNGER: Yeah. I think he's asking in part, are there some businesses we won't have as subsidiaries in Berkshire even though they're wonderful businesses? So, are we rejecting some business opportunities on moral grounds?

WARREN BUFFETT: Yeah, well we've referred in past meetings to one we did on that basis. We will own stocks of companies where we wouldn't want to own the whole business. I mean, you know, you can —

I'm not sure that the logic is perfect on that, but we would not have trouble owning stock in a cigarette company. We wouldn't want to manufacture cigarettes, you know. We might own a retail company that sells cigarettes. I mean, there's all kinds of gradations.

But we do not — there are things we don't want to own and be responsible for their businesses, where we have no problem owning their stocks or bonds. And some years back, Charlie and I went down to, where, Memphis?

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: Yeah, we looked at a — and we were invited down, and we looked at a company that made a product that — perfectly legal — probably one of the best businesses I've ever seen, in terms of the economics of it.

CHARLIE MUNGER: Absolutely.

WARREN BUFFETT: Still doing very well. And we met in the room with — we went to a hotel. We met in the room with the people that had the business. And people were perfectly decent people. And they described the business to us. And we went down in the lobby.

And as I remember, we sat down in the lobby and just decided that we didn't want to be in that business. And, you know, the lines are not perfect on this sort of thing.

I mean, it — I'm sure that there may be ads in the Buffalo News that are selling some investment service or something that I would cringe at if I knew the people involved or what they were selling.

And it — if you own a big retail establishment, a retailer, general merchandise, you know, you're probably going to be selling cigarettes when you don't think that you should smoke yourself or that your children should smoke. And it's — they're not perfect.

But we have turned down some — the most dramatic being that one because we went — took us a trip of 1,000 miles or so to finally face up to the fact that we didn't want to own it.

Charlie, you have anything to add on it?

CHARLIE MUNGER: No, but that was interesting because we were young and poor then by modern standards. And, you know, we're very human. And we could see it was just, like, putting $100 million in a bushel basket and setting it on fire as we walked away. And — (Laughter)

WARREN BUFFETT: You're making me feel bad. (Laughter)

CHARLIE MUNGER: We made the decision all right and with no difficulty. But there was a certain twinge. (Laughter)

23. Munger's collected wisdom

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: My name is J Dwight. I'm from a small town in Maine called Wilton, Maine. My question comes more of a request.

And could Charlie Munger create a curriculum, or a list of reading and experiences, which he believes would lead to his concept of worldly wisdom? This would serve two great — three great purposes.

One, it would pass on the most valuable possession — that is your knowledge and experience — to us and to others in the future.

Two, it would preserve and enhance that wealth beyond the material riches endowed on future generations.

And three, it would begin to remedy the stunted educations of those like — Mr. Munger — are plunging along with ordinary will, with time to improve ourselves. Thank you.

CHARLIE MUNGER: Well, of course, Peter Kaufman has tried to do that in that book that he stitched together out of my old speeches plus a lot else.

And I didn't want to do it. And he went and saw Warren, and Warren got enthusiastic. And Warren suggested this ridiculous name, "Poor Charlie's Almanack." (Laughter)

And between the two of them, they really got me to do it. But the whole idea of doing it is with just the motivation you're talking about.

I think if you assimilate everything in that simple book, you will know a lot more than about 95 percent of your compatriots.

And it's not that hard to do. So, Peter Kaufman has made it easy for you.

WARREN BUFFETT: Yeah, I couldn't be more enthusiastic about what you suggested. And it's been done. And it's a sensational book. And anybody that reads it is going to learn a whole, whole lot about life.

And you'll learn even — to get you to read it, I'll tell you you'll even learn something about making money. The — and it's right next door here, they haven't sold out.

24. Future of pharmaceuticals is "too hard"

WARREN BUFFETT: Number 3, please?

AUDIENCE MEMBER: Good afternoon. Scott Jeffords (PH) from Davidson, North Carolina.

The major pharmaceutical companies have faced a myriad of fundamental and legal challenges in recent years.

With that in mind, and given the apparent ongoing nature of those obstacles, how should investors be thinking about the long-term prospects for this very important industry?

WARREN BUFFETT: Well, my answer is, I don't know. But maybe Charlie will. And it's — you know, it's a terrific question.

It’s just that — that industry is in a state of flux now. It does very important things for mankind. It’s historically earned good returns — very good returns — on invested capital.

But it’s going — it could well be that the world will unfold differently for those companies in the future than the past. It may — that may not be the case.

And I’m — I don’t think I’m really qualified to give you a good answer on that because much of it is in the political realm. And my judgment about the — what politicians will do is probably not better than yours.

Charlie?

CHARLIE MUNGER: I share Warren’s agnosticism on the subject. We just throw some decisions into the “too hard” pile and go on to others. (Laughter)

25. No “degree of difficulty” adjustment for investing

WARREN BUFFETT: Incidentally, there’s a lot of wisdom in that remark. I mean, there are things in life that you don’t have to make a decision on and that are too hard.

And many years ago on one of the reports, I said one of the interesting things about investment is that there’s no degree of difficulty factor.

I mean, if you’re going to go diving in the Olympics and try to win a gold medal, you get paid more, in effect, for certain kinds of dives than others because they’re more difficult. And they properly adjust for that factor.

But in terms of investing, there is no degree of difficulty. If something is staring you right in the face and the easiest decision in the world, the payoff, can be huge. And we get paid, not for jumping over 7-foot bars, but for stepping over 1-foot bars.

And the biggest thing we have to do is decide which ones are the 1-foot bars and which ones are the 7-foot bars so when we go to step we don’t bump into the bar. And that is something that I think we’re reasonably good at.

Now maybe we cast out too many things as being too hard and thereby narrow our universe. But I’d rather have the narrow — the universe be a little too — interpret it as being a little too — a little smaller than it really is, than being interpreted as larger than it is.

Charlie?

CHARLIE MUNGER: Obviously.

26. Avoiding emotional investment traps

WARREN BUFFETT: 4. (Laughter)

AUDIENCE MEMBER: Good afternoon. I'm Whitney Tilson, a shareholder from New York City.

And one of the things I find most refreshing and admirable about you, as corporate leaders, is that you're very candid about making mistakes, and — as you put it last year, Mr. Munger — rubbing your noses in it.

Last year, Mr. Buffett, you talked about the $10 billion mistake of starting to buy Walmart and then stopping after it had ticked up a little bit.

Today, you seem to allude to a somewhat similar mistake. You bought a stake in PetroChina. Then after it was disclosed that you owned it, it popped up a bit. And obviously in hindsight, you could have made a lot of money had you continued buying it.

If these emotional traps — I think you called it "anchoring" at last year's annual meeting — are the traps that even people as experienced as you gentlemen are, occasionally fall into, I sort of wonder what hope do the rest of us have?

So, my question is, is how do you — what are the mental tricks you have? Or how do you overcome these behavioral and emotional traps like anchoring? And what advice do you have for us?

WARREN BUFFETT: Well, that's a good question. And, of course, it first — the first step is in recognition of the fact that they can be traps and that you will be affected by them. And you will make some mistakes because of them.

But Charlie in his — in "Poor Charlie's Almanack," which I probably do take credit for the name of, and the — he talks about the various psychological traps that people fall into. And simply reading that section, you will come away wiser than before you started on it.

We will — our personalities are such that Charlie and I probably are a little less prone to some of those mistakes than other people are. But as our record clearly indicates, we still are prone to them. And we make them and we'll make them again.

We're probably a little less inclined to make some of them than we were 30 or 40 years ago. But, you know, the nice thing about it is, though, is that if you make fewer of those mistakes than others, you know, they will continue making their share and you'll get very rich.

Charlie?

CHARLIE MUNGER: Yeah. You don't have to have perfect wisdom to get very rich. All you've got to do is have slightly more than other people, on average, over a long time. (Applause)

WARREN BUFFETT: You know, it's the old story about the guy outrunning the bear. I mean, I don't have to outrun the bear. I just have to outrun that other fellow. And — (Laughter)

27. Low Treasury yields are a mystery

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Hi, I'm Steve Casbell (PH) from Atlanta.

With signs of inflation, you know, in commodities and oil, why do you think the 10-year is still — you know, the yield is 4.2 percent? And, you know, is it that the market sees signs of deflation coming in the future?

And in addition to that, if you thought rates would stay at this level for an extended period, would you have a more favorable view of the market?

WARREN BUFFETT: Well, the answer to the second part is yes. I mean, if somebody guaranteed me that the 10-year rate would never go above 4.2 percent for the next 50 years, we would have to readjust, recalibrate every decision we make around Berkshire.

I think it was [Federal Reserve Chairman] Alan Greenspan, I don't know whether he's talking about the 10-year or what is the closest thing now to the 30-year — we don't issue 30-years anymore — but the — he referred to it as a conundrum.

And after I looked it up, I decided I agreed with him. (Laughter)

I don't understand it. And — but that's OK. There's a lot of things in financial markets I don't understand. And that doesn't mean I have to make a decision.

I don't have to either go long or go short, the 10-year. Although by keeping as much money as we do short, we are in effect at least making the decision that we don't want to be long, long bonds.

That doesn't mean we think it necessarily would be smart to be short them. But we do not want to be long, longer bonds. And I —

If you'd told me two years ago that every move that the Fed would make in the last two years, and you told me all the other variables that would take place, and you'd asked me what the 10-year rate would be at this time, I would have been very wrong.

So, you know, it's not a game I've excelled at so far. I'm puzzled by it. And we'll see where it is next year when we meet.

Charlie?

CHARLIE MUNGER: Yeah, I think the one thing you can confidently predict is there won't be some automatic and rational correlation between inflation and interest rates. There will be weird diversions.

WARREN BUFFETT: Do you want to elaborate on how these weird things will manifest themselves?

CHARLIE MUNGER: No, no. All I know is it happens.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Frequently very surprising.

WARREN BUFFETT: Well, it surprised us on this so far, didn't it?

CHARLIE MUNGER: Sure.

WARREN BUFFETT: Yeah.

28. "Finite" insurance

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Hi. Glenn Tongue from New York City. I hope this does not overstate your ground rules.

I've read what you have written about finance reinsurance in the annual report. There's been much erroneous stuff written recently about finite reinsurance. Can you simply explain the product and its importance to Berkshire?

WARREN BUFFETT: Yeah, well it's a good question because the term has been used, "finite reinsurance." And, you know, basically almost all insurance is finite.

I mean, if you have a $200,000 homeowner's policy, or if you have a 100/300 auto liability, that's a finite policy. The insurance company will pay you that much and pay you no more.

And with the exception of workers' comp, and maybe there's something else I'm forgetting about, but basically all insurance is denominated in some amount with a limit.

That 500 million we wrote on that airport, I mean, we can lose 500 million but I don't think we can lose 501 million. And so the — I think the term finite has gotten — it's gotten to be convenient to use without anybody totally describing it well.

Actually, when the SEC sent out its first request for information, I think they called it non-traditional insurance. And I think that may be a better term to use in terms of what's being looked at.

And there is nothing wrong — I mean, there's nothing wrong at all with finite insurance. We're issuing finite insurance policies every day at our — on our auto policies and everything else.

And there's nothing wrong, in my view, at all with retroactive contracts. For example, we wrote — a few years back we wrote a — and this is very rough, but it'd been in the press, so that I'm not violating any confidences of clients —

We wrote a contract as I remember — and I may be just a little off on this — that to pay, when INA was being sold to ACE, we — to pay 2 1/2 billion of claims from the past. And I think we got a premium around 1 1/4 billion on it.

Now, we were making an estimate or a guess as to whether the whole 2 1/2 billion would be paid, how fast it would be paid, and a lot of things.

And ACE, on the other hand, was getting rid of 2 1/2 billion of potential liabilities, and they did not have the capital strength of Berkshire.

And that contract went before the Pennsylvania Insurance Department. It was improved. I mean, it had value to both parties. It had — you can argue it had value to the public in that Berkshire was a stronger insurer.

Actually, in the first quarter of last year in our 10-Q, you will see that we recorded a loss of $100 million because the payment pattern on that contract turned out to be faster than we anticipated.

I mean, there was risk involved. But it was all retroactive and a perfectly proper contract, in my view, or I think anybody's view. And we would do more of that business. In fact, we looked at a very, very big one here recently.

What I think the — and understandably — the authorities are looking for is that contracts that had no purpose and that were possibly misused by some party in accounting. And the facts on that remain to be seen.

But I think calling it finite, it just isn't the right descriptive word. I think that, like I say, non-traditional — we can have a lot of non — we issue non-traditional products all the time.

I mean, I talked last year about the billion-dollar thing for PepsiCo. That certainly isn't traditional. But it's real insurance.

And the question is whether risk is transferred. But the risk on the ACE contract, for example, was several.

One is, we had a risk as to whether the whole 2 1/2 billion would be paid. Second, was how fast it would be paid. And the third risk is what you can do with the money in between. And money hasn't been worth very much to us lately. So, there was risk in that. And that's what insurance is all about.

Charlie?

CHARLIE MUNGER: Well, I certainly agree with you about the word finite reinsurance. It's — absolutely — you could hardly not invent a worse word to use to describe a new class of insurance. It's just a meaningless rubric.

And, of course, non-traditional is imperfect, too, because we have traditionally issued non-traditional insurance. (Laughter)

And — but we have to use some words to describe what's happening.

There's no question about the fact that the corporate world has gotten more and more interested over the last 10 years in having regularity in earnings reports. And they've turned to a huge variety of ways to try and do that.

And reinsurance is a very minor part of the whole picture. But there has been more reinsurance sought because people were more anti-volatility, in terms of reported results.

WARREN BUFFETT: But, of course, insurance is a way to reduce volatility, and a perfectly proper way. I mean, if you pay $1,000 a year on your auto premiums for the next 30 years, it isn't —

You are going to have a more regular income stream than if you wait and have one $25,000 accident one year and don't pay the premiums in the other years.

So, I mean, people have bought insurance to reduce the volatility in their own personal results and their own business results. So, reducing volatility, per se, is not bad at all. It's the reason —

CHARLIE MUNGER: No.

WARREN BUFFETT: — there are $400 billion worth of insurance premiums paid in this country every year. But that doesn't — you know, you can also get into abuses of that. And that's what they're — the people are looking to find and see what the real situation is.

29. Buffett: I make mistakes but don't agonize over decisions

WARREN BUFFETT: Number 7?

AUDIENCE MEMBER: Wow, this more nerve-wracking than I thought it would be. Hello, Warren, Charlie. My name is Aki Progakis. I'm from Montreal, Canada.

Warren, I wrote a letter back in January. I wrote a letter to you recommending a beautiful Canadian retail company in which I described my analysis to you.

I'd like to thank you for taking the time to respond to me. You said some nice kind words. That meant a lot to me. And I think you're an amazing individual. My question go — (audio dropout) — people, what is the single most difficult decision you've had to make in your lifetime, whether it be business or personal?

WARREN BUFFETT: I think I'm going to let Charlie answer that one first. (Laughter)

CHARLIE MUNGER: Yeah. I would argue that that may be one that you shouldn't ask. (Laughter and applause)

Or let's put it this way, I think you should answer it with several interesting examples before you ask us to answer it. (Laughter)

WARREN BUFFETT: That's a (Inaudible). (Laughter)

It's interesting. As Charlie was talking, I was — I have — I can't think of a lot of difficult — I can think of a lot of wrong decisions I've made. But I certainly can't think of anything I agonized over making for any long period of time.

Like I say, that isn't — you know, I mean, it's calling balls and strikes. I mean, you got a second there and if you don't do it in that — you're no longer an umpire.

So, I've made plenty of wrong decisions. I'm going to make plenty more. That's just part of living.

But I don't think in terms of being difficult as measured by the time it took me to do it or the — not a lot of them pop to mind. And if they do I'll probably give you the same answer as Charlie.

Charlie, have you thought of any more there while we were talking?

CHARLIE MUNGER: No. Let's go on to another.

WARREN BUFFETT: OK. (Laughter) That was not a bad decision.

30. Real estate brokerage will get a "lot bigger"

WARREN BUFFETT: Number 8. (Laughter) But thank you.

AUDIENCE MEMBER: Good afternoon. My name is Franklin Grin (PH). I'm from Philadelphia. And I'm interested in real estate.

You've already covered many different areas today about real estate, such as the real estate bubble, the long-run performance most people have obtained in their personal holdings of real estate, the GSEs, the REITs.

But one of the things that appears in today's newspaper is quoting Mr. Buffett about building a brokerage powerhouse. And that seems to say that you envision changes in the way in which people buy and sell their houses and other kinds of related things.

So, I was wondering if you could tell me a little bit more about that area of where you envision Berkshire Hathaway going.

WARREN BUFFETT: Yeah, I'll be glad to. But the — we are hoping to build a powerhouse that's built very much on the model of today. In other words, we do not envision big changes in residential real estate brokerage, which is what we're in.

We — as we put in — they talk about sides in real estate, the buy side and the sell side. We participated in sides that totaled $50-odd billion last year. And we are the second largest residential real estate brokerage firm in the country.

But we expect that business really to be conducted quite similarly in the future to how it has been in the past. Now there are people that disagree with that and think that way more will happen via the internet.

But, you know, the purchase of a home is the single most important transaction for most people in their lifetimes. It's — it can be partly emotional. It's partly something that they appreciate people guiding them through.

It's something where I think one-on-one will be very important in the future as it has been so far.

And in this country, there are going to be millions and millions and millions of homes that get sold every year. It's — just in terms of people moving and dying and moving up in their economic potential.

So, there — the real estate brokerage business is going to be a very, very big business. And I think it will tend to be a very local business.

And we have bought leading local firms in a number of markets. And they have retained their individual identity. We have not gone for a Century 21 or something approach, where we put them all under the umbrella of a single brand.

Rather we have these individual brands in given communities. And they're usually very strong brands in each community. But we've only scratched the surface.

And I would expect — and it has nothing to do with the potential for real estate or anything. It just relates to the fact that tens and tens and tens of millions of people own their own homes. And some are going to move around every year.

And there's — I think that they're going to continue to have a real estate broker involved in most of the transactions. And we would like to be very big in that business. We already are big, but we're going to —

I would think it's almost certain that we will be a lot bigger in that business five or 10 years from now — I mean, a lot bigger — than we are now. And it's a question of acquiring these firms.

Generally, they're — you know, they're proprietorships. They're owned by a single individual or a family. And they come up periodically because of the family circumstances or the individual circumstances of somebody.

But there's a lot of them out there. And we're a logical buyer. And we've been found to be a good owner. So I think it's going to be a good-sized field for us over time.

Charlie?

CHARLIE MUNGER: Yeah, we voted by buying the brokerage operation instead of the real estate. Obviously, we regard it as having better economics than the underlying real estate which Berkshire could buy.

31. Munger: "Stupid and dishonorable accountants"

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: Hello. My name is Martin White. I'm in the insurance business in London. And quite separately, together with other volunteers, I also help to run the only independent lobby group for private shareholders in the U.K.

I would like to ask you your thoughts on two aspects of worldwide solvency and how assets and liabilities are recognized in everyone's accounts. I suppose both are about whether the regulators have the bottle to do the right thing in spite of possible complaints from companies.

One aspect is about how insurance liabilities and assets are valued for solvency purposes and the discussions that are going on to develop new accounting standards worldwide. The other aspect is about derivatives, the potential "weapons of financial mass destruction."

For those derivatives which don't have quotes, I suspect we could find out how big a black hole there might be if the regulators around the world required everyone to report at the same date for each derivative they have, their current recognized asset or negative assets, and most importantly, who the counterparty was.

So, the regulators, sharing information collected from both sides, could see what the worldwide aggregate misstatement was.

On insurance solvency, if we started with a fair attempt at mean discounted liabilities, and then added a large chunk for safety, and for reinsurance assets, did the same, discounted, but this time the safety chunk was deducted, life would be a lot simpler and there would be a lot more consistency and, I suspect, safety, than under the current undiscounted regime.

I think both problems need regulatory attention. What are your thoughts?

WARREN BUFFETT: Well, on a subject of discounting reserves — which essentially means taking what you expect to pay in the future and then taking in the appropriate interest rate and carrying at some lower figure now, because you don't have to pay now, but later —

You know, I can certainly make the purist argument — or the argument of the purist — for the fact that that might be the most accurate way. And certainly, of course, in the life insurance field, it is prevalent.

But I would say there has been such a tendency of managements to understate reserves worldwide, and in some cases by extraordinary amounts, that I think anything that pushes in the direction of carrying those reserves at even lower amounts —

And I realize you stuck in that part about the healthy bumping of them, too — but I think anything that — any accounting that lets — gives people a rationale for making reserves even lower than they have been, on balance, is dangerous.

There is such a tendency on what they call long-tail business — or business where you don't expect to actually make the payments for a few years or more — I think there's such a tendency to view those with optimism, particularly when somebody's going to retire in a couple years or their options are about to run out or whatever it may be, that I don't like giving them the extra leeway of discounting on top of that.

The derivatives question you raise is really interesting, but it would be mind-boggling to implement.

I mean, it's always fascinating to me how people can write a derivative contract, you know. And both sides of it — the trader will be, perhaps at least, showing a profit on it, you know, by the end of the month or something of the sort, that — you know, usually the contracts aren't that precisely matched because you have all kinds of other contracts that bear on the one you're doing.

But I would say that the trader's estimate, and maybe the auditor's estimate, of the value of all derivatives contracts outstanding in the world, would end up with — quite a large positive sum for something that essentially will wash out as a zero sum.

And I can tell you from the fact that I inherited a book of 23,000 contracts that's far, far, far from the largest or the second largest or the third largest in the world.

And the complexity of those contracts, and the complexity of unwinding them now where we're three years into it — and we've done an awful lot of it, but we've been operating in a benign environment —

I don't think any regulator, and I'm not sure any auditor, when you get up to really extensive derivative books, in effect, can get their minds around evaluation.

I know that, you know, as I pointed out in our report, ours were supposedly marked to market. And people think of that as something that you just go out and hit bids and, you know, within a few days wind up something.

And if you're trading government bonds, you know, you can do that. And if you're trading actually active equities, you can do it. But when you start trading derivatives, it's unbelievable what you can find. And I've had a couple of experiences with them.

Charlie, what are your thoughts?

CHARLIE MUNGER: Well, my thoughts are that stupid and dishonorable accountants allowed the genie of totally improper accounting to come out of the bottle and descend in the derivative books of the world.

Once that has happened and people have used it to create masses of assets and masses of earnings reports and bonuses and status and so on and so on and so on, getting the genie back in the bottle is no small task because you have these huge vested interests who are fighting you.

And what ordinary housewife, as she puts the toast in in the morning, is thinking, "My god, I've got to do something about derivatives?" You know? (Laughter)

So the people that are — have vested interest in the current system are powerful. And the rest of the people don't care. And so this evil genie stays out of the bottle and does more and more mischief with each passing day.

If you're trying to fix this, you are going to have a very interesting life. (Laughter)

32. Q&A ends

WARREN BUFFETT: It's 3 o'clock now. If you haven't had enough, [TV journalist] Charlie Rose has a show on, on Channel 12 tonight at 8 o'clock where there's another hour and a half of interviews he did with me and with Bill Gates and various people.

Morning Session - 2006 Meeting

1. Welcome

WARREN BUFFETT: Good morning. I'm Warren; he's Charlie.

There's one thing I should probably clear up first because I know it's puzzling you. In the movie, he always gets the girl.

Now, that's hard to figure out, isn't it? But I've — Charlie — but I finally understand what the — what's happening.

It's something called the "Anna Nicole Smith Rule." That's when choosing between two old rich guys, pick the older one. (Laughter)

Now, in a few minutes we're going to open this up to your questions. We have a number of zones, and we'll just proceed around zone by zone.

But before we do that, there are a few people I would like to thank, and then there's a couple of short announcements I'd like to make.

First of all, if can we get the spotlight up there on Andy Heyward, Andy does that cartoon for us every year. He travels around. He gets the voices in there. Andy, where are you? (Applause)

He comes up with the ideas.

Andy is the — runs DiC Entertainment. DiC is the one I've told you about in the past that produced "Liberty's Kids," which I think is probably the best way not only for youngsters to learn American history, but for people my age as well.

I mean, it's a terrific series of young kids — a couple of young ones in the time of the American Revolution. And I watched several of those episodes, and I'd forgotten a lot of American history since I was in school. It's just a really — it's a wonderful series.

It appeared on PBS over time. And if you're looking to learn American history or have your children or grandchildren learn it, you couldn't do better.

And in the months ahead, he's working on the — what do we call it? — it's the "Secret Millionaires Club."

But it's going to be a program that's designed to teach young people some of the very basic lessons of — about money. How to avoid getting into trouble with it, how to use it effectively, and what your attitude should be toward it.

So, we're looking forward to getting that out early next year. I'll guarantee you that it will be a terrific program for teaching children and your grandchildren something about the subject of money.

I also want to thank Bob Iger. Bob is up there. Bob runs Disney. He's doing a terrific job, and — (Applause)

I thought we could originally entice the "Desperate Housewives" into appearing simply by the chance to appear with Charlie. But after we made that appeal, we then went to Bob Iger and said, "See what you can do for us, Bob." So thank you, Bob.

Also in that section, I'd like to have a special introduction for the man that first taught Charlie and me something about the value of franchises and the advisability of buying great businesses instead of cheap businesses.

Prior to the purchase of See's Candies in 1972, I intended to look primarily at financial measures in buying businesses and buying things that were cheap in relation to book value, and we always tried to get a lot of tangible assets in relation to our money.

But we found out that the intangible assets, if properly nourished and if properly identified, you can make a whole lot more money with than buying a lot of tangible assets cheap.

And in 1972 — early in '72, Charlie and I went to See's Candy, which had been in the hands of the See family for many decades, and we bought it.

And, of course, Charlie and I didn't know a thing about making candy — we were pretty good at eating it — and we needed someone to run the place.

We met a young fellow there. It was clear to both of us that he was the ideal person to run See's Candy, and in just a few minutes we made a deal with him that's lasted a lifetime.

And if Chuck Huggins and his wife, Donna, would stand up, I'd love to have you give them a real well-deserved round of applause. (Applause)

As you notice, my daughter Susie produced that movie. She does every year.

She works hard on it, and we don't pay her anything, although she does remind me occasionally when I'm out at Borsheims that she worked very hard on the movie — (Laughter) — and I'll see her there on Sunday.

And, Suz, if you would take a bow, please. (Applause)

And the impresario of this event, I just turn it over to her every year and forget about it.

But she puts on this show. She brings all the exhibitors in. She arranges everything. She moves into the hotel across the street a few days ahead of time, or a week ahead of time, and makes sure everything hums.

And Charlie and I just come down on the day of the meeting and take a bow. And that's Kelly Muchmore-Broz.

Kelly, are you here? Where's Kelly? There she is. Give her a big hand. (Applause)

We wouldn't be having this without her.

2. Berkshire directors introduced

WARREN BUFFETT: Now I'd like to introduce our directors. We're going to get to the business meeting at 3:15. We do the Q&A first, and we get to that later on.

But for those of you who won't be around — and a lot of people tend to leave at lunchtime — I'd like to introduce the various directors. You've met Charlie and myself.

If you'll just stand individually, we can withhold the applause, if any, until the end. (Laughter)

That way that embarrassing applause meter that we had on the Omaha Idol Show will not cause anyone distress.

Howard Buffett — Howie — Malcolm Chace, Bill Gates, David Gottesman, Charlotte Guyman, Don Keough, Tom Murphy, Ron Olson, and Walter Scott, Jr. It's a terrific group of directors. (Applause)

I know of — I literally know of no directors of any large, publicly-owned companies that have, universally, as significant a percentage of their net worth in the company, purchased in the open market, as that group. Do you, Charlie?

CHARLIE MUNGER: None.

WARREN BUFFETT: None. OK. (Laughter)

That may be all you hear from him, folks — (Laughter) — so kind of savor a little bit.

3. Jamie Lee Curtis

WARREN BUFFETT: I also would particularly like to thank Jamie Lee Curtis, even though she came up with the wrong guy at the end.

Jamie cooperated on this. We're going to have, as a thank you — Jamie is very interested in the Park Century School. One of her sons goes to that school. It's for gifted, but learning-challenged students.

They're having an auction tonight, but it will continue subsequently. And Bill Gates and I have autographed a Monopoly set, and we will personally inscribe it to whoever the winner of that auction is.

So if you want to go to eBay and check that out, we promise that we will not similarly autograph anything else. So I hope that Jamie Lee and the school have a big success on that.

4. Berkshire's Q1 earnings

WARREN BUFFETT: We have two announcements, one relatively unimportant but, nevertheless, pleasant, and that is that we released our earnings yesterday after the close.

And I think we can put those up on the screen. Having any luck on that? Did we withdraw those earnings, Marc? Oh, they still have another six hours of audit or so.

And, as you can see, we don't pay any attention to realized gains or losses. We had some gains this year; we had some losses in the first quarter of last year.

So — but that's meaningless in the short term. Over time, obviously, it makes a difference.

But the — you know, we do not pick anything to buy or sell in any given quarter or any given year in the way of securities based on the effect it will have on our income account for that period. It's totally immaterial.

In fact, we'd rather sell things that we have a loss in, just from a tax standpoint.

If we have some high-tax cost stocks and some low-tax cost stock, we'll sell the high one and record the loss because we would get a better tax result that way for the short term. So we ignore that.

But if you look at the operating earnings, you'll see that in those main divisions that I take in the annual report — I show our four major businesses and then investment income is aside of it — things worked out pretty well in the first quarter for all of them.

I would caution you that, in our insurance underwriting, our worst quarter would normally be expected to be our third quarter. You're not going to have hurricanes in this hemisphere in the first quarter.

The real exposure — the worst exposure — is in the third quarter, and then there's a lesser exposure in the fourth quarter.

We write a lot of catastrophe insurance business.

Earthquakes, as far as we know, don't have any particular seasonal aspect to them, but hurricanes definitely do.

And the interesting thing is that under standard accounting, if we write a hurricane policy for the calendar year 2006 and we receive a million dollars of premium, we would earn a quarter of a million in the first quarter and a quarter of a million in the second quarter and so on.

We would earn a pro rata throughout the year. And that, in our view, actually is not proper accounting, but it's required accounting.

The real exposure to loss is primarily in the third quarter.

So you can't take our insurance underwriting results in any way for a rather benign quarter, like the first quarter, and extrapolate them for the year. But, nevertheless, it was a very good year — a very good quarter.

GEICO had excellent growth, I believe that our — well, I'm almost certain that our growth in the first quarter was better than any of our main competitors, and, actually, by — probably by some margin — the underwriting was very good. Our reinsurance underwriting was very good.

Gen Re had a good quarter. Our smaller companies had a good quarter.

So things, generally, have been working very well in all four sectors.

And that's nice, but that's not terribly important. I mean, five years from now, nobody will remember whether the first quarter or the second quarter was good at Berkshire Hathaway.

5. Acquisition of "really extraordinary" ISCAR

WARREN BUFFETT: But what did happen, and which we announced last night — which was very important — the acquisition of a large, extremely well-managed, profitable, really extraordinary company called ISCAR.

And up until October of last year, I knew nothing of ISCAR. I did not know about their extraordinary management.

But I got a letter, and I got a letter from Eitan Wertheimer, and — maybe a page and a half, page and a quarter — and he told me something about this business.

And sometimes character and talents sort of just jump off the page at me, and this was one of those letters, and it came from Israel. And I expressed an interest, after reading this letter, in getting together with Eitan.

And not long thereafter, I met not only Eitan, but his CEO and president, a remarkable man named Jacob Harpaz; Danny Goldman, the CFO. And we met in Omaha. They subsequently met Charlie.

And this all came to fruition yesterday when we signed a contract. Now we have — well, before I go on to this, maybe Charlie would like to say a word or two about ISCAR.

He's the — hard as it is for you to believe, he is not only — he's as enthusiastic about this as I am.

Now, have you ever seen that before, I'd ask you? Charlie likes this one extraordinarily well. Charlie?

CHARLIE MUNGER: Well, this is a company that, from very modest beginnings, grows to be the best company in its field in the world. It's not yet the biggest, but that leaves them something to do.

The average quality of the people in this company is not only extraordinary, it's off the chart. And the beauty of this, as you look at the two of us, is they're all young.

No, this is a real quality enterprise, and these people know how to do some things that we don't know how to do. A lot.

So, of course we're enthusiastic about the company. I'm always enthusiastic when I get to deal with some of the best people in the world.

I would like if we could get the spotlight down there. They're right down here in front. I would like, individually, three managers to stand up.

And then Eitan is going to talk to us a bit, and then we have a — I think we've got it arranged so that we can have a short movie that will tell you something about ISCAR.

But, first of all, if Eitan Wertheimer would stand up and we can get the spotlight on him? Over there. OK.

Eitan, let me introduce the other two, and then can we have you speak to the group?

Jacob Harpaz is the president and the CEO. (Applause)

Take a good look at these people because they're going to make you — they're going to do very, very well for you.

And Danny Goldman. Danny, would you stand up? (Applause)

Thank you. And if you'll give the microphone to Eitan, I think Eitan would like to talk to the group just a bit.

EITAN WERTHEIMER: Good morning, everybody. It's Omaha. It's spring. The fields are green. The days get longer. And we bring a big family into a new home.

I'm standing here before you representing 5,869 people, not only the people, but the families, their past and their future.

It took us three years to look what to do next. We are successful. We still have a lot of mistakes ahead of us to do.

Until we found one day somebody came to us and asked, "Have you heard about Berkshire Hathaway and Mr. Buffett?" We said, "Yes, we heard, but we never thought about it."

And when we started studying about the company, we understood that this is the right combination for us, a family company with a strong culture and a culture we'd love to keep, a young group of people that will love to work, maybe not for very long, but not less than 20, 25 years from today.

And we decided, let's try it. And we had a very interesting lesson from Warren, we had a very interesting lesson from Charlie, and we survived both of them. (Laughter)

I'm very happy that I represent here, not only the people that make the products and go to the customers, I also in a way represent the big family of customers that make — manufacture things.

They make cars go faster and safer. They'll make airplanes fly. They will make the mold to make the bottles for the Coca-Cola. They'll make a washing machine. They'll make the tools to make a carpet.

They'll make many things. And many times the people that manufacture are a little bit in the shade.

And I'm very proud to stand as a manufacturing guy, and say I'm standing for all of them, all our customers, which I must thank them every morning, not only for buying, but also for trying new ideas that we bring and working very hard to stay competitive.

Whoever will stay competitive will be there long-term. And this is also our goal.

Here is Mr. Harpaz, Jacob. In reality, my job is not to disturb. He, in a very gentle way, fired me ten years ago.

He performed and did better things than I could do, and it didn't make sense that I'll disturb him; so I went on to do other things. We've been in the company only 34 years, and the real job is done by Jacob and many, many other people.

I'm sure that you have seen the film "In 80 Days Around the World." And we prepared for you, "In 61 Companies Around the World." And I hope you enjoy it.

We definitely have to fulfill a lot of expectations. We definitely have to work very hard to make everybody very proud that we joined the family, also our people and for sure everybody in this room.

So let's hope we'll all be successful, and let's look into the future. And I'm looking forward to come every spring, to Omaha, where the fields are green and the days get longer. Thank you. (Applause)

ON TAPE, ANNOUNCER: IMC presents "Better Solutions for a Better World."

In 1889, the appearance of the first automobiles brought with it the need for sophisticated solutions in metal processing. Such were the beginnings of a new company, launched by engineers in the U.S.: Ingersoll.

In the decades to follow, another plant was set up in Germany. Since its creation, Ingersoll has established strong ties with industry, which has placed it firmly in a leadership position.

For over a century, time after time, Ingersoll has proved that the best solutions begin with the best engineers.

In 1999, Ingersoll joined the IMC Group and discovered that the sky is not the limit but only the starting point.

Meantime, at the turn of the 20th century, another metal processing plant was established on the other side of the world in South Korea: TaeguTec. In joining the IMC Group in 1997, TaeguTec reinforced its position as the main supplier of cutting tools for industry in the Far East.

Today TaeguTec has achieved unparalleled success, penetrating new markets, streamlining production process, and showing that precise global thinking can cancel distances.

In the middle of the 20th century, in the north of Israel, Stef Wertheimer had predicted, from his little shack in Nahariya, the global need for more advanced cutting tools. "The new world demands better solutions," said Wertheimer, and established ISCAR.

In a relatively short time, ISCAR has become the second largest cutting tool manufacturer in the world, a leader in the area of metal removal.

ISCAR has revolutionized every aspect of machining. Its mission: to apply innovation, quality, and automation on the highest technological level.

Among ISCAR's groundbreaking achievements are the revolution in cutoff applications; development of SELF-GRIP in the '70s; the pioneering triumphs in milling; the HELIMILL in the '80s; the CHAMDRILL; the revolution in drilling in the '90s and tangential positive milling; the innovative TANGMILL.

These innovations and more have reinforced ISCAR's position as the world's leader in development of cutting tools.

The combination of Ingersoll, TaeguTec, and ISCAR has given rise to the IMC Group, taking the best of all worlds and creating the world's best tools.

Today's rapidly advancing world demands that we constantly elevate standards, apply ourselves more and more to provide ever-smarter and precise solutions, pushes us to advance to improve ourselves, to lead.

ON TAPE, EITAN WERTHEIMER: You have to be a full line supplier. To be a global company means to be local in many countries, in many places around the world."

ON TAPE, ANNOUNCER: Other IMC Group companies:

IT.TE.DI Italy, designers and manufacturers of PCD diamond tools for high-precision aluminum machining in the automotive and aerospace industry;

UOP Italy, producers of high-quality solid carbide and high-speed steel standard tools and special tailor-made designs for applications in the aerospace and dye and mold industries;

Outiltec France, expert creative solutions in extra-long gun drills for deep drilling and applications that require unique geometries;

Unitac Japan, deep-drilling BTA-style tools with brazed and indexable heads;

And Wertec Italy, design and manufacturer of unique counterboring tools for deep and complicated boring applications.

ON TAPE, JACOB HARPAZ: If you look outside and you see some cars over there, be aware that in each car at least one part is manufactured by one of the IMC companies, for sure.

ON TAPE, ANNOUNCER: Automotive.

ON TAPE, EITAN WERTHEIMER: Before you have a product line, the geography spread, the people that understand the language, you cannot start thinking, “May I try or may I not try to become automotive supplier?”

ON TAPE, ANNOUNCER: We at IMC have made the automotive industry the foremost objective for all the factories of the group. All the Ingersoll vessels connect to contribute massively to the work of the automotive industry in North America.

At the same time, on the other side of the globe, TaeguTec cutting tools joins the momentum of the rapidly-developing Japanese and Korean automotive industries.

The alliance between ISCAR’s developments and the IMC Group has led to comprehensive solutions, which contribute to the efficiency of global automotive production and pave the way for production cost savings.

ON TAPE, JACOB HARPAZ: We’re not only selling tools, we are selling technology. We are selling the customer a better way to make profit. And we believe, by giving a solution, it can increase its productivity. And the bottom line for the productivity, making more profit for his company.

ON TAPE, ANNOUNCER: Heavy industry.

The power of IMC comes clearly to the fore in heavy industry. The unique combination of the three main manufacturing plants creates new opportunities.

The geographic location of Ingersoll and TaeguTec has led the companies to develop specific heavy industry specialization. The innovative geometries developed by ISCAR, together with the design and production of tools made to conform to the special requirements of this industry, places IMC at the forefront of this important industry.

Aerospace.

The blend and precision and inventiveness ought to go far.

If you want to reach far and high, you must be on top of the game in technology, in understanding materials, (inaudible).

The aerospace industry demands machining solutions for exotic and difficult-to-process materials, proficiency in lightweight materials, such as aluminum, and the ability to machine parts that require massive processing capabilities.

The grouping of the three plants and the profound understanding of cutting materials and complex cutting geometries, along with the expertise and building large-size tools, make IMC the strategic partner for the aerospace industry.

General engineering.

All this vast engineering experience accumulated in every field, in every industry, and in every corner of the world, has paved the way for the development of new, groundbreaking tools, which streamline production processes, shorten machining time, and reduce costs for every customer in the world of general engineering.

ON TAPE, JACOB HARPAZ: After releasing the product into the market, we put another team — our own team — and they'll now compete against the release of the product.

ON TAPE, EITAN WERTHEIMER: In exhibitions, we are recognized as a very, very innovative company. Many times the sentence is, "Let's go there because they must have something new. They always have something new." That's a big compliment, and innovation will make the difference.

ON TAPE, STEF WERTHEIMER: I believe that, in a way, industry is an art in itself. It's art. It's creation. You create something.

ON TAPE, ANNOUNCER: You can see it immediately upon entering an IMC branch or factory. The house of IMC is, first and foremost, a home for employees and customers as one. Years of experience have taught us that this is a vital element for success.

ON TAPE, EITAN WERTHEIMER: Many companies have buildings and machines and a lot of real estate, but it's only people that have a chance to make any difference.

ON TAPE, JACOB HARPAZ: I believe with the ambition of the people, with the hard work of the people, we are going to reach the position of being number 1.

ON TAPE, ANNOUNCER: The world demands better solutions. That is why we're here. IMC. (Applause)

WARREN BUFFETT: This is an important acquisition, as we paid $4 billion for 80 percent of the company. The family remains in partnership with us. They retained 20 percent.

It's the first business we've purchased that is based outside the United States. We have others that have operations there.

I think you'll look back on this in five or ten years as being a very significant event in Berkshire's history.

And it's interesting. In this world, in which many businesses get auctioned off, figures get dressed up before they sell them and leveraged up and so on, we continue to hear from people periodically who consider their business as too important to auction.

And we've never really bought one at auction — have we, Charlie — that I can remember?

CHARLIE MUNGER: I can't remember one either.

WARREN BUFFETT: Yeah. So there's a benefit in that.

Because, in effect, the people that pass through that filter of caring enough about their business that they don't simply put it up like a piece of meat at an auction are also the people, in our view, that make the best managers and make the best partners over time.

There is something going on in their brain that says this business is so important, and the people that are here are so important, and the customers we take care of are so important, that we actually care about the home in which these businesses reside.

And I think that filter works very much to our benefit. We've bought a number of businesses in the last 15 or 18 months where people have felt that way, and I think the crowning one here is ISCAR.

So, I welcome our new friends from Israel. I'm going to go over there and visit in September to see if there are any more girls out there like you, see if we can drum up a little more business.

6. Questions and answers

WARREN BUFFETT: And with that, let's go on to the question period.

And we will do this until noon, at which time we'll break for 45 minutes or so and come back, and then we'll continue until about 3 o'clock.

Then we'll break for about 15 minutes, have the formal business meeting from 3:15 to 3:16. (Laughter)

And then at 4 o'clock, Charlie and I are meeting with all of the people who came from outside of North America.

This year we had about 550 requests for tickets from countries outside of North America, as opposed to about 380 last year. So we're looking forward to meeting all of you that have come a long way to attend this meeting.

7. We can "easily handle" Social Security

WARREN BUFFET: Now, we've got a dozen zones in here, and we'll start off with zone number 1.

AUDIENCE MEMBER: Yeah. My name is Edward Jannig (PH) from Denver, Colorado.

First, I want to thank Charlie and Peter Kaufman for their wonderful book. I think Benjamin Franklin would be very proud.

My question is, last year when asked about Social Security, you said that a country as rich as the U.S. should take care of their old people.

This year I read Pete Peterson's book, "Running on Empty," and I was wondering, from the standpoint that is the greatest benefit to society, where should you draw the line on entitlement spending?

And I was wondering if you gentlemen disagree on the subject at all.

WARREN BUFFETT: Now, you always have the question in every society — whether it's formalized or not — you have the question of how you take care of the old and the young.

You know, you have people in their productive years turning out goods and services, and you have people that are too young to participate in the turning out of those goods and services but that, nevertheless, need them, and you have people that are old in the same position.

And starting in 1935, I believe, we statutorily formalized that idea. We'd always felt that way about the young, that school should be there for them when they couldn't pay for them themselves, and that the society owed a duty to both classes. But in 1935, we took up the idea that the government would provide this base limit.

Now, I think there's some merit to the argument that the 65 became outmoded as longevity improved. And that is now being changed, to some degree, and I think there's probably some more change needed.

But this country has an output of almost $40,000 of GDP per person. And some people, like Charlie and myself, are very lucky to be wired in a way that in a market system we get enormously wealthy.

And other people are not so wired, and they come out and they, in a market system, do not necessarily do so well, and they're fairly lucky if they provide for themselves during their working years and they do not have the ability to earn at a rate that takes care of them in later years.

And society has taken that on. Our country can easily handle the Social Security question.

I mean, it — and it's kind of astounding to me that a government that is quite happy to run a 3- or $400 billion deficit now worries a lot about the fact they're going to have a $100 billion deficit or something in Social Security 30 years from now. I mean, there's a little bit of irony in that. (Applause)

It is true that, if we maintain the present age brackets, that eventually you have one person in the older years for every two that are producing in the younger years.

But we produce more every year as we go along. And there will always be a struggle in a representative society, in a democratic society, between how you divide up that pie.

But we have a huge pie. We have a growing pie. And we can very easily take care of people, in a manner at least as well as we take care of them now, in the future from that growing pie without the people in their productive years not — also having a gain in their standard of living.

CHARLIE MUNGER: Yeah. I think the world of Pete Peterson, but I don't come to the same conclusion.

Of course, if we didn't tinker with Social Security, it would eventually run low on funds.

But if the country is going to grow at 2 or 3 percent per annum for decades ahead, it's child's play to take a little larger share of the pie and divert it to the people who are older.

It would be crazy, I think, to think you would always freeze the share of money going to the old at exactly the same sum no matter how rich you got.

It's a perfectly reasonable thing to do to pay a little more in the future to support what I regard as one of the most successful programs in the history of our country.

Social Security has a low overhead and does a world of good. It's a very reasonable promise to make, and I wish my own party would wise up a little on how little an issue it is. (Applause)

WARREN BUFFETT: This is what happens when you ask a couple of guys our age how you feel about treating older people. (Laughter)

Incidentally, the — currently — and everybody likes to talk about the unified budget — you didn't hear talk about the unified budget 30 years ago on the national level.

But the unified budget means that the Social Security surplus now gets counted toward reducing the overall budget. So they're very happy at present to take the Social Security surplus and trumpet the number that is after that.

But then when they start talking about a Social Security deficit out 20 or 30 years, they tend to get — they want to separate that off and get very panicky about it. So I think there's a lot of hypocrisy in the argument.

8. Different businesses, different compensation

WARREN BUFFETT: Let's go to number 2.

AUDIENCE MEMBER: Good morning. My name is Phil Rafton (PH), shareholder from Orinda, California.

My question for you: How would you design a compensation system in a very cyclical industry that can swing from boom to bust?

You want to tie compensation to results in some way, but this can lead to huge swings in pay. And, for example, today in booming industries, like energy and mining, profits are large as a result of the boom in the industry and not necessarily the results of management skill.

Conversely, when the industry is down, profits are low due to no fault of management.

So, again, my question: How do you design a compensation package to best reward management performance?

WARREN BUFFETT: Yeah. That's a terrific question. Because if you're running a copper company now with copper at 3.50 a pound, you can coin money even if you happen to be the village idiot, you know.

And, similarly, when copper was 80 or 90 cents a pound, which has been most of our adult lifetime, in that general — there were fairly sparse times in mining much of the time.

And we design compensation systems at Berkshire. We have dozens and dozens of companies. Some of them are capital-intensive. Some of them are cyclical. Some of them don't require much capital.

Some of them are terrific businesses if no one runs them. Some of them are very difficult businesses, even if the best of management comes.

And we have a wide variety of compensation systems. You're wise when you say, "How do you design one for that kind of a situation?" Because so often people come in with, sort of, standardized systems or whatever the highest system they see is, and then apply it to their own benefits.

Most people, if left to select their own compensation systems, will come up with the appropriate, from their standpoint, comparable arrangement.

If we owned a copper mining company in its entirety, we would measure it, probably, more by cost of production than we would by whether copper was selling for $2.00 a pound or a dollar a pound.

I mean, they — the management has control — depending on the kind of ore bodies and everything — but they certainly have control over operating conditions. They do not have control over market prices.

And we would have something, I think, that would not fluctuate a lot in a business like that, the bonus available, but it would probably tie to what we thought was under the control of the individual who's managing the business. That's what we try to measure.

We try to understand the industry in which they operate, and we try to understand the things that the manager can have an impact on, and how well they're doing in that.

We measure, at GEICO, for example, we measure by two unit measures: one is growth — unit growth — and one is the profitability of seasoned business.

New business costs money. We want new business; so we don't charge that against the manager or the 20,000 other employees who share in it.

We do not want to pay for anything that is not under their control. We do not want to pay for the wrong things.

And I would say, in a cyclical business, that you — you know, if oil is $70 a barrel, I don't think any particular management deserves credit for it. In fact, they all sort of deny that they've got anything to do with it when they get called before Congress.

But I would not give them credit for the fact that oil is $70 a barrel or $40 a barrel. I would give them credit for low finding costs for — over time.

I mean, what you really want to do, if you have a producing oil company, is you want a management that, over a five- or ten-year period, discovers and develops oil at lower-than-average unit cost.

There's been a huge difference in performance in that among even the major companies, and I would pay the people that did that well. I would pay them very well, because they're creating wealth for me.

And I would not pay the guy a lot of money that simply is cashing in on $70 oil and that really has got a terrible record in finding it at reasonable prices. Charlie?

CHARLIE MUNGER: Yeah. It's easy to have a fair compensation system like we have at Berkshire.

And a lot of other publicly-traded corporations also have fair compensation systems, but about half of them have grossly unfair systems in which the top people get paid too much.

We know how to fix Berkshire, but our ability to influence the half of American industry where the compensation systems are unfair has so far been about zero.

WARREN BUFFETT: Yeah. One thing you may find interesting, we have — I don't know — 68 operating companies. We probably have — I probably have responsibility for the compensation system of, perhaps, 40 managers or thereabouts, because some of them have businesses grouped under them.

I can't think — again, I can't think of anyone we have lost over a 40-year period because of differences in views on compensation.

I also — we've never had a compensation consultant come into Berkshire. They may have had them at the subsidiaries, but they're smart enough not to tell me. (Laughter)

They — it's never happened. I mean, we do not — and we do not have lots of meetings. We don't spend a lot of time on it. It is not rocket science.

It's made more complicated than it needs to be, more confusing than it needs to be, because having a system that is complicated and confusing serves the needs of some who want to get paid a whole lot more than their worth.

And the system won't change because it's working to the advantage of the people that have their hand on the switch, the people that pick the human relations consultants and pick the people who are on the comp committee.

I was put on one comp committee, and Charlie can tell you what happened. (Laughter) He was there.

CHARLIE MUNGER: Yeah. We were the biggest shareholder at Solomon. Two of us were on the board, and Warren was on the comp committee.

And in that frenzy of envy, which characterizes compensation in investment banking, Warren remonstrated, softly, I thought, towards a slightly more rational result, and he was outvoted.

WARREN BUFFETT: Charlie used the term "envy" rather than "greed," which is interesting, because that's been our experience, is that envy is probably a bigger motivation, in terms of people wanting to be in that top quartile, or whatever it may be, than greed.

It's a very interesting phenomenon that you can hand somebody a $2 million bonus, and they're fine until they find out that the person next to them got 2-million-1, and then they're sick for the next year. (Laughter)

Charlie has pointed out — you know, of the seven deadly sins — that envy is kind of the silliest because you don't feel better. You know, I mean, if you get envious of somebody, you feel worse the whole time.

Now, you know, gluttony — you know, I've had some of my best times while being gluttonous. (Laughter)

There’s a real upside to gluttony. (Laughter)

We won’t get into lust. (Laughter)

But I’ve heard that there are upsides to that, occasionally.

But envy, you know, all you do is sit around and make yourself sick and can’t get to sleep. But that’s — it’s part of the human psyche, and you see it big time and you get this irony.

The SEC wants even more transparency on pay, which I think, you know, basically is a good idea except for the fact that it becomes a shopping list for every other CEO when they see that somebody is getting their haircuts paid for by the company.

They decide that they, too, need their haircuts paid for by the company, and they suddenly become big tippers.

9. Our managers are “trained” by our culture

WARREN BUFFETT: Let’s move on to number 3.

AUDIENCE MEMBER: Greetings to all of you from the Midwest of Europe. I’m Norman Wintrop (PH) from Bonn, Germany.

Thank you very much for writing your shareholder letter in such a way that we feel treated as partners.

Warren, in the shareholder letter, you ended with your thoughts on managing Berkshire Hathaway in the future.

May I ask you, how do you train your successors? What do you tell them? How do you summarize to them what is important to you?

And how, if you are able to do so, how would you measure whether or not they have lived up to your expectations?

WARREN BUFFETT: Well, that’s a good question.

And, I think, actually, in reading that letter — you know, that’s part of the — part of the reason it’s written — is to convey, not only to our partners, our shareholders, but also to our managers and anybody else in the public, you know, what Berkshire is all about.

This meeting, you know, in terms of what we do is intended to give a personality and a character to Berkshire. And we don’t say it’s better than anybody else’s, necessarily, but we do think it’s us.

And we think — we want managers to join us who believe in the sort of operation we have, a partnership with shareholders, a lifetime commitment to the businesses. We want those people to join us.

We want what they see after they join us to underscore the values we have. So everything we do we hope is consistent with what most people would call a "culture" at Berkshire.

So the written word, what they see, what they hear, what they observe. And that is training in itself.

It's the same sort of training you get as a child. I mean, you — when you are in the home and you're learning something every day by the behavior of these terribly important people, these big people that are around you.

And a home has a culture. A business has a culture. To some extent, a country can have a culture. And we try to do everything that's consistent with that. We try to do nothing that is inconsistent with that.

And, believe me, if you're a bright Berkshire manager — and they are bright — you know, they buy into it to start with, they see that it works, you know, and it doesn't require formal lessons or mentoring or anything of the sort.

I mean, if you talk to our Berkshire managers, you would find that they think consistently with how, in effect, Charlie and I think.

There are plenty of people that don't, and they don't join us.

I mean, you know, we hear all the time from people — I've got one coming in a little while, actually, that, you know, nothing is going to come of it because this guy — I mean, his brain processes things different than mine does.

And I'm kind of interested in learning about his business, so we'll get together, but it wouldn't fit. You know, it would just not — it would be a mismatch.

And the nice thing about it is our culture is so well-defined that there aren't many mistakes, in terms of people entering it or behaving in a way inconsistent with it. So I think that — I don't think there's any formal training necessary.

I mention in the annual report the fact that, if I die tonight, there are three obvious candidates to take my place.

Now, the board knows which one of them they would agree on tonight. Might be different three years from now, but any of those three would not miss a beat in terms of stepping into the culture that I hope we have here, because it's theirs too.

Charlie?

CHARLIE MUNGER: Well, you know, if Warren has kept the faith until he's 75 years old in maintaining a certain kind of culture and a certain way of thinking, do you really think he's going to blow the job of passing the faith on?

What could be more important, in terms of his duties in life? You all have something — (Applause)

You all have something more important to do than worry about the fact that the candle is going to go out at Berkshire just because some people die.

This is a place where the faith is going to go on for a long time.

Of course, at headquarters, we aren't training executives. We find them. And they're not hard to find.

You know, if a mountain stands up like Everest, you don't have to be genius to recognize that it's a high mountain. (Laughter)

10. Irrational pricing of closed-end funds

WARREN BUFFETT: OK. Number 4?

AUDIENCE MEMBER: My name is Yuen Gunn (PH), and I'm from Whitehaven in England.

Actually, the last time I was this nervous asking a question, I'd just presented my wife with an engagement ring from Borsheims. (Laughter)

WARREN BUFFETT: Well, I hope you get nervous again. (Laughter)

AUDIENCE MEMBER: My question for you is, with the enthusiasm at the moment for emerging markets, many closed-end funds which contain emerging market stocks are trading at significant premiums to their net asset values, even when open-ended funds can be used to acquire similar portfolios of stocks for the net asset values.

This doesn't seem very rational to me. Why do these premiums persist, and do you agree that it's irrational?

WARREN BUFFETT: Yeah. I would say it would tend to be. I don't know anything about the specifics that you're referring to on emerging market funds. I haven't looked at the size of the premiums.

But, history would certainly show that most closed-end funds — just about all closed-end funds — eventually go to discounts.

I actually worked — well, I'll skip that analogy. But the — overwhelmingly, closed-end funds have gone to discounts.

You know, initially, if they're sold with a 6 percent commission, of course, the initial people are getting 94 cents of net asset value by paying the dollar, but I know I — if I saw two — if I had an interest in buying into emerging markets through other people's management and I could buy an open-end fund at X, or an asset value, and I had to pay 120 percent of X for some closed-end fund, you'd have to convince me very strongly that the management of the closed-end fund was better.

So I think you're right. I don't — again, I don't know the — if the premium is a few percent, it doesn't really make much difference.

But occasionally, Charlie and I have witnessed in the past closed-end funds that have sold even at 30 or 40 percent premiums over asset value.

Overseas Securities was a tiny fund that used to do that for years and baffled everybody. But eventually they will come back down to earth.

Charlie?

CHARLIE MUNGER: I've got nothing to add. (Laughter)

WARREN BUFFETT: He's hitting his stride now. (Laughter)

11. Corporate boards should think like owners

WARREN BUFFETT: Number 5?

AUDIENCE MEMBER: Warren and Charlie, I want to thank you for putting a once obscure Midwestern city on the map last year with your acquisition of Pete Liegl's company, Forest River.

I'm Frank Martin (PH) from Elkhart, Indiana, the RV capital of the world. I also want to thank —

WARREN BUFFETT: Glad to have you here, Frank.

Frank has just brought out a book, incidentally, that's a history of some of his annual letters. It's a good book, and I recommend you get it.

AUDIENCE MEMBER: Thank you, Warren.

I also want to thank you for your influence over Robin Williams and other Hollywood stars. Those of you who have seen the movie "RV" realize that Warren will go to no ends to promote the products of the companies he acquires. (Laughter)

WARREN BUFFETT: A few people have already noticed that, actually, Frank. (Laughter)

AUDIENCE MEMBER: On a more serious note, there's a small but growing trend in American business governance to move from plurality voting for directors to majority voting, long the standard in Great Britain.

What do you see as the upside and downside of majority voting, as it relates to raising the standard of ethics in the corporate boardroom?

WARREN BUFFETT: Charlie, you want to take a swing at that?

CHARLIE MUNGER: I don't think it'll have any effect at all on ethics in the corporate boardroom.

There get to be fashions in the governance subject. I think that the troubles in American corporations are not going to be fixed by something like that.

All these reforms have to be considered in the light of the kind of people that are likely to be activist in using new powers, and that crowd is a mixed crowd, to put it gently.

WARREN BUFFETT: The question in the boardroom is to what extent — and you have to understand, it's partly a business situation; it's partly a social situation.

The question is to what extent do the people that are participating there think like owners, and whether they know enough about business so that even if they're trying to think like owners, that their decisions will be any good.

And Charlie and I have been on boards of companies with dual voting. Berkshire has that, although it's so minor that it doesn't really make any difference. But we've been on other boards.

I have never really seen any difference in behavior based on the nature of the votes that got them into the boardroom.

But there's an enormous difference — I think you'd be blown away if you watched boardrooms over the years — there's just an enormous difference in terms of, really, the business savvy of the people in the room, the degree to which they are thinking like owners as they go along.

And I've seen no — I don't know that dual voting or the lack of dual voting really is going to have very much to do with that.

The key — I've mentioned it in the past — there's all these fashions, as Charlie says, in corporate governance.

But the job of the board is to get the right CEO, to prevent that CEO from overreaching. Because sometimes you have some people that are very able, but they still want to take it all for themselves.

But if they take nothing and they're the wrong CEO, they're still a disaster. So low pay itself is not the criteria.

So you want the right CEO. You do not want them overreaching.

And then I think the board needs to exercise independent judgment on important acquisitions, because I think CEOs — even smart CEOs — are motivated, frequently, in acquisitions by other than rational reasons.

And in those three areas, you know, American directors have — I don't think they've given a tremendous account of themselves in recent years, whether at dual system places or otherwise.

The only cure to better corporate governance, in my view, is that the very large shareholders start really zeroing in on whether those questions I just mentioned are being addressed properly.

If they go on to all these peripheral issues, you know, they have a lot of fun and they get in the papers. You know, they have little checklists and they can issue grades and all that. It isn't going to do anything in terms of making American business work any better.

But if the eight or ten largest shareholder groups, if the really large institutional investors say, you know, "This compensation plan doesn't make any sense and we're not voting for the directors, and here's why we're not voting for the directors," you'd get change. But so far, they've been unwilling to do that.

It takes the big shareholders. It's not going to be done by any coalition of small shareholders or people sticking things on ballots. But the big shareholders of this country, you know, basically they — some of them farmed out their voting, even.

I was amazed to find that out, that a number of very large institutional investors have actually just turned their voting process over to somebody else. They don't want to think like owners. And, you know, they bear — we all bear — the penalty for that.

12. Tech is still in the "too hard" pile

WARREN BUFFET: Number 6?

AUDIENCE MEMBER: Hello. My name is Andy Pollen (PH) from Adrian, Michigan. Thank you, once again, for having me to Omaha.

My question is for Warren, but, Charlie, please add your thoughts as well.

Warren, I've heard you say many times that you don't understand technology and that you rely on Bill for that, and that's fine. And I see from this year's movie that you're learning, so that's good.

WARREN BUFFETT: Slowly.

AUDIENCE MEMBER: I'm also curious to hear what you've learned so far about the other information technology companies, such as IBM, Sun Microsystems, Oracle, Dell, EMC, and Intel.

WARREN BUFFETT: I know — what I've learned is I know enough not — to know that I don't know enough to make an investment decision.

The — Charlie and I have circles of competence that extend to evaluating a number of types of businesses, and there are a whole lot of businesses that we won't be able to evaluate.

Some of them, I don't think — I think very few people can evaluate.

I mean, you get outside of — you just get into businesses that — where the future is so likely to be different than the present that maybe there's a few people that have great insights on it, but we sure don't.

We are best at the businesses where we can come to a judgment that they're going to look a good bit like they do now five years from now, ten years from now. They'll be bigger. They'll be doing different things, but the fundamentals will be the same.

ISCAR will be a bigger company five years from now. It may be a much bigger company, and we may get a chance to do interesting acquisitions.

But what you saw there, the fundamentals, won't change. The way the people think won't change.

I can name a number of businesses that are bound to change dramatically. I mean, when you think of how much the telecom business, for example, has changed over the last 15 or 20 years, it's startling.

Even with hindsight, it's a little hard to figure out, you know, who was going to make all the money and so on. There's just — there's just games that are too tough.

Charlie says, you know, "We've got three boxes at the company: in, out, and too hard." (Laughter)

And a lot of things end up in the "too hard" pile, and it doesn't bother us. You know, we don't have to be able to do everything well.

If you go to the Olympics, you know, if you run the hundred meter well, you don't have to throw the shotput. You know, some other guy can throw the shotput and you'll still get a gold ribbon, you know, if you run the hundred meter fast enough.

So, we try to stay within the circle of competence.

Tom Watson, Sr. — I think it was Senior — yeah, Tom Watson, Sr. — many years ago said, "I'm no genius, but I'm smart in spots, and I stay around those spots."

Well, that was pretty damn smart, you know. And we have found a lot of our managers who don't think, you know, they can solve every problem in the world, but they run their businesses extraordinarily well.

You do not want to — Frank Martin mentioned Forest River. You do not want to go and compete with Pete Liegl and his business. He's going to kill you. He's very, very, very good.

But he doesn't come around and try and tell us how to run the insurance business, because that's not his game.

We look for people that are very good at things they understand. And we don't get any inferiority complex at all about the fact that — well, I — you mentioned Intel, I believe.

I was virtually there at the birth of Intel because I was on the board of Grinnell, and Bob Noyce was the chairman of the board of Grinnell. And we bought — at Grinnell — we bought $300,000 worth of their original debentures.

And, you know, I knew Bob was always a very, very smart guy, but I wouldn't have had the faintest idea how to evaluate the future of Intel then, and I really don't have it now, you know.

And I think they probably had a few surprises themselves in the last few years with AMD and what's been happening in their business.

But what that's going to look like in five years, I don't have any idea. And I'm not so sure, if you're in the industry, you'd know exactly what it was going to look like in five years. Some businesses just are very, very hard to predict.

Charlie?

CHARLIE MUNGER: Yeah. One of the foreign correspondents last year, after looking at us carefully, said, in effect, “You guys don’t seem smart enough to do so much better than other people as you’re doing.” (Laughter)

WARREN BUFFETT: Were they looking at me or you, Charlie?

CHARLIE MUNGER: Both. (Laughter)

“Have you got an explanation?” And we said, “We know the edge of our competency better than most people do.”

It’s a very useful thing to know the edge of your competency. And I always say it’s not a competency if you don’t know the edge of it.

WARREN BUFFETT: I’ll have to think about that a little bit. (Laughter)

Bill will explain it to me later.

13. Too many tax breaks for the rich

WARREN BUFFET: Area 7, please.

AUDIENCE MEMBER: I am John Bailey (PH) from Boston, Massachusetts.

I wanted to ask, Warren and Charlie, if you could consider three hypothetical securities for a long-term investment.

The first would be, like, a share in median family income for the United States. The background there that, in real terms, median family income has been stagnant for approximately 30 years.

The second security would be a share in all corporate income in the United States. The background there that corporate income has been taking an ever larger slice of GDP for several years.

And, finally, a bit more abstract, a share in all capital assets in the United States, and I would like to include all intangible capital assets, if possible.

So would any of these be of interest for a long-term holding, perhaps 20 years or so? And, if not, why not?

WARREN BUFFETT: Well, I think I’d rather buy ISCAR. (Laughter)

The corporate profits, as you point out, have been close to their highs, except for a very few years post- World War II, as a percentage of GDP. It’s hard to imagine being much larger.

It's interesting. While corporate profits is reported — you take S&Ps, percentage of book, percentage of sales, put on the line, they're all on the high end.

Corporate income taxes, really, are not that high relative to the total revenues of the country. So you can see that there's been a little disconnect there in some manner.

But median family income is something that Charlie and I have never even considered. We're not shooting for that.

It is certainly true that, in the last five to ten years, that the disparity in income has widened significantly and that the tax breaks for the wealthy have been extraordinary.

I've pointed out in the past that most of the members of the Forbes 400, myself included, pay a lower percentage of their income to the U.S. government, counting Social Security taxes, than does the receptionist that works in their office.

That was not true 30 years ago, and I don't think it's something that should be true in a rich society, but it has happened.

And I just computed my 2005 return. In 2004 — and I have no tax shelters. I don't have a tax adviser. I just do things, and at the end of the year I add it all up.

In 2004, my rate was the lowest of the 15 or 16 people in the office, and in 2005, my rate was even lower.

And that's courtesy of the U.S. government. It's not courtesy of a lot of tax write-offs or anything of the sort.

And I think that's — I think it's crazy, and I don't think the American people understand it very well. And I think that if they did understand it, they should, and would, be quite unhappy about it.

So I think that — I think that the lower incomes, median — and the medium — people making medium amounts of income, have not shared in the prosperity of the last decade or so in a way that's all proportional to the way the wealthy participate in it.

The last point you mentioned was too esoteric for me, so I'll pass it over to Charlie.

CHARLIE MUNGER: Yeah. The main figure that matters to all of us, including the people at the median, is how does GDP per capita grow? And those figures have been very good.

And so, I wouldn't get too wild on the subject of median income. It isn't like we're all permanently in some status from nobody moving from status A to status B.

There’s a huge flux, both up and down. And what’s really important is that the pie keep growing at a decent clip.

All that said, I think that Warren is right, that some of those tax changes were a little crazy. I mean, they caused more envy than we needed. But I don’t think it’s all that important.

WARREN BUFFETT: Yeah. We might think it was more important if we were working at the median income, Charlie. (Laughter)

14. Munger: Ethanol is “stupid”

WARREN BUFFET: Let’s go to Number 8.

AUDIENCE MEMBER: Good morning. I’m Diane Ryan (PH) from Kansas City.

My question is, what is your opinion on the economics of ethanol and as — just as a fuel additive?

And, as a potential investor, should I be looking at that industry?

WARREN BUFFETT: Well, I don’t know enough to answer the latter part. I know we don’t — Charlie and I would not know enough to evaluate ethanol projects.

We’ve been approached on them. And, of course, they’re quite popular now.

But in terms of figuring out what an ethanol plant is going to be earning on capital five or ten years from now, it’s far easier for us to figure out whether people will be drinking Coca-Cola, or even eating See’s Candy, which I highly recommend. (Laughter)

So, you know, it will depend on government policy. It will depend on a lot of variables that we’re not particularly good at predicting.

It’s easy to raise money for it now. I mean, it’s a popular item. You know, it’s hot.

And our general experience is that we don’t look at things very much that are hot at any given time.

I know nothing about the — you know, the biochemistry or anything of the sort.

I have a son who was a head of the ethanol board in Nebraska. And if I notice that he suddenly starts getting richer than I am, you know, I will suspect that I should start looking at ethanol very hard.

But so far, I haven’t seen tangible evidence of that.

There's no question ethanol usage is going to grow. I mean, that we will see.

Generally speaking, ag processing — agriculture processing — businesses have not earned high returns on capital. I mean, if you look at Cargill, you look at ADM, you look at the big processers, that has not been a great business.

Ethanol could prove an exception, but I'm not sure how you gain a significant competitive advantage over time, you know, with any given ethanol plant.

And if you get too many of them around, you know, it will not be a good thing when you're turning out a commodity.

Charlie?

CHARLIE MUNGER: Well, my attitude is even more hostile than Warren's.

I have just enough glimmers of thermodynamics left in me to suspect that it takes more fossil fuel energy to create ethanol than you can get out of the ethanol you've created.

If so, that's a very stupid way to try and solve an energy problem. (Applause)

WARREN BUFFETT: Well, considering my family situation, I would say I have friends who like ethanol, and I have friends who don't like ethanol.

And I want my position to be perfectly clear: I'm for my friends. (Laughter)

15. Watch out for speculative commodity bubbles

WARREN BUFFETT: Let's go to number 9.

AUDIENCE MEMBER: Hello. My name is Johann Freudenberg (PH) from Hanover, Germany.

Do you think we are in a commodity bubble? Thank you.

WARREN BUFFETT: Well, certainly — not in agriculture commodities, they haven't done anything, if you're talking about wheat or corn or soybeans or something.

But if you get into the metals, oil, there's been a terrific move. The most extreme, probably, has been copper, I would say.

Oil, if you go back a few years to when it was $10 a barrel — it's been more extreme than copper — but you were undoubtedly — it's like most trends. At the beginning, it's driven by fundamentals, and at some point, speculation takes over.

The very fact that — the fundamentals cause something that people looked at for years without getting excited about. Fundamentals change the picture in some way.

Copper does get a little short, you know, or people get a little worried about currency and, maybe, gold goes up or whatever it may be.

But, you know, it's that old story of what the wise man does in the beginning, the fool does in the end.

And with any asset class that has a big move, that's based initially on fundamentals, is going to attract speculative participation at some point, and that speculative participation can become dominant as time goes by.

And, you know, famous case always being tulip bulbs. I mean, tulips may have been more attractive than dandelions or something, so people paid a little more money for them.

But once a price history develops that causes people to start looking at an asset that they never looked at before and to get envious of the fact that their neighbor made a lot of money without any apparent effort because he saw this early and so on, that takes over.

And my guess is that we're seeing some of that in the commodity area. And, of course, I think we've seen some of it in the housing area, too.

How far it goes, you never know. I mean, it just — some things go on to just unbelievable heights, and then, you know, silver went back and that was manipulation, to some extent, but it got up to $50 an ounce very briefly back in the early '80s.

But the eyes of the world that never looked at silver when it was $1.60 or — or $1.30 back in the '60s, you know, everybody in the world was looking at it. And some were shorting and some were buying, but it becomes a speculative football.

And my guess is that an awful lot of the activity in something like copper now is speculative on both sides of the market.

If — you know, if it goes to $5 a pound, who knows? But it — you are looking at a market that is responding more to speculative forces now than to fundamental forces, in my view.

Charlie?

CHARLIE MUNGER: Well, I think we've demonstrated how little we know about commodity prices by our very skillful operations in silver.

WARREN BUFFETT: I think you can change that from "our" to — it's mine, actually.

I bought it very early. I sold it very early. Other than that, everything I did was perfect. (Laughter)

We managed to minimize things there with great efficiency, or I managed to. Charlie didn't have anything to do with that. I was the silver king there for a while.

We did make a few dollars on it. But we're not good at the game of, when it gets into the speculative area, figuring out how far a speculative boom will go.

If the fundamentals are attractive, we think we're getting a lot for our money, buying equities or whatever it may be, we'll make some money.

We will — we may not make as much money — remotely as much money — as somebody who is, you know, plays out the last 30 days or 30 weeks of a real wild orgy.

I mean, these things, they tend to be the wildest toward the end.

But that gets back to the question, you know, of Cinderella at the ball. I mean, you know, you're there. You're having a wonderful time. The punch bowl is flowing and the dance partners are getting prettier all the time.

And you know at midnight, it's going to turn to pumpkins and mice.

And, you know, you look around the room and you think, "Just one more dance, one more good-looking guy," you know, "one more glass of champagne."

And you think you're going to get out of there at midnight, and, of course, everybody else thinks they're going to get out of there at midnight, too. And in the end, it does turn to pumpkins and mice.

And in this game, as I've said — you know, Adam Smith said it many years ago — a fellow named Jerry Goodman wrote under the pseudonym of Adam Smith — says the problem with that particular dance for Cinderella is that there are no clocks on the wall.

You know, and in the markets — if you're talking copper now, if you're talking Internet stocks in 1999, if you're talking uranium stocks in the 1950s — there are no clocks on the wall.

And the party does get to be more fun, you know, minute after minute, hour after hour, and then it does turn to pumpkins and mice.

16. "Brazil would not be off limits"

WARREN BUFFETT: Number 10?

AUDIENCE MEMBER: My name is Luisa Loredo (PH). I'm a student at University of Kansas, and I'm originally from Brasilia, Brazil.

My question is for both Mr. Buffett and Mr. Munger.

The stock market in South America has been growing quickly in the last few years. What do you think about investment opportunities in South America, given the political environment and underlying risks?

WARREN BUFFETT: Yeah. We would — our problem in many markets is that we have to put a lot of money to work to move the needle at Berkshire. We've got a market value of 135 billion or something like that.

So we are looking to put out hundreds and hundreds of millions of dollars at a minimum when we look at marketable securities. And that really narrows the field in terms of countries or in terms of businesses within those countries.

But, you know, we made an investment about three years ago in PetroChina. Now, PetroChina is one — probably one of the — well, it is one of the five largest oil companies in the world — and, yet, we were only able to — even there — to get 400 and some million dollars into it, which fortunately is worth a couple of billion now.

But here it's a country the size of China, largest company in that country, and even there we only got 400-and-some million dollars in, although we would have liked to have gotten more.

But we weren't afraid to go into China. We wanted to get paid more for going into China, and we did, because we don't know the game as well there. We would feel the same way in Brazil.

I mean, we — a great beer company down there that a friend of mine ran, and, you know, we should have been in that. We knew he was a great manager, and he was going to do a great job with it.

So, Brazil would not be off limits at all, but we'd have to be able to get a lot of money into a business we understood at an attractive price.

We would want it to be cheaper than if it were in the United States. We wouldn't understand the tax laws as well, the nuances of governance, a whole bunch of things. But after allowing for that, at a price, we would do it.

We're unlikely to put a lot of money into — Brazil is a big country, but we're unlikely to put a lot of money into really small economies because we can't get enough money into them. Charlie?

CHARLIE MUNGER: No more.

17. Outlook for Clayton and manufactured homes

WARREN BUFFETT: Number 11?

AUDIENCE MEMBER: My name is Jeff Bingham (PH). I'm from Chicago, Illinois.

I have a question regarding the manufactured housing industry. What is your outlook on demand for the industry? And, correspondingly, in your opinion, will lending increase in a meaningful way over the next few years?

And are the homes priced attractively relative to competitive products, like stick-built housing and apartments, in the face of continued site rent increases at the community level and, in some cases, lenders requiring shorter maturities on mortgages?

WARREN BUFFETT: It's been kind of an interesting history on manufactured housing. If you go back — you have to go back 30 or 40 years — 40 years, I think, almost, to have — find volume as low as it's been in the last couple of years. And the houses are better than — by far better — than they were then.

There have been years when 20 percent of the housing — the new housing product in the United States — was manufactured housing. One out of every five.

Last year, leaving out FEMA demand, you know, we were bumping along for the third year, I believe, just a tiny bit over the 130,000 level, you know, which is like 6 or 7 percent — probably 7 percent — of new housing starts.

So, the percentage of the total new housing stock that has been manufactured housing in recent years has really been very low, while the houses are better — considerably better — quality than in the earlier years.

You can look at the house. We've got two houses out there on the exhibition floor, around $45 a square foot. You know, that's good value.

There's a lot of resistance, through local zoning laws and that sort of thing by the local builders, to the influx of manufactured housing. We've made progress on that in some areas. We're actually developing subdivisions in that business.

The houses were mis-sold four or five years ago in huge quantity because you had manufactured housing retailers selling the properties, getting any kind of a down payment, taking the loans — selling to people that shouldn't be buying them — taking the loans, securitizing them, so somebody in some insurance company someplace lost significant sums of money.

So you had, really, an abuse of credit in the field. And there's a hangover from that, and it's taken a long time for that hangover to work its way through.

I think Clayton Homes, which we own, has done a terrific job in both the financing — they should be financed on shorter terms, incidentally.

I'm — if you put them on owned land, that's one thing, but financing them for 30 years, in my view, was a mistake.

But the terms got very lax for a while, and, you know, we're bearing the consequences of that now.

But I think the market will get bigger, but I do not think it will get bigger this year. I see a year that, counting some FEMA demand and some hurricane-induced demand, maybe 150,000 units, 145,000 units. And by industry standards, that's down a lot.

Now, the number of plants is down a lot and the number of retailers are down a lot.

Clayton's position is very strong. And their record is so much better than anybody in the industry that you have to look very hard to find number two.

Charlie?

CHARLIE MUNGER: Yeah. You asked about stick-built housing and how competitive it was. That's been one of the troubles of the manufactured housing game is that the stick-built housing has gotten so efficient.

But there the system is aided greatly by Berkshire's subsidiary MiTek. So — and stick-built housing is amazingly efficient when it's done in big quantity with systems like MiTek provides.

And if it weren't for that, there would be a lot more manufactured housing.

Personally, I think manufactured housing is going to get a lot better and take a lot more of the market. It may take a considerable period, but that is so logical that I think it will eventually happen.

WARREN BUFFETT: Yeah. Somewhere down the road, you would expect 200,000-plus units for the industry. But I don't think you'll see it in the next year or two.

The industry has to think through — and they have, they've made a lot of progress on this — but they have to think through what's the logical way of financing these things, and what's the way to make sure that the person who buys it really has an asset that's in excess of their loan value five and ten years down the road.

And, really, very little consideration was given to that five years ago. It was just a question of put together the papers, sell it on Wall Street, and let somebody else worry about it later on.

Clayton did a way better job than other companies in that respect, but those were the industry conditions that existed then.

But I think Clayton will be — Clayton could easily be — the largest homebuilder in the United States in future years because we will be a big part of an industry that, as Charlie says, should be doing more volume.

CHARLIE MUNGER: I also think that some of the sin that was in the manufactured housing finance a few years ago has shifted into the finance of the stick-built houses.

There is a lot of ridiculous credit being extended in America in the housing field. And it had a horrible aftermath in the manufactured housing sector, and my guess is there will be some trouble in the stick-built sector in due course.

WARREN BUFFETT: Well, dumb lending always has its consequences and usually on a big scale, but you don't see it for quite a while. So, therefore, it's like a disease that doesn't manifest itself for, you know, a few weeks.

And you can have an epidemic of something like that, and by the time you know you have an epidemic, you're very well into it. Well, that's what happens in dumb financing.

And you had that — you periodically — you certainly had it in commercial financing in the '80s, and you had the RTC and the savings and loan crisis and all of that because, literally, one dumb project was put up after another.

A developer will develop anything he can borrow the money against. It's that simple. And when the lending institutions pour the money out for something, it will get built.

And that happened in manufacturing housing. It happened in commercial real estate in the '80s. I think it's happened in conventional housing here in recent years.

And if you look at the 10-Qs that are getting filed for the first quarter of some lending institutions, and 10-Ks that were last year, and you look at the balances increasing on loans for interest that's accrued but was not paid because people had adjustable mortgages, but they're only adjustable so far, but the lending institutions are taking in the income as if it were paid, you'll see some very interesting statistics.

CHARLIE MUNGER: Yes. And some of this dumb lending is being facilitated by contemptible accounting. The accounting profession has not stopped compromising its way into terrible behavior.

WARREN BUFFETT: Our auditing bill just went up.

18. No interest in investing in Russia

WARREN BUFFETT: Number 12? (Laughter)

AUDIENCE MEMBER: My name is Elliott Samuels (PH). I'm from New York City.

Thanks to high energy prices and other factors, Russia has been one of the best performing markets recently. The country's financial condition has stabilized since the 1990s.

A fledging middle class is taking shape as personal incomes grow. And there are also risks — political, legal — risks to minority investors.

But there are also potentially great values among second tier companies there.

I was wondering, what needs to happen in Russia for you to invest there, whether for Berkshire or for yourself, and what kind of companies would interest you there?

WARREN BUFFETT: Sounds like you may own a few Russian stocks yourself. The — I would — as you know, in 1998, Walter Wriston said sovereign governments don't default.

In 1998, in Russia, at least, he was proven wrong. And Charlie and I were — inherited a business at Salomon that was in the oil business big time-out in the — in Siberia.

And there came a time when — we got to dig the holes. We sent the money in. And as long as we were drilling, we were welcome. And then when we wanted to start taking the oil out, after our money had been used to drill the holes, they weren't quite as friendly. In fact, it was really kind of extreme what took place with us.

So, having had a few experiences like that, it might take us quite a while before we wanted to sink a lot of money into Russia. It may be different now, but I don't think it's any certainty.

I had breakfast in Sun Valley three years ago this July, I believe it was, with [Mikhail] Khodorkovsky, and we had a translator there. And he talked to me about whether — he was thinking about listing Yukos on the New York Stock Exchange, but he said, you know, it would require registering with the SEC or something, and he wasn't sure whether that would be too dangerous.

Well, I don't think he listed it there, but he went back to Russia, and he's been in jail now for — well, just about ever since.

And Yukos was put into bankruptcy with tax claims, and, you know, it — I don't — I just think it's a little hard to develop a lot of confidence that the world has changed permanently there in terms of its attitude toward capital, and particularly toward outside capital.

Charlie, what are your thoughts?

CHARLIE MUNGER: Yeah. The situation reminds me a little of POLY Petroleum, which, years ago, was much traded in Los Angeles.

The saying always was, "If they ever do find any oil, that old man will steal it." And I'm afraid we have some of that problem in many of the countries in which we're seeking for oil.

WARREN BUFFETT: Didn't we really have the livelihood of our guys threatened over there, Charlie?

I think we sent in some people to get out the equipment, and they said if we sent in the people to get out the equipment, not only would the equipment not get out, but the people wouldn't get out.

So we understood the situation. That was not that long ago.

CHARLIE MUNGER: No.

19. Hottest real estate markets are cooling off

WARREN BUFFETT: Number 1 again.

AUDIENCE MEMBER: I'm Lori Gold (PH) from San Francisco, California.

My question is, what are your thoughts about the residential real estate market in the U.S., where it's headed? And how is California different, if so?

WARREN BUFFETT: Well, Charlie is our California expert. We've managed one time to develop a great piece of property in California. We spent about 20 years or so developing it, Charlie, or —

CHARLIE MUNGER: Yes. And we got our money back with interest.

WARREN BUFFETT: Barely. (Laughter)

CHARLIE MUNGER: Barely, yeah.

WARREN BUFFETT: We finished it at just the wrong time. We — the land value that we nurtured — that was a terrific piece of land. Charlie lives there. And I don't think it's an exaggeration to say we spent 20 years —

CHARLIE MUNGER: No.

WARREN BUFFETT: — working on developing the land. And the land value, which, in effect, we cashed out for, what, 5 or $6 million, now would have an — the implicit land value — would be what?

CHARLIE MUNGER: Maybe a hundred million dollars.

WARREN BUFFETT: Yeah. But we finished it at the wrong time.

So, you know, it's a wonderful — the climate is wonderful. Everything is wonderful about this property.

It's just that, from time to time, even in great localities — you've seen it happen in New York a couple of times, you know, in the last 30 years, where the swing in property values has just been huge.

And what we see in our residential brokerage business — and we're in, I don't know how many different states — is we see a slowdown every place.

Now, we see it most dramatically in some of the — what have been the hottest markets.

In the markets where you're going to — in my view — you're likely to see the greatest fall-off and where you've had the biggest bubble are the ones — they tend to be the high-end market, and they tend to be ones where people have bought for investment or speculation, rather than use.

People will pay $300,000 for a house and mortgage it for 270,000, and if the value goes to 250, if they have a job and everything, they won't move out.

I mean, you don't lose a lot of money even though the market value on a given day is less than the loan value when families stay together and employment is present and all that.

But when you have investment-type holdings, speculation-type holdings, when you, in effect, have had the day traders, you know, of the Internet move into the day trading of condos, then you — then you get — then you get a market that can move in a big way.

First it sort of stops, and then it kind of reopens. Real estate is different than stocks. If you own a hundred shares of General Motors, it's going to trade on Monday and that's what it's worth and you can't kid yourself about it.

But if you own real estate, you know, there's a great tendency to think about the one that sold down the street a few months ago. And there's a great tendency to think, you know, you only need one buyer who hasn't gotten the word that things have slowed down and you'll make your sale.

I can tell you that in Dade and Broward County, for example, in Florida, where the average condo is about 500,000, if you go back to December of 2004, there were less than 9,000 condos listed for sale, and I think 2,900 of them sold in the month so you were — turnover one every three months, less than that.

Now, the listings are up to 30,000, and the sales are down to under 2,000 a month. Well, 30,000 is $15 billion worth of properties. And you are — very likely, you can get real discontinuities in a market like that, where all of a sudden people realize that the whole supply-demand situation has changed.

So I think we've had a bubble, to some degree, and it's very hard to measure that degree until after it's all over.

But I would be surprised if there aren't some significant downward adjustments from the peak, particularly in the higher-end properties.

CHARLIE MUNGER: Yeah. The man is right that the bubbles came in Manhattan and in certain places in California. In Omaha, housing prices are quite reasonable. So it's — the country is not all the same, at all.

20. Attendance estimate and Furniture Mart sales

WARREN BUFFETT: We just got an estimate of the attendance at 24,000, which was about what it looked like from the tickets we had gotten. I thank you all for coming, on that note. (Applause)

Even better, the Furniture Mart, which had sales in 1997 of 5-and-a-fraction million, 2003 sales of 17 million, sales last year of 27 million, is up so far 2 1/2 million, with the best yet to come.

So we're — I would say we're likely to do over 30 million at the Furniture Mart. And that, incidentally, is about equal to a normal monthly volume for the store. So you're doing your part. Thank you. (Applause)

21. Don't like excess cash, but we hate dumb deals

WARREN BUFFETT: Number 2?

But you can do more. (Laughter)

AUDIENCE MEMBER: Good morning. My name is John Norwood (PH) from Des Moines, Iowa.

I have a two-year rule for my closet. If I don't wear a particular pair of pants or a shirt within two years, I give it away to Goodwill so that someone else can put it to better use.

With 40 billion in cash, I'm wondering whether Berkshire Hathaway should have a similar closet rule for deployment of surplus shareholder cash.

WARREN BUFFETT: It won't go to Goodwill, I promise you that. (Laughter)

AUDIENCE MEMBER: Thank you. And wouldn't it be better if you had a smaller budget and fewer gifts you needed to — you and Charlie needed to shop for? Wouldn't you have more time for the beach and a better chance of hitting some home runs?

WARREN BUFFETT: Yeah. I don't think we'll hit any home runs, under any circumstances. But the — you might consider a normal level of cash at Berkshire as being about 10 billion, although we — you know, there could be circumstances where we'd go below that.

But because of the catastrophe insurance business we're in and all of that, we do not — you know, we do not scrape the bottom of the barrel, but we don't need anything like 40 billion.

I think you'll see in the 10-Q that we have — I think it was about 37 billion at the end of March — double check that — and I'm not counting the cash and the finance business — yeah, 37-something — and we're spending 4 billion on ISCAR.

We've spent — we're spending some money on some other things as well.

But we would be happier — much happier — if we had 10 billion of cash and all the balance in things that we liked very much.

And we work toward that end at all times. But there is nothing even about the way businesses come to us.

We've got one idea at present, low probability, but that would take — could take — as much as 15 billion or close to 15 billion of cash. And whether it comes to fruition or not, who knows, but we do work on them.

And, what we care more — we don't like having excess cash around. We like even less doing dumb deals because we do them forever.

I mean, if we make a dumb deal, it just sits there. We don't resell it three months later by having an IPO of it or something of the sort.

So you're right to say that we should be very uncomfortable about the fact that we've got the cash. But it's also important that we not be so uncomfortable that we go out and do something just to be doing something.

I would say it's likely, but far from certain, that three years from now we have significantly less cash and, I hope, significantly more earning power. But the goal of that cash is to be translated into permanent earning power over time.

Like I say, with the 4 billion that we've just committed on ISCAR, you know, we love having that 4 billion employed there instead of sitting around in short-term securities.

And that's our job. Charlie and I don't do anything else, except appear in movies and that sort of thing.

But the — you know, you're right to keep jabbing us on that because — but we jab ourselves. You know, we — neither one of us is — basically likes cash.

We always want to have adequate cash and we always will have adequate cash. And we are the biggest player in the world in cat insurance, and people come to us because they know we're going to run a place that's very strong financially. But it doesn't have to be as liquid as we are now.

We spent 5 billion — well, we didn't spend that much. At the Berkshire level, we spent about 3 1/2 billion on PacifiCorp.

You know, we contracted (inaudible) earlier, but we will get more chances, I think, in that field, but you never can tell when they'll come.

So come back next year, and I hope we have less cash.

OK. We'll go to 13 now.

OK. Charlie, would you like to add anything on that?

CHARLIE MUNGER: Yeah. I think you may get some perspective on what bothers you if you go back to the annual report of Berkshire ten years ago and then compare that report with the last one.

Despite the great difficulties of deploying cash, we managed to put an awful lot of wonderful stuff into Berkshire in the last ten years. So, we aren't altogether gloomy about that process continuing. (Applause)

22. Should have sold Coca-Cola at "silly" price

WARREN BUFFETT: I neglected to go to the adjacent room, which has a number of people in it as well. So I'm going to go to No. 13 now, which will come from the ballroom.

AUDIENCE MEMBER: This is Phil McCaw (PH) from Connecticut.

I wonder — it's been some time since you've commented on Coca-Cola. And now that you're off the board, I wonder if you feel free to comment on it?

WARREN BUFFETT: Yeah. Well, I won't make particularly different comments than from when I was on the board.

But Coca-Cola is a fabulous company. Coca-Cola will sell over 21 billion cases of various products — more Coke than anything else — around the world this year, and it goes up every year.

It's interesting. The stock in, what, 1997 or '98, whenever it was, sold over $80 a share when the earnings were — I don't remember whether they were $1.50 a share, or something like that — and the earnings then were not as good quality as the earnings are now when, you know, they were $2.17 or something like that.

And every year the — you know, they have — they account for a little greater share of the liquids consumed by people in the world.

They make fabulous returns on invested capital. You know, it's a business that has — exclude the bottling part of it — has 5 or 6 billion of tangible assets and makes a similar amount.

So, there are not lots of big businesses in the world that earn 100 percent pretax on tangible assets.

And it will be a great business, and it's been a great business.

The stock got to what, in retrospect, clearly was a ridiculous level, but you can't hold the present management, Neville Isdell, responsible for that.

And he — you know, if the company sells 4 or 5 percent more units this year than last year, and the population of the world goes up 2 percent, it just means that more people are putting that particular source of liquid down their throats than the year before, and that's been going on ever since 1886.

So it strikes us as a really wonderful business that sold at a very silly price some years back.

And you can definitely fault me for not selling the stock. I always thought it was a wonderful business, but clearly, at 50 times earnings, it was a silly price on the stock.

So we like it. We'll own it ten years from now, in my view. Charlie?

CHARLIE MUNGER: No more.

WARREN BUFFETT: This peanut brittle gets caught occasionally, but it's worth it. It's worth it, definitely.

CHARLIE MUNGER: Why don't you share with me?

WARREN BUFFETT: What? Oh, you want some, huh? Get your own box next time. (Laughter)

23. Reinsurance rate variations

WARREN BUFFETT: Now, do you want us to go to 14 or not? Yes. OK. Number 14.

AUDIENCE MEMBER: My name is John Gosh (PH) from Key West.

Have insurance rates hardened as much as you anticipated, and have you seen a significant flight to quality in the last few years?

WARREN BUFFETT: Yeah. I think you're probably asking more about reinsurance rates.

Actually, in auto insurance, you can figure it out. Our policies are up more than our premium volume. So the average premium in auto insurance, which, after all, is close to 40 percent of the whole market for insurance — the average premium in auto insurance is actually down a little bit.

But in reinsurance, in which we are a big player, you will — there's great variances.

If you take insurance for marine risks in the Gulf Coast — drilling rigs and offshore platforms and that sort of thing — those prices are up very dramatically, but they should be.

I think in the last couple of years, there's been, like, 2 1/2 billion of premium in the Gulf Coast and 15 billion in losses. So if you paid out 15 billion and took in 2 1/2 billion, the more astute of you would figure that you needed a little more money for that particular risk.

We have been, historically — at least in recent years — the largest writer of cat — catastrophe — mega catastrophe insurance in world, and I think we will be this year. In fact, I'm almost sure we will be this year.

Our mix has changed some. Prices are up a lot, but what we don't know is whether exposures are up even more.

We don't know whether the experience of the last two years, we'll say, with hurricanes in this hemisphere, is more to be relied upon than the experience of the last hundred years.

You can take the hundred-year experience and it tells you one thing, and you can take the last couple years and it tells you something else. And which is more meaningful? We don't know the answer to that.

We do know that it would be kind of silly to assume that the 100-year experience is the relevant criteria when conditions — we know certain atmospheric conditions have changed. We know water temperature's changed.

But we do not know all of the variables that are into the propensity of hurricanes to occur and the degree to how intense they may be if they do occur. We don't know the answer to that. We don't think anybody else knows the answer to it, either.

So we are getting more money for hurricane insurance. We're getting appreciably more money.

If the last two years are the relevant years, we're not getting enough. If the last hundred years are the relevant years, we're getting plenty. And we will know more as time unfolds.

The really scary possibility is that variables are changing in some way so that the change is continuous and that what we've seen the last two years is not a worst-case example at all.

And, of course, you get into chaos-type theory with some of these variables where the outcome is not a linear relationship to the input, and you can dream up some pretty scary scenarios on this.

I don't know whether they're true and nobody knows.

We are willing to write certain areas, certain coverages, because we believe the prices are adequate, and we can sustain the losses.

We're willing to lose many billions of dollars in a given catastrophe if we think we've been paid appropriately for it.

But it is not like figuring out the odds on flipping coins or rolling dice or something like that. You are dealing with changing variables, and you — the worst thing you could have would be a 100-year history book in making those judgments.

The third quarter, we will have a lot of exposure for wind. We don't have as much exposure now — well, we may. I'd say we're getting there. But we don't have as much — certainly as much as we had a couple of years ago.

Prices — question about prices hardening. Prices are getting — are hardening — in that particular area. And if they get to what the — where we really feel they're appropriate — you know, we might take on a fair — we will take on — a fair amount more risk.

If they don't get there, even though they're higher than last year, we won't write — you know, we're not interested in writing it, because it's a dangerous business.

And we don't believe in modelers at all. I read all this stuff about modeling. I wrote about that a few years ago. It's silly. You know, the modelers don't know a thing, in my view, about what's going to happen.

And we get paid for making guesses on it. If, over a lifetime, the guesses are decent, we will know that, you know, we were doing the right thing.

But if this year goes by and nothing happens, we still don't know whether we were right on the prices.

Because if you get a 25 percent rate for something and it doesn't happen in a year, that does not mean that you didn't need 40 percent or 50 percent. It just means that if you do it enough times, you will find out whether, overall, your judgments are any good.

It's still a business we like. We bring a lot to the party. Everybody knows we can pay. You get into the question of creditworthiness.

If there is some super, super catastrophe — and I regard, sort of, the outer limits of that being a $250 billion insured loss — for reference, Katrina was a — presently estimated — was about a $60 billion loss.

So, if something comes along that's four times Katrina, which could happen, you know, we can pay, and we can comfortably pay. We would probably have about 4 percent of that, maybe 10 billion.

A very large percent of the industry would be in very, very serious trouble.

So, we can play bigger than others, and we can survive better than others if something bad comes along. And we will see, over a five- or ten-year period, how we do. You can't judge it by any one year.

Charlie?

CHARLIE MUNGER: The record of the past, if you average it out, has been quite respectable.

And why shouldn't we use our capital strength to get into volatile stuff that makes other people frightened?

24. NetJets losses and retroactive policies

WARREN BUFFETT: Do we go back to number — to here? One more. Number 15?

AUDIENCE MEMBER: Hello?

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: I'm Marc Rabinov from Melbourne, Australia. I had a two-part question on the 2005 annual report.

Firstly, NetJets is a substantial part of our operations. Unfortunately, its value is obscured by losses in recent years, and I can't estimate its value from the report. I was hoping you might be able to help me on that.

The second thing, how do I value the Berkshire Hathaway reinsurance group in light of the deferred charges on retroactive policies? Thank you.

WARREN BUFFETT: The second question, that — about the — we have an item that's about $2 billion on the asset side.

I think I'm addressing the question of deferred charges on retroactive policies. That reflects the fact that those retroactive policies, where we insure — we reinsure, in effect — the losses that somebody has already incurred, although they may not know how much they've incurred, and we have limits on these.

But we set up a factor that, essentially, recognizes the fact that we will have that money for a considerable period of time. We set up an asset, and that gets amortized over the length of time we have that asset.

That number, which I think has gotten as high as 3 billion over the years, since we haven't done any of those — any big contracts recently, is down around 2 billion.

There's nothing magic about that. It means that we're going to amortize that 2 billion over the lifetime of the use of the funds, and we think we'll make money, net, during that time.

But we misguessed on one a couple years ago and took a $100 million charge, for example, in the first quarter of — I think it was the year before last.

The other question was about NetJets, wasn't it, Charlie?

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: And I didn't get it all. I love the Australian accent of our gecko, but I didn't pick up the exact nuances of what you asked.

But my guess is you asked about the earnings and operation of NetJets.

And NetJets has grown rapidly, and so far, our expenses have grown faster than our revenue.

We've got the top service in the world. We've got, really, the only worldwide service. We have a very strong position, particularly in larger airplanes.

But I'd have to tell you that I did not anticipate — I thought we would have economies of scale, to some degree, and so far you can almost argue that we've had diseconomies of scale.

And our expenses, particularly last year, you know, basically got out of hand. And there are various reasons I could give you for that. All I can tell you is, it's being addressed.

Rich Santulli, who runs that operation, you could not have a better operator. He loves NetJets. He works at it 16 hours a day. He's — there's nobody in the world I would have run that except for Rich.

I think it's an important service. It's tough to make money with airplanes. They're capital-intensive. We've had fuel do what it has, although that's a pass-through to people, but it still affects the business.

And I would — I had expected we would be profitable last year, and as I put in the annual report, I was dead wrong.

I think we will be profitable before long, but you should take my prediction there with — probably with — a certain amount of skepticism until it actually happens because I, like I say, I've been wrong.

We've got a good business in that almost anybody looking for a large plane on a fractional jet program comes to us. We are able to get full price for our service. But there were a variety of inefficiencies last year which added up to a lot of dollars.

And you know, you're entitled to hold me accountable for the fact that we paid a lot of money for the business many years ago, and we haven't earned any money since.

And we've got a much bigger business now, probably five times or so the size of the business we bought. That may be some solace to — I looked at Raytheon's figures the other day. They lost a lot of money, and they have the second largest operation.

They sell their — they sell airplanes too, so they may not feel it the way I do.

But if I had to bet one way or the other, I would bet we will be making money before long, but I've lost that bet in the past.

Charlie?

CHARLIE MUNGER: Yeah. The product integrity is so extreme between flight safety and NetJets. The pilots are subjected to real oxygen withdrawal in the course of the safety training so they will recognize the subtle sensation that you get, and not everybody does that. It's an expensive, difficult thing to do.

In place after place after place, that system is very obsessive about product integrity, and it's my guess that that obsession, in due course, will be rewarded.

25. Why Buffett bought, and sold, silver

WARREN BUFFETT: OK. We'll go to Number 3.

AUDIENCE MEMBER: Dear Warren and Charlie, I'm Oliver Couchet (PH) from Frankfurt in Germany.

Here's a question to the Silver King: Some commodity investors give you as a reference as one of the largest owner of physical silver. Could you please clarify what kind of exposure you or Berkshire currently have in silver?

And, further, could you please help us to understand how you determine the value of a noninterest-bearing precious metal?

WARREN BUFFETT: Do you have any silver on you, Charlie? We had a lot of silver at one time, but we don't have it now.

The original decision — my decision — was that the production of silver and the reclamation of silver — I don't remember the numbers exactly now — but they were running, perhaps, 100 million ounces or thereabouts, less than the consumption.

And, now, a lot of consumption has gone down in photography, but that's where the reclamation was, too, so that those tended more to balance each other out.

I haven't looked at the figures for the last year or so, but silver was out of balance.

Now, on the other hand, there were enormous quantities of silver aboveground, and there were huge quantities of silver that could possibly be removed from other uses, perhaps, you know, in jewelry and all kinds of things, that could conceivably add to supply as they did in the early 1980s when the Hunt Brothers thing took place.

But, overall, silver was being produced and reclaimed at a lesser rate than it was being consumed.

And added to that was the fact that there are relatively few pure silver mines. Silver is largely produced as a by-product of copper and lead and zinc, and so that it was not easy to bring on added production.

So, all of that added up to the fact that I thought that silver would get tight at some point.

And, as I said, I was very — I was early in that conclusion, and I was early in selling.

So we have no silver now, and we did not make much money on it.

And you're right that it doesn't earn anything. So you sit with it. It's not like sitting with a stock where, in most cases, earnings are piling up for you.

You have to hope that it — you have to hope that a commodity moves in price, because it is not producing anything as it sits there looking at you. And that's one of the drawbacks of commodities.

Charlie?

CHARLIE MUNGER: We didn't get where we are by owning noninterest-bearing commodities. I don't think it's a big issue around here.

WARREN BUFFETT: We actually owned oil at one time too, didn't we? But we didn't make much money on it. We made a little money.

CHARLIE MUNGER: No. You made quite a bit out of oil.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: But, you know, it's a good habit to trumpet your failures and be quiet about your successes. (Laughter)

WARREN BUFFETT: Yeah. We have more to trumpet than we have to be quiet about. (Laughter)

26. "We don't play big trends"

WARREN BUFFETT: How about number 4?

AUDIENCE MEMBER: Good morning. My name is Bill Gurn (PH). I've traveled from the United Kingdom.

And I would like to ask if you think it's a good investment strategy to invest in regions of high resources per capita?

In particular, I should like to ask if you think that the analysis per capita should lead to higher growth for businesses in that region, plus the bonus of a relative exchange rate growth? Thank you.

WARREN BUFFETT: I'm not sure about the per capita part, Charlie.

CHARLIE MUNGER: My understanding is he was talking about investing in a region with high resources per capita. I think he means natural resources.

WARREN BUFFETT: Yeah. Are you thinking of places like Canada or something of the sort where the —

AUDIENCE MEMBER: I can clarify. Yes, high natural resources, but also good infrastructure. Thank you.

WARREN BUFFETT: And whether there would be relative currency strength in those as well and —

CHARLIE MUNGER: No. Whether it's a good area for us to be operating in.

WARREN BUFFETT: Well, that would be a little macro for us. We really just zero in on, you know, whether people will keep eating candy and whether we can charge a little more for it next year.

We don't play big trends. You know, we don't think about demographic trends or anything of the sort. We think about our own age as getting older.

But other — big trends, they just don't mean that much. There's too much money to be made from year to year to think about things that take decades to manifest themselves.

So I can't recall of a decision we've ever made on a purchase of a business or a stock or a junk bond or a currency or anything else based on a macro.

CHARLIE MUNGER: Not only that, we've recently failed to profit much from one of the biggest commodity booms in history.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And we'll probably continue to fail in the same way. (Laughter)

WARREN BUFFETT: But we'll search for new ways to fail. I mean, we're not trying to limit ourselves. (Laughter)

It's probably true, incidentally, in a country like Canada, where you've got, probably, millions of barrels of oil of — millions of barrels a day — of oil production coming on and where there's, you know, relatively few people and where there's already a surplus.

When they're running a significant current account surplus, that — you know, it's not strange that their currency should be strong relative to a country like ours where we're running a huge current account deficit and we don't have that same natural — the gain in natural exports coming on that they do.

But that — there's so many more important factors that are going to hit us immediately that that's what we really think about day-to-day.

27. Nuclear threat is "ultimate problem of mankind"

WARREN BUFFETT: Number 5?

AUDIENCE MEMBER: Good morning. My name is Glen Strong (PH). I'm from Canton, Ohio.

I'm an optimistic person, and I'm sure it would be more enjoyable to discuss the Chicago Cubs' march to the World Series.

WARREN BUFFETT: You are optimistic. (Laughter)

But everybody has a bad century now and then, as somebody said about the Cubs. (Laughter)

AUDIENCE MEMBER: However — (Laughter) — I have an information deficit on a certain topic that I hope you can fix. Please gaze into your crystal ball.

As an investor, I want to know how to address the risk of nuclear terrorism in the United States.

Consider a scenario where terrorists have detonated a nuclear device in a major U.S. city. I know there would be a terrible cost in human lives.

Gentlemen, what would happen to our economy? How would it respond? How resilient would it be? Thank you.

WARREN BUFFETT: Well, it would certainly depend on the extent of it.

But, if you're asking how to profit from that, there's probably some dealer that will sell you mortality derivatives. But I'm not sure that's what we would be thinking about then.

No. I agree with you. I couldn't agree with you more about that being the ultimate problem of mankind, not necessarily a terrorist-type usage, but a state-sponsored usage of weapons of mass destruction.

And it will happen someday. The extent to which it will happen, where it will happen, who knows. But we've always had evil people. We've always had people who wish evil on others.

And, you know, thousands of years ago, if you were psychotic or a religious fanatic or a malcontent and you wished evil on your neighbor, you picked up a rock and threw it at them, and that was about the damage you could do. But we went on to bows and arrows and cannons and a few things.

But since 1945, it's — the potential for inflicting enormous harm on incredible numbers of people has increased, you know, at a geometric pace.

So it is the problem of mankind. It may happen here. It may happen someplace else.

People say it's a — sometimes they say, "Well, you know, if we'd solve poverty, we'd solve this." Well, I will just remind you that nuclear weapons have only been used twice, and those were by the richest country in the world, the United States, in 1945.

So, people will justify their use under some circumstances, if they feel threatened. They will justify them for religious reasons. They will do all kinds of crazy things.

And the — what holds it in check is the degree to which the lack of knowledge of how to do it is controlled, and the degree to which the materials are controlled, and which the deliverability is circumscribed.

And we're losing ground on all of those fronts. The knowledge is more widespread. The possibility of getting your hands on materials — you know, the Dr. Khans [Pakistani nuclear scientist] of the world and so on, has increased.

And it will be a — it's a real problem, but we won't be thinking about what Berkshire did that day in the stock market.

And I don't know how money attacks that. I mean, I've always saw that as the top priority, I think should be the top priority for philanthropy, in my particular case.

But it's a difficult — it's a very difficult — it's a worst-case problem. You know, you have 6 billion people in the world, and you have a certain percentage of them who are, one way or another, a little crazy, or very crazy, and some of whom in that craziness would manifest itself by trying to do great harm to a lot of people.

And it's — only one of them has to succeed.

I don't know how many we've intercepted over the years. I'm sure we've intercepted a lot of incipient ones.

But it is a worst-case problem, and one will succeed at some point. And it may be state-sponsored; it may be terrorists.

But, you know, Berkshire is better set to survive than anybody else, but it won't make much difference.

Charlie?

CHARLIE MUNGER: Well, I think that the chances we'll have another 60 or 70 years with no nuclear devices used on purpose is pretty close to zero.

So, I think you're right to worry about it, but I don't, myself, think there's much that any of us can do about it, except be as sensible as we can and take the consequences as they come.

WARREN BUFFETT: The only thing you can do about it — but you only have one vote — is to elect leaders who are terribly conscious of the product — problem — and who devote a significant part, you know, of their thought and energy into minimizing it.

You can't eliminate it. You know, the genie is out of the bottle. And you would like to have the leading — the leaders — of the major countries of the world regarding it as their primary — as a primary — focus.

Actually, in the 2004 campaign, I think that both candidates said it was the major problem of our time. But, you know, they probably suffer from the same feeling that I do, that it's very hard to address.

28. A Berkshire stock buyback won't be a secret

WARREN BUFFETT: Number 6?

AUDIENCE MEMBER: Hello, Mr. Buffett, Mr. Munger. My name is William Schooler (PH), and I'm a shareholder visiting from Spicewood, Texas.

I would like to thank you both for being so generous to the public with your ideas.

Last year, I read "Poor Charlie's Almanack" and came across a passage on share repurchases.

It reads, quote: "When Berkshire has gotten cheap, we've found other even cheaper stocks to buy. I'd always prefer this. It's no fun to have the company so lacking in repute that we can make money for some shareholders by buying out others," end quote.

Last year, you bought stock in some great businesses trading at fair prices, such as Walmart and Budweiser, but did not attempt to buy our own shares.

Would shareholders be correct to infer from this decision that you both felt Walmart and Budweiser were trading at a deeper discount to their intrinsic values than Berkshire was?

And would it be possible to buy as much Berkshire in the open market as you did Walmart without running up the share price?

WARREN BUFFETT: Most of the time, we would not be able to buy an amount that would be material, in terms of increasing the value of the remaining Berkshire shares. But that doesn't mean it would never happen.

But it — if you look at the trading volume on Berkshire — and, [CFO] Marc [Hamburg], you might put that up, if we can, in a second — we probably have less opportunity than most companies if our stock is selling — should be selling — below intrinsic value to have anything meaningful happen.

We would also have — if we regarded some other company as worth X, a good business, and we could buy it at 90 percent of X, we might be doing that now, whereas we wouldn't have done it many years ago.

But we might require a somewhat greater margin, in terms of buying Berkshire shares, simply because our view on that might be less — we probably have more knowledge on it, but we might be less objective than on some other things.

We think that when we buy — if we were to buy in Berkshire shares — and, if you remember, four or five years ago I announced we would if the price stayed the same — that the case ought to really be compelling, and if it's compelling, we ought to do it. It was compelling at that time.

But simply the act of writing about it — you know, a little bit of a Heisenberg principle — the act of writing about it, in effect, eliminated the opportunity to do it, which is fine.

Because we do not — we are not looking to make money off of buying from shareholders at a depressed price.

On the other hand, if the price is sufficiently depressed, we will announce again that we intend to do it, and then we'll see whether we actually get a chance to do it. Charlie?

CHARLIE MUNGER: Yeah. The whole climate in the country is different now.

It used to be that almost every company that bought in shares was buying them in at an obvious bargain price. Now I think a lot of share buying is designed to, sort of, prop the stock price.

In other words, it's not bargain-seeking. It's more like Sam Insull.

WARREN BUFFETT: Yeah. Forty years ago, 30 years ago, it was a very fertile field for making money to look at companies that were aggressively buying in their shares, the most extreme case probably being Teledyne.

But those people were buying overwhelmingly — Gurdon Wattles was doing it at the companies he controlled — those people were motivated simply by the fact they wanted to buy the stock below what it was really worth and — significantly below — and you could make money with that group, and we did a little of that at the time.

I would say in recent years, that motivation has been swamped by people who either think it's fashionable to buy in shares, or by people who really like the idea of trying to prop their stock up somewhat.

And the SEC has certain rules, in terms of the way you conduct your repurchases to prevent daily, sort of, propping up.

But I think there's a lot of motivation that our stock has got to be cheaper than other people's stock, and we've got a wonderful company, and we're just going to buy the stock come hell or high water, and that is not the way we would go about repurchasing shares.

We've got — well, we had up there, I think — some figures that showed the turnover of Berkshire shares compared — in a year — compared with a few others I picked out.

I think Berkshire has the lowest turnover, by some margin, of any major company in the United States.

And I put Walmart up there because the Walton family owns about the same — in fact, they own more — of Walmart than I do of Berkshire.

So, this is not a function of simply the fact that we've got concentrated holdings with the Buffett family.

This is a reflection of the fact that we've got a really unusual shareholder body in that they think of themselves as owners and not as people who are moving around with little pieces of paper every week or month.

We have the most — in my view — we have the most what I would call honest-to-God ownership attitude among our 400,000 or so shareholders of any company — of any big traded company — in the United States.

People buy Berkshire to own it, and hold it, and that's reflected in our turnover. That does mean if, for some reason, the stock gets cheap — real cheap — that we would not be able to buy a lot of stock in.

But we don't want — we are not looking to buy out our partners at a discount. If it sells there and we tell them we're going to buy it, we'll buy it. But that's not a way that we're trying to make money.

Charlie, any more?

CHARLIE MUNGER: No. I've said my piece.

29. Advice to young investment professionals

WARREN BUFFETT: Number 7?

AUDIENCE MEMBER: Good morning. My name is David Saber (PH), shareholder from Minneapolis, Minnesota. Looking for some advice you might give the young professionals here.

I could be classified as one of those helpers you describe in your annual report. In fact, most of my friends are helpers, and some could be classified as super helpers.

Most would love to step out and explore some of their more innovative ideas, innovative business models, strategies, and things of that nature.

But the risk of giving up a significant salary, health insurance, flights, other ridiculous corporate perks some of us young professionals earn.

What advice would you have for us in pursuing those dreams?

WARREN BUFFETT: Charlie, what do you think?

CHARLIE MUNGER: Well, there's certainly a lot more helpers in the economy than there used to be, and the ones that come here tend to be the very best of the helper class.

So, I don't think you should judge the helper class by those you meet here. We get the best of them.

And as to what the young helpers ought to do so that they'll eventually be like Warren Buffett, I would say the best thing you can do is reduce your expectations. (Laughter and applause)

WARREN BUFFETT: I think I've heard that before.

Well, you know, as I wrote about — and I — trying to tweak the system a little bit — but it is an interesting business in that the activities of the professionals are self-neutralizing.

And if you're going to — if your wife is going to have a baby — you're going to be better off if you call an obstetrician, probably, than if you do it yourself. You know, and if your plumbing pipes are clogged or something, you're probably better off calling a plumber.

Most professions have value added to them above what the laymen can accomplish themselves. In aggregate, the investment profession does not do that.

So you have a huge group of people making — I put the estimate as $140 billion a year — that, in aggregate, are, and can, only accomplish what somebody can do, you know, in ten minutes a year by themselves.

And it's hard to think of another business like that, Charlie.

CHARLIE MUNGER: I can't think of any.

WARREN BUFFETT: No.

But it's become a bigger and bigger business.

And, as I've pointed out in the report, the main thing that's been learned is that the more you charge, at least temporarily, the more money you bring in, that people have this idea that price equals value.

It's useful to get into a business like that.

Sometimes, if I'm talking to the people at a business school and I ask them what the — what a great — to name me a great business — and, of course, one of the great businesses is a business school because, basically, the more you charge, the more your prestige is, to some extent.

And people think that a business school that charges 50,000 a year tuition is going to be better than one that charges 10,000 a year of tuition.

So there's some of that that — well, there's a lot of that that's gotten into the investment field recently, and you now have large — certain large — portions of investment management that are charging fees that, in aggregate, cannot work out for investors.

Now, obviously some do, you know. But you cannot be paying people 2 percent and 20 percent where they get up it in the good years, and they fold their partnerships and start another one if they have a bad year and that sort of thing.

You can't have that coming out of an economy that's only going to produce, we'll say, you know, 7 percent or something like that a year for investors, and have people net better off. It isn't going to work.

And then the question that you will have is, "How do I pick out the few exceptions?" And everyone that calls upon you to sell you this will tell you that they are an exception.

And, I am willing to bet a significant sum of money, we'll put it up, to anybody who wants to name ten partnerships that are $500 million or more of management and pit those, after fees, against the S&P over a ten-year period.

It — you know, it gets away from the survivorship bias and all that kind of a thing. And it isn't going to happen.

But a few will do well. They're bound to do well.

And, actually, I think I do know how to pick a few that will do well. I mean, I did it in the past.

When I wound up my own partnership in 1969, I told people to go to either Bill Ruane or Sandy Gottesman, and that would have been a very good decision, whichever place they went.

So, if you know enough about the person, know enough how they've done it in the past, know enough about their personality, honesty, and a whole bunch of things, I think that occasionally you can make a very intelligent choice in picking an investment manager.

But I don't think you can do it if you're sitting running a pension fund in some state and you have 50 people calling on you.

You're going to go with the ones that are the best salespeople and not the ones that are the best investors. Charlie?

CHARLIE MUNGER: Yeah. On that state pension fund investment subject, I think it ought to be a crime to entertain, in any way, a state pension fund official, and I think it ought to be a crime, if you are a state pension fund official, to accept the entertainment.

It's not a pretty scene, a lot of investment management, in America now. And, human nature being what it is and the amounts of money being what they are, I don't think much is going to be improved.

30. Break for lunch

WARREN BUFFETT: Well, we wanted to leave you in a good mood for lunch. So — (laughter) — we will break now, and we'll come back in about 45 minutes or so.

And those of you who are in the other rooms, by then the crowd thins, for some explainable reason, and you can all join us here in the main room. And we'll be back in about 45 minutes.

Afternoon Session - 2006 Meeting

BACK TO TOP

1. Buffett favors path to citizenship for some illegal immigrants

WARREN BUFFETT: OK. We'll go to zone 8.

AUDIENCE MEMBER: Where's the light?

Good afternoon, Mr. Buffett. First of all, I want to thank you for responding to all my letters throughout the years. I will always treasure them.

Last week, demonstrations in many cities across the United States took place on the subject of illegal immigration. Many companies want to stay in the U.S. but have grown dependent on cheap, illegal labor as a way to remain globally competitive.

A recent Businessweek article describes Shaw's competitor, Mohawk Carpets, and their employment of illegal immigrants. If illegal immigration reform were to occur, how would you see this affecting Shaw, Clayton, and other Berkshire subsidiaries?

WARREN BUFFETT: Yeah. I didn't read that, and I don't know much about the Mohawk situation. I don't — I don't know anything about it.

I'm sure in Nebraska, you know, there are very substantial numbers of illegal immigrants employed. Meatpacking has been an area that a number have gone into.

And I actually was down at the Omaha airport about 2 years ago, and there was a very large plane there, and I saw these — well over 100 people that were in shackles that were being put on that plane.

I kind of wondered what they did, if they ever had some kind of emergency on the plane. But they were being deported. So there's a lot of it goes on in Nebraska.

You know, I think it's a problem that should be addressed and addressed promptly. I don't believe in shipping 11 million people back away from the United States. Whatever acceptable way that the country can handle giving those people citizenship, I, basically, would support.

I think we ought to enforce the rules in the future. I think they ought to be liberal rules, but I think they ought to be enforced.

But I don't think it would make dramatic differences. I mean, if one meatpacking plant employs people at subpar wages, you know, the rest of them are going to do the same thing.

You may end up paying a little bit more for meat in the end, but I do not think it would have a dramatic effect on the economy or even on specific industries, except to change, maybe, relative prices a bit.

But I don't think it would have a dramatic effect on the economy if the people that are here illegally became legal in some manner.

You know, who's to say if Charlie and I had been born into some terrible situation in some other country, we wouldn't have tried to get into this place ourselves.

So it's a — I'm pretty empathetic with it, but I believe that we do need to have laws that are enforced in the future. I don't think we should send 11 million people back.

Charlie?

CHARLIE MUNGER: If you don't like the results, I think you should get used to it because we never seem to have the will to enforce the immigration laws. I just think that what you've seen is what you're going to get.

WARREN BUFFETT: I don't — in terms of the carpet industry specifically — you mentioned Clayton Homes. I wouldn't — I would think the mobile manufactured housing industry — I'd be surprised if there was any unusual number at all of illegal immigrants, but I — the answer is, I don't know that for sure.

But I don't see any change in those industries.

2. Business schools have improved "considerably"

WARREN BUFFETT: Number 9?

AUDIENCE MEMBER: Hi, Warren. Hi, Charlie. My name is Jeremy Cleaver (PH), and I come from Lawrence, Kansas. I'm a Jayhawk.

And what do believe is the best finance program in the U.S.? (Buffett laughs)

Also, I will be graduating in a year. Could you compare and contrast the financing opportunities now and when you graduated college?

WARREN BUFFETT: He comes from a school that has set some classes up in the last couple years that are absolutely terrific.

I've had — I will have in this school year, probably close to 40 schools where the students come out. And now I usually double up schools, because 20 of these a year is about all I can handle.

And we've had some terrific groups come out. And I would say that the teaching in finance departments, based on what I've seen, has improved quite a bit over 20 years ago. But that was from a very, very low base.

The orthodoxy of 20 or so years ago where, really, you know, the flat Earth was being embraced, has improved considerably.

And one particular place is KU. Professor Hirschey has done a great job. (Applause)

Missouri, Florida, Columbia, a lot of good schools — Stanford — have got people in those departments that are doing a very good job.

And 25 years ago, you'd have had a tough job getting a position at a finance department, and you certainly would have had your advancement stifled, unless you went along with the orthodoxy: efficient markets and modern portfolio theory and a lot of stuff that, not only wouldn't do you any good, but might get you in trouble.

And that has — that's improved a lot. And I enjoy seeing these groups of students as they come out, because it's quite encouraging. Now, they all think they're going to get rich by, sort of, copying what Charlie and I did many, many years ago. I wish them well.

It's — the amount of brain power going into money management gets a little distressing, particularly to Charlie. But I would — you know, it's a great time to be 22 or 23 or 25 and getting out of school.

So, you can look ahead to a very — I think a very interesting future in this country, even though you may find that the method of using the talents you have in investing get used in a somewhat different manner than where they — where they're used presently.

I mean, right now an awful lot of the students that come to visit Omaha say private equity or hedge fund, and it's hard to imagine a world where everybody is running a hedge fund. I'm not sure exactly what we would do for food and clothing, and a few things like that.

But I am encouraged by the kind of students I meet. When the KU group comes up — we had a great time. They put on various skits. They tried to sell me companies. I'm hoping they succeed.

We haven't had any luck yet, but they keep coming up with good ideas, and I'll keep pursuing them. And one of these days, every one of those students will get — I've offered them two B shares, and that's a limited-time offer to try to spur extra activity.

And I hear from a lot of students later, and I think a lot of them have their heads screwed on right. Charlie?

CHARLIE MUNGER: Well, I've heard that something like half of the business school graduates in the elite eastern schools want to go into private equity or hedge funds.

And those whom I bump into seem to judge their progress in life as to whether or not they're keeping up with their age cohort at Goldman Sachs. That appears to be the minimum standard by which progress of life is measured, and this can't possibly end well. (Laughter)

WARREN BUFFETT: You can see why they come —

CHARLIE MUNGER: — in terms of satisfying all these expectations.

WARREN BUFFETT: That's why they come to see me instead of Charlie. (Laughter)

He'd give them better advice, don't misunderstand me, but go away with very long faces.

3. New CEO will go through a "media probation-type affair"

WARREN BUFFETT: Number 10?

AUDIENCE MEMBER: My namaste and good afternoon to Swamiji and respected Charlie Munger. Yes, I did say "Swamiji." I see your inner dress crowned by your truth, by your humbleness, by your simplicity.

But your outer dress — I mean your wealth — is for the needy, at large. So you look upon us, your children, your friends, and your partners.

My name is Shekhar Agarwal. I'm from Sugarland, Texas, suburb of Houston.

Since May '99, I got interested in Berkshire Hathaway. And I have read a lot of what you have written. So, I can judge a little about you.

By the way, I bought B shares March 3, 2000, at 1410 before they hit the low on March 10, and it became at that time 40 percent of my portfolio, and I still own all those shares and many more.

As you tell the students who come to Omaha to run a portfolio with real money to have a real feeling and real learning, I had the same experience with you.

You know, three years back, I had a chance, with my wife, my daughter, and my 6-year-old son, who is with me today, to spend a few minutes with you when you came to Houston during the opening of a new Star Furniture store.

As we were posing for a family picture with you, my 6-year little one was standing just beside you, while you were sitting on a high-bar chair. And you said to this stranger, "Son" — you said

— “Son, you come and sit in my lap.” Sir, Swamiji, that is your simplicity. That is your humbleness.

And you talk about the contribution of Ajit Jain and ask us to bend really down if we see him, or name our children Tony to honor his contribution. Well, 40 years of selfless services to this corporation and to the humanity, you rightly deserve this distinction or this title of ”Swamiji.”

There is a beautiful, beautiful — (Applause) — beautiful prayer in the Holy Vedas that says “tvam jīvehiṁ śaddhā-śataṁ.” It means, “The Almighty God says, ‘Oh, my child, may you live hundred and longer peacefully.’”

So that’s my wish. That’s my prayer on your 75th birthday. And, Swamiji, I’m waiting for my chance to touch your feet and get your blessings. (Applause)

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: Let me finish, please. Swamiji, I have a question anyway. (Laughter)

A lot of business people have a great amount of respect and trust for this 75-years-young teenager girl who is sitting by the phone waiting for it to ring, and now and then that phone rings.

I have no concern about the next CEO of Berkshire Hathaway to take this company forward, but I do wonder about this phone. It may not ring as often as it does now, until the new CEO earns the respect and the trust of these phone dialers.

Do you see that a concern? And do you think it is a good idea that you may become the only chairman, and let someone else become the CEO, and let him earn the respect and trust under your umbrella while you are still young and healthy? Thank you very much.

WARREN BUFFETT: Yeah. Thank you. (Applause)

I don’t think there’s any question, but — that my successor, you know, will go through, sort of, a media probation-type affair for a year or so.

And people will, understandably, wonder whether the culture is going to be different under the successor than it’s been at this point.

That’s going to happen. It won’t be the end of the world. It will mean that the phone will — it — the phone probably won’t ring less, it will just be a different kind of suitor that is calling.

The investment bankers will all try out this guy to see if he’s softer than I am and wants to participate in auctions and all of that sort of thing.

But I think it will become evident — and it will take a year, two years, maybe — I think it will become evident that the culture is the same, that the yardsticks, the metrics, the attitude towards shareholders, the whole thing, will not change, the board will not change.

But I think there will be a hiatus of sorts where people do not have the same feeling immediately that joining Berkshire is going to be the same experience as it — with our companies — as its been in the past. But it won't last long.

I can tell you that the successors that the board has in mind — you know, they're very smart. They understand. They've bought into the whole corporate personality we have.

And they will develop — be somewhat different in style, but they will — they will develop the confidence of the world that — and to possible sellers of businesses — they will develop the confidence that it's going to be the same Berkshire going forward.

But it's a good question. And there will be — there will be a period when the phone won't ring for a while until people realize that Berkshire is, sort of, one-of-a-kind, and it's continuing to be one-of-a-kind.

I don't think it would work well, you know — but it's the kind of the thing we talk over with the board, though — but I don't think it works well to have, sort of, a half-and-half arrangement.

I mean, you could say that I could handle, or encourage the handling, of the deals and somebody else could, sort of, be the operating guy. But the truth is, we don't need an operating guy.

You know, we've got people running the businesses that are running them, and they're very good at it. And the main thing to do is to not destroy or damage the spirit they bring to it and the fact that they like this method of operation.

So it would — I'm not sure what a chief operating officer would do at Berkshire except expose the fact that I wasn't doing anything. (Laughter)

And as long as I'm around, they're not going to get the calls on the deals. I mean, people are going to want to talk to me. I mean, that's not a handoff that would work.

So I think we'll go along in this mode. And, you know, you will have a period, everybody — there will be stories a year after I die that, you know, says one year later and what's happened and all that sort of thing, but that will fade out.

And my successor will put his own particular stamp on the place, but he won't mess with the culture. They're too smart. They've seen it work too well. So that — the calls will start coming in again after a while.

We will still represent, sort of, a one-of-a-kind place for the owner that really cares about the future of his business.

For one reason or another — tax reasons, family division of shares or something — you know, they have to — they have to solve the ownership problem.

But they want to solve it in a way that really doesn't change the psychic ownership of the place and the management of the place. And they can't find that elsewhere, and they'll continue to find it at Berkshire.

Charlie?

CHARLIE MUNGER: Well, speaking for the Munger heirs, I would rather the current method of operation continue to wring the last drop of good out of Warren. (Laughter)

WARREN BUFFETT: At low pay.

CHARLIE MUNGER: Yes, yes.

WARREN BUFFETT: Part of Charlie's instructions under all circumstances.

No, if we — if we thought there was some better way to make this place function better or to even make the transition easier to the next person, you know, we'd be delighted.

But I really think it's going to work pretty darn well. If I die tonight, the person who will take over tomorrow will not get as many phone calls for a while, perhaps, but very, very smart people. Know the business. You know, they know a lot about all businesses. They've got a general business knowledge.

I use "they" because there's three candidates, but there would be one specific one in mind. They know how to make deals. These people are plenty deal-savvy, and they know how to avoid other kinds of deals, which is equally important.

And the world would not fully grasp that for a year, maybe even two years. But once it happened, you can argue that it would be even stronger than before because at that point people would realize that it was institutionalized and not just a person.

You've got a — kind of a hat — I mean, I don't want to compare myself because it's not in the same league, but, you know, everybody, when Sam Walton died in, I think, 1991 or something, wondered whether Walmart would continue in the same tradition.

Well, the fact that it did has made that place a lot stronger than if it had just depended on the guy in the pickup truck. I mean, it was not — it was the creation of one person at Walmart, but it was not required for the continuation at all. And we're not in the same league, but it's the same idea.

4. Go with your gut when picking a charity

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: My name is Martin Wiegand from Chevy Chase, Maryland. Mr. Buffett and Mr. Munger, on behalf of the assembled shareholders, we thank you and all the Berkshire staff who put so much work and thought into making this weekend such a wonderful community-building event. (Applause)

WARREN BUFFETT: Martin, is Janie (PH) with you?

AUDIENCE MEMBER: Yes, sir.

WARREN BUFFETT: OK. Well, she sent me some great sweetbreads the other day. I love them. Keep them coming. Thank you. (Laughter)

AUDIENCE MEMBER: Through the years, you have generously helped us thinking through capital allocation decisions for funding our businesses and feeding our families.

Would you please help us think through the capital allocation decisions we face when it comes to charitable giving, particularly as it concerns how we pick effective charities? Thank you.

WARREN BUFFETT: You know, it's tough to give other people advice on that. But, you know, you have to pick the things that are important to you. And, you know, many people — majority in the United States — it's their church. You know, there's more money given to churches than anything else.

Many people — very many people — it's their school, or schools generally. You know, I think, to a great extent, you should pick whatever gives you the most satisfaction, and that will probably be something that you know, something you've, maybe, benefited from yourself.

I look at it a little differently. The amount of funds are different, too, but I like to think of things that are important but that don't have natural funding constituencies.

But that isn't something, you know, for millions of people to be following as an example or something. Nothing wrong with doing something that gives you plenty of personal satisfaction and does some good for other people in the process.

So I would not be reluctant — I would not feel I had to be as objective about that, necessarily, as I was about buying securities or something of the sort. I would, kind of, go where my gut led me and make it something you participate in.

And, like I say, I think if you're doing it with large sums, you may have some reason, maybe even some obligation, to try and think about where really large sums can have an important impact on a societal problem that might not get attention otherwise. And, you know, that's, sort of, where my own thinking leads me.

But I would — I would go with something where I felt I knew where the money was going to go and I knew some good was going to come out of it. And maybe, by observing what took place, I could make the next gift more efficient than the last gift and more beneficial.

Charlie?

CHARLIE MUNGER: I've got nothing to add. But I have a question: would you pour me a cup of coffee? (Laughter)

WARREN BUFFETT: We don't sell coffee, Charlie. We sell Coke. (Laughter)

We get the profit on one out of every 12 Cokes. So I don't care whether you drink them, just open the can. (Laughter)

5. We like the regulated utility business the way it is

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: Good afternoon. My name is Robert Piton (PH) from Chicago, Illinois.

And my question is, did the possible future deployment of telecommunications services over power lines factor into Berkshire's decision to invest in the utility space? Thank you.

WARREN BUFFETT: Yeah. The answer is no. We're in the utility business — the regulated utility business — because we like the business as is.

Where it leads, you know, will be determined — well, in specific states — by what they want us to do and maybe by technological changes, generally.

But we're going to earn a return on capital employed if we do an efficient job, keep consumers happy, whether we transmit it the old way or, you know, some new processes come along.

So it's a business where we're trying to be efficient, which means serving our customers while keeping their costs down as much as possible. And we will — even in terms of what generating sources we use — we are following the will of the people in the states in which we operate.

There are different costs associated with different forms of generation. And we feel that if people want to elect a more expensive way to generate electricity but one that they're more comfortable with in terms of the environment, you know, that's the decision of the people whose state in which we operate.

And we — so I do not see us — I don't see any large developments that change the economics of what we're doing. And we're certainly not going in — we're not buying an electric utility because we expect it to generate revenues from activities other than that.

Charlie?

CHARLIE MUNGER: Nothing to add.

6. "Media businesses do not have a great outlook"

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: OK. First, my name is Egil Dahl. I'm a retailer from Norway. I would like first to thank you gentlemen for the opportunity to come here and ask two of the best businessmen in the world a question.

My question is regarding the media and entertainment business. Do you think that the nature of newspapers, magazine, television, and maybe movie and music business as well, are about to change permanently and become less predictable because of new technology and internet?

And the second part is, if not so, do you think that some of these businesses represent good purchases at the moment because the market thinks so? Thank you.

WARREN BUFFETT: Well, people are always going to want to be entertained and they're going to want to be informed and some mix thereof. But, you know, we only have two eyeballs, and we only have 24 hours a day.

So if you go back 50 or 60 years and think about how people got informed or entertained then, the choices were far fewer. You had the local movie theater, and you had the radio, and you had newspapers.

And as the years have gone by, what technology has done is opened up a huge variety of ways of being informed faster, certainly. And whether it's better or not depends on who you ask.

And certainly entertained in way many more forms, many that are free. And it hasn't expanded the time you have for entertainment or for acquiring knowledge.

And any time you get more and more people competing in any given area, generally, the economics deteriorate.

And the economics have deteriorated for newspapers, although they're still enormously profitable in relation to tangible equity employed, but they do not have the same economic prospects, if you look at the future stream of earnings, that it looked like they had 20 or 30 or 40 years ago.

And television, again, the margins have been maintained surprisingly well, but the audience keeps going down and — for any given means of distribution.

So, that has to erode economics over time. Cable was thought to operate pretty much all by itself, and the telecoms come in.

And very few businesses get better because of more competition. They like to talk about it, you know, but it — you know, the idea —

I had one friend in the newspaper business. And I think Charlie used to tease her a bit by saying that her idea of a competitor was a corpse laid out on a slab with a toe twitching, you know. And the — it is not a better business when more people compete.

So I think that, generally speaking, the economics of media businesses do not have a great outlook, I mean, compared to — like I say, they're enormously profitable now, in returns on tangible assets.

I mean, it's a business — you know, a license from the federal government became a royalty stream on huge amounts of money.

I mean, there were only three highways between — electronic highways — between Procter & Gamble and Ford Motor and the eyeballs of several hundred million people, and those three highways could make a lot of money when there were only three highways.

But you keep building more ways to — for the P&Gs, or the Gillettes, or whomever it might be, or Ford Motor, or General Motors — to get to those eyeballs, and you decrease the value of the highways. It's not complicated.

So, I think you will see — it's hard to imagine those businesses having great prospects in aggregate.

We owned the World Book. We still own the World Book. We were selling 300,000 sets a year or something like that in the mid '80s. It's a very valuable product. It sold for $600 or thereabouts, and it was worth it.

But the problem became that you could get that same information, or a good bit of the same information, you know, very, very cheap through the internet.

And you didn't have to cut down trees. And you didn't have to run paper mills. And you didn't have to hire United Parcel Service to deliver a very bulky package.

And it isn't that the product we have isn't worth the money; it's that people have lots of other alternatives. And that's true in information and entertainment in a big, big way, and it won't stop, in my view.

Charlie?

CHARLIE MUNGER: Yeah. It's simplicity itself. It will be a rare business that doesn't have a way worse future than it had a past.

WARREN BUFFETT: Give them the bad news, Charlie. (Laughter)

The thing to do was to buy the NFL originally or something like that.

I mean, you know, there still is only — you know, there are certain primary events, but it's the people who transmit them — there's more ways to transmit those events, and so the value gets extracted in a much different way.

7. "Significant consequences" from U.S. trade imbalance

WARREN BUFFETT: Area 2?

AUDIENCE MEMBER: Good afternoon. My name is Yuji Siamoto (PH) from New York City.

I would like to ask Mr. Buffett regarding your views in respect to currency: the renminbi, the yen, and the euro, in particular.

During the visit by Hu Jintao, this issue of the currency level had become a big issue. And increasingly, this is becoming a very, very important issue for economic health of this country.

United States is becoming highly dependent on very cheap, underpriced Chinese exports in all consumer goods. You go to Walmart, and most of the high product — high-end product electronics — or most of the — any value-added products — are manufactured in China.

U.S. is almost addicted to very low-priced Chinese goods, thanks to artificially maintained currency level. At the same time, U.S. is becoming addicted to very cheap capital from China and Japan, as they provide infusion of capital to U.S. Treasury markets, thus keeping the interest rate low for mortgage rates.

I see a great danger if this is maintained for long time, as U.S. becomes addicted to this cheap Chinese or Asian exports for all our consumption, and also for all of our cheap mortgage rates.

And this is almost like being addicted to opium, as Chinese were addicted to opium during Opium Wars.

And should government try harder to break this vicious cycle? And, if so, what would you think about the currency level?

And you have — previously, you have held very strong views about the dollar, but what are your views now, and are you capitalizing on your views on the currency?

WARREN BUFFETT: Yeah. Well, my views — and Charlie may disagree — but my views are strong as ever, perhaps a bit stronger. The — we are doing less directly in currency futures because the — as I explained in the annual report — the carry cost has gone from being positive to quite negative.

So there are better ways, in my view — considerably better ways — of mitigating the consequences of the dollar becoming a lot weaker in the future.

We like the idea of developing earning power in other currencies around the world, and, in effect, in ISCAR itself, the — a large portion of the earnings are not in dollars, and we're doing it in other areas as well. We will hold less in currency futures unless the carry picture changes.

But the fundamental picture, what, in my view, is almost — you never say "certain," but a very high probability of happening, is that the U.S. currency weakens over time.

No idea about the next 6 months or year or anything, but over a long period of time, weakens against other currencies because we are following policies that don't seem much — don't seem to leave much alternative.

Here is a quote referring to running a large current account deficit that was given on February 28, 2002. The quote is, "Countries that have gone down this path invariably have run into trouble, and so would we. Eventually the current account deficit will have to be restrained."

Now, that was said by a very smart fellow whose name was Alan Greenspan. And at that time, the current account deficit was 385 billion, and it will be more than double that now.

So here, 4 years later, we have gone down that path, which he talked about, and we've gone faster and faster down the path. And he says, invariably, it runs into trouble.

Now, in his later years as Fed chairman, he did not emphasize this view as much. He never repudiated it, but he sort of talked about other things more.

But it — it's going to lead to something, and it — in my view, it's likely to be something significant. And people talk about a soft landing, but they never explain to me exactly how it's going to take place.

And Chairman Bernanke recently gave a talk where he said the probabilities were that the ending would be good but that he couldn't rule out the possibility otherwise.

I think you will see significant consequences at some point. We will have, at Berkshire, a fair amount of our earning power coming from other countries with other currencies, but we will always be primarily in the United States.

And, you know, we may — one consequence certainly seems possible is significantly higher inflation as the years go by.

Because as you owe more and more money as a country, it gets more and more tempting to devalue what you owe by paying in a cheaper currency than in the one in which the debts were incurred.

Charlie, what do you have to say on this?

CHARLIE MUNGER: Well, I don't feel I have any special capacity to predict whether the euro was exactly priced right, right now. I don't consider it a big deal that Berkshire has had the position it's had.

In effect, about half of our surplus cash was stashed short-term in currencies other than the dollar. I regard that as almost a nonevent. Now, as it happened —

WARREN BUFFETT: Well, we made a couple billion dollars off it. (Laughter)

CHARLIE MUNGER: Yeah. I was — as I was about to say, that as it's happened so far, it's been a very profitable nonevent, but... (Laughter) Generally —

WARREN BUFFETT: If it doesn't mean anything to him, he can always give his share to me. (Laughs)

CHARLIE MUNGER: Yeah. Generally speaking, it can't be good to be running a big current account deficit and a big fiscal deficit and have them both growing.

I mean, a great civilization may be able to stand something like that for a way longer period than you might have thought at the outset.

But you think that in the end, there would be a comeuppance and that we would have to change policies, perhaps painfully. In fact, I would say almost surely painfully. Wouldn't you, Warren?

WARREN BUFFETT: Yeah, I would. And it's interesting because I think almost everybody says it's unsustainable, and then they never explain how it doesn't keep being sustained until something comes — very unpleasant comes along.

But then they also say that there will be a soft landing, and I don't always get from A to B to C when I listen to them. The —

Certainly the longer it goes on, the greater the credit — the greater the net debtor position the United States is in, the more people see that we are, sort of, addicted to this kind of behavior, the more chance there is at some point, probably brought about by some other extraneous affair, that currency doesn't —

There aren't some big adjustments that take place and, perhaps, some chaotic markets in which currency adjustments play a part. But knowing when or exactly how, it's impossible to say that sort of thing — predict that sort of thing.

Charlie and I, in the 1980s, saw something called "portfolio insurance" — and that was a very popular term then — catch on with institutions.

And what happened was that a group was around selling the idea that this was a sophisticated, superior way for large institutions to manage money. And they charged appreciable sums for people — to people — to set up mechanistic procedures for dealing with stock market fluctuations.

They did this with pension funds and various big guys. And it was very popular, and the academic literature was full of it, and people were teaching about it in the schools.

And then October 19, 1987, came along, and a relatively small portion of American money invested — American investments — were being guided by this portfolio insurance doctrine.

But just that small amount of money was a leading factor in producing a 22 percent change in the value of American stocks in one day.

Every one of these people individually thought what they were doing was intelligent, but, when aggregated, and having to follow a given signal, in effect, you created a doomsday machine. It was out of control, and some really chaotic things happened then.

I would say the potential for that sort of thing — not that exact thing at all, but that sort of thing to happen in the world ahead is — it's probably magnified quite a bit from what existed in the '80s.

And currency enters into it, but it's not — who knows where it starts or exactly why somebody yells "fire." But when "fire" is yelled, there will be — the currency markets will play a part in the rush for the door.

8. "CPI has understated inflation"

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Hi, there. Alex Rubalcava from Los Angeles.

Warren, you just brought up the topic of inflation, and so I wanted to ask, do you believe — or do you believe that the Consumer Price Index is a good and true and accurate measure of inflation?

WARREN BUFFETT: Well, that's a good question. Bill Gross has written a little bit about that in some of his PIMCO methods and — messages. And, you know, if you go out to the Furniture Mart and construct a price index, it hasn't moved very much.

I mean, it makes it very tough for comparable store sales when you were selling DVD players at X few years ago, and now you're selling them at a quarter of X. So there's certain areas that there have been a huge — in effect, deflationary aspects.

But I do think the CPI — and, like I said, Gross has written about this — but the CPI is not particularly a good index.

I always get a kick out of when they talk about the core CPI, and then they — and they say that excludes food and energy.

You know, food and energy strike me as pretty core to anything, in terms of the average — I can't think of anything that's much more core.

The CPI, as you may or may not know, many, many years ago had housing figured in directly.

There is no — the CPI now has a rental — which is an imputed rental type computation. It's still a large portion of the CPI, but it does not reflect the new housing prices, or —

And rentals — the rental factor has lagged, in my view, significantly below what housing costs really are for an American family. And since housing is a big portion, I don't think it picks it up well.

So I would say that the CPI has understated inflation for a great many people.

Now, if you're older and you own your own house — I mean, everybody has their own way of living.

And, I mean, if all you do is drink Coca-Cola all day, you know, Coca-Cola hasn't gone up in price enough, in my view, and you — my CPI has not changed very much.

But for somebody buying a new house versus 6 or 8 years ago and driving 30 or 40 miles to work or having a lot of driving in the family, the CPI has gone up a lot more than the government figures would indicate.

Charlie?

CHARLIE MUNGER: Yeah. I see it at Costco where there's been almost no inflation in the composite product that flows through Costco, and, yet, in other places you get these dramatic rising figures.

I don't feel sorry for the people that pay $27 million for an 8,000-foot condo in Manhattan. You know, if they've had little inflation, I guess it doesn't matter to the rest of us.

But it's almost weird the way the situation works in terms of how it's —

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: — it comes in just a few places.

WARREN BUFFETT: If you look at the Costco annual report or the Walmart annual report — these are huge enterprises — and you'll see their LIFO adjustment is just peanuts.

CHARLIE MUNGER: Almost nothing.

WARREN BUFFETT: Yeah. Just peanuts — is Costco on LIFO for —

CHARLIE MUNGER: Sure.

WARREN BUFFETT: — for fuel? I know they're on LIFO generally. Are they on it for gasoline or not?

CHARLIE MUNGER: I think so. I can't imagine they're not.

WARREN BUFFETT: Yeah. But they wouldn't have a large inventory relative to —

CHARLIE MUNGER: No.

WARREN BUFFETT: — their sales volume. But they — at Walmart, it's inconsequential. I just got through reading their annual report, and the LIFO adjustment isn't worth a hiccup, you know, basically.

And you're dealing with 300 billion — well, in the United States a little less than that — but $200-and-some billion worth of sales, and the LIFO adjustment would have picked up changes in prices of that mix overall relative to their inventory level.

So in jewelry, you know, because of gold and some things, we had some big LIFO adjustments last year.

Steel, we've had big LIFO adjustments. We have a steel service center in Chicago and we buy a lot of steel at MiTek and there's a big LIFO adjustment. So it's very uneven.

Carpet went no place for 20 years, but because it's petrochemical-based, there have been substantial price changes in the carpet business in the last couple years.

And our LIFO — we had a LIFO net — a minus LIFO figure, in effect — 3 years ago, and now we have 100 million or so of LIFO adjustments. So there's been a significant price change there.

I think overall, though, for a typical young family, that the CPI probably underestimates the burden they have faced, in terms of their own living situation.

9. Why we don't "do deals" with investment banks

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hi. I'm Mike Kelly (PH) from Iowa City.

We've heard a bit about ISCAR today. Could you tell us some things about some of the other acquisitions of the past year?

WARREN BUFFETT: What would you like to know, Mike? (Laughter)

AUDIENCE MEMBER: Um.

WARREN BUFFETT: I mean, we described it a bit in the annual report, but —

AUDIENCE MEMBER: Right. Well, I believe since the annual report, there have been a couple others. Russell, for instance.

WARREN BUFFETT: Yeah. Russell is in the works. There's just been a proxy statement that isn't out yet, but it's been filed with the SEC. You can get a copy of the filing. But that is one in process and is probably a couple months off from actual completion.

You know, we — I described the Business Wire situation in the annual report where I got a letter from Cathy after reading — reading a Wall Street Journal article. And, you know, these — they just all sort of pop up.

Medical protective, I think I suggested to Jeff Immelt at GE, that if — I knew they were interested in doing things with their insurance assets, and I suggested that was one portion of their insurance assets that Berkshire would have an interest in. And he and I met one time and we made a deal on that one.

PacifiCorp — that originated with Dave Sokol and the people at Scottish Power. I'm not even exactly sure what the sequence was.

But the one thing we haven't done is we haven't participated in any auctions.

I get books occasionally on various businesses, and the projections are just plain silly in these books. I mean, it's a — I would — maybe that's why they don't sign their names in the books, the people that write them, because they'd be embarrassed about the projections they put forth.

I would just love to meet the people that write those investment banking books and make them a bet on the earnings that they project four years out. I would win a lot of money over time. They wouldn't be met.

But we get the calls, occasionally, from the people that care about where their businesses end up.

We're going to close on Applied Underwriters in just probably a few days, and those are two terrific guys, built it up from absolutely nothing.

Actually, I bought a tiny business here in Omaha — as I explained in the report — that's why it's here.

But they wanted to come with Berkshire. They think their own — they're keeping 19 percent of the company. They think their own future will be the best in many ways, including financially, I'm sure, of being associated with us. They feel it's the best place for the people, have the most opportunity to grow. And, you know, they came to us directly.

You know, I don't know how many stories you read about a $4 billion deal, as appeared today in connection with ISCAR, where it doesn't say anything about an investment banker, on either side.

But you'll see more of those, I think, with Berkshire over the years.

Charlie, do you have anything in particular to add on our acquisitions recently?

CHARLIE MUNGER: Well, the interesting thing about it to me is the mindset. With all of these new helpers in the world, they talk about doing deals. That is not the mindset at Berkshire. We are trying to welcome partners. It's a total different mindset.

The guy who's doing a deal, he wants to do the deal and unwind the deal and — not too far ahead and make a large profit, et cetera, and that's not our mindset at all.

We like the things that we can buy and that never leave us, and we like the relationships that last and are fruitful, not just for us, but for the people working there and the customers and everybody else.

I think our system is going to work better, long term, than flipping a lot of deals. And we have so many new deal flippers in the game that I think they're going to get in one another's way.

In other words, I don't think there's enough money out there to have all this new class make all the money they expect to make on a permanent basis just flipping, flipping, flipping, flipping.

WARREN BUFFETT: They'll make it on fees, fees, fees, fees. (Laughs)

CHARLIE MUNGER: Warren reminds me, once I asked a man who just left a large investment bank — and I said, "How does your firm make its money?" He said, "Off the top, off the bottom, off both sides, and in the middle." (Laughter)

WARREN BUFFETT: I know which firm he's talking about, too. (Laughter)

CHARLIE MUNGER: That's not our culture. And a lot of you have been here so long, you can see that's not our culture. But in the end, it may be that Omaha will do better than Wall Street.

10. Salomon's 1991 reprieve prevented "absolute chaos"

WARREN BUFFETT: Number 5. (Applause)

AUDIENCE MEMBER: Hi. Steve Rosenberg (PH) from Michigan, originally. First, I'd just like to thank you both very much for continuing to serve as role models for integrity and common sense.

Can you describe a little bit more specifically — (Applause) — how a derivatives meltdown might progress and, ultimately, get resolved after it's been precipitated, and is there a plausible way to resolve it without some sort of a major bailout that would exacerbate a too-big-to-fail moral hazard problem?

WARREN BUFFETT: It's really hard to tell. I mean, it — you know, it — what will cause people to yell "fire," what will — how many people will rush for the exits, what they'll do when they get there — it happens occasionally.

You know, with LTCM — Long-Term Capital Management — in 1998, you know, it affected the financial world in a big way. It didn't affect it in the biggest way. I mean, the feds stepped in. But there were some pretty — pretty strange things happened during that period, in markets.

What happened in the junk bond market in 2002? I mean, it closed for a while almost, and it was chaos. So it's very hard to know exactly what would happen. I'll give Charlie a question here.

In 1991, when we were in Salomon — it was in August, middle of August — and on a Sunday we were within, probably, a half an hour of seeking out a federal judge to turn over the keys to the place to him and go into bankruptcy.

And, fortunately, the Treasury reversed itself, and we got out of that particular predicament. But the law firm was drawing up the papers for bankruptcy.

Now, that was on a Sunday. What would have happened Monday — and we had a good — we had, for those days, a good-sized derivative book. It would be peanuts now, but it was — it looked big at the time. We had a lot of security settlements due the next day.

Now, it happened to be the same day that Gorbachev was spirited away, and the Dow opened down a couple hundred points the next day off of a much lower Dow.

Now, if you had superimposed upon that the fact that Salomon failed in Japan starting at 7 o'clock or so the previous night and that it was — if you were delivering securities to them against payment the next day, you weren't going to get paid.

And if you were expecting securities from them, you weren't going to get those securities. And, by the way, you had a — I think a 6- or $700 billion derivative book.

And people who had traded off those derivatives had to try and figure out where they stood and scrambled around and whether their counterparties were any good.

What do you think would've happened on that Monday, Charlie?

CHARLIE MUNGER: Well, it could have been absolute chaos. That was a very interesting story with an interesting moral. Nick Brady really prevented that bankruptcy.

And he knew about Berkshire Hathaway from having been a family shareholder with the Chaces way, way back. And that had caused him to follow the matter with interest, particularly since he'd sold his own stock and watched his relatives, the Chaces, hold theirs.

So he knew about us, and I think he trusted you, Warren. And I think that mattered that day. So these old-fashioned reputational —

WARREN BUFFETT: Well, what would have happened the next day? I —

CHARLIE MUNGER: Well —

WARREN BUFFETT: It was terrifying. I'll put it that way.

CHARLIE MUNGER: Yeah, it was terrifying. And — but there was an element of personal reputation in the avoidance of finding out what would have happened that next day.

WARREN BUFFETT: Kim Chace, who I introduced you to earlier, his father actually introduced me to Nick Brady many, many years earlier, mid '60s, when Nick was working — was at Dillon Read and Malcom Chace said, "I'd like you to meet" — I guess he was a nephew or grandnephew.

In any event, I went over to Dillon Read and — I would have been in my 30s then — and Nick was a few years older — and we had a good time talking.

And then in 1991, he was secretary of the Treasury. And the Treasury had issued a death sentence to us at 10 o'clock in the morning on Sunday, and, fortunately, Nick, reversed that about 2:30 in the afternoon.

And if he hadn't, I don't know what would have happened. But that would have been kind of a pilot case for a mild derivatives daisy-chain-type panic. But that would be nothing compared to something now.

If — now, there's way more of the stuff that is collateralized these days than formerly, but it would not be a — it's not an experiment you would want to voluntarily conduct, I'll put it that way.

11. We love reading them, but newspapers are in trouble

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Hi. My name is Jeremy from San Diego. And, first of all, I want to thank you all for the tremendous impact that you've had on my career as a professional investor.

My question is also about the newspaper industry that the gentleman earlier touched on.

And for some of those same points that you brought up, some of the largest newspaper stocks seem to earn incredible return on invested capital as compared to a lot of the businesses in the S&P 500.

My question is more specifically related to valuation. If either of you were looking at a newspaper stock today and watching them fall, as some people may categorize falling knives, what would you use to determine — or how would you determine a very comfortable margin of safety to protect yourself against the deteriorating aspects of the newspaper industry?

WARREN BUFFETT: Yeah. Well, the question is what multiple you — what multiple should you pay for a business that's earning $100 million a year — call it pretax — whose earnings are going to go down 5 percent a year compared to what you should pay for a business with a — that's earning $100 million a year whose earnings are going to go up 5 percent a year.

And I would say that — I'm not saying that those are percentages I predict on newspaper companies — but certainly newspaper companies face the prospect of their newspaper earnings eroding.

And we've seen some of it already. We see every trend pointing in that direction. We own a newspaper ourselves.

And, you know, I do not think the circulation of our paper will be larger in five years, and I don't think the advertising pages will be greater.

And I think that's true even of newspapers that operate in more prosperous — or, actually, more growing, I should say — areas of the country than we do.

So — but I don't think — I don't think most owners of papers still have quite gotten to the point where they start projecting out declining earnings.

Certainly multiples on newspaper stocks are unattractively high if you would see some decline, like 5 or 6 percent a year on earnings, occurring to this point. They just — they're not cheap enough to compensate for that sort of erosion in earning power.

And then you face the added risk that they may have, sort of, a perception lag and that they may continue to use some of that money to buy other newspapers at prices which, again, don't make much sense.

It's pretty hard in a declining business to buy things cheap enough to compensate for the decline.

People in the business always tend to think that they're seeing the first robin, you know, or something, and that it's going to get better. And I would say in the newspaper business, the decline, if anything, is accelerated somewhat. I —

You know, when they take — when they take people out to the cemetery, they're taking newspaper readers, and when people graduate from school, they're not gaining newspaper readers.

And that may not change things overnight, but it goes in the wrong direction. And the less the readers, the less the readership, the less compelling argument to have to advertisers.

So that virtuous circle where everybody read a paper because every ad was in it, and every ad was in it because everybody read a paper, that virtuous cycle is going in the other direction now. And I don't think present prices for papers compensate for that.

And you are now hearing from a couple of guys that just love newspapers.

We think newspapers are indispensable, but we don't have a lot of — we have less company in that view. We love — I read five newspapers every day. Charlie probably does about the same.

CHARLIE MUNGER: Four.

WARREN BUFFETT: Yeah, he's — well, it shows too. The — (Laughter)

The — we couldn't live without them. But a lot of people can, and more people can every day. And though we started out — we love the idea of buying newspapers. We traveled to Cincinnati, cheap hotels, all kinds of things, to buy newspapers.

But — and we thought, incidentally, we loved them as products, and we thought they were the greatest of businesses, the ultimate bulletproof franchise. But it became apparent we were wrong.

You know, we still love them as news — as products, but we were wrong about the bulletproof franchise. And, you know, we've got to believe our eyes, in terms of what we're seeing in that world.

Charlie?

CHARLIE MUNGER: Yeah. I have an even greater sin to admit to. I once thought General Motors was a bulletproof franchise. And — but we have a wonderful way of coping with a lot of these things. We have this "too hard" pile.

I don't know if Warren is buying General Motors or not, but I have a good guess.

And it's just too hard. If something is too hard to do, we look for something that isn't too hard to do. (Laughter)

What could be more obvious than that? (Laughter)

WARREN BUFFETT: It may mean that we don't do very much. (Laughter)

CHARLIE MUNGER: Yeah. Yeah.

WARREN BUFFETT: We won't get into specifics. The news — it's — I don't think anybody has watched the newspaper business much more carefully than Charlie and I have for, really, 50 years.

We used to — we always talked about every paper in the country, and the potential for buying it and, all that sort of thing.

And it was a — it was easily understood. I mean, it was about as easy an economic — a business economics problem — as you could imagine. And we slowly woke up to the change on it.

Actually, I wrote in the 1991 annual report, the newspaper — the very — the preprints of the world, you know, started turning the newspaper into a wrapper. It contained a whole bunch of things that could have been contained in some other package.

Now, your newspaper wasn't reproducible in some other package, but this thing was carrying around a bunch of preprints. Now, the question is there a bunch — is there — are there easier ways to carry around those preprints?

But there was nothing magical about the paper except it got inside the house and brought the preprints inside the house. And as the newspaper lost penetration, it became a somewhat less efficient way of getting things into the house and other ways became more efficient at getting things into the house.

So these things — it's not a hard business to understand. And it has been interesting to me to watch both owners — direct owners — and investors in the business sort of resist seeing what's right in front of them, you know?

It just — it went so long the other way that you couldn't make a mistake buying a monopoly newspaper. Nobody ever made a mistake buying one, you know, until, what, 1975 or '80 or something like that.

CHARLIE MUNGER: Yeah. If the technology had not changed, they'd still be impregnable franchises. But the technology did change. Fortunately, carbide cutting tools appear to have no good substitute. (Laughter)

WARREN BUFFETT: It's a lot better business over time, if you have the right management. Now, it takes very good management. Nice thing about the newspaper business 30 or 40 years ago, it took no management at all.

I mean, if you had an idiot nephew, you know, you — that would be a perfect — or a network television station. I mean, they were going to make money no matter what happened.

They were going to make more money if they were under good management. I mean, if Tom Murphy was running your television stations, you were going to do much better than if you had your nephew doing it, but the nephew would have done all right. (Laughs)

12. Don't let your fear overcome your logic

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Hello, Warren, Charlie. My name is Matt Peterson (PH). I'm a shareholder from Seattle, Washington, and it is a true pleasure being here today. My question for you is simple.

The two of you have had a — many great opportunities throughout your years to work with many fine mentors and teachers.

And I'm wondering if you could provide us with a few names of some present-day mentors that we may look to for advice and our own ways to approach problems and situations, people similar to the Grahams and the Fishers of the present day?

WARREN BUFFETT: Well, the interesting thing, you don't have to look at the present-day ones, necessarily.

I mean, if you wanted to look at great business careers, you could look at Tom Murphy or Don Keough on our board.

And you can learn everything you could learn about being an outstanding businessperson by just studying them. And you don't have to study somebody that is 55 and currently in some executive position. Their lessons are timeless.

And there's going to be a study — I think the Harvard Business — somebody sent it to me from the Harvard Business School, you know, on Cap Cities.

But there's been others in the past. And, you know, if you learn the lessons of Tom Murphy, you don't need to learn any other lessons in terms of business.

And I would say if you learn the lessons of certain investors in the past, you know, you don't need to worry about a contemporary example.

Charlie?

CHARLIE MUNGER: Well, I think it's also true that Warren and I are not following very well the 40-year-old investment professionals. Isn't that right? (Laughter) Are you hiding something from me?

WARREN BUFFETT: I didn't know there were any 40-year-olds. (Laughs)

I thought they're all 25 now.

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: The — investing is not that — is really not complicated. I mean, the basic framework for it is simple. Now, then, you — you have to work at it some to find the best pockets of undervaluation, maybe, or something.

But you didn't have to have a — you didn't have to have a high IQ. You didn't have to have lots of investment smarts to buy junk bonds in 2002 or even to do some of the stuff that was available when LTCM got in trouble.

You really had to have, sort of, the courage of your convictions. You had to have the willingness to do something when everybody else was petrified.

And — but that was true in 1974 when, you know, we were buying stocks at very, very low multiples of earnings. It wasn't that anybody didn't know that they were cheap.

They were just paralyzed for one reason or another. And, you know, that — the lesson of following logic rather than emotion, you know, is something that — it's obvious. And some people have great trouble with it, and others have less trouble.

Charlie, can you give them any more?

CHARLIE MUNGER: Well, I think this is different. When we were young, we had way less competition than you people have now.

There weren't very many smart people in the investment management field. (Laughter) There really weren't. And you should have seen the people who were in the bank trust departments. (Laughter)

I mean — so, now we've got armies of brilliant young people and all these private partnerships and all these proprietary desks in all the big investment banks. It's a — and we've got a vast amount of talent in the investment management business.

So — and there's a lot of competition. Now, if there were suddenly a crisis now, there would be 500 firms that would be studying it intensely, each having capital that they could commit on a hair trigger. In our day, we would frequently be all alone.

WARREN BUFFETT: But in 2002 —

CHARLIE MUNGER: We'd be the only buyer.

WARREN BUFFETT: But in 2002, Charlie, there were tons of people that had investment experience and high IQs and lots of money was around. It wasn't a question about money, it's just they were terrified of that particular arena.

CHARLIE MUNGER: Well, when you have a huge convulsion, which is like a big fire in this auditorium right now, you know, you get a lot of weird behavior. (Laughter) And if you — (Laughter) — and if you can —

WARREN BUFFETT: Particularly at the head table. (Laughter)

CHARLIE MUNGER: — and if you can be wise when everybody else is going crazy, sure, there will still be opportunities. But that may give you long, dull stretches, if that's your strategy.

WARREN BUFFETT: Three years ago — two — three years ago you could find a number of securities in Korea, population 50 million, advanced society, strong balance sheets, strong industry positions, at three or so times earnings. Now —

CHARLIE MUNGER: But that took a convulsion to create that, a real — a big convulsion.

WARREN BUFFETT: Yeah. But the convulsion happened three or four years earlier —

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: — five years earlier. And plenty of smart people in Korea in the investment business, plenty of smart people here scouring — the information was all available.

You can go to the internet and get information about Korean companies that's just as good as you get it from the SEC. And there they were, dozens of companies at very, very, very cheap prices. Now, where —

CHARLIE MUNGER: It did —

WARREN BUFFETT: — were all these smart people with all this money —

CHARLIE MUNGER: It did happen. But if I asked you to name 20 more like it, you would have great difficulty.

WARREN BUFFETT: Well, if I have 20 more like it, I'm not going to name them. (Laughter)

13. If we were starting out again …

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: My name is Simon Denison-Smith from the UK.

My question is this: if you were starting out today with a million dollars, with a vision of building a business with 20 percent average growth in value over 40 years, what type of investments and investment strategy would you look to make in the first five years?

WARREN BUFFETT: Well, it's somewhat interesting that we formed the first partnership 50 years ago last — 2 days ago, Thursday, May 4, 1956, which was 105,000. (Applause) That's my sister clapping. She was in the partnership. (Laughter)

The — we would — if Charlie and I were starting all over again and we were in this, Charlie would say we shouldn't be doing this. (Laughter)

But if we were to succumb to Satan and engage in the same kind of activity, we would, I think, be doing something very similarly. If we were investing in securities, we would look around the world, and we would look at a Korea.

And Charlie says you can't find 20 of them, but you don't have to find 20 of them; you only have to find one, really. You do not have to have tons of good ideas in this business, you just have a good idea that's worth a ton, occasionally.

And in securities, we would be doing the same thing, which would probably mean smaller stocks — it would mean smaller stocks — because we would find things that could have an impact on a small portfolio that will have no impact on a portfolio the size of Berkshire.

If we were trying to buy businesses, we'd have a tough time. We would have no reputation, so people would not be coming to us. We'd be too small a player, if you're talking about a million dollars. So we would not have much success, I don't think, with small amounts, buying businesses.

Charlie started out, you know, in real estate development because it took very, very little capital, and you could magnify brain power and energy — or, I should say, brain power and energy could magnify small amounts of capital in a huge way that was not true in securities.

You know, my natural inclination was to look at securities and just kind of do it one foot in front of the other over time. But the basic principles wouldn't be different.

You know, I think if I'd been running a partnership a couple of years ago with a small amount of money, I think I'd have probably been 100 percent in Korea.

And, you know, I would be looking around for something that was very mispriced and which — and that I understood. And every now and then, that's going to happen.

Charlie?

CHARLIE MUNGER: Well, I agree with that. The concept that you're likely to find just one thing where it will make 20 percent per annum and you just sit back for the next 40 years, that tends to be dreamland.

And in the real world, you have to find something that you can understand that's the best you have available. And once you've found the best thing, then you measure everything against that because it's your opportunity cost.

That's the way small sums of money should be invested. And the trick, of course, is getting enough expertise that your opportunity cost — meaning your default option, which is still pretty good — is very high.

And so, the game hasn't changed at all in terms of its basic arithmetic. That's why modern portfolio theory is so asinine. (Laughter)

WARREN BUFFETT: It really is, folks.

CHARLIE MUNGER: Yeah. When Warren said he would have been all in one country, that's pretty close to right. He wouldn't have quite done that when he had the partnership, but he would have been way more concentrated than is conventional if you listen to modern portfolio theory.

Most people aren't going to find thousands of things that are equally good; they're going to find a few things where one or two of them are way better than anything else they know. And the right way to think about investing is to act thinking about your best opportunity cost.

WARREN BUFFETT: Number 9.

CHARLIE MUNGER: By the way, that's in the freshman course in economics everywhere in the basic textbook; it just hasn't made its way into modern portfolio theory.

WARREN BUFFETT: We don't get asked to do book reviews. (Laughter)

14. Munger thinks Prof. Jeremy Siegel is "demented"

AUDIENCE MEMBER: It's Anvayas Vegar (PH) from Munich, Germany. Thank you very much for the open discussion that you had with us.

Actually, I'd like to ask a question on a book, so I'll come back to the book review.

Jeremy Siegel had some ideas in his second book, and I would like to understand what — how this would impact your investment strategies, if there are any changes from his ideas, and how you react to these recommendations that he makes? Thank you.

WARREN BUFFETT: This is which book? Jeremy Spiegel?

AUDIENCE MEMBER: Jeremy Siegel, the second book, “Why the Tried and the True Triumph Over the Bold and the New.”

WARREN BUFFETT: That — it’s had no effect on us.

Charlie?

CHARLIE MUNGER: No, is that the fellow who’s very optimistic about common stock investment over long periods of time?

WARREN BUFFETT: The University of Pennsylvania. Yeah.

CHARLIE MUNGER: Yeah. Well, I think he’s demented. (Laughter)

WARREN BUFFETT: Well, he’s a very nice guy, Charlie. But — (Laughter)

CHARLIE MUNGER: Well, he may well be a very nice guy, but he’s comparing apples against elephants and trying to make accurate projections. (Laughter)

15. “Things are really screwed up if you’re getting calls on Sunday”

WARREN BUFFETT: Number 10. (Laughter)

AUDIENCE MEMBER: I’m Bob Klein (PH) from Los Angeles. You so eloquently stated that you can’t see who’s swimming naked until the tide goes out.

Could you discuss the issue of trying to employ a rational decision-making process in investing, or in business generally, as opposed to focusing on outcomes or results of just a few instances or over a short period of time?

For example, it may not be a good idea to underwrite some insurance policies if competition has lowered the premiums too far. And, likewise, in the stock market, momentum investors may get good results for a while. But buying high and trying to sell higher isn’t a good long-term strategy.

So I’d just like to hear you guys provide some detail on the importance of using an effective decision-making process, even though it may lead to some bad outcomes and underperformance in the short run.

WARREN BUFFETT: Yeah. Well, Ben Graham said long ago that you’re neither right nor wrong because people agree with you or disagree with you.

In other words, being contrarian has no special virtue over being a trend follower.

You're right because your facts and reasoning are right. So all you do is you try to make sure that the facts you have are correct. And that's usually pretty easy to do in this country. I mean, information is available on all kinds of things. Internet makes it even easier.

And then once you have the facts, you've got to think through what they mean. And you don't take a public opinion survey. You don't pay attention to things that are unimportant. I mean, what you're looking for is something — things that are important and knowable.

If something's important but unknowable, forget it. I mean, it may be important, you know, whether somebody's going to drop a nuclear weapon tomorrow but it's unknowable. It may be all kinds of things. So you — and there are all kinds of things are that knowable but are unimportant.

In focusing on business and investment decisions, you try to think — you narrow it down to the things that are knowable and important, and then you decide whether you have information of sufficient value that — you know, compared to price and all that — that will cause you to act.

What others are doing means nothing. It's what Graham writes in Chapter 8 of "The Intelligent Investor," that the market is there to serve you and not to instruct you. That's of enormous importance.

When people talk about momentum in stocks or charting or any kind of things like that, they're saying that the market is instructing you. The market doesn't instruct us; the market is there to serve us.

If it does something silly, we get a chance to do something because it's doing something silly. We do it. But it doesn't tell us anything. It just tells us prices.

And if the price is out of line where the facts and reasoning lead you, then you — then action is called for. And if it doesn't, you forget it and go play bridge that day and the next day, see whether there's something new. And the nice thing is there always is something new.

I mentioned the LTCM crisis. We were getting calls on Sunday from people that had portfolios that were in trouble. Now, I will tell you that if — you can make a lot of money on Sunday.

You may not get a chance very often, but any calls you get on Sunday you're probably going to make money on. (Laughter)

Things are really screwed up if you're getting calls on Sunday. And all you have to do is make sure that you're the callee and not the caller — (laughs) on Sunday.

But if you get those calls — you get a call on a Sunday and somebody says that the off-the-run is trading 30 basis points away from the on-the-run, you know, all you have to do is decide whether — how you handle that particular piece of information — whether it's correct in the first place — but how you handle that piece of information, whether you can play out your hand.

You never get in a position, obviously, where the other fellow can call your tune. You have to be able to play out your hand under all circumstances. But if you can play out your hand, and you've got the right facts, and you reason by yourself, and you let the market serve you and not instruct you, you can't miss.

Charlie?

CHARLIE MUNGER: Well, I would say some of you probably can miss. (Laughter)

WARREN BUFFETT: I would say Charlie can't miss. I'll put it that way. He'll agree with that.

Do you have anything further to add?

CHARLIE MUNGER: No.

WARREN BUFFETT: OK. (Laughter) At least I've got him off that previous subject.

16. How to read Berkshire's annual report

WARREN BUFFETT: Number 11. (Laughter)

AUDIENCE MEMBER: Hello. I'm Randall Bellows from Maryland. I would like to know how you would look at the Berkshire annual report.

What numbers in the balance sheet or the cash flows would tell you that Berkshire is underpriced? And what numbers would you look at to determine if Berkshire is overpriced? Thank you.

WARREN BUFFETT: We try to — and we take it very seriously — we try to put everything in that report that we would want to know if the positions were reversed.

If I were sitting with all of my net worth in Berkshire and had been on a desert island for a year and I — and the manager was reporting to me about the business, we'd try to have that same information that I would want from him. And we would try to present it to you in a way that's understandable.

And we don't leave out things that we think are important. We try not to put — I mean, there's — it runs about 76, I think, or maybe even 80 pages this year. I mean, there's — you can drown people in information that really doesn't make much difference.

But we've tried to organize it in a way by talking about these different groups of businesses. We try to explain how we think about it, in terms of things like the amount of operating earnings we've generated and the investments we have.

It's really as if it's a report that I was making to Charlie or Charlie would be making to me if one of us were inactive in the business and the other was running it.

And so I think — I mean, it may take a few hours to do it, but I think if you regard yourself as a serious owner of Berkshire, it's really worth reading the whole report.

Thinking about: what is there? What are these guys going to do with it? What are they trying to attempt? What are the odds they're going to be successful in that attempt? What are they —?

You know, what is it worth if they don't succeed very well in deploying additional capital? What might be the case if they were successful in deploying excess capital and incremental capital?

But I can tell you that, obviously, we think it's very important.

What counts is the kind of businesses we have, the kind of managers we have running those businesses, what those businesses are likely to earn over time — and we've expressed ourselves a little on that —

And then what are the resources that are available to keep adding to that collection of businesses? What are the kind of businesses we are looking to add?

And I think — you know, I think you'll find the information that you need to evaluate Berkshire, and it's not a — you know, you don't carry it out to four decimal places.

Charlie and I, if we had to stick a number down on a piece of paper right now as to some pinpoint number — we wouldn't do it because we know that's impossible. But if we had to stick a number down, it would be a different number between the two of us.

It would be a different number if I did it today from tomorrow, probably. But we'd be in the same ballpark, and we'd be looking at the same things. And the things we would be looking at we report to you in that report.

I would focus — you know, the real question of what Berkshire is going to be worth 10 years from now will depend on the — earnings that we have developed — annual earnings that we've developed by that time, the quality of those earnings, the possibilities going forward from that point of those businesses, and the liquid assets we have.

And we've worked on increasing both of those elements over the years, and we'll keep working on it. And it's a lot tougher, in terms of percentage gains, from this point forward than it was in the past.

There's no way in the world that we can replicate what's happened in the past. It just won't happen. The question is whether we can do a reasonable job or not.

Charlie?

CHARLIE MUNGER: Yeah. I generally try and approach a complex task, like the one you presented, by quickly disposing of what I call the no-brainer decisions and — meaning the easy ones.

I think, if you go through all the operating insurance that don't involve surplus cash, and the insurance operations, that that's the easiest valuation process in Berkshire.

And the insurance operation is very interesting, and so is the process by which the huge amounts of excess cash are continually redeployed. But I would go at it in that sequence: taking the no-brainers first.

17. Buffett's key insurance question

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: David Winters, Mountain Lakes, New Jersey.

Would you please discuss how your underwriting standards have changed as the weather patterns seem to become more severe, the challenges of global terrorism seem to escalate, and unforeseen super-cat events, such as earthquakes and pandemics, go into your thinking, and just what the prospects are for the development of the float?

WARREN BUFFETT: Well, the development of the float is a different question. That really depends on how much business we write in the future and the nature of the business, whether it's long-tail or short-tail.

I think it will be very hard to increase our float of 48 or -9 billion at a big clip in the future. I mean, I've been amazed as what's happened in the past. And it's done way better than Charlie and I ever would've dreamt.

But, you know, we have — we're getting to where we're close to 10 percent of the float of the entire American insurance — property-casualty insurance industry — and some of it's abroad that we have.

But it just can't — it can't grow at very rapid rates. But it can be very attractive, and so far, it has been.

In terms of the questions about underwriting in terms of pandemics or terrorism and all of that, I mean, you know, I'm aware of them. You're aware of them.

We get propositions offered to us virtually every day, and in the end I — mostly Ajit, I mean, in this particular case, in terms of big-type contracts — financial-type contracts I would evaluate. He would —

But we talk about what we think the probabilities are of $50 billion events and up, or $20 billion events and up. And, he's the fellow that does most of — he applies it, but we kick around the possibilities.

But that's all there is to it. I mean, it's a question of making judgments about whether you're getting paid enough. And if we have a lot of money, you know, 30 years from now, it will mean that our judgments overall were decent.

And if we have a big loss on one this year, it does not mean that our judgment's wrong because it — it's going to lead to peaks and valleys. But there's no magic to it.

There's probably — I would feel that the earthquake experience of the last 100 or 200 years has more validity than the windstorm or the hurricane experience of the last hundred or 200 years. I don't know that for sure, but I would bet real money that way, and we have.

What is — what will hurricane experience be like 10 years from now, in terms of the number of those that hit the United States and the ferocity of the ones that do hit? You know, I don't know. But I'll keep thinking about it every day.

Charlie?

CHARLIE MUNGER: Well, I think the laws of thermodynamics are such that if the oceans get warmer — I think they are getting warmer — the weather is going to be — have more high-energy uproar in it.

So I think we'd be out of our minds if we wrote weather-related insurance on the theory that global warming would have no effect at all. And the natural reaction is to raise your prices, as the risks go up.

And whether you've raised them enough, and carefully controlled your risks enough, that's the art of the business.

WARREN BUFFETT: Yeah. And you have this possibility that, you know, 1 percent changes or 2 percent changes in something can produce 100 percent of probabilistic changes in cost.

It’s an explosive sort of equation that you’re dealing with. And, you know, but that’s the game we’re in, and we don’t have to play it ever.

If we don’t like what we’re being offered — and we didn’t like what we were being offered a while back in many areas — somebody else can take our place in line. We’ll be happy to have them.

18. Health care is in Berkshire’s “too hard” pile

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: Dear Warren and Charlie, my name is Dr. Rashad Patel (PH). I’m a family physician from Taunton, Massachusetts. Two years ago I wrote you a letter; you responded with me back quickly. Thank you for that.

My question is, what are the criteria or principles to find a person like you in health care? It seems that a person moves up the ladder in this ethical business, they are more prone to become more unethical, get more options, sell shares, open a shop next door.

How do you find those checkpoints? Can you please express your view, on this soon $2 trillion economy, how to find the leaders so we don’t get a surprise in dog-eat-dog world?

WARREN BUFFETT: Charlie, did you get that? (Laughter)

CHARLIE MUNGER: Well, I will try that. I’m not sure I understood the whole — I think she’s asking about the health care business —

WARREN BUFFETT: That part I got.

CHARLIE MUNGER: — and whether or not, with the — much bad ethics being present — we have anything to contribute about doing well in that sector. Is that about right?

AUDIENCE MEMBER: Yes.

CHARLIE MUNGER: Yeah. Oh no.

WARREN BUFFETT: Now I understand the question, I still —it’s still yours. (Laughter)

I’d be glad to answer it, but I’m eating candy at the moment. (Laughter)

CHARLIE MUNGER: That has tended to go into the too hard pile — (laughter) — at Berkshire. (Applause)

A lot of people have made a lot of money writing health insurance. And I've watched the behavior of some of those people, wearing my hat as the chairman of a big central city hospital.

And you are right, there's a lot of bad ethics in health care. There's also a lot of good ethics. It's a very, very complex field with a lot of change, a lot of technological differences.

And in terms of investments, I think the policy has generally been that it all goes into the too hard pile. We don't — unless Warren has something he's keeping secret from me.

WARREN BUFFETT: No. We have not owned much in health care. My only expertise is in diet. (Laughter)

But I appreciate the seriousness of the question. You know, there — it is just — it is a very, very tough problem on which I have no particular insights.

CHARLIE MUNGER: And you're right. The worst of the ethics is really bad.

19. "A complicated bankruptcy can offer opportunities for profit"

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Hello. My name is Barry Steinhart (PH), shareholder from New York. My question relates to the Chapter 11 bankruptcy process.

I know you have been active in the past in some activity in the bankruptcy court. And if you had thoughts on possible reforms in that area, if you believe that any reforms are necessary?

WARREN BUFFETT: Well, that's a good question. Charlie is probably better qualified to answer than I am. I mean, we have bought Fruit of the Loom out of bankruptcy.

And we have had some involvement in owning junk bonds. You know, we get — we think about the bankruptcy process. But in terms of the practicalities of improving on it, what do you think, Charlie?

CHARLIE MUNGER: Well, I think much of that is pretty horrible.

You have a competition there, where the courts themselves have gone into bidding contests to get bankruptcy business attracted. Meaning that the —

There are various courts that can handle bankruptcy cases. And they have found that if they develop a culture where they overpay a lot of people egregiously, they can attract more business: lawyers, trustees, consultants, et cetera, et cetera.

I find it so unpleasant to watch that I don't pay as much attention to bankruptcy as I probably should. You know, I'm an old man, and I don't like to have an upset stomach. (Laughter)

WARREN BUFFETT: But we will — we look at — at least I do, I'm not sure about Charlie — but he — you know, bankruptcies will be something that we will — one way or another, over the next 20 years — we'll have various ways of participating.

And we have bought — well, we bought certain of the bonds, for example, of Enron after they entered bankruptcy — we bought something called the Ospreys.

And a complicated bankruptcy can offer opportunities for profit. Now, there's so many people looking at bankruptcies currently, or potential bankruptcies, it's a field that I would say does not have a lot of promise right now, but it has had promise in the past.

We actually, in the Fruit of the Loom situation, I first went into that just by buying some Fruit of the Loom bonds, but — when I had no notion that we might conceivably end up with the company. But, you know, I knew enough about it to buy the bonds.

And Enron comes along, and it's a big mess. The Penn Central came along 20-odd years ago, and it was a big mess, and there was a lot of money made in the Penn Central, simply because it was such a complicated mess.

So anytime there's something big, complicated, there's certainly a good chance of mispricing. Now, lately the mispricing may be more on the high side than on the low side. But, over time, you're going to find some — there will be some attractive things to do in bankruptcy situations.

We've had other bankruptcy situations where we've gotten involved in the process and then been outbid. It happened at Burlington and it happened at Seitel. And — but we owned all the bonds at Seitel, so we came out fine.

It's something to understand if you're in the business of buying investments or businesses. And I would say that, you know, if we're around for another 10 or 15 years that we'll do something or other, maybe substantial, in the bankruptcy field.

The Enrons — the payment is still being made in various ways. But the Ospreys, which were kind of a complicated situation — the whole thing was complicated.

But, you know, we didn't buy at the bottom or anything like that. But, you know, we considerably more than tripled our money in something that you could have put a fair amount of money in. So they can be interesting.

Charlie, do you want to —

CHARLIE MUNGER: Well, I remember the Eastern Airlines bankruptcy, where there were a lot of employees that would've — and communities that would've been affected. And the courts in that case, I would say, abused the senior creditors horribly.

And so you could have read a law book and reached one conclusion, and if you'd bought the wrong securities, why, you would have found out you'd guessed wrong. It's a very interesting field.

WARREN BUFFETT: Yeah. It — and it can be very unpredictable. In the Penn Central case, you had an incredible variety of claims. I mean, you had leased lines and you had all kinds of first and second liens and everything.

And the judge, as I remember — I may be wrong a little bit on this on the details — but as I remember, the judge just looked at this incredible — probably the most complicated bankruptcy that had come down the pike in the history of bankruptcy to that point — and he just said, "This is just too damn complicated. I'm just, sort of, going to ignore the various priorities and all this. I'm just going to" — perhaps you might call it substantive consolidation, or something — "I'm just going to put this all together, and I'm going to give you a quick, fast solution."

And I think it was a very smart way to handle things, because otherwise I think Penn Central might still be going. But it wasn't what the book said would be done at —

Judges can determine things in a very big way. I remember when we were in Cincinnati on that newspaper case I mentioned earlier, I said to Charlie — a judge had stayed an order, I think, for a week or something like that.

And I said to Charlie — I said, "How much power does a federal judge have?" And Charlie says, "Well, for a while, as much as he thinks he has." (Laughter)

I learned a lot out of that.

20. Buffett endorses Procter & Gamble-Gillette merger

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Good afternoon, gentlemen. Long-time listener, first-time caller here. This is my first shareholder meeting. Thanks for hosting. You guys do a great job. I'm looking forward to coming back for several more years.

My name is Craig Beachler. I'm from Cincinnati, where my paychecks are signed by Uncle Procter and Mr. Gamble.

Thinking about that, I know that when the P&G-Gillette merger was announced, you called it a, quote, "dream deal."

Considering that P&G is primarily thought of as a consumer products company, what are your thoughts on the short- and long-term fit for P&G's pharmaceutical business?

WARREN BUFFETT: For just the pharmaceutical business or, did you say, or —

AUDIENCE MEMBER: Long-term growth of P&G as a whole.

WARREN BUFFETT: As a whole. Yeah. Well, you know, I think it's clear that P&G is a consumer powerhouse of sorts. And I think Gillette — in its field, they have just about as strong a consumer position as anybody will ever have.

And when you get into blades and razors, stronger than the — most of the P&G brands, strong as they may be. And I do think that the big retailers are becoming — and more so all the time — brands of their own. And they are become — and there's more and more concentration going on.

So I think the struggle between the manufacturers of brands and retailers will go on and on and on and become more intensified. So I would think, if I were on either side of that equation, I would want to be strengthening my hand.

And I think that — I think the future of both Gillette and P&G are better as a combined enterprise than they would have been as a separate enterprise.

And I think that's particularly true because of the strengths of the Walmarts and the Costcos and — you name it — around the world. I don't know.

How do you see it, Charlie?

CHARLIE MUNGER: He also wants you to tell him how P&G will be affected by its pharmaceutical business.

WARREN BUFFETT: I don't know a thing about that.

CHARLIE MUNGER: That makes two of us. (Laughter)

WARREN BUFFETT: I really don't. I'd help if I could, but I can't.

21. "A strategic buyer is some guy that pays too much"

WARREN BUFFETT: Number 4?

AUDIENCE MEMBER: Hi. My name is Andy Von Dorn (PH), and I'm here from Omaha.

I'm currently employed by Oriental Trading Company, and they just announced that they were putting themselves up for sale.

I was just wondering if Berkshire would have any interest in a company like Oriental Trading Company as an acquisition.

WARREN BUFFETT: That's interesting, and I didn't know they put themselves up for sale. But I looked at it — whenever it was — four or five years ago when Terry Watanabe sold it.

And I haven't really followed it since then, but just from listening to what you say — and I have no knowledge of it at all — but it sounds to me as if some private group bought it and now they're reselling it.

And we get approached on that sort of thing all the time, where a financial group has bought the business and then wants to resell it fairly quickly. And they almost — well, they invariably, I would say — auction the business.

They seek what they call a strategic buyer. A strategic buyer is some guy that pays too much. (Laughter) Because — you know, and he wants to justify it, so he says it's strategic. I mean, I have never understood being a strategic buyer.

Every time somebody calls me up and says, you know, "We think, maybe, you're the logical strategic buyer for that," you know, I hang up faster than Charlie would. (Laughter)

The — and I'm not talking to the specifics of this one at all because I really don't know on Oriental Trading.

But the idea that we're going to find a business to buy from some guy who, from the moment he bought it a few years ago, has been thinking, "How do I get out of this thing?"

You know, "What do I do to make it earn — have those figures for a couple years look a certain way so that I can get the maximum amount in a couple years?" You know, that — we're just not going to make any attractive buys there. We won't trust the figures.

You know, we — it just — it's — what we like is a business that — where the guy before was running with the idea of running it a hundred years, and taking care of the business in every way possible and was not contemplating sale, but, for one reason or another, finally needs to monetize the company.

We won't — we will not get any sensible buys, really, from the resellers.

Some of the — it's amazing to me what's going on. Some of these things, literally, you know, Fund A is selling to Fund B to Fund C.

I mean, I've seen some that have changed hands three or four times. They're just marking them up, and everybody's getting two — they're getting 20 percent of the profit so they mark it up.

And probably Fund C or Fund D may be owned by the same pension funds that own Fund A, except that everybody's just taking a big 20 percent slice out of it every time they move it from one place to another.

We're not buyers of anything the financial buyers have been in in recent — you know, and currently own.

Charlie?

CHARLIE MUNGER: In the 1930s there was a stretch when certain kinds of real estate — when with certain kinds of real estate — you could borrow more against the real estate than you could sell it for.

And I think that's happened in some of these private equity deals, and it's weird. It's weird. This is not our field. (Laughter)

22. Looking for bright spots in U.S. trade imbalance

WARREN BUFFETT: Number 5?

AUDIENCE MEMBER: Hi. I'm John Golob from Kansas City.

I'd like to get you back to the current account deficit. I was looking for reasons not to despair, so I have a couple of factoids I'd like to throw at you and see how you react.

If you add up all of the current account deficits over the last couple of decades, you get about $4 1/2 trillion. Now, you'd think that means our net indebtedness to a foreign investor should be minus 4 1/2 trillion, but it's not.

It's only 2 1/2 trillion because capital gains for domestic investors has exceeded those for foreign investors. So, essentially, $2 trillion of our current account deficit has been financed by cap gains.

Now, the other factoid is that if you look at the income on assets, the U.S. investors are still in a net positive position. That is —

WARREN BUFFETT: They went negative in the last quarter, actually.

AUDIENCE MEMBER: Oh, excuse me. So it's been close. So I guess my question is, do these facts influence your concern or maybe mitigate your concern about the current account deficit?

And the second part of the question is, do you have any cultural reasons why the U.S. should earn more on investments abroad than foreign investors earn on domestic investments?

And, of course, the dollars explain a little bit of it because we're not paying any interest on those dollars. But I'd like your comments.

WARREN BUFFETT: Yeah. Well, those are a couple interesting points. But, we have earned more on American assets owned outside this country than people outside this country have earned on assets in this country. I mentioned that in the annual report this year.

It did flip. The net balance flipped in the other direction in the most recent quarter, and my guess is it keeps going in that direction. There are a lot of reasons for that.

One important reason a year or two ago was the fact that foreigners owning our Treasury bonds were getting as little as — you know, a little over 1 percent.

So if the rest of the world owned a trillion of our bonds and got 1 percent, that was 10 billion, and if we owned a trillion of their bonds and got 4 percent, you know, that would have been 40 billion.

And the higher — the lower interest rates in this country, the higher interest rates abroad — just simply meant that you got paid — that you were going to have — with a balance of investment — you were going to have a favorable net balance in interest income in this year. We were earning more on our assets abroad than they were earning here.

That is turning somewhat. I mean, our interest rates have been increased.

Now, they didn't all own short maturities or anything of the short — sort. And it may well be that our direct investment — as opposed to our marketable securities investment — our direct investment abroad was made in earlier times and returning higher returns. But, over time, it's going against us.

Now, when you get into the net debtor position that we're in, which you — is now over 3 trillion, that varies with what the dollar is doing.

Because, say, in recent weeks, the dollar has weakened, and that means that brings down, actually, our net debtor position. That's why inflation could be something that becomes a real attractive possibility to politicians in the future.

But I wouldn't — it's not a huge factor. I know what you're talking about in terms of those year-to-year variances in the net debtor position.

They're affected much more by the actual currency that's — change that's been made — because they're expressed in dollars. And if the dollar gets weaker, it makes us look better for the time being.

Overall, that will not be what determines the consequences three, five, or 10 years from now, in terms of the current account problems, or in terms of the possibility of them — of currency — exacerbating some other kind of chaos in markets.

Charlie?

CHARLIE MUNGER: This is not a field to which I've devoted the same attention as Warren. And — but I do share his general pessimism that, eventually, there will be a price to pay for the course we're on.

Where I've disagreed a little with Warren is I've always feel there's more ruinous behavior that could be tolerated in a great place, probably, than he does.

It's just amazing how much ruinous behavior you can get by with if you're a successful governor — government.

Now, if you start with a lousy reputation as a government, it doesn't work that well. But when you start with the reputation the United States had, the people who expected instant calamity, I think, were wrong. It —

WARREN BUFFETT: Yeah. If you landed from Mars, you'd probably still rather land in the United States than anyplace else.

CHARLIE MUNGER: If you stop to think about this subject, do you want to invest in Europe where, you know, 10 or 12 percent of the young people are unemployed because of their crazy employee security policies?

And a lot of 28-year-olds are living at home and going to university because it's a fairly comfortable way to, kind of, while away the time with the state paying for most of it?

Do you want to go into a place with fabulous assets, like Brazil, with a lot of political instability that you fear, or Venezuela?

So it isn't as through all the other options look wonderful compared to us. And so, I don't think it's just totally irrational that everybody still likes the United States in spite of its faults.

And so that gives me some feeling that what happened with regard to fiscal misbehavior on our part could go on quite a long time without paying the due price.

WARREN BUFFETT: Yeah. And I agree with that, although there's always the potential, when you're doing something dangerous, that it can get accelerated.

Generally speaking, if you had to bet on anybody to get away with misbehavior fiscally for a long time, you'd bet on the United States.

And we still think it's by far the best place to be, and we have a majority of our assets in it. We just recognize certain things going on that could cause significant problems, particularly in markets.

23. Key distinction between insurance and gambling

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Hi. It's Peter Webb here from London, UK.

Your views on gambling are well-known, and I think most people would agree that gambling is for the fiscally challenged.

But when I look at the insurance industry, what I see is an industry — I can't even say it — I see an industry that's based upon probabilities, and people not knowing those true probabilities, and money being made for the house in the same way as you see in a gambling market.

So the question I have for you is, how do you reconcile your views with gambling versus the insurance industry, and is the insurance industry for the fiscally challenged?

WARREN BUFFETT: Well, gambling, I think — I think the distinction that usually is made is that gambling involves creating risks that don't need to be created.

I mean, if the — you want to go out and gamble on where a little ball is going to fall on a wheel that's revolving, that is not something that — that is a created risk.

Whereas, if you've got a home or a business, you know, on a coastal area, the risk is there.

It wasn't created intentionally — I mean, you say you built in that place, but — and then the question is who bears it. So there's a transfer of — in the case of cat coverage — large existing risks as opposed to the creation of a risk that is not required.

I mean, you can watch a football game without betting on it. But you can't live in a house, you know, on a Florida coast without having a risk that your entire investment disappears.

So that's the distinction, basically. I hope you're right that the house wins in both cases. (Laughter)

Charlie?

CHARLIE MUNGER: Well, I don't think I can add to that either. The whole concept of house advantage is a very interesting one in modern commerce.

A lot of the investment management operations, which were not ordinarily spoken of in the past in croupier terms — but the terms of a lot of private equity investment now —

I think the proprietors of the partnerships are taking a house edge that looks a lot like the rake of the croupier in Monte Carlo, except it's bigger. (Laughter)

WARREN BUFFETT: Is there anyone we've forgotten to insult? (Laughter)

Want to make sure we don't miss anyone here. (Laughs)

24. Selling short isn't unethical, but it's tough to make money

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: I'm Tom Nelson (PH) from North Oaks, Minnesota.

What are your thoughts on the issue of illegal naked short selling?

WARREN BUFFETT: Well, as you know, I — you may know — I have a friend that's been fairly outspoken on that. And we — from our standpoint — we have no objection to anybody selling Berkshire short at all.

The more shorts, the better, because they have to buy the stock later on. And some of our shareholders may make some money lending — we — Charlie and I can't do it, but there's nothing I would love better, if it were legal, than to lend my stock to shorts and have them pay me something for doing it.

I might want to get prepaid, in certain cases. The — (Laughter)

There's nothing evil, per se, about — in my view — about selling things short.

I would say that it's a very, very tough way to make a living.

It's not only often painful financially, it's very painful emotionally because it — a stock that you sell short — a stock that you buy at 20 can go down 20 points, and a stock that you sell short at 20 can go up an infinite amount.

And you don't think about that until you've gone short and it goes up 10 or 15 points, and then you don't sleep very well. So it's a very tough way to make a living.

There are people on the short side that have done, and that do things, to try to make stocks go down, some of which are appropriate and some of which are inappropriate. There are people on the long side that have done the same exact — the same sort of things go on.

So I don't see any — I have no ax to grind in the least against short sellers.

And in terms of — it's called naked shorting, which you — which means that you don't have the stock lined up to be borrowed and maybe you have a whole bunch of fails-to-deliver and that sort of thing.

I don't have a great problem with that. If anybody wants to do that with Berkshire, you know, they — more power to them.

Short sellers — the situations in which there have been huge short interests very often — very often have been later revealed to be frauds or semi-frauds. Now, the one my friend runs is not at all.

But the — the batting average — I mean, I've — over the years, I've probably had a hundred ideas of things that should be shorted, and I would say that almost every one of them have turned out to be correct.

And I'll bet if I'd tried to do it and make money out of it, I probably would have lost money, I would have had no fun, and the opportunity cost, as Charlie said, would have been enormous.

Because if somebody's running something that's semi-fraudulent, they're probably pretty good at it and they're working full time at it and they've succeeded for a while and they may keep succeeding.

And if they succeed and you go in at X and it goes to 5X, you know, all you're hoping after a while it that it goes back to X again or something of the sort.

It's a very tough psychological game to play. Few people may be well-suited for it.

I would never put any money with a short fund, but not because I would think it would be ethically wrong. I just think they're unlikely to make money.

Charlie, do you have any thoughts on short selling or naked short selling?

CHARLIE MUNGER: Well, I think you're absolutely right there — in the sense that it's — that would be one of the most irritating experiences in the world, to figure out something is crooked and foolish and so forth and then short it at X and have it go to 3X.

Now you're watching all these happy crooks splashing around in your money while you're meeting margin calls. (Laughter)

Why would you want to go in hailing distance of an experience like that?

WARREN BUFFETT: Well, we've hit 3 o'clock. We're going to adjourn until 3:15. We will then have the business meeting of Berkshire. And you're all welcome to stay, you're all welcome to shop, you're all welcome to enjoy Omaha, and thanks for coming. (Applause)

25. Berkshire formal business meeting

WARREN BUFFETT: OK. We'll now convene the business part of the meeting. I introduced the directors to you before.

Also with us today are partners in the firm of Deloitte & Touche, our auditors. They're available to respond to appropriate questions you may have concerning the firm — their firm's — audit of the accounts of Berkshire.

Mr. Forrest Krutter, the secretary of Berkshire, will make a written record of the proceedings. Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott and Marc Hamburg.

Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at this meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 8, 2006 — being the record date for this meeting — there were 1,260,704 shares of Class A Berkshire Hathaway common stock outstanding, with each share entitled to one vote on motions considered at the meeting, and 8,407,392 shares of Class B Berkshire Hathaway stock outstanding, with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 1,096,383 are represented at this meeting by proxies returned through Thursday evening, May 4.

WARREN BUFFETT: Thank you. That number represents a quorum, and we will therefore directly proceed with the meeting.

First order of the meeting will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott, who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

VOICE: I second the motion.

WARREN BUFFETT: Motion has been moved and seconded. Are there any comments and questions?

We will vote on this motion by voice vote. All those in favor, say “aye.”

VOICES: Aye.

WARREN BUFFETT: Opposed? Motion is carried.

26. Election of Berkshire directors

WARREN BUFFETT: The only item of business before this meeting is to elect directors.

If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholder that is present has not turned in a proxy and desires a ballot in order to vote in person, you may do so. If you wish to do this, please identify yourself to meeting officials in the aisle, who will furnish a ballot to you.

Those persons desiring ballots, please identify themselves so that we may distribute them.

I now recognize Mr. Walter Scott to place a motion before the meeting with respect to election of directors.

WARREN BUFFETT: I move that Warren Buffett, Charles Munger, Howard Buffett, Malcolm Chace, William Gates, David Gottesman, Charlotte Guyman, Don Keough, Thomas Murphy, Ron Olson, and Walter Scott be elected as directors.

VOICE: Second the motion.

WARREN BUFFETT: It’s been moved and seconded that Warren Buffett, Charles Munger, Howard Buffett, Malcolm Chace, William Gates, David Gottesman, Charlotte Guyman, Donald Keough, Thomas Murphy, Ronald Olson, and Walter Scott be elected as directors.

Are there any other nomination? Is there any discussion?

Nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections the ballot on the election of directors voting and the proxies in accordance with the instructions they have received.

Miss Amick, when you are ready, you may give your report.

BECKI AMICK: My report is ready. The ballots of the proxy holders in response to proxies that were received through last Thursday evening cast not less than 1,125,034 votes for each nominee.

That number far exceeds the majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as any cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick.

Warren Buffett, Charles Munger, Howard Buffett, Malcolm Chace, William Gates, David Gottesman, Charlotte Guyman, Donald Keough, Thomas Murphy, Ronald Olson, and Walter Scott have been elected as directors.

27. Formal business meeting adjourns

WARREN BUFFETT: Does anyone have any further business to come before this meeting before we adjourn? If not, I recognize Mr. Scott to place a motion before the meeting.

WALTER SCOTT: I move that this meeting be adjourned.

VOICE: Second.

WARREN BUFFETT: Motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor say “aye.”

VOICES: Aye.

WARREN BUFFETT: All opposed say “no.” The meeting is adjourned. Thank you. (Applause)

Morning Session - 2007 Meeting

1. Jimmy Buffett sings "Berkshire Hathaway-ville"

ANNOUNCER: And now, please welcome the charming, insightful, witty, rather brilliant, debonair, influential, well-heeled yet down-to-earth, talented, surprisingly modest, handsome, and refined exemplar of unflappable character, Mr. Buffett.

(Applause and cheers as musician Jimmy Buffett comes on stage with a guitar)

JIMMY BUFFET: Who were you expecting? My junior partner? (Laughter)

For those of you who don't know, I'm the distant cousin, Jimmy Buffett.

This would be a good day to rob a bank in Omaha. Everybody's here, you know, so — (Applause)

I couldn't be around for the game with LeBron James. I was busy working on my wardrobe for this surprise appearance.

This is my first time in the Qwest Center, so I feel very at home in large spaces like this. It's great to be back in Omaha. (Applause)

That's the good news.

The disturbing news is, as a long-time Berkshire Hathaway stockholder and shareholder, the big question is, you know, those guys are getting up in age, you know, Charlie and Warren.

Who are they going to leave it to?

Well — (laughter) — I got news for you. We did a genetic test, Warren and I did. You won't see that in your program or in the shareholders report. And somewhere back about 6,000 years ago, in some ancient village in Scandinavia, they were trading Buffett genes, and I got the talent. He got the business.

So, later on in life, after Doris [Buffett, Warren's sister] introduced us — I don't know, 30 years ago — I started figuring out, so I better get that business thing going as well.

So, since blood is thicker than water, I am your new chairman. So, I hope you like that. (Applause)

Don't run out to sell. I'm keeping my mine. (Laughter)

So, on the way out here on the plane, I figured — it was an interesting day, if you read The New York Times business section yesterday. There was a lot going on.

So, I thought I would — this song has done very well for me, so I thought I would bring this for my first appearance in Omaha at the Qwest Center — I would rewrite a little “Margaritaville” with a little Berkshire — well, actually we’re wasting away in Berkshire Hathaway-ville this — today.

I’ve never sung this early in the morning, except on the [NBC] “Today” show, so you’re not paying, so don’t worry about it, so — (Laughter)

Don’t worry, I’m a semi-professional. This is OK.

I will be looking at these notes. As you can tell, Warren gave me a really big budget for a teleprompter here. (Laughter)

All right. So, you can sing along if — but you will not know — you’ll know a few of the words to these songs. But then I’ll try to do this slowly, and I have my bifocals, so I think we’re in good shape here, so —

We’ll start the morning off with a little hymn.

(Singing to the melody of “Margaritaville”)

Nibblin’ on sponge cake,

And Omaha beef steak,

Watchin’ you stockholders buying the rounds.

The Qwest Center’s rockin’,

The press is all blockin’.

There isn’t a doubt

Warren’s big in this town.

Wastin’ away in Berkshire Hathaway-a-ville,

Searchin’ for my lost box of See’s.

Some people claim that Charlie Munger’s to blame,

And you know, Rupert Murdoch is peeved.

From World Books to sofas,

Jet planes, diamonds, and (inaubible),

(Inaudible) in euros,

Let’s not forget euros.

(Spoken)

Uh oh. I made a mistake here. All right. Hold on.

You won’t pay for that, OK?

Are you going anywhere? We’ll start again.

From — from —

Let me get these bifocals off here.

(Singing)

From World Books to sofas,

(Inaudible) and (inaubible),

Jet planes, diamonds, and underwear cover the floor.

(Spoken)

It was the Fruit of the Loom that got me.

(Singing)

Tool books (inaudible).

Let’s don’t forget euro,

Make all those —

(Spoken)

Oh, this is a good line. I got to —

(Singing)

Make all those hedge funders

Want to go and buy stores.

Wastin’ away again in Berkshire Hathaway-ville,

Searchin’ for some good companies to buy.

Some people claim privatization’s to blame,

But we know, this holding company’s on fire.

So, who was the wizard,

Who thought up the lizard,

To sell car insurance to humans while making some jokes?

Projects we’ll surmount,

But I still want that discount.

Can someone show me where they’re sitting those rich Geico bulbs?

Wastin’ away again in Berkshire Hathaway-ville,

Searchin’ for my lost shaker of salt.

And some people claim that Doris Buffett’s to blame,

But I know this is all Warren’s fault.

And some people claim that ukulele’s to blame,

If there’s a God, he’ll turn that thing into (inaubible).

(Applause)

(Spoken)

All right.

So you thought I was kidding about that running the company stuff, didn’t you?

So — I was. (Laughs)

That's a big relief there. So, with a great bit of pride and admiration, please welcome my junior partners, Warren and Charlie. (Applause)

WARREN BUFFETT: Separated at birth. Separated at birth. (Laughs)

Thanks, Jimmy.

JIMMY BUFFETT: All right.

WARREN BUFFETT: OK.

I actually had asked Charlie to do that number — (Laughs)

2. Opening remarks

WARREN BUFFETT: Got a lot of people to thank, starting off with Jimmy. Wonderful.

We hid him out — came in last night kind of late and we — to be sure it was a surprise, we stashed him away over at the Hilton, and I just want to say thanks to him.

We both got the commercial gene, but unfortunately, he got the singing gene. I got this voice you're hearing.

We — the movie, as we mentioned, we get a lot of help from a lot of people. They all do it just for the fun of it.

I particularly want to thank Andy Heyward of DIC who did that cartoon. He's done them now for a number of years. They come back here to get my voice recorded and to get Bill's [Gates] voice and Charlie's voice. They do it all themselves just to participate in the movie.

Andy and I — I'm working with Andy on a cartoon series that will be out pretty soon, which we're aiming toward younger people to try and work a little financial education into a good time on Saturday morning for kids.

And we'll see how that all comes out. But Andy is wonderful to work with. It's been — (Applause)

WARREN BUFFETT: My daughter Suze puts that movie together. It's a lot of work and it's a labor of love. She does a terrific job, and I just want to thank her for — as usual. (Applause) Thank you.

WARREN BUFFETT: Then finally I want to particularly thank the grand impresario of this whole affair is Kelly Broz.

And Kelly puts this all together, the exhibition hall. I just turn it over to her. I forget about it, and Charlie and I just show up on Saturday morning.

And Kelly is having her 50th birthday tomorrow. So, Kelly, would you stand up and take a bow, please. Yeah.

(Singing) Happy birthday to you. Happy birthday to you. Happy birthday, dear Kelly. Happy birthday to you.

For Kelly. (Applause)

WARREN BUFFETT: Now, today we're going to follow the usual format. We have a number of microphones placed around this room and we have overflow rooms. We will go from one station to the other, keep going until about noon or thereabouts, and then we'll break for 30 or 45 minutes for lunch.

We'll come back here, and we will then go until about 3 o'clock, continuing the same routine.

We don't prescreen the questions or the questioners. It's whoever got in line first for the microphones.

At 3 we will take a break for a few minutes. We will reconvene at 3:15 for the official business meeting.

We have an item of business — normally we take care of business in about five minutes, re-elect the directors. But today we have an item on the proxy relative to our holdings of PetroChina.

We were not required to put that on the ballot. The SEC told us we didn't have to, but we really thought it would be a good idea to do it so that all of you that are interested can hear about our reasoning and the reasoning of the people who disagree with us. We'll give them plenty of time to tell you why they think we're wrong and we'll respond.

And I hope anybody that's interested at all on the subject, I hope you stay right until 4 o'clock when we will adjourn, because Charlie and I are then going to greet, perhaps, as many as 600 shareholders who have come from outside of North America.

We have a record number. I think we have a hundred or so from Australia, and we have close to that number from South Africa.

We have shareholders from all over the world. So we feel if they come all the way to Omaha, Charlie and I would at least like to shake their hands, and we have that from about 4 till 6:00 o'clock, and then we'll be doing some other things this evening.

But that is the drill for this meeting. We won't elect the directors until the regular meeting, which commences at 3:15, but I would like to introduce them at this time and we have a few special announcements in that connection.

3. Berkshire directors introduced

WARREN BUFFETT: But we start off — this is Charlie, this fellow that's been making all the noise over here. (Laughter)

He's quite hyperkinetic. But we seem — I think he's on his medicine. (Laughter)

Charlie, incidentally, can hear quite well and I can see, so we work together. I have a little — I thought I was doing pretty well when I remembered his name, actually.

But our combined ages are 159 for those of you who can't work with big numbers.

So Charlie. And then we have — and if you'll stand as I read your name — Howard Buffett. (Applause)

Bill Gates. (Applause)

Sandy Gottesman. (Applause)

Charlotte Guyman. (Applause)

A former Omahan, Don Keough. (Applause)

Tom Murphy. (Applause)

Ron Olson. (Applause)

And a lifetime Omahan, Walter Scott. (Applause)

Now, in addition, we have with us a director whose family has been involved with Berkshire Hathaway and its predecessor companies for over a hundred years. His father played a very key role in Buffett partnership obtaining control of Berkshire Hathaway in 1965.

He was supportive in every possible way, as his father, and now his son. And Kim Chace has been on our board for a great number of years. He's been a — just like his father before him, he's been a wonderful director.

He's been a great friend. He will be leaving the board this year, but Kim is here with his family and, Kim and the family, if you would stand up, I'd like the shareholders to recognize you. (Applause)

WARREN BUFFETT: And then finally we will have a new director get elected, and I've got the votes in my pocket so there's no question about it, and that is Sue Decker. And, Sue, if you will, please stand. (Applause)

4. Q1 earnings are "good"

WARREN BUFFETT: Just one or two items of business the — before we start the questioning.

We did report our earnings yesterday after the close, and I can't see the — are they up on the monitor?

But it was a good first quarter. We had a good year last year. The insurance earnings are going to go down. There's no question about that. How much they go down depends on Mother Nature and a few other factors.

But it's been an extraordinary period for insurance. I mean, nothing bad happened last year, and the same was true in the first quarter.

As you might expect, that favorable experience has caused people to lower prices in some areas quite dramatically. And the nature of insurance, if you write a one-year contract, say, six months ago, you were still getting premium at the old rate, if you write at a one-year policy, for another six months.

So there's a lag effect when things are getting either better or worse. And the lag effect from this point forward, we will — our insurance rates results will show the effect of lower prices.

They will probably show — certainly we have the most benign hurricane season imaginable last year. We have less hurricane exposure that we've written this year but, nevertheless, as natural catastrophes occur we will be paying out lots of money if and when they occur.

It couldn't get any better than it was last year from our standpoint. So things in the insurance world, our insurance earnings, underwriting earnings, are bound to decrease.

Now, what we really hope over time is more or less to break even on the underwriting of insurance. So when you see a significant profit like last year or underwriting profit this year, just look at that as kind of the good side of what will later be an offset to it in a way of an underwriting loss.

But if we break even in insurance on underwriting, we do very, very well because we generate lots of float and we earn money on that float and our float is at an all-time high.

So this is really the frosting on the cake when we have an underwriting profit, and it's not to be expected to necessarily — well, it won't occur year after year. Ever since we've been in the insurance business, about half the years we've made money underwriting and half we haven't.

I think our mix of business now is such that we'll even maybe do a touch better than that in the future, but we won't do anything like what we did in the last year and in the first quarter this year.

There's one unusual item in our balance sheet that you should be aware of. March 31, you'll see our receivables went up by about $7 billion. That was because of the Equitas transaction I described in the annual report.

On March 31st, the deal, basically, was closed at the end of the quarter. So we had a receivable of 7 billion, and then a couple of days later we were given 7 billion of cash and securities. So that receivable very quickly turned into liquid assets, cash.

And we sold all those securities we got. So we had 7 billion transferred from receivables to cash very early in April.

Other than that, most of our noninsurance businesses did fine. The residential construction-related businesses are getting hit, in some cases getting hit very hard, and in some cases getting just — but still reflecting decreases in their business.

And my guess is that that continues, perhaps, for quite a while. So you will see lower earnings coming from the companies that are related to residential construction such as Shaw, Johns Manville, ACME Brick, and that group.

But overall, compared to the companies they compete with, our managers continue to do an absolutely sensational job.

We have the greatest group of managers and, for that matter, we've got the greatest group of stockholders, of any company I know of in the world, and Charlie and I are very grateful.

You saw in the movie Charlie and I going over there to give the fellows in Israel a lot of advice on how to run their operation better.

And Charlie might want to — you might want to comment on ISCAR.

CHARLIE MUNGER: Well, that was a great experience, and ISCAR is a very great company. I have never seen anything as automated as that ISCAR operation. I think they regard it as a disgrace if any human hand has to do anything.

WARREN BUFFETT: We bought it without looking at it, but after we looked at it, we really liked it. (Laughter)

For those of you who won't be around for the 3:15 — and I hope everybody that's interested sticks around for that — it will be an interesting discussion.

But we do have a preliminary vote. Again, I can't see the vote up there. But, [CFO] Marc [Hamburg], is the vote up there? Unable to hear anything there, but I assume it.

The — basically, I can't see it from here, but it's about 2 percent are in favor of the resolution and about 98 percent opposed. And that was true of both the A and the B stock.

So there really wasn't any great difference in the way people voted on the proposal. And even if you leave out my personal vote, which was against, it's about a 25-to-one margin that voted in opposition to it.

And anybody that wishes to vote in person or to change their vote, be sure and stay for the meeting at 3:15, and I think you'll find the discussion very interesting if you care to stay.

5. Buffett sees no private equity "bubble" about to burst

WARREN BUFFETT: Let's get a map here. Here we are. We will start with area 1, which I think is over here, and there we are and we have a questioner.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. My name is Kevin Truitt (PH) from Chicago, Illinois.

Thank you both for, again, hosting this "Woodstock for Capitalists" for your shareholders and fellow capitalists. I have two questions. My first question is for both Mr. Buffett and Mr. Munger.

WARREN BUFFETT: I don't like to interrupt you, but we're only letting everybody do one question, so pick whichever one you feel the strongest about getting an answer for, please.

AUDIENCE MEMBER: OK. First, given the ocean of equity money that is out there — private equity money — that is out there today chasing deals, and with the quality of the deals continually diminishing as the quantity of good deals continues to go down, and given the fact that these private equity funds are getting their equity portion of the money from pension funds and college endowments and using very high levels of borrowed money from the banks, this has the look, feel, and smell of a bubble that is about to burst and is likely to end badly for many of the deal-makers and the investors.

What events, in your opinion, could cause this bubble to burst, and how do you think this is likely to all end?

WARREN BUFFETT: Well, as you were reading off that list, we are competing with those people, so I started to cry as you — (laughs) — explained the difficulty we have in finding things to buy.

The nature of the private equity activity is such that it really isn't a bubble that bursts.

Because if you're running a large private equity fund and you lock up $20 billion for five or longer years and you buy businesses which are not priced daily, as a practical matter, the plug will not — even if you do a poor job, it's going to take many years before the score is put up on the score board, and it takes many years, in most cases, for people to get out of the private equity fund even if they wished to earlier.

So it does not — it's not like a lot of leverage can lead to in-marketable securities or something there. And the investors can't leave and the scorecard is lacking for a long time.

What will slow down the activity — or what could slow down the activity — is if yields on junk bonds became much higher than yields on high-grade bonds.

Right now the spread between yields on junk bonds and high-grade bonds is down to a very low level, and history has shown that periodically that spread widens quite dramatically.

That will slow down the deals, but it won't cause the investors to get their money back.

There's one other aspect, of course, that — of this frenzied activity, you might say, in private equity is that if you have a $20 billion fund and you're getting a 2 percent fee on it or $400 million a year, which seems like chump change to those that are managing them but sounds like real money in Omaha — if you're getting 400 million a year from that $20 billion fund, you can't start another fund with a straight face until you get that money pretty well invested.

It's very hard to go back to your investors and say, well, I've got 18 billion uninvested and I'd like you to give me money for another fund.

So there's a great compulsion to invest very quickly because it's the way to get another fund and another bunch of fees coming in.

And those are not competitors for businesses that Charlie and I are going to be particularly effective in competing with.

I mean, they — we are going to own anything we buy forever. The math has to make sense to us. We're not given to optimistic assumptions, and we don't get paid based on activity.

But I think it will be quite some time before — it's likely to be quite some time — before disillusionment sets in and the money quits flowing to these people that are promoting these. And whether they can continue to make deals will depend on whether people will give them lots of financing at what I would regard as quite low rates.

Charlie?

CHARLIE MUNGER: Yeah. It can continue to go on a long time after you're in a state of total revulsion.

WARREN BUFFETT: The voice of optimism has spoken. (Laughter.)

6. I didn't do enough to "sell" Berkshire internationally

WARREN BUFFETT: We'll go on to 2. And I should have mentioned at the start. We really only take one question per person because there's a lot of people waiting and some people get very talented about rolling four or five into one, but we — we've gotten more talented about unraveling them, so try to keep it to one. Area 2, please.

AUDIENCE MEMBER: Greetings to all of you from the Midwest of Europe from the city of Bonn in Germany.

My name is Norman Rentrop. I'm a shareholder in Berkshire since 1992, as well as a shareholder in Wesco and Cologne Re.

I'm a great admirer of both of you and want to thank you again for sharing your wisdom with us and for continuing to stay humble by managing Berkshire for the benefit of all of us without any big 2 and 20 percent fees, without stock option plans. (Applause)

WARREN BUFFETT: Be careful. You're giving Charlie ideas here. (Laughter)

AUDIENCE MEMBER: And I want to applaud you in setting another great example by donating most of your wealth to charity and for donating — (applause) — and for donating it in a very intelligent and selfless — that it's not your name on the foundation — way.

Now, I'm a little disturbed by the remarks from another great investor, from John Templeton, who continues to say that you are narrow-sighted in not investing more overseas.

You do focus on the U.S. with relatively little, so far, internationally. You explained that it doesn't really matter whether a company is headquartered in the U.S. or London or Munich or Paris, and that you would pay almost as high an amount for such companies as for similar U.S. companies.

You were audacious to invest your petty cash in South Korean stocks.

Coca-Cola went totally global many years ago; whereas, Hershey's missed the opportunity to go global, leaving the chocolate globalization to Swiss-based Lindt & Sprungli.

Now, what would it take you to go totally global with Berkshire by investing internationally in a big way?

WARREN BUFFETT: Well, that's a very good question. And I would say that I know I probably bought my first stock outside the United States at least 50 years ago.

It is not that we have not looked in the marketable securities field beyond this country, and we've made some investments there.

It really wouldn't make any difference to us if Coca-Cola was based in Amsterdam or Munich or Atlanta as long as they had the business they had.

So we're very involved in international business, but the hard fact is that in terms of buying entire businesses, we were simply not on the radar screen to the same extent — close to the same extend —outside the United States as we became in the United States.

When we started in the United States, really, nobody knew anything about Berkshire, either, so we had — we had a selling job to do here, but we did not do the selling job — or I did not do the selling job — well abroad.

And thanks to Eitan Wertheimer, he found us. And I think has contributed in a very significant way to getting us better known.

We have no bias against buying either marketable securities or entire businesses outside the United States.

Eitan is even planning a little procedure to get us even better known — get Berkshire even better known — outside the United States, and I'm going to participate in that with him within the next six or eight months.

But we can be very validly criticized for not being a better effort to get on that radar screen.

I think we're — I think it's improving. We own a number of non-U.S. securities. We own stock in — just stock, marketable securities — we own two that are based in Germany, and we own others — as it's been pointed out — we own, for example, 4 percent of POSCO, which is based in South Korea. That's over a billion-dollar investment at current market.

And we have — I can think of a half a dozen or so marketable securities investments outside the United States.

We don't have to report those in the 13F — I believe I'm right on this, [CFO] Marc [Hamburg] — so they don't necessarily get picked up the same way as do our domestic investments by reports we make to the SEC.

There's a problem — for example, in Germany we have to report our holdings in Germany if our holdings exceed 3 percent.

Well, if you're talking about a company with 10 billion in market value, that means at $300 million we have to tell the world what we're buying, and telling the world what we're buying is not the favorite activity of Charlie and myself.

So — and it tends to screw up future buying. So that 3 percent threshold, which exists in the UK, exists in Germany, is a real minus to us, in terms of accumulating shares.

But I can assure you that the entire world is definitely on our radar screen, and we hope to be on its.

Charlie?

CHARLIE MUNGER: Well yes. I'd say that John Templeton made a fortune going into Japan very early and having the Japanese stocks go up to 30 or 40 times earnings.

And that was a very admirable piece of investment. But, you know, we did all right in the same period. (Applause)

7. CEO compensation is a "joke"

WARREN BUFFETT: Let's go to station 3, please.

AUDIENCE MEMBER: Hi. (Inaudible). I lived most of my life in India, but now in Hoboken, New Jersey.

Warren, first thank you for replying to my letter. I misspelled your name, and where I come from if I did the same thing, the reply would have been, more on, get my name correct before asking a question. So thank you once again.

Investment managers nowadays are benefiting a lot more at the expense of the investors and the (inaudible).

My question is both to you and Charlie is, what do you think is the best structure/fees that managers should have that will give him an opportunity to maximize the time (inaudible) and money (inaudible) over the next few decades and being fair to the profession — the investors and himself? Thank you.

WARREN BUFFETT: Before I answer that, I think I should tell you a very short story. It's a little embarrassing, but I got worried a few years ago about Charlie's hearing.

But I mean, the guy's been my pal for 45 or 50 years. I didn't really want to confront him with this apparent evidence of old age.

So I went to a doctor and I said, "You know, I got this good pal. I don't think he's hearing so well. I really don't want to confront him with it, so what do you suggest I do to check this out?"

He said, "Well, stand across the room, talk in a normal tone of voice, see what happens."

So the next time I was with Charlie, I got across the room and I said, “Charlie, I think we ought to buy General Motors at 30. Do you agree?” Not a flicker. Not a flicker.

I went halfway across the room. I said, “Charlie, I think we ought to buy General Motors at 30. Do you agree?” Nothing changes.

Get right next to him, put my voice in his ear and said, “Charlie, I think we ought to buy General Motors at 30. Do you agree?”

Charlie said, “For the third time, yes.” (Laughter)

So, Charlie, would you like to address that question? (Laughter)

CHARLIE MUNGER: Yes. The question addressed the problem of unfairness of executive compensation and the effects of that unfairness on investors. And now that you know the question, you can solve the problem. (Laughter)

WARREN BUFFETT: Well, Charlie and I have plenty to say about compensation, and some of it makes our stomach turn.

I will say this, though. There are more problems with having the wrong manager than with having the wrong compensation system.

I mean, it is enormously important who runs — you name the company — Proctor & Gamble, Coca-Cola, American Express — and any compensation sins are generally of minor importance compared to the sin of having somebody that’s mediocre running a huge company.

That said, Charlie and I think that compensation has — there’s a natural tendency — because of ratcheting, because of the publicity of what other people get, and because of the lack of intensity in the bargaining process.

I mean, you read about labor contracts, you know, where impasses go on for weeks and where they negotiate till 3 in the morning and, you know, both sides take their case to the press and everything.

I ask you, when have you heard of a comp committee, you know, working until 4 in the morning, declaring an impasse for a week, not being able to make a deal?

It just doesn’t happen because the CEO cares enormously how he or she is paid, and to the comp committee — and they’re doing, perhaps, a little better job now — but it’s basically play money.

And, of course, as I’ve pointed out in the past, I’ve been on 19 boards. They put me on one comp committee and they regretted it subsequently.

You know, they are looking for cocker spaniels with their tails wagging to put on comp committees and, you know, they're not looking for Dobermans.

And I try to pretend I'm a cocker spaniel just to get on one, but it doesn't work. (Laughter)

But it is not — there is not a parity of intensity in the bargaining process. One guy cares enormously and the others don't.

And as Charlie has pointed out in the past, what really drives a lot of this ratcheting impact is envy.

I saw that on Wall Street. You can talk about greed, but if you paid somebody $2 million, they might be quite happy until they found out the guy next to them made 2 million-one, and then they were miserable.

And Charlie has also pointed out that envy, of the seven deadly sins, is probably the dumbest, because if you're envious of somebody, you feel terrible and, you know, the other guy isn't bothered at all.

So all you get out of envy is this miserable grinding in your stomach and all that sort of thing.

You know, compare that to some of the other sins like gluttony, which we are about to engage in. (Laughter)

You know, there's some upside to gluttony. I'm told there's upside to lust, but I'll leave that to Charlie to explain. (Laughter)

But envy, where the hell is the upside, you know? But it does produce this ratcheting effect in pay.

The comp committee sits down. The human relations person comes in. The human relations person knows what the CEO thinks of them is going to determine their future, and the human relations department recommends some comp consultant. The comp consultant knows that his recommendation to other firms is dependent on what these people say about him.

So under those circumstances, you know, can you imagine that it's anything like a fair fight? It's a joke.

Charlie?

CHARLIE MUNGER: Yes. The process is contributed to by a wonderful bunch of people called compensation consultants.

And that reminds me of the old story where the mother asked the child why she told the census taker that the man of the house was in prison for embezzlement. And the child said, "I didn't want to admit he was a compensation consultant." (Laughter)

WARREN BUFFETT: We'll get around to the rest of you later on, too. Don't feel smug because we haven't attacked your —

I just had a note handed to me. We do have about 27,000 people here. The overflow rooms are full, and we will have a whole bunch in the exhibition hall as well. (Applause)

8. Corporate jets can be good

WARREN BUFFETT: Let's go to number 4.

AUDIENCE MEMBER: Yes. Good morning. I'm Rob (inaudible). I'm from the UK, and I traveled from Switzerland to be here today.

This is a question that Charlie will like. There's a study by David Yermack that companies with private jets underperform their peers by 4 percent.

What is the yardstick that you use to judge whether people are good stewards of money — management?

WARREN BUFFETT: Did he direct that to you, Charlie?

CHARLIE MUNGER: Well, he referred to private jets being a possible indication of executive excess.

I want to report that we're solidly in favor of private jets. (Laughter)

WARREN BUFFETT: We even pay for them ourselves. (Laughs)

Charlie used to only — he traveled on the bus, and only then when they offered a senior citizen's discount.

But in recent years I've shamed him into getting his own NetJets share — I have my own — I have two NetJets shares.

Actually, Berkshire is significantly better off in a number of its businesses, and including at the corporate level, because we use corporate jets.

I don't know which deals wouldn't have been made, but I do know that — excuse me — I would not have had the same enthusiasm for traveling thousands of miles to go after deal after deal and so on.

And I see what it produces at our — a number of our other businesses. So it has been a valuable business tool.

It can be misused like anything else. I remember many, many years ago, we owned stock in a public company, and the CEO stopped off in Omaha on the way to see me, and he explained that they use some grocery chain in Idaho or something to be sort of their test case on all new products.

And they would go visit it because they also had this lodge out there. I mean, you can abuse any system. But properly used, I would say that corporate jets have been a real asset to Berkshire.

I would go back to this comp question just one second, too.

I mean, comp is not rocket science. I mean, we have very simple systems that compensate those people whose pictures you saw during the movie.

They're terrific people. We compensate them based on things that are under their control and that we care about. And we don't make it complicated, and we don't pay them for things that are happening that they have nothing to do with.

I mean, we talked last year about what you do in a commodity business like copper, oil. I mean, if oil goes from $30 to $60 a barrel, there's no reason in the world why oil executives should get paid more for what's going on. They didn't get it to $60 a barrel.

If they have low finding costs, which is under their control, and which is important, I would pay like crazy for that, because a person who finds oil and develops reserves at $6 a barrel is worth a lot more than somebody that finds and develops them at $10 a barrel, assuming they're similar quality reserves.

That is the job that you hire the person for. But the price of oil, they've got nothing to do with it, and to hand them huge checks because oil goes up or to cut them back because it goes down — if oil went down and somebody had the lowest finding costs that was working for us, we would pay them like crazy.

Charlie?

CHARLIE MUNGER: Yeah. Well, I'd like to go back to that corporate jet thing.

If the trappings of power are greatly abused, I think you would find a correlation that some of those companies would be disappointing to investors.

And, you know, man has known for a long time that getting too enchanted with the trappings of power is counterproductive.

The Roman emperor that's most remembered as presiding over a period of great felicity was Marcus Aurelius, who was totally against the trappings of power even though he had them all — he had all the power.

So I think all these things can be abused, and I think the best way to tackle a subject is to provide examples of contrary behavior.

WARREN BUFFETT: Charlie, have a (inaudible) —

CHARLIE MUNGER: I think I'll go over here.

WARREN BUFFETT: This is our idea of corporate benefits up here, lots of fudge, lots of peanut brittle. I recommend the diet to everyone.

9. "Extraordinary" things can happen when people panic

WARREN BUFFETT: Let's go to number 5.

AUDIENCE MEMBER: David Winters, Mountain Lakes, New Jersey.

Could you please explain what you believe the impact and, hopefully benefit, of a credit contraction would be on Berkshire Hathaway, and maybe higher interest rates as well?

WARREN BUFFETT: Well, we do benefit when others suffer.

That doesn't mean we enjoy their suffering, but times of chaos in financial markets, the situation that existed in junk bonds in 2002, the situation that existed in equities, you know, back in 1974.

So I don't think you'll necessarily see a contraction in credit. That — I think most authorities are very reluctant to really step on the brakes. You know, it's too easy to figure out who did step on the brakes.

But you could very well see some exogenous event that starts feeding on itself in markets.

In fact, I think it's much more prone to feed on itself in markets than in most periods in the past, if you really got a shock to the system.

And that would result in a huge widening of credit spreads, cheaper equity prices, all kinds of things that actually are helpful to Berkshire because we usually have at least some money around to do something at times like that.

There will be periods like that. If you go back 30 or 40 years, when credit contracted, it just really wasn't available.

Charlie and I went through a couple periods like that. We were trying to buy a bank in Chicago 40 — 40 or so years ago, and the only people that would lend it to us in the world — because banks weren't lending for acquisitions — we found some people over in Kuwait who said they'd lend it to us in dinars.

And we thought, you know, it might be fine to borrow it, but when it came time to pay them back the dinars, they would probably be telling us what the dinar was worth, so we passed on that particular deal.

But you had real credit contractions then. And, of course, the whole reason — not — I would say the major reason the Federal Reserve was established was the huge contractions in credit that were felt, particularly here in places like the Midwest where they were dependent on correspondent banks in the larger cities, and when those banks had problems, the banks here got shut off.

And we really needed a system that would not have that happen except by design. And I would say the Fed, by design, is probably not going to produce any credit crunches.

Charlie?

CHARLIE MUNGER: Well, the last time we had that credit contraction, we made, what, a quick 3 or $4 billion? And we were acting with vigor.

The whole investment world is more and more competitive, and if you talk about a real credit contraction, which gums up the whole civilization, no one would welcome that.

And I would predict that if we ever had a really big credit contraction after a period like the one we're in with all this excess, which is causing so much envy and resentment, that we would get legislation that most of us wouldn't like.

WARREN BUFFETT: There's a book by Jonathan Alter that came out about a year ago that talks about the first hundred days after [President Franklin] Roosevelt took over [in 1933], and by the nature of the book it tells about some of the days before that, too.

But if you want to get an example of — I mean, this country was close to the brink at that point, and, basically, Roosevelt got anything passed he wanted, just as fast as they could write the bills there, initially. And that was a good thing, you know, with banks closing and people dealing in scrip and that sort of thing.

So nobody wants that to come back, and we've learned a lot more about that sort of thing since the Great Depression.

I don't think you'll see an orchestrated credit contraction.

Now, you had in 1998, in the fall, when Long-Term Capital Management got in trouble, you had a seize up of the credit markets.

It wasn't an orchestrated by the Fed-type contraction. You simply had people panicked about even the most — even the safest of instruments and credit spreads doing things that they'd never done before.

And that's rather an interesting example, because that was not a hundred years ago. It was less than ten years ago. You had all kinds of people with high IQs in Wall Street. You had all kinds of people with cash available.

And you had some really extraordinary things happen in credit markets simply because people panicked and they felt other people were going to panic. And you get these second- and third-degree type reactions in markets.

We will see that sort of thing again. It won't be the same but, you know, as Mark Twain said, history doesn't repeat itself but it rhymes. And we will have something that rhymes with 1998.

10. Munger reminds people "too much of John Adams"

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Hello. My name is Andrew Paullin (PH), a former Michigander now from Woburn, Massachusetts.

My question is for Charlie, though Warren, please add your thoughts as well.

Charlie, you were quoted in "Poor Charlie's Almanack" as saying, quote, "Ben Franklin was a very good ambassador and whatever was wrong with him from John Adams' point of view probably helped him with the French," end quote.

If you are willing, I'm curious to hear your additional thoughts regarding John Adams and his wife, Abigail Adams.

CHARLIE MUNGER: Well, of course, they were wonderful people, both of them. And —

WARREN BUFFETT: Did you know them personally, Charlie? (Laughter)

CHARLIE MUNGER: No. No.

But if you wanted to have a really jolly evening, I would have taken Franklin every time. And the French love Franklin.

I think I remind many people too much of John Adams and too little of Ben Franklin. (Laughter)

WARREN BUFFETT: He does pretty well in respect to Ben Franklin, too

11. Corporate profits can't stay at record highs

WARREN BUFFETT: Let's go to number 7.

AUDIENCE MEMBER: My name Takashi Ito (PH) from Japan.

In addition to the global excess liquidity, corporate profits are very high compared to the share of labor. Does that make it extra challenging for you to find investment opportunities? Thank you.

WARREN BUFFETT: Yes, corporate profits in the United States are — except for just a very few years — are record, in terms of GDP.

I've been amazed that after being in a range between 4 and 6 percent of GDP, they have jumped upward. And — (coughs) — you would not think this would be sustainable over time.

Excuse me just one second. Charlie, want to talk for a second? (Laughter)

You've just heard him on the subject.

But corporate profits, when they get up to 8 percent plus of GDP, you know, that is very high. And so far it has caused no reaction.

One reaction could be higher corporate taxes. You have lots and lots of businesses in this country earning 20 or 25 percent on tangible equity in a world where long-term bond rates are 4 3/4 percent — government bond rates.

That's extraordinary. If you'd read an economics book 40 years ago and it talked about that kind of a situation persisting, you wouldn't have found a book like that.

I mean, that does not make sense under pure economic theory, but it's been occurring for some period of time and, as a matter of fact, it's gotten more extreme.

Corporate profits continue to rise as a percentage of GDP. That means somebody else's share of GDP is going down.

And you're quite correct that the labor component of GDP has actually fallen fairly significantly.

Whether that becomes a political issue — maybe in the next campaign — whether it becomes something that Congress does something about — Congress has the power to change that ratio very quickly.

Corporate tax rates not that long ago were 52 percent and now they're 35 percent and a whole lot of companies get by with paying 20 percent or less.

So I would say that, at the moment, corporate America is kind of living in the best of all worlds, and history has shown that those conditions don't persist indefinitely.

What brings it to an end, when it happens, I don't know. But I would not expect corporate profits to be eight-and-a-fraction percent of GDP, on average, in the future.

Charlie?

CHARLIE MUNGER: Yeah. Of course, a lot of the profits are not in the manufacturing sector or the retailing sector, either. A lot of them are in this financial sector.

And so we've had a huge flow of profit to banks and investment banks and investment management groups of all kinds, including various kinds of private equity.

And that has, I think, no precedent. I don't think it's ever been as extreme as it is now. Do you agree with that?

WARREN BUFFETT: Yeah. And Charlie and I would have said 20 years ago — and we've done things in banking from time to time, including owning a bank.

But if you had said to us, in a world of 4 3/4 percent long-term governments, will one major bank after another be earning more than 20 percent on tangible equity, dealing in what is basically a commodity — money — we would have said that that condition just wouldn't persist.

Now, part of that is because the banks are geared up more. So if you earn 1 1/2 percent on deposits, you know, and you have — or 1 1/2 percent on assets — and you have assets of 15 times equity, you're going to be earning 22 1/2 percent on equity. And by gearing up more, it does improve the return on equity.

But you still would think that would be self-neutralizing. You'd think that after one guy did it, another guy would do it, and then instead of earning 1 1/2 percent on assets, you'd earn, you know, 9/10 of a percent or 1 percent on assets, but it hasn't happened. It's gone on for a long time.

And, you know, we are living — I'd have to look at a chart on it, but there may have been a year or two post-World War II, but I don't think that — I would bet there haven't been more than two or three years in the last 75 when corporate profits, as a percentage of GDP, have been this high.

CHARLIE MUNGER: Some of this has come from consumer credit, which I think has been pushed to extremes that we've never before seen in the history of this country.

Some other countries that pushed consumer credit very hard had enormous collapses. Korea had one, for instance, that caused chaos for, what, two or three years? Maybe longer. So I don't think this is a time to just swing for the fences.

WARREN BUFFETT: And the chaos in 1997 and 1998 when the IMF stepped in, I mean, it was bad in Korea for a while.

It produced some of the most ridiculously low stock prices that I've ever seen in my life.

In fact, I mean, you could go back to 1932 in this country and you wouldn't have seen things any cheaper. And in the meantime, the companies rebuilt their balance sheets and their earning power.

So things do turn around in financial markets. You will — if you're young enough, you will see everything and then some.

I mention in the annual report, in looking for an investment manager to succeed me, that we care enormously about finding somebody who's not cognizant of everything risky that's already happened, but that also can envision things that have not yet been experienced.

That's our job in the insurance business, and it's our job in the investment business.

And there are a lot of people that just don't seem to — they're not — they're very smart, but they just — they're just not wired to think about troubles that they haven't actually witnessed before.

But, you know, that's the problem Noah had. You know, the first 40 days, it was tough sledding for Noah, but he got revenge eventually.

12. We welcome short-sellers betting against us

WARREN BUFFETT: Let's go to number 8.

AUDIENCE MEMBER: Hello. My name is Brian Bowalk (PH), Fremont, Nebraska.

With the growing number of fail-to-deliver trades happening in our stock markets, including investors' cash accounts, Roth IRAs, and other retirement accounts, it seems like the problem is getting worse.

With some companies being on the Regulation SHO list for hundreds of days, what can be done to make Wall Street deliver stock that they have sold but never delivered? Thank you.

WARREN BUFFETT: Yeah. The so-called fail to deliver and naked shorting, I think is the question. I don't know exact — I've never been in a position where I've asked a broker from whom I bought stock to give me the certificate and have them decline it for any period of time.

I would think that you might have some action against them. But I've never — I do not see the problem at all with people shorting stocks.

I mean, I would welcome people shorting Berkshire Hathaway. I mean, it — if you own stock, and they need to borrow from you, you can get some extra income from your stock. And the one sure buyer of your stock eventually is somebody who shorted it. I mean, that guy is going to buy it someday.

And I have no problem with shorts. If there's some kind of a game that's played — and I've read about it — I've never seen it happen to anything that we've owned.

Like I say, if anybody wants to naked short Berkshire Hathaway, they can do it until the cows come home, and we'll be happy to. We'll have a special meeting for them.

But — and I would say this: the shorts generally have the tougher time of it in this world. I mean, there are more people bowling stocks for phony reasons than there are burying stocks for phony reasons.

So I do not see shorts as any great threat to the world. If enough people shorted Berkshire stock, they would have to borrow it and they would pay you to borrow your stock and that's found money.

We did that on USG. When USG got hammered after they went into bankruptcy — or maybe just before — one large brokerage firm came to us and they wanted us to lend them millions of shares and they paid us a lot of money.

And we happily lent them the stock. We wished they borrowed more. In fact, we insisted that they borrow it for a given length of time just so that we could collect a large premium.

And I don't know how many — I'd have to look it up but — I don't know whether it's in the hundred thousands or, maybe, low millions, but we were better off.

And they didn't do too well shorting USG at $4 a share either, but it was immaterial to us.

So I do not regard — I do not regard shorts as — it's a tough way to make a living.

It's very easy to spot phony stocks and promoted stocks, but it's very hard to tell when that will turn around.

And somebody that's promoted a stock to five times what it's worth, may very well promote it to ten times what it's worth, and if you're short, that can get very painful.

Charlie, do you have any thoughts on shorting?

CHARLIE MUNGER: Well, not on shorting. But those delays in delivering sometimes reflect a tremendous slop in the clearance process, and it is not good for a civilization to have huge slop in the clearance processes for its security trades.

That would be sort of like having a lot of slop in the management of your atomic power plants. It's not a good idea to have slop that causes a lot of financial exposure that people are ignoring.

WARREN BUFFETT: Charlie, reach back into your law practice. If I buy a thousand shares of General Motors, and my broker doesn't deliver it to me, and I ask him to deliver it and he doesn't deliver it to me after a week or two weeks or three weeks, what's the situation?

CHARLIE MUNGER: Well, if you're a private customer, you may wait a while. And a lot of the other trades — the clearance systems do cause people to put up collateral and so on.

But a lot of — take derivative trading. There's a lot of slop in derivative trading. And the clearance problem would be awful if a lot of people wanted to do something at once.

WARREN BUFFETT: But if I demand delivery after three weeks, can I walk into court and say I want my stock, I've given you the money?

CHARLIE MUNGER: I don't think there's any court that can issue you a stock certificate just because you want it.

No, the clearance system is failing you. Why, you can scream a lot, and you may have some ultimate remedy, but there's —

WARREN BUFFETT: I'll get somebody else to represent me. (Laughter)

13. "Gambling is a tax on ignorance"

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: Hello, hello. My name is Johann Fortenberg (PH) from Hanover, Germany.

Do you think gambling companies will have a great future? Thank you.

WARREN BUFFETT: What kind of company?

CHARLIE MUNGER: Gambling companies.

WARREN BUFFETT: Gambling companies. Gambling companies will have a terrific future, if they're legal.

You know, which ones or anything, I don't know anything about that.

But the desire of people to gamble and to gamble in stocks, incidentally, too. Day trading, I would say, very often was — came very close to gambling as defined —.

But people like to gamble, you know. I mean, it's a — if the Super Bowl is on — better yet, if a terribly boring football game is on but you don't have anything to do, and you're sitting there with somebody else, you're probably going to enjoy the game more if you bet a few bucks on it one way or the other.

As you know, I mean, we insure hurricanes, so I watch the Weather Channel. But that's a — (Laughter)

It can be exciting. (Laughter)

But people — the human propensity to gamble is huge. Now, when it was legalized only in — pretty much in Nevada — you had to go to some distance, or break some laws, to do any serious gambling.

But as the states learned to — you know, what a great source of revenue it was, they gradually made it easier and easier and easier for people to gamble.

And, believe me, the easier it's made, the more people will gamble.

I mean, when I was — my children are here, and 40 years ago I bought a slot machine and I put it up on our third floor, and I could give me kids any allowance they wanted as long as it was in dimes. I mean, I had it all back by nightfall. (Laughter)

I thought it would be a good lesson for them. Now they weren't going to Las Vegas to do it, but believe me when it was on the third floor, they could find it, you know.

And my payout ratio was terrible, too, but that's the kind of father I was. (Laughter)

The — but gambling, you know, people are always going to want to do it.

And for that reason, I particularly think that access — you know, in terms of friendly gambling or anything like that, I'm not a prude about it, but I do think that to quite an extent, gambling is a tax on ignorance.

I mean, if you want to tax the ignorant, people who will do things with the odds against them, you know, you just put it in and guys like me don't have to pay taxes.

I really don't — I find that — I find it kind of socially revolting when a government preys on the weaknesses of its citizenry rather than acts to serve them. And, believe me, when a government — (Applause)

WARREN BUFFETT: When a government makes it easy for people to take their Social Security checks and start pulling handles or participating in lotteries or whatever it may be, it's a pretty cynical act.

It works. It's a pretty cynical act. And it relieves taxes on those, you know, who don't fall for those or who don't — who aren't dreaming about having a car instead of actually having a car or dreaming about a color TV instead of having one.

So it's not government at its best, and I think other things flow from that over time, too.

Charlie?

CHARLIE MUNGER: You know, I would argue that the gambling casinos use clever psychological tricks to cause people to hurt themselves.

There is undoubtedly a lot of harmless amusement in the casinos, but there's also a lot of grievous injury that is deliberately caused by the casinos.

It's a dirty business, and I don't think you'll find a casino soon in Berkshire Hathaway. (Applause)

14. How to be a better investor

WARREN BUFFETT: Number 10, please.

AUDIENCE MEMBER: Good morning. I'm Thomas Gamay (PH) from San Francisco. I'm 17-years-old and this is my tenth consecutive annual meeting. (Applause)

WARREN BUFFETT: You must be a Ph.D. by now at least.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, I'm curious about what you think is the best way to become a better investor.

Should I get an MBA? Get more work experience? Read more Charlie Munger almanacs or merely is it genetic and out of my hands?

WARREN BUFFETT: Well, I think you should read everything you can.

I can tell you in my own case, I think by the time I was — well, I know by the time I was ten — I'd read every book in the Omaha Public Library that had anything to do with investing, and many of them I'd read twice.

So I don't think there's anything like reading, and not just as limited to investing at all. But you've just got to fill up your mind with various competing thoughts and sort them out as to what really makes sense over time.

And then once you've done a lot of that, I think you have to jump in the water, because investing on paper and doing — you know, and investing with real money, you know, is like the difference between reading a romance novel and doing something else. (Laughter)

There is nothing like actually having a little experience in investing. And you soon find out whether you like it. If you like it, if it turns you on, you know, you're probably going to do well on it.

And the earlier you start, the better, in terms of reading. But, you know, I read a book at age 19 that formed my framework for thinking about investments ever since.

I mean, what I'm doing today at 76 is running things through the same thought pattern that I got from a book I read when I was 19.

And I read all the other books, too, but if you — and you have to read a lot of them to know which ones really do jump out at you and which ideas jump out at you over time.

So I would say that read and then, on a small scale in a way that can't hurt you financially, do some of it yourself.

Charlie?

CHARLIE MUNGER: Well, Sandy Gottesman, who is a Berkshire director, runs a large and successful investment operation, and you can tell what he thinks causes people to learn to be good investors by noticing his employment practices.

When a young man comes to Sandy, he asks a very simple question, no matter how young the man is. He says, "What do you own and why do you own it?" And if you haven't been interested enough in the subject to have that involvement already, why, he'd rather you go somewhere else.

WARREN BUFFETT: Yeah. It's very — that whole idea that you own a business, you know, is vital to the investment process.

If you were going to buy a farm, you'd say, I'm buying this 160-acre farm because I expect that the farm will produce 120 bushels an acre of corn or 45 bushels an acre of soybeans and I can buy — you know, you go through the whole process.

It'd be a quantitative decision and it would be based on pretty solid stuff. It would not be based on, you know, what you saw on television that day. It would not be based on, you know, what your neighbor said to you or anything of the sort.

It's the same thing with stocks. I used to always recommend to my students that they take a yellow pad like this and if they're buying a hundred shares of General Motors at 30 and General Motors has whatever it has out, 600 million shares or a little less, that they say, "I'm going to buy the General Motors company for $18 billion, and here's why."

And if they can't give a good essay on that subject, they've got no business buying 100 shares or ten shares or one share at $30 per share because they are not subjecting it to business tests.

And to get in the habit of thinking that way, you know, Sandy would have followed it up with the questions, based on how you answered the first two questions, that made you defend exactly why you thought that business was cheap at the price at which you are buying it. And any other answer, you'd flunk.

15. When you don't need a huge margin of safety

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, I'm Marc Rabinov from Melbourne, Australia.

I just wanted to ask you, how do you judge the right margin of safety to use when investing in various common stocks?

For example, in a dominant, long-standing, stable business, would you demand a 10 percent margin of safety and, if so, how would you increase this in a weaker business? Thank you.

WARREN BUFFETT: We favor the businesses where we really think we know the answer.

And, therefore, if a business gets to the point where we think the industry in which it operates, the competitive position or anything is so chancy that we can't really come up with a figure, we don't really try to compensate for that sort of thing by having some extra large margin of safety.

We really want to try to go on to something that we understand better. So if we buy something like — See's Candy as a business or Coca-Cola as a stock, we don't think we need a huge margin of safety because we don’t think we’re going to be wrong about our assumptions in any material way.

What we really want to do is buy a business that’s a great business, which means that business is going to earn a high return on capital employed for a very long period of time, and where we think the management will treat us right.

We don’t have to mark those down a lot when we find those factors. We’d love to find them when they’re selling at 40 cents on the dollar but we will buy those as much closer to a dollar on the dollar. We don’t like to pay a dollar on the dollar, but we’ll pay something close.

And if we really get to something — you know, when we see a great business, it’s like if you see some — somebody walk in the door, you don’t know whether they weigh 300 pounds or 325 pounds. You still know they’re fat, right, you know?

And so if we see something we know it’s fat, financially, we don’t worry about being precise. And if we can come in, in that particular example, at the equivalent of 270 pounds, we’ll feel good.

But if we find something where the competitive aspects are — it’s just the nature of the business that you really can’t see out five or 10 or 20 years because that’s what investing is, is seeing out.

You don’t get paid for what’s already happened. You only get paid for what’s going to happen in the future. The past is only useful to you in the extent to which it gives you insights into the future, and sometimes the past doesn’t give you any insights into the future.

And in other cases, like the stable business that you postulated, it probably does give you a pretty good guideline as to what’s going to happen in the future, and you don’t need a huge margin of safety.

You should have something that — you always should feel you’re getting a little more than what it’s worth, and there are times when we’ve been able to buy wonderful businesses at a quarter of what they’re worth, but we haven’t seen those — well, we saw it in Korea here recently — but you don’t see those sort of things very often.

And does that mean you should sit around and hope they come back for 10 or — you know, wait 10 or 15 years? That’s not the way we do it. If we can buy good businesses at a reasonable valuation, we’re going to keep doing it.

Charlie?

CHARLIE MUNGER: Yeah. You’re — that margin of safety concept boils down to getting more value than you’re paying. And that value can exist in a lot of different forms.

If you’re paid four-to-one on something that’s an even money proposition, why, that’s a value proposition, too.

It’s high school algebra. And people who don’t know how to use high school algebra should take up some other activity.

16. Health care is too tough for Berkshire

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: — morning. Good morning.

WARREN BUFFETT: Morning.

AUDIENCE MEMBER: My name is Mike Klein, and I’m a general surgeon from Salinas, California.

Given your resources and experience in underwriting insurance, do you have any thoughts of entering into, or helping to solve, our health care mess?

Time is right for a new approach with Berkshire’s clarity brought to the formula. Let’s acknowledge the stakes are huge with implication for our economy and our future as a country.

CHARLIE MUNGER: Let me try that one. It’s too tough.

WARREN BUFFETT: I would —

CHARLIE MUNGER: Warren and I can’t solve that.

WARREN BUFFETT: Yeah, we can’t solve that one.

We try to look for easy problems because those are the ones we find we have the answers for. And you can do that in investments. We don’t really try tough things.

Now, sometimes life hands you a problem, not in the financial area in our case, usually, but it will hand you a problem that is very tough and that you have to wrestle with.

But we don’t go around looking for tough problems. I would say this: we do very, very little in health insurance. You know, if we were to have — if we were looking for a solution through the private sector, we would be looking for something with very, very low distribution costs.

I mean, you do not want a lot of the revenue soaked up in frictional costs between the benefits paid and the premiums received.

I don't know how to do that, and I haven't seen anybody else that's very good at doing it, and you can say if you're paying close to 15 percent of GDP for health costs, you know, somebody ought to be able to figure out something, but I haven't heard it.

Maybe we'll hear it in the upcoming political campaign but Charlie's views reflect mine at the present.

17. Munger on what's driven Berkshire's "extreme" success

WARREN BUFFETT: Now we're going to go to the grand ballroom. We have these two overflow rooms that are full — or more or less full — and the grand ballroom is number. 13. Would they come in, please?

AUDIENCE MEMBER: This is Phil McCall (PH) from Connecticut.

I wondered if you could comment on a subject I don't think you like to talk about very much, which is intrinsic value, and the evolution over the past 10 or 12 years of going to — off and on — but giving us investments and then giving us the operating income and suggesting that might be a good guide to us.

I find it extremely helpful. I'm not sure other people do when looking out the 20 years you're talking about, looking ahead on both those two parts. Any comments you might have, I'd surely appreciate.

WARREN BUFFETT: Yeah. Well, the intrinsic value of Berkshire, like any other businesses, is based on the future amount of cash that can be expected to be delivered by the business between now and judgment day, discounted back at the proper rate.

Now, that's pretty nebulous. Another way of looking at it is to try and figure out the value of the businesses we own presently, and we try to give you the information that will enable you to make a reasonably close estimate at that.

We own lots of marketable securities. It's probably safe to say that they're worth more or less what they are carried for. And then we own a number of operating businesses, and we try to give you the figures on those businesses that are the figures that we use in making our own judgments about the value of those businesses.

Now, that tells you what we have today and more or less what it's worth. But since Berkshire retains all of its earnings, it becomes very important to evaluate what will be done with those earnings over time.

I mean, it is not only a question what the present businesses are worth. It's a judgment on the efficiency or the effectiveness with which retained earnings will be used.

If you had looked at the intrinsic value of Berkshire in 1965, we had a textile business that was probably worth about $12 a share. But that was not the only part of the equation, because we intended to use any cash generated to try and buy into better businesses than we had, and we were fortunate to be able to buy in the insurance business in 1967 and build on that.

So it was not only a combination of the business we had, but the skill with which retained earnings would be used, that determined what the present value actually should have been at Berkshire going back that far.

It's the same situation today. We will put to work billions and billions of dollars this year and next year and the year after. If we put that to work effectively, each dollar has a greater present value than a dollar has simply in cash or distributed. If we do ineffectively, it has a value of something less.

The businesses today, you know, we have whatever the figure is in the annual report — roughly $80,000 in marketable securities.

If our insurance business breaks even, that $80,000 is free to us, in terms of using it. And we have a group of operating businesses and we show their earnings in the report and we're going to try to add to those and they'll try to add to their earnings.

But if Charlie and I were each right now to write down on a piece of paper what we think the intrinsic value of Berkshire is, our figures would not be the same. They'd be reasonably close.

And I think with that, I'll turn it over to Charlie.

CHARLIE MUNGER: Yeah. What's hard to judge at Berkshire is the likelihood that you'll have anything like the past to look forward to in the future.

Berkshire has gotten very extreme, in terms of investment results. In fact, it's gotten so extreme that it's hard to think of another similar precedent in the history of the world.

And the balance sheet is gross, considering the small beginnings of the place. Now, what on earth has caused this extreme record to go on for such a very long time?

I would argue that the young man who was reading everything he could read when he was 10-years-old became a learning machine, and he got a lot of power early, and then he got a very long run when he kept learning.

If Warren had not been learning all the while, I'm telling you having watched the process closely, the record would be a pale shadow of what it is. And Warren has improved since he passed the retirement age of man.

In other words, in this field, at least, you can improve when you're old.

Now, most people don't even try and create that kind of a record. They pass power from one 65-year-old to one 59-year-old and then do it over and over again. But you get an enormous advantage from practice in this field.

And so what happened accidentally in the case of Warren has helped you shareholders greatly because you had this long run with power extremely concentrated, and with the man holding the power being a ferocious learner.

Our system ought to be more copied than it is. (Applause)

This idea of passing the power from one old codger to another, in a settled way, is not necessarily the right system at all.

WARREN BUFFETT: We have a very strong culture now of rationality, of being owner-oriented, that will go on long after I'm not around. And we have a talent on the operating side in place to do a lot of wonderful things over time.

We will need, in capital allocation, to keep doing intelligent things. We won't get to do brilliant things because you don't get to do brilliant things with the kind of sums we're talking about. Maybe once in a blue moon or something, you know, you'll get a chance.

But we will need somebody that never does — basically doesn't do any dumb things, and occasionally does something that's reasonably good. That can be done.

And we have — we're on that road already. It does not — fitting into this organization as an investment officer or a capital allocator, you're getting in the right vehicle. It has the right standards. It will reject ideas that really are irrational.

I've been on a lot of boards. Charlie's been on a lot of boards. You would be amazed at the number of things that are responding to "animal spirits" rather than to rationality that take place. And we have our animal spirits but we devote them to other areas.

18. "Deficient" auditing of derivatives will cause problems

WARREN BUFFETT: Let's go on to number 14. That's in — that's in the junior ballroom.

AUDIENCE MEMBER: Yes. Hi, Mr. Buffett and Mr. Munger. This is Whitney Tilson, a shareholder from New York.

For many years both of you have been warning about the dangers of derivatives, at one point calling them "financial weapons of mass destruction."

Yet every year, tens of trillions of dollars of derivatives are bought and sold. It just seems to be getting bigger and bigger and almost certainly improperly accounted for.

And so I was wondering if you could comment, and, specifically, if you have any thoughts on how much longer this might go on.

Do you see anything imminent that could derail this ever inflating bubble? What might trigger it? And who should be doing what to try and mitigate this looming danger?

WARREN BUFFETT: Well, we've tried to do a little to mitigate it ourselves by talking about it, but the — you're right, the — and it isn't the derivative itself. I mean, there's nothing evil about a derivative instrument.

As I mentioned, we have 60-some of them at Berkshire, and on Monday I'll go over with the directors — I'll go over all 60-some and, believe me, we'll make money out of those particular instruments.

But they — usage of them on an expanding basis, more and more imaginative ways of using them, introduces, essentially, more and more leverage into the system.

And it's an invisible — or largely invisible — sort of leverage. If you go back to the 1920s, after the crash, the United States government held hearings.

They decided that leverage — margin, in those days, as they called it — leverage contributed to, perhaps, the crash itself and certainly to the extent of the crash. And it was like pouring gasoline on a fire was — when people's holdings got tripped, you know, when stocks went down 10 percent people had to sell, another 10 percent, more people had to sell and so on.

Leverage was regarded as dangerous and the United States government empowered the Federal Reserve to regulate margin requirements, regulate leverage, and that was taken very seriously.

And for decades it was a source of real attention. I mean, if you went to a bank and tried to borrow money on a stock, they made you sign certain papers as to — that you weren't in violation of the margin requirements, and they policed it.

And it was taken quite seriously when the Fed increased or decreased margin requirements. It was a signal of how they felt about the level of speculation.

Well, the introduction of derivatives and index futures, all that sort of thing, has just totally made any regulation of margin requirements a joke.

They still exist and, you know, it's an anachronism.

So I believe — I think Charlie probably agrees with me — that we may not know where, exactly, the danger begins and where — and at what point it becomes a superdanger and so on.

We certainly don't know what will end it, precisely. We don't know when it will end, precisely.

But we probably — at least I believe — that it will go on and increase to the point where at some point there will be some very unpleasant things happen in markets because of it.

You saw one example of what can happen under forced sales back in October 19, 1987, when you had so-called portfolio insurance.

Now, portfolio insurance — and you ought to go back and read the literature for the couple years preceding that. I mean, this was something that came out of academia and it was regarded as a great advance in financial theories and everything.

It was a joke. It was a bunch of stop-loss orders which, you know, go back 150 years or something, except that they were done automatically and in large scale by institutions and they were merchandise.

People paid a lot of money to people to teach them how to put in a stop-loss order. And what happened, of course, was that if you have a whole series of stop-loss orders by very big institutions, you are pouring gasoline on fire.

And when October 19th came along, you had a 22 percent shrink in the value of American business, caused, essentially, by a doomsday machine. A dead hand was selling as each level got hit. And three weeks earlier, you know, people were proclaiming the beauty of this.

Well, that is nothing compared — it was a formal arrangement to have these — this dynamic hedging or portfolio insurance — sell things.

But you have the same thing existing when you have fund operators operating with billions in aggregate, trillions of dollars, leveraged, who will respond to the same stimulus.

They have what we would call a "crowded trade," but they don't know it. It's not a formal crowded trade.

It's just that they're all ready to sell if a certain given signal or a certain given activity occurs. And when you get that, coupled with extreme leverage which derivatives allow, you will someday get a very, very chaotic situation.

I have no idea when. I have no idea what the exogenous factor — I didn't know that shooting some archduke, you know, would start World War I, and I have no idea what will cause this kind of a thing, but it will happen.

Charlie?

CHARLIE MUNGER: Yeah. And, of course, the accounting being deficient enormously contributes to the risks.

If you get paid enormous bonuses based on reporting profits that don't exist, you're going to keep doing whatever causes those phony profits to keep appearing on the books.

And what makes that so difficult is that most of the accounting profession doesn't even recognize how stupidly it is behaving.

And one of the people in charge of accounting standards said to me, "Well, this is better, this derivative accounting, because it's mark-to-market, and don't we want current information?"

And I said, "Yes. But if you mark-to-model, and you create the models, and your accountants trust your models, and you can just report whatever profit you want as long as you keep expanding the positions bigger and bigger and bigger, the way human nature is, that will cause terrible results and terrible behavior."

And this person said to me, "Well, you just don't understand accounting." (Laughter.)

WARREN BUFFETT: If four years ago, or whenever it was, when we started to liquidate Gen Re's portfolio, we had reserves set up for in the hundreds and millions and all sorts of things.

And our auditor — and I emphasize any other of the Big Four auditors absolutely would have attested to the fact that our stuff was mark-to-market.

You know, I just wish I'd sold the portfolio to the auditors that day. (Laughs) I'd be 400 million better off.

So it's a real problem. Now there's one thing that's really quite interesting to me. If I owe you, on my dry cleaning bill or something, $15, and they're auditing the dry cleaners, they check with me and they find out that I owe you $15 and it's all fine.

If they're auditing me, they find out I owe the dry cleaner 15 bucks. There are only four big auditing firms, you know, basically in this country.

And I will — so in many cases, if they're auditing my side of the derivative transaction, you know, what I'm valuing it at, the same firm may often be valuing — or attesting to the value of the mark by the person on the other side of the contract.

I will guarantee you that if you add up the marks on both sides, they don't equate out to zero.

We have 60-some contracts, and I will bet that people are valuing them differently on the other side than we value themselves, and it won't be to the disadvantage of the trader on the other side.

I don't get paid based on how ours are valued, so I have no reason to want to game the system. But there are people out on the other side that do have reasons to game the system.

So if I'm valuing some contract at plus a million dollars for Berkshire, that contract on the other side, it's just one piece of paper, should be valued at a minus 1 million by somebody else.

But I think you probably have cases — and this is — I'm not talking about our auditors, I'm talking about all four of the firms — but they have many cases where they are attesting to values that — of the exact same piece of paper — where the numbers are widely different on both sides.

Do you have any thoughts on that, Charlie?

CHARLIE MUNGER: Well, I — as sure as God made little green apples, this is going to cause a lot of trouble in due course.

As long as it keeps expanding and ballooning and so on and the convulsions are minor, it can just go on and on. But eventually there will be a big denouement.

19. Dangers of short-term investing and advanced mathematics

WARREN BUFFETT: Let's go back to number one.

AUDIENCE MEMBER: Hi. I'm Stanley Ku from Hong Kong. My question is about a proliferation of short-term mindset to investing.

As more and more money is being placed under absolute return mandate, these managers, as you just said, responded the same response, and tried to trade issues.

So with credit spread on — I should say, risk premium — on various products declining across the board and correlation across markets increasing, can we read into it and say what is healthy or not healthy for the economy or the markets? And can we arguably say the portfolio insurance dynamics is already in place today?

WARREN BUFFETT: Well, I think you put your finger on it. And, you know, we do think it's unhealthy.

Obviously, if you take — and no way of precisely measuring this, but I'm quite certain I'm right — if you take the degree to which, say, either bonds or stocks, the percentage of them that are held by people who could change their minds tomorrow morning based on a given stimulus, whether it be something the Fed does or whether it be some kind of an accident in financial markets, the percentage is far higher.

There is an electronic herd of people around the world managing huge amounts of money who think that a decision on everything in their portfolio should be made, basically, daily or hourly or by the minute.

And that has increased turnover on the New York Stock Exchange — and I don't know the exact figures — but I think it was down around the 15 or 20 percent range 40 years ago and it's increased it to a hundred percent, I believe, plus, now.

So — and certainly in the bond market, the turnover of bonds has increased dramatically. People used to buy bonds to own them and they'd buy bonds to trade them.

And there's nothing evil about that, but it just means that the participants are playing a different game, and that different game can have different consequences than in a buy-and-hold environment.

And I do think it means that if you're trying to beat the other fellow on a day-to-day basis, you're watching news events very carefully or watching the other fellow very carefully.

If you think he's about to hit that key, you know, you're going to try to hit the key faster, if that's the game you're playing and if you're getting measured on results weekly.

So I think that you describe the conditions that will lead to a result that we've been talking about expecting at some point.

It's not new to markets, though. I mean, markets will do crazy things over time. Every time — when Charlie and I were at Salomon, they'd always talk to us about five sigma events or six sigma events, and that's fine if you're talking about flipping coins, but it doesn't mean anything when you get human behavior involved.

And people do things that — and intelligent people do things — very intelligent, educated people do things — that are totally irrational, and they do them en masse.

And you saw it in 1998. You saw it in 2002. And you'll see it again. And you'll see it — it's more likely to happen when you have people trying to beat currency, bond, stock markets, day by day.

It's — I think it's a fool's game. But — you know, it may be what's required to attract money.

When I set up my partnership, I told the partners, you know, you'll hear from me once a year.

And I even thought — in 1962 I put the partnerships together and in May of 1962 the market got terrible — and I actually thought of sending all my partners a letter, and then sending it down to Brazil to have it reshipped back up, just to sort of test them out, but — how they felt about things.

But, you know, I had a few with bad hearts. I decided it wasn't worthwhile.

Charlie?

CHARLIE MUNGER: Yeah. When people talk about sigmas, in terms of disaster potentialities in markets, they're all crazy.

They got the idea that bad results in markets would be predicted by Gaussian distributions. And the way they decided on that outcome was it made everything so easy to compute.

They don't follow Gaussian distributions. You have to believe in the Tooth Fairy to believe that.

And the disasters are bigger and more irritating than [German mathematician Carl Friedrich] Gauss would have predicted.

WARREN BUFFETT: It was easier to teach as well.

CHARLIE MUNGER: It's easier to teach, too.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: I once asked a distinguished medical school professor why he was still doing an obsolete procedure, and he said, "It's so wonderful to teach." (Laughter)

WARREN BUFFETT: There's more of that in finance departments than you might think.

It's very discouraging to learn advanced mathematics and, you know, how to do things that none but the priesthood can do in your field, and then find out it doesn't have any meaning, you know.

And what you do when confronted with that knowledge, after you've invested these years to get your Ph.D., you know, and you've maybe written a textbook and a paper or two, having a revelation that that stuff has no utility at all, and really has counter-utility, I'm not sure, you know, too many people can handle it well. And I think they just generally keep on teaching.

20. Quantitative approach to intrinsic value and investments

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Hello. Burkhardt Whittick (PH) from Munich in Germany.

I would like to get some more transparency on how you make investment decisions, particularly how you determine intrinsic value.

You mentioned that the theoretically correct method is discounted cash flow, but at the same time you point out the inherent difficulties of the methodology.

From other books, I see that you use multiples on operating earnings, or (inaudible) multiples. Your [former] daughter [in law] Mary, in one of her books, describes another methodology where you apply compounding economics to the value of the equity.

Could you give us a bit more transparency which quantitative approach you use and how many years out you try to quantify the results of the investments you're interested in?

WARREN BUFFETT: I understand the question, but I'm going to pretend I don't and let Charlie answer first. (Laughs)

I really do.

CHARLIE MUNGER: Yeah. When you're trying to determine something like intrinsic value and margin of safety and so on, there's no one easy method that could be simply mechanically applied by, say, a computer and make anybody who could punch the buttons rich.

By definition, this is going to be a game which you play with multiple techniques and multiple models, and a lot of experience is very helpful.

I don't think you can become a great investor very rapidly any more than you could become a great bone tumor pathologist very rapidly. It takes some experience and that's why it's helpful to get a very early start.

WARREN BUFFETT: But if you're — let's just say that we all decided we're going to buy a — or think about — buying a farm.

And we go up 30-miles north of here and we find out that a farm up there can produce 120 bushels of corn, and it can produce 45 bushels of soybean per acre, and we know what fertilizer costs, and we know what the property taxes cost, and we know what we'll have to pay the farmer to actually do the work involved, and we'll get some number that we can make per acre, using fairly conservative assumptions.

And let's just assume that when you get through making those calculations that it turns out to be that you can make $70 an acre to the owner without working at it.

Then the question is how much do you pay for the $70? Do you assume that agriculture will get a little bit better over the years so that your yields will be a little higher?

Do you assume that prices will work a little higher over time? They haven't done much of that, although recently, it's been good with corn and soybeans. But over the years agriculture prices have not done too much. So you would be conservative in your assumptions, then.

And you might decide that for $70 an acre, you know, you would want a — if you decided you wanted a 7 percent return, you'd pay a thousand dollars an acre.

You know, if farmland is selling for 900, you know you're going to have a buy signal. And if it's selling for 1200, you're going to look at something else. That's what we do in businesses.

We are trying to figure out what those corporate farms that we're looking at are going to produce. And to do that we have to understand their competitive position. We have to understand the dynamics of the business.

We have to be able to look out in the future. And like I've said earlier, some businesses you can't look out very far at.

But the mathematics of investment were set out by Aesop in 600BC. And he said, "A bird in the hand is worth two in the bush."

Now our question is, when do we get the two? How long do we wait? How sure are we that there are two in the bush? Could there be more, you know? What's the right discount rate?

And we measure one against the other that way. I mean, we are looking at a whole bunch of businesses, how many birds are they going to give us, when are they going to give them to us, and we try to decide which ones — basically, which bushes — we want to buy out in the future.

It's all about evaluating future — the future ability — to distribute cash, or to reinvest cash at high rates if it isn't distributed.

Berkshire has never distributed any cash, but it's grown in its cash producing abilities, and we retain it because we think we can create more than a dollar present value by retaining it. But it's the ability to distribute cash that gives Berkshire its value.

And we try to increase that ability to distribute cash year by year by year and then we try to keep it and invest it in a way so that a dollar bill is worth more than a dollar.

You may have an insight into very few businesses. I mean, if we left here and walked by a McDonald's stand, you know, and you decided, would you pay a million dollars for that McDonald's stand, or a million-three, or 900,000, you'd think about how likely it was there would be more competition, whether McDonald's could change the franchise arrangement on you, whether people are going to keep eating hamburgers, you know, all kinds of things.

And you actually would say to yourself this McDonald's stand will make X — X plus 5 percent — maybe in a couple years because over time prices will increase a little.

And that's all investing is. But you have to know when you know what you're doing, and you have to know when you're getting outside of what I call your circle of competency, you don't have the faintest idea.

Charlie.

CHARLIE MUNGER: Yeah. The other thing, you've got to recognize that we've never had any system for being able to make correct judgments on the values of all businesses.

We throw almost all decisions into the too hard pile, and we just sift for a few decisions that we can make that are easy. And that's a comparative process.

And if you're looking for an ability to correctly value all investments at all times, we can't help you.

WARREN BUFFETT: No. We know how to step over one-foot bars. We don't know how to jump over seven-foot bars.

But we do know how to recognize, occasionally, what is a one-foot bar. And we know enough to stay away from the seven-foot bars, too.

21. What Buffett wants as he hires portfolio managers

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: John Stevo (PH), shareholder from Chicago. Mr. Buffett — Mr. Buffett, Mr. Munger, thank you for the great weekend.

In your annual shareholders letter, you stated that you're looking for someone younger to possibly work at Berkshire, and I was wondering if you could expand on that, and how would I apply for that job? (Laughter)

WARREN BUFFETT: I think you just did. (Laughter)

The — we're looking for one or more. I mean, I would — I don't think it's at all impossible we might even find three or four that we would decide to have run some money and to take a closer look.

We're not looking for someone to teach. I probably didn't make that clear enough in the annual report. We're not — we're not going to be mentors or teachers or anything of the sort.

We're looking for somebody that we think knows how to do it. And there are people like that out there. We've heard from 6- or 700.

I did hear — I heard from one that had a four-year-old son. I thought that was quite a compliment that — I mean, I knew a caveman could do my job, but a four-year-old? (Laughter)

The — but we're looking — and we've heard from a number of very intelligent people. We have heard from a number of people that have had good investment records for — in recent years, and in some cases some time.

The biggest problem we have is whether they would scale up, because it's a different job to run a hundred billion than it is to run a hundred million.

And incidentally — and you can't do as well running a hundred billion as a hundred million, in terms of returns. You can't come close to doing it. That doesn't bother us.

But we do want to find somebody that we think can run large sums of money mildly better than the general performance in securities. And I emphasize mildly.

There's no way in the world somebody's going to beat the S&P by 10 percentage points a year with a hundred billion dollars. It isn't going to happen.

But we think maybe we can find somebody or some group, several of them, that can maybe be a couple percentage points better, but we really are interested in being sure that we have somebody that, under conditions that people haven't even seen yet, will not blow it.

You know, anything times zero is zero. And I don't care how many wonderful figures are in between.

So we are looking for somebody that's wired in a way that they see risks that other people don't see that haven't occurred, and they're plenty cognizant of the risks that have occurred.

And those people are fairly rare. Charlie and I have seen a lot of very smart people go broke, or end up with very mediocre records where, you know, 99 out of the 100 things they did were intelligent but the hundredth did them in.

So our job is to filter through these hundreds and hundreds of applications, find a couple of them that we think can do the job who are much younger, perhaps give them a chunk — two, three, five billion — have them manage it for some time, have them manage it in the kind of securities that they would scale up to a larger portfolio because — and then either one or more of them will get the job turned over to them at some point.

Charlie?

CHARLIE MUNGER: Yeah. Our situation in looking for this help reminds me of an apocryphal tail about Mozart. And a young man of 25 or so once asked to see Mozart and he said, "I'm thinking of starting to write symphonies, and I'd like to get your advice."

And Mozart said, “Well, you’re too young to write symphonies.” And the guy says, “But you were writing them when you were ten-years-old.” And Mozart says, “Yes, but I wasn’t asking anybody else for advice how to do it.” (Laughter.)

CHARLIE MUNGER: And so if you remind yourself of young Mozart, why, you’re the man for us.

WARREN BUFFETT: We will come up with, probably, a couple of people. And, you know, it’s — I’ve known people over the years.

I’ve been in the job before. I mean, in 1969 I wound up my partnership, and I had a lot of people that trusted me, and I wasn’t going to just mail the money back to them and, you know, say good-bye, because they would have been sort of adrift, most of them.

And so I had the job of finding somebody to replace me. And there were three absolutely stand-out candidates. Any one of the three would have been a great choice.

Charlie was one of them. Sandy Gottesman was one of them. And Bill Ruane was one of them.

Charlie wasn’t interested in having more partners.

Sandy was interested in individual accounts and took on the accounts of some of my partners and they were very, very happy and they’re still happy that he did it.

And Bill Ruane set up a separate mutual fund called Sequoia Fund to take care of all of the partners, whether they had small amounts or not. And he did a sensational job.

So I really identified three people in 1969 that were not only superior money managers, but that were also the kind that could never get you a terrible result and that were terrific stewards of capital.

Now, they were about my age at the time so it was a universe that I was familiar with, and now I have the problem that at — the people I know that are even close to my age, we don’t want anyway, and besides, most of them are already rich. They don’t care about having a job.

So I have to look into an age cohort where I don’t really know lots of people, but it can be done.

And like I say, we did it successfully with three people in 1969. And it was done successfully in 1979 with Lou Simpson for GEICO.

And I never knew Lou Simpson before I met him down at the airport here, and I spent a few hours with him, and it was clear that he was a steward of capital. He was going to get an above-average result, and there was no chance he was going to get a bad result.

And he’s been managing money for GEICO now for 28 years, roughly.

So it's doable. It's a little more work than I like to do. I've been kind of spoiled. But I'll — I've got a job to do on it, and I'll do it.

22. Buffett and Munger differ on climate change

WARREN BUFFETT: Number 4?

AUDIENCE MEMBER: Good morning. I'm Glen Strong (PH) from Canton, Ohio.

Please tell us where you stand on the global warming debate or where your managers at General Re stand.

In particular, perhaps you can give us your thoughts on the science of global warming and how serious you believe it is, and whether warming is actually more harmful than helpful. Thank you.

WARREN BUFFETT: Yep. Well, I believe the odds are good that it is serious. I'm not enough of a — I can't say that with 100 percent certainty or 90 percent certainty, but I think that there's enough evidence that it would be very foolish to say that it's 100 percent certain or 90 percent certain that it isn't a problem.

And since it's — if it is a problem, it's a problem that once it manifests itself to a very significant degree, it's a little too late to do something about it.

In other words, you really have to build the ark before the rains come, in this case. I think if you make a mistake, in terms of a social decision, you should, what I call err, on the side of the planet.

In other words, you should build a margin of safety into your thinking about the future of the only planet we've got a hundred years from now.

So I think — I take it seriously. In terms of our own businesses, you mentioned General Re. Gen Re writes less — way less business — that would be subject to the annual increments in global warming that would have an effect on their results than the reinsurance division of National Indemnity, where we write far more of the catastrophe business.

It's not going to affect, you know, in any measurable degree at all, you know, excess casualty insurance, property insurance. You're thinking much more of whether it's going to produce atmospheric changes that change materially the probabilities of really — of catastrophes, both their frequency and their intensity.

In my own mind, and in the minds of the people that run National Indemnity's reinsurance division, we crank — we think the exposure goes up every year because of what's going on in the atmosphere, even though we don't understand very well what goes on in the atmosphere.

And the relationship between damage caused and the causal factors is not linear at all. I mean, it can be explosive.

So if temperatures in the waters of the Atlantic or something change by relatively small amounts, or what seem like small amounts, it could increase the expectable losses from a given hurricane season by a factor of two, three, four or five.

So we're plenty cautious about it. It's not something that keeps me up, in terms of our financial prospects, at all at Berkshire. But it's something that I think every citizen ought to be very cognizant of and make a decision on.

Charlie?

CHARLIE MUNGER: Well, of course carbon dioxide is what plants eat. And so — and generally speaking, I think it's a little more comfortable to have it a little warmer instead of a little colder. (Laughter)

WARREN BUFFETT: I hope you don't get a chance to test that after death, Charlie. (Laughs)

CHARLIE MUNGER: It isn't as though there's a vast flood of people trying to move to North Dakota from southern California.

And so you're talking about dislocation. It's not at all clear to me that, net, it would be worse for mankind in general to have the planet a little hotter.

But the dislocations would cause agonies for a great many places, particularly those that would soon find themselves underwater.

WARREN BUFFETT: Yeah. I was going to ask you. How do you feel about the sea level being 15 or 20 feet higher? (Laughs)

CHARLIE MUNGER: Well, that's very unfortunate, but — (Laughter)

Holland lives with what, 25 percent of the nation below sea level? With enough time and enough capital, why, these things can be adjusted, too.

I don't think it's an utter calamity for man that threatens the whole human race or anything like that. You know, you'd have to be a pot-smoking journalism student or something to — (Applause)

CHARLIE MUNGER: — believe that.

WARREN BUFFETT: We're finally unleashing him, folks. (Laughter)

Well, we'll continue to have people in charge of insurance who are plenty worried about global warming, I promise you.

But it — we don't know — we do know that 2004 and 2005, there was a frequency, and more particularly, there was an intensity of hurricanes that would not be expected at all by looking at the previous century.

And we were spared — even though we had Katrina — we were spared what could have been a far worse case by a couple of Category Fives that didn't hit the mainland.

So I do not regard Katrina as being anywhere near a worst-case scenario.

And, like I say, I don't know whether — how much of — I don't know whether the water is a half a degree or 1 degree Fahrenheit warmer than 30 years ago, but I don't know — and I don't know all the factors that go into hurricanes.

I mean, I know that, obviously, the water temperature, you know, contributes to energy and all that sort. But there could be 50 variables.

All I know is, on balance, I think they're probably getting more negative for us and I know we ought to be very careful about it. And I know that it would be crazy to write insurance in 2007 at the same rates that it was being written a few years ago, in relation to catastrophes.

And since we're in the catastrophe business, that is something I think about, and the people that actually write the policies think about it as well. So it's a factor with us.

23. Bank problems don't mean China will collapse

WARREN BUFFETT: Five.

AUDIENCE MEMBER: Hi. I'm John Golob from Kansas City.

I have a question about the Chinese economy. Some observers have suggested that the Chinese banking system looks a little like Japan back in the 1990s.

Are you concerned that China could experience similar disruptions as Japan in '90 or is China possibly — with different institutions — possibly more resistant to economic disruptions?

WARREN BUFFETT: I would have to say I don't know the answer to that. I mean, it's a very interesting question. It's a very important question.

But, you know, I didn't necessarily understand what was going to happen in Japan before it happened, and my insight into Chinese banks is about zero.

We’ve been offered chances to buy into various Chinese banks and, again, because I don’t know anything about them, I pass. It’s no judgment that there’s anything bad.

It just means that sitting in Omaha, Nebraska, not knowing what some item of loans and advances — what composes it or anything about the real operation of the place — that I can make a decision whether it’s worth X, half of X, 2X, a quarter of X, I just don’t know.

And I really don’t know — I just have no notion as to the answer to your question, but maybe Charlie does.

CHARLIE MUNGER: Well, if you stop to think about it, all of the remarkable economic progress that we’ve seen in China in the last 15 years has been accompanied by practices in their government banks that would make you shutter if you compared them to normal banking standards.

So everything you see in terms of progress has occurred despite — the banks were almost doling out money for aid as distinguished from doing normal banking.

So I’d be very leery of predicting that that’s sure to cause a huge economic collapse in Japan — in China.

They’ve been doing it for a long time, and they may actually be getting better now.

WARREN BUFFETT: Yeah. We’ve had our share of banking troubles in this country. I mean, it wasn’t that long ago in terms of the savings and loan crisis and all kinds of things.

And strong economies come through those things. So, you know, if ahead of time you’d seen all the problems with foreign loans that the commercial banks got into and all the problems with real estate loans that the savings and loans got into, you could have said, you know, it’s going to be terrible for the American economy, and it did produce a lot of dislocations and all of that.

But if you look at the regular American economy, it’s come through all kinds of financial crises with the real output per capita rising at a very substantial rate just decade after decade.

I don’t know what will happen in China, but I think it’s pretty amazing in terms of the gains that have been made.

And I think they’ll be — I think they’ll continue to be made, and I don’t know what will happen with the banking system, though.

24. Easy decision: stocks over bonds

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Good morning, Warren and Charlie. My name is Frank Martin from Elkhart, Indiana. I'm a shareholder.

WARREN BUFFETT: Yeah. You've written a good book too, Frank. (Laughs)

AUDIENCE MEMBER: Thanks, Warren. I'll do my best to be succinct with this question. As you know, my long suit is not brevity in the written word.

Recently, I sequentially read everything that you and Charlie have written, or that has been written about you, since 1999, including your help wanted ad in the annual report, which sought not a Ted Williams, but the consummate defensive player in your forcefully worded quotations in last Monday's Wall Street journal.

When contemplating the chronology, I sensed a gradual but unmistakable sea change in your perspective on the investment environment for marketable securities.

The intensification of your preoccupation with managing risk is conspicuous by its absence among the other biggest players at the margin — hedge funds, private equity, mutual funds — who are shamefully mute both about what are likely to be anemic prospective returns and the unconscionable risks assumed to achieve them, all the while charging a king's ransom for such low value-added services.

When I give free rein to my intuition, the post-1999 Warren Buffett reminds me of the Warren Buffett of post-1969.

Back then, when Berkshire was a small fraction of its current size, you spoke of the difficulty in playing a game you did not understand, that there was little margin of safety in the equity markets in general.

You weren't forecasting what in its own time became the bear market of '73-'74, but you were surely intuitively aware of what [former Federal Reserve Chairman Alan] Greenspan years later has repeatedly warned: the inevitable day of reckoning that follows long periods of low equity risk premium.

Imagine yourself, if you are willing, cast overnight into a new role with a clean slate as head of the investment committee of a $10 billion pension fund.

Today, would your decisions reflect the same risk-averse mindset that dominated your behavior in the post-1969 period? And might you anticipate that following all of this might appear opportunities that were as mouthwatering as appeared in '73-'74?

Please explain, and I hope Charlie will weigh in on the subject as well. Thank you.

WARREN BUFFETT: Yeah Frank, when I closed up to the partnership, if I'd had an endowment fund to run then, the prospective return — and actually, I wrote this in a letter to my partners that I'd be glad to send you a copy of — the prospective return — and I was looking at them as individuals on an after-tax basis — was about the same, I felt, from equities and from municipal bonds over the next decade, and it turned out to be more or less the case.

I would say that I do not regard that as being the same situation now. If I were managing a very large endowment fund, for one thing it would either be a hundred percent in stocks or a hundred percent in long bonds or a hundred percent in short-term bonds.

I mean, I don't believe in layering things and saying I'm going to have 60 percent of this and 30 percent of that. Why do I have the 30 percent if I think the 60 percent makes more sense?

So — and if you told me I had to invest a fund for 20 years and I had a choice between buying the index, the 500, or a 20-year bond, you know, I would buy stocks.

You know, that doesn't mean they won't go down a lot. But if you — I would rather a have an equity investment — I wouldn't rather have an equity investment where I paid a ton of money to somebody else that took my stock return down dramatically.

But simply buying an index fund for 20 years of equities or buying a 20-year bond, I would — it would not be a close decision with me.

I would buy the equities. I'd rather buy them cheaper, you know, but I'd rather buy the bond with a bigger yield, too. But in terms of what's offered to me today, that's the way I would come down.

Charlie?

CHARLIE MUNGER: Yeah. I don't think that was the answer that was expected, but that's the answer. (Laughter)

WARREN BUFFETT: It doesn't have a thing to do with what we think stocks — we don't think at all — but where stocks could be or bonds could be.

We don't have the faintest idea where the S&P will be in three years, or where the long-term bond will be in three years, but we do know which we would rather own on a 20-year basis.

CHARLIE MUNGER: Warren, we'd also expect that the current scene will cause some real disruption, not too many years ahead.

WARREN BUFFETT: That's true, but if you go back a hundred years, you could almost say that, you know, in almost any period, you will get disruptions from time to time, and it's very nice if you have a lot of cash then and you have the guts to do something with it.

But predicting them or waiting around for them, that sort of thing, is not our game. And I mean, we bought $5 billion worth of equities in the first quarter, something like that.

And, you know, we don't think they're anything like — well, they aren't — they're not — it would be a joke to even compare them to 1974 or a whole bunch of other periods. But we decided we would rather have them than cash, or we would rather have them than sit around and hope that things get a lot cheaper.

We don't spend a lot of time doing that. It — you can freeze yourself out indefinitely.

So any time we find something — what we think is intelligent to do, we just do it, and we hope we can do it big.

25. Buffett bought and sold silver early: "Other than that, a perfect trade"

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: My name is Nathan Narusis from Vancouver, Canada.

Mr. Buffett, Mr. Munger, my question concerns your previous silver bullion investment. I'm curious to hear more about why you sold when you did.

More specifically, whether you sold your bullion to the organizers of the silver exchange-traded fund in return for cash plus, perhaps, important noncash consideration in order to keep silver markets from either rising or falling sharply.

Thank you very much for anything you would care to share with us.

WARREN BUFFETT: I'm not sure who we sold it to, but whoever we sold it to was a lot smarter than I was. (Laughs)

I bought it too early. I sold it too early. Other than that, it was a perfect trade. (Laughter)

Charlie, do you have anything to add? Charlie had nothing to do with the silver decision, so that one falls entirely on me.

CHARLIE MUNGER: I think we demonstrated how much we know about silver.

WARREN BUFFETT: Yeah. (Laughter)

The very fact you asked us a question on silver flatters us because nobody asks us about silver anymore. (Laughs)

But we'll come up with something else at some point.

You know, the last part of your question, there was a small implication, I think, of perhaps a silver conspiracy.

We — as soon as we started — it got known that we bought silver, we started getting all these letters in the mail from people who had all these different theories about the fact that hedging was killing things or these kind of traders were doing something.

In the end, silver responds as supply and demand just like oil responds to supply and demand. Oil is — the price of oil at 60 or $65 is not a product of a bunch of oil executives conspiring or anything of the sort. It's supply and demand on a huge commodity.

Silver is a small commodity, but on any kind of commodity like that, supply and demand is what determines prices over time. Although the Hunt brothers, I must admit, for a short period there, in a few years, managed to change the equation and they forever wished they hadn't.

26. Why Buffett "outsourced" his philanthropy

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Hello, Mr. Buffett. Eben Pagan, Santa Monica, California.

You seem amazing at keeping your composure in tough situations. I would be very interested to know what your thought process was when you were in that incredibly stressful situation, you knew the world was watching, and you went head-to-head with LeBron James. (Laughter)

WARREN BUFFETT: The game was rigged. (Laughter)

He was the one that had a problem. (Laughs)

AUDIENCE MEMBER: What I'd really like to know is, I'm a real big fan of you and Mr. Gates and your philosophy of channeling all the value you've created back into the world.

And I have a successful business, and I'd like to do the same, but maybe in 20 or 30 or 40 years, and with a time horizon like that, I'd love to know what advice you'd give someone like me.

WARREN BUFFETT: Well, there's nothing wrong with your time horizon, in my view, as long as you're going — as long as you plan to give it back, I mean, A) the decision is yours entirely, anyway, whether you want to do it.

But assuming you want to give it back, or give it to society in some way, if you're compounding your money at a rate greater than people generally do, you are, in effect, an endowment fund for society.

And, you know, all kinds of organizations in the nonprofit area have endowment funds, and they think it's wise to have it, and they do that in order to get standard returns, usually.

And if you can compound it more and you're going to give it back later on, let someone else take care of current giving, and you can take care of giving in 20 or 30 years. But, you know, I regard that as a personal decision.

I always felt that I would compound money at a rate higher than average, and it would have been foolish to give away a significant portion of my capital to somebody who would spend it within, you know, months, when there could be a really much larger amount later on.

And, on the other hand, the time had come, I'd really thought my wife would be doing that, and when that didn't work out, the time had come to do something with it.

And, fortunately, I had some great options available, and I get to keep on doing what I love doing and I let some — I farm out all the work.

But, you know, when my wife had a baby, we hired an obstetrician. I didn't try and do it myself. I mean, when a tooth hurts, you know, I don't have Charlie fix it. I go to a dentist.

So when I have money to give away, I believe in turning it over to people who are — and I've got five different organizations, including my three kids — and I believe in turning it over to people who are energized, working hard at it, smart, you know, doing it with their own money, the whole thing.

And I get to keep doing what I like doing. So as far as I'm concerned, I haven't given away a penny.

Charlie?

CHARLIE MUNGER: Well, I think it's wonderful for the shareholders that somebody else is giving away the money. (Laughter)

I tell you, if all Warren wanted to talk about was interfacing with applicants for donations, we would have a different life. And we wouldn't be very well adapted to it, either.

WARREN BUFFETT: Yeah. You know, actually on the smaller ones I send them all to my sister Doris, and she does a great job with it, and enjoys it, spends lots of time on it, good at it, and I'm glad she does it and I don't.

You know, the truth is, I haven't given away anything in a practical matter. I have everything in life I want. You know, there's no way I can sleep better, I can eat better. Other people might think I could eat better. (Laughter)

I haven't given up anything.

Now, if you think about it, you know, somebody that gives up having an evening out, somebody that, you know, gives up their time working on something, somebody that doesn't take their kids to Disneyland this year because they've, you know, they've given the money instead to their church, I mean, those people are changing their lives in some way with what they give.

I haven't changed my life at all. I don't want to change my life. I'm having a lot of fun doing what I do. And, you know, it's just a bunch of stock certificates that one way or another they're going to go someplace.

And what I really want to do is keep doing what I enjoy doing, and feel that the claim checks that I accumulate that comes about for this, are going to get used effectively for the same general purposes that I would want to use them for if I really had the energy and the interest in doing the job myself.

But somebody else can keep doing the work.

27. You can always earn big returns with small amounts of money

WARREN BUFFETT: Number 9.

AUDIENCE MEMBER: Hi. I'm Eric Schline (PH) from Larchmont, New York.

My question is directed at Mr. Buffett. Mr. Buffett, you claim you can do 50 percent a year.

If you had to start over with a small portfolio, would you still be doing buy and hold, buying quality companies at a good price, or would you be doing arbitrage and really getting down to the nitty-gritty Benjamin Graham cigar butts that you did in the Buffett Partnership?

WARREN BUFFETT: Yeah. If I were working with a very small sum — and you should all hope I'm not — (laughs) — if I were working with a very small sum, I would be doing entirely — almost entirely — different things than I do.

I mean, there's — your universe expands. I mean, if you're looking, there's thousands and thousands and thousands of times as many options to think about if you're investing $10,000 than if you're investing a hundred billion.

And, obviously, if you have that many — you've got all the options you got with a hundred billion, except buying entire businesses, and you've got all of these other options.

So you can earn very high returns with very small amounts of money, and it will always be such.

I don't mean that everybody can do it, but if you know something about values and investments, you will find opportunities with small sums, and it will not be with a portfolio that Berkshire itself owns.

We can't earn phenomenal returns putting 3 billion, 4 billion, 5 billion in a stock. It won't work that way. It won't even come close to working that way.

But if Charlie or I were in a position of working with a million dollars or $500,000 or 2 million, we would find little things here and there — and it wouldn't always be stocks — where we would earn very high returns on capital.

Charlie?

CHARLIE MUNGER: Yeah. But it's — there's no point our thinking about that now. (Laughter)

WARREN BUFFETT: But he's thinking about it, Charlie. (Laughter)

28. Subprime mortgage defaults won't be "huge anchor"

WARREN BUFFETT: OK. We'll take one more, and then we will go to lunch and then we'll — after that we'll come back. So we'll go to number 10 now.

Is the microphone open on 10?

AUDIENCE MEMBER: Hello? Hello?

WARREN BUFFETT: Do we have a problem here?

AUDIENCE MEMBER: Warren and Charlie, my question is, what's your opinion regarding the subprime market relative to the foreign national market?

CHARLIE MUNGER: We can't hear that.

WARREN BUFFETT: We can't hear that.

AUDIENCE MEMBER: What's your opinion regarding the subprime market relative to the foreign national market? Sorry. My name is Calvin Chong (PH). I'm from New York.

WARREN BUFFETT: Well, the subprime market, encouraged by both lenders, intermediaries, and borrowers themselves, resulted in a lot of people buying a lot of houses that they really didn't want to own or that they can't make payments on for once the normal payments were required.

And the people, the institutions, in some cases the intermediaries, are going to suffer in various degrees.

Now, the question is whether it spills over and starts affecting the general economy to a big degree, and I would — my guess would be — it's quite severe some places.

But my guess would be that if unemployment doesn't rise significantly, and interest rates don't move up dramatically, that it will be a — it will be a very big problem for those involved, and some people are very involved. Some institutions are very involved.

But I don't see it — I think it's unlikely that that factor alone triggers anything of a massive nature in the general economy.

I think it — you know, I've looked at several financial institutions. I've looked at their 10-Qs and 10-Ks, and I've seen that a very high percentage of the loans they made in the last few years allowed people to make very tiny payments on the mortgages, but, of course, those subnormal payments increased principal so that they had to make above average payments later on at some point.

And I think that's dumb lending, and I think it's dumb borrowing, because somebody that can only make 20 or 30 percent of their normal mortgage payments the first year is very unlikely to be able to make 110 percent of their normal mortgage payments a few years later.

Those people and those institutions were largely betting on the fact that house prices would just keep going up, and it really didn't make any difference whether they could make the payments.

And that worked for a while until it didn't work. And when it doesn't work, you have an abnormal supply of housing coming on the market, similar to what happened in manufactured housing, the business we're in, six or seven years ago, and that changes the whole equation.

From people on the demand side, you no longer have people thinking they're buying something that's bound to go up, and then you have the supply coming on from the people who were anticipating that before and really don't want to hold the asset unless it's going to go up.

So you'll see plenty of misery in that field. You've already seen some. And I don't think — I don't think it's going to be any huge anchor to the economy.

Charlie?

CHARLIE MUNGER: Yeah. A lot of what went on was a combination of sin and folly, and a lot of it happened because the accountants allowed the lending institutions to show profits on loans where nobody in his right mind would have showed any profit until the loan had matured into a better condition.

And, once again, if the accountants lay down on their basic job, why, huge excess and folly is going to come inevitably, and that happened here.

The national experience with low-interest starter home loans to what I would call the deserving poor, has been very good. But the minute you pay a bunch of people high commissions to make loans to the undeserving poor, or the overstretched rich, you can get loan losses that are staggering.

And I don't see how the people did it and still shaved in the morning, because looking back at them was a face that was evil and stupid.

WARREN BUFFETT: Yeah. (Applause)

WARREN BUFFETT: You've seen some very interesting figures in the last few months on the number — on the percentage — of loans where people didn't even make the first or second payment. And there's really — that shouldn't happen.

That happened, incidentally — you had a prelude to this in the manufactured housing industry.

I mean, in the late 1990s — and securitization accentuated the problem, because once you had somebody in Grand Island, Nebraska, selling a mobile home — or a manufactured home — to someone and they needed a $3,000 down payment and the salesman was going to get a $6,000 commission, believe me, you start getting some very strange things going on.

Now, if the person doing that had to borrow the money in Grand Island, the chances are the local banker would have seen what was happening and said, you know, we don't want any of this where the salesman fakes the down payment and all that.

But once you just package those things and securitize them so they get sold through major investment banking houses and sliced up in various tranches and so on, you know, the old — the discipline leaves the system.

And securitization really accentuates that, and we have had that in subprime loans, just as we had it in manufactured housing six or seven years ago.

And, like I say, that has not all worked its way through the system, but I don't think it's going to cause huge troubles.

Now, we do see certain areas of the country where it will be at least a couple of years before real estate recovers.

I mean, the overhang is huge compared to normal monthly volume in certain sections. And the people that were counting on flipping things there are going to get flipped, but in a different way.

Afternoon Session - 2007 Meeting

1. "Areas don't make opportunities, brains make opportunities"

WARREN BUFFETT: OK. If you're ready, we are.

We're going to keep going in the same order because there's people in the other rooms that have been waiting. So we will go to number 11.

AUDIENCE MEMBER: Hi. My name is Christian Baha from Superfund. I have a question for you, Mr. Buffett.

What do you think about managed futures funds?

WARREN BUFFETT: About which fund?

CHARLIE MUNGER: I didn't quite get that. What kind of fund?

AUDIENCE MEMBER: Managed futures funds.

CHARLIE MUNGER: Oh, managed —

AUDIENCE MEMBER: Like a very diversified portfolio in stocks and bonds going long and short, all the different markets, based on the most natural human behavior, trying following a herd behavior?

CHARLIE MUNGER: Managed futures funds.

WARREN BUFFETT: Well, I would say that we think the most logical fund is the one we have at Berkshire where, essentially, we can do anything that makes sense and are not compelled to do anything that we don't think makes sense.

So any entity that is devoted to a limited segment of the financial market we would regard as being at a disadvantage to one that has total authority if you have the right person in charge.

But you — that's an assumption you're going to make under any fund. So we would not want to devote our funds to something that was only going to buy bonds, something that was only going to buy futures, or anything of the sort.

We would — we buy futures at Berkshire. We buy bonds at Berkshire. We've bought — we buy currencies. We buy businesses.

So I think it's a mistake to shrink the universe of possibilities. Ours is shrunk simply by size, but we don't try to — we don't set out to circumscribe our actions in any way.

But in the end, there's no form that produces investment results.

Hedge funds don't produce investment results. Private equity doesn't produce investment results. Mutual funds don't produce it.

If it was simply a matter of form, we'd all call ourselves, you know, whatever that form happened to be.

What really makes the difference is whether the person that's running it knows what their limitations are, knows where their strengths are, plays when they have the opportunity to play advantageously, and stays out when they don't see any opportunities.

Charlie?

CHARLIE MUNGER: Yeah. I'd go further. I'd say averaged out, I would expect that the return per dollar per year in managed futures funds would be somewhere between lousy and negative. (Laughter)

WARREN BUFFETT: And I would agree with that. Yeah.

Usually those are sales tools. I mean, people find out something that will sell, and it can be — you know, it can be bond funds at some point, it could be — but when they find something to sell, it will get sold to the public. That will be — it will sell until it stops selling.

And that means lots of money comes in and lots of competition for a limited number of opportunities.

And I think it's a mistake to get sold something on the basis that here is a great area of opportunity.

Areas don't make opportunities; brains make opportunities, basically.

2. Read a lot, look for opportunities, avoid catastrophes

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: Matthew Monahan (PH) from Palo Alto, California.

Mr. Buffett, Mr. Munger, first of all, I want to thank both of you for so freely sharing your wisdom and knowledge over the years.

Even though we've never met in person, I consider you both to be close personal mentors and attribute your teachings and philosophies to any success I've had in business so far. So thank you.

Here's my question: for a 23-year-old with high ambitions, some initial working capital, and a genetic wiring, as you call it, for disciplines like investments, mathematics, and technology, what do you foresee as the significant areas of opportunity over the next 50, even 100, years?

And, if you were in my shoes, what would be your approach and methodology for really learning, tackling, and mastering these areas of opportunity for the purpose of massive value creation?

WARREN BUFFETT: Well, I remain very big on the idea of reading everything in sight.

And, frankly, when you get the chance to talk to somebody like Lorimer Davidson, as I did when I was 20 years old — I probably learned more from Lorimer Davidson in those four or five hours than I learned in college, with the exception of learning some accounting and one or two subjects like that.

So you just want to soak it up. If you have those qualities you talked about, you'll see the areas as you go along. I mean, we have — Charlie and I probably — you know, we've made money in a lot of different ways, some of which we didn't anticipate, you know, when we were — 30 or 40 years ago.

But we did have the ability to recognize some; we didn't have the ability to recognize others. But we did know when we knew what we were doing and when we didn't, and we just kept looking.

We had a curiosity about things. You would know at a time like the Long-Term Capital Management crisis, for example, that there were going to be ways to make money.

I mean, they were going to be out there, and all you had to do was just read and think eight or ten hours a day and you were going to cover a lot of possibilities, probably a very high percentage of them good, and some of them sensational.

So you can't really lay it out ahead of time. You can't have a defined roadmap. But you can have a reservoir of thinking, looking at different kinds of businesses, looking at different kinds of securities, looking at markets in different places, and you will then spot a reasonable number of things that come along.

You won't spot every one of them. We've missed all kinds of things.

But the biggest thing, too, is to have something in the way you're programmed so that you don't ever do anything where you can lose a lot.

I mean, we — our best ideas have not been better than other people's best ideas, but we've never had a lot of things that pulled us way back.

So we never went two steps forward and one step back. We probably went two steps forward and a fraction of a step back.

But avoiding the catastrophes is a very important thing, and it will be important in the future. I mean, you will have your chance to participate in catastrophes.

Charlie?

CHARLIE MUNGER: Yeah. And, of course, the place to look when you're young is in the inefficient markets.

You shouldn't be trying to guess whether, you know, one drug company has a better drug pipeline than another. You want to go, when you're young, someplace that's very inefficient.

WARREN BUFFETT: And you shouldn't be trying to guess whether the stock market is going to go up or whether long-term bonds are going to change in yield.

I mean, you don't have anything going in that kind of a game, but you can have a lot going in games that very few people are playing, and maybe where they've even got their heads screwed on wrong, in terms of how they're thinking about the subject.

The RTC was a great example of a chance to make a lot of money.

I mean, here was a seller of hundreds of billions of dollars' worth of real estate where the people that were selling it had no economic interest in it, were eager to wind up the thing, you know, and they were selling at a terrible time when the people who had been venturesome in lending were no longer lending, the people who had been venturesome in the equity end of real estate had gotten cleaned out.

So you had a great background of environment, and then you had an imbalance of intensity, in terms of analyzing situations between the seller, which was the government, with a bunch of people who had no economic interest in it and were probably eager to wind up the job, and buyers on the other side who were of the generally cautious type. Because the more venturesome type had taken themselves out of action. And there were huge amounts of property.

So you get these opportunities, and you'll get more. I mean, there won't be any scarcity of opportunities in your life, although there will be days when you feel that way.

3. Politics and catastrophe insurance

WARREN BUFFETT: OK. Let's go to the other rooms now. They've been waiting. Number 13.

AUDIENCE MEMBER: John Goss (PH), Key West, Florida.

Katrina created litigation that resulted in some rulings that combined flood damage and wind damage where the insurance companies thought they covered wind only.

As a result, some insurance companies are significantly reducing coverage in those states.

Florida recently empowered their insurance company called Citizens to be more aggressive not only with wind storms, but also with homeowners, while at the same time not allowing requested rate increases of other insurance companies.

The result is that some solid insurance companies have announced reducing their coverage or pulling out of Florida.

Is this type of government interference a random fluctuation in insurance or a major cause of concern for the future?

WARREN BUFFETT: Well, that’s an easy one to understand both sides of the question on.

I mean, the average homeowner is not going to sit there and read line-by-line what is in his insurance policy, and a lot of times the agent is not going to explain it carefully to them.

So when something comes along and he thinks it’s insured and it turns out that he bought a policy where it wasn’t insured, he’s going to feel very unhappy about it.

And when tens of thousands of people feel unhappy about it, you’re very likely to get some kind of governmental interference, and probably an inflation by judicial degree or by threats of the government to, in effect, extend the terms of the policy beyond what the insurance company thought it was insuring.

Now, an insurance company that’s had that kind of experience is going to be very reluctant to write insurance policies in the future, if they don’t think that the words will be adhered to.

And, on the other hand, I can fully understand some guy who’s had his house blown away in a storm and a lot of it was water damage and a lot of it was wind damage, thinking that, you know, he’s been wiped out and the insurance company comes around waving a policy that’s got a lot of small print in it, you know, he’s going to be unhappy.

So it’s a real tussle on that. And, you know, I guess I would — if I were writing policies, I would put the exclusions in very big type and very easy to understand.

But I still would expect that if thousands of people suffered losses, that courts and legislators would probably seek to stretch the terms, or even abrogate the terms of the contract, in order to take care of their own constituents and figure that guys like me or institutional investors who own insurance companies can afford it better than the homeowner.

When you get into the question of whether you should, in effect, have all of the people in the country pay premiums for, we'll say, hurricanes, in a way, subsidize it through policies in Nebraska or Minnesota or someplace, for hurricanes in Florida, that gets very tough.

I mean, it can be very expensive to insure against hurricanes if hurricanes become more frequent and more intense. In fact, it can become so expensive that people really will not want to bear the cost of insurance, and they'll want to socialize it some way.

And, of course, the guy in Nebraska says, "Look it. You went down there to live on the ocean and you thought it was wonderful, and we're back here with these terrible winters, but why should we pay a portion of your insurance?"

So you're going to have that tussle go on, and you'll really have that tussle go on if you get a hundred billion dollar or $150 billion insured loss in Florida.

Because that will mean a huge change in taxation if the State of Florida steps in to compensate people. There will be calls for Washington to pay for it.

But, you know, it's how much people who are not exposed to a risk should pay for the people who have elected to be exposed to the risk is — you know, it becomes a political question.

And my guess is that sometime in the next five or 10 years, you'll see a struggle on that subject that exceeds — far exceeds — what we saw on Katrina. Charlie?

CHARLIE MUNGER: I've got nothing to add.

4. We're still looking for a big acquisition

WARREN BUFFETT: Number 14?

AUDIENCE MEMBER: Hi. My name is Glenn Tongue, and I'm a shareholder from New York.

I'd like to congratulate you on Berkshire's newest director. Sue is a terrific addition. My question is —

WARREN BUFFETT: We agree with you.

AUDIENCE MEMBER: My question is, according to the 10-Q filed yesterday, you purchased about 5.3 billion in shares in the first quarter.

This acceleration in activity is occurring while the general market levels are getting more expensive.

Does this indicate some shift in your thinking about hurdle rates of return for your ever-growing asset base and/or your prospects for an elephant-sized acquisition?

WARREN BUFFETT: Well, that's a good question. I would — incidentally, I would say in the first quarter, actually, stocks didn't rise. But they've risen a lot in April.

But they didn't go down, either. I mean, they were pretty much flat. And we did invest 5 billion or so in equities.

Did we change our standards? You know, I don't think so. But, you know, you can't be a hundred percent sure that you have — you know, if you haven't had a date for a month, you know, you may say that was a girl you would have dated the first day, but who knows. (Laughter)

So, I don't know for sure the answer, but I think we would have dated that girl the first day.

And the second question, in terms — does it reflect giving up on finding an elephant to acquire in terms of a business? The answer to that is no. We've got plenty of money available.

And we would sell stocks if we really — I mean, that would not be a problem — if we really needed to, to buy a really big business.

So we're as prepared as we've ever been prepared to buy a big business outright. We hope we do. We hope we buy relatively small ones if they're attractive.

We bought a very attractive business, TTI, run by Paul Andrews — terrific business — in the first quarter.

And, you know, I wish it was five times the size, but maybe it will be some day. But we know that we're in with the kind of person we want and the kind of business we want. And if we find larger ones, one way or another, we'll swing them.

Charlie?

CHARLIE MUNGER: Yeah. The one thing I think we can promise you is that we won't make returns, on average, in the kind of stuff we're buying now like those that we made 10 or 15 years ago.

WARREN BUFFETT: Yeah. We won't come close, no.

CHARLIE MUNGER: No. It's a different world with more modest expectations.

WARREN BUFFETT: And we hope you share them.

5. Buffett defends Planned Parenthood

WARREN BUFFETT: Let's go to number 1.

AUDIENCE MEMBER: Hello, Charlie, Warren. Bill Paparella (PH) from St. James, New York.

Warren, I brought my ten-year-old daughter, Gina, with me. She asked me last summer, "How do I get rich?"

So I gave her your letters, writings, even gave her "Charlie's Almanack."

So she's been reading it ever since, asking me a lot of questions. So I said, "Maybe we'll go to our first meeting together."

WARREN BUFFETT: Is she married? I mean, she's the kind of girl I want my granddaughter — or grandson — to meet. (Laughs)

AUDIENCE MEMBER: So we're learning together.

Warren, my question for you is in regards to your recent charitable gifts. And if I could start by saying that I mean no disrespect. You're my hero. So — and nor is it political.

WARREN BUFFETT: You're doing fine so far. (Laughter)

AUDIENCE MEMBER: OK. I am, as a father of five daughters, perplexed and upset that one — or I've read — that one or more of these foundations is a big supporter of Planned Parenthood and abortion rights. (Scattered applause)

If you were to go on the Planned Parenthood website, you would see a website that promotes promiscuity, goes out of its way to support internet porn — (audience noises)

WARREN BUFFETT: Yeah. Let's get to the question, please. Do you have a question?

AUDIENCE MEMBER: The question is, Warren, I was hoping that you could speak to the billions of dollars that's been allocated with an agency as Planned Parenthood that is very well-funded.

It just doesn't seem to jive with the hero that I study, and I was hoping that you could speak to it.

WARREN BUFFETT: Yeah. Well, I'll be glad to speak to it. I think it's a terrific organization. (Applause with some boos)

And I really think it's too bad that for millennia, you know, women, not only in the United States, but all over the world, you know, have had involuntary bearing of babies forced upon them, and usually by a government run by men. (Applause)

So I don't think we want to get into a — we don't want to get into a cheering contest here — but, you know, I think that it's a very important issue.

I think it tends to have a small natural funding constituency because it isn't a popular-type thing where it's like sticking your name on a hospital or something like that.

But I would say that if we'd had a Supreme Court with nine women on it starting when the country became the United States, that by now I don't think a question like yours would even be being raised.

You know, men set the rules for a lot of years — (applause) — and I think it's wonderful that a woman can make reproductive choices.

But, you know, I've got a lot of people that disagree with me on that. I've got a lot of people that agree with me on it. And I hope you'll respect my opinion as I do yours. Thank you. (Applause)

6. "Volatility is not a measure of risk"

WARREN BUFFETT: Number 2, please.

AUDIENCE MEMBER: Hi. I'm Bob Kline (PH) from Los Angeles.

Pursuing your earlier comments on sigmas from a different angle, the conventional wisdom in the investment world is that an investment risk can be measured by the volatility of the price of the investment in the marketplace.

To me, this approach has it backwards. Since changes in price are determined by the changes in the opinions of investors in the marketplace, why would a rational investor substitute the opinions of the marketplace, as reflected in the volatility of the price, for his own assessment of the risk of the investment?

And consultants take this idea further by tracking the volatility of a portfolio manager's results in an attempt to measure risk. So could you guys expand on your thoughts on this?

WARREN BUFFETT: Yes. Volatility is not a measure of risk.

And the problem is that the people who have written and taught about volatility do not know how to measure — or, I mean, taught about risk — do not know how to measure risk.

And the nice thing about beta, which is a measure of volatility, is that it's nice and mathematical and wrong in terms of measuring risk. It's a measure of volatility, but past volatility does not determine the risk of investing.

I mean, actually, take it with farmland. Here in 1980, or in the early 1980s, farms that sold for $2,000 an acre went to $600 an acre. I bought one of them when the banking and farm crash took place.

And the beta of farms shot way up. And, according to standard economic theory or market theory, I was buying a much more risky asset at $600 an acre than the same farm was at 2,000 an acre.

Now, people, because farmland doesn't trade often and prices don't get recorded, you know, they would regard that as nonsense, that my purchase at $600 an acre of the same farm that sold for 2,000 an acre a few years ago was riskier.

But in stocks, because the prices jiggle around every minute, and because it lets the people who teach finance use the mathematics they've learned, they have — in effect, they would explain this a way a little more technically — but they have, in effect, translated volatility into all kinds of — past volatility — in terms of all kinds of measures of risk.

And it's nonsense. Risk comes from the nature of certain kinds of businesses. It can be risky to be in some businesses just by the simple economics of the type of business you're in, and it comes from not knowing what you're doing.

And, you know, if you understand the economics of the business in which you are engaged, and you know the people with whom you're doing business, and you know the price you pay is sensible, you don't run any real risk.

And I don't think Charlie and I — certainly Berkshire — I don't think we've ever had a permanent loss in marketable securities that was, what, 1 percent, maybe, half a percent of net worth.

I made a terrible mistake in buying Dexter Shoe, which cost us significantly more than 1 percent of net worth where I bought an entire business then.

But I was wrong about the business. It had nothing to do with the volatility of shoe prices or leather or anything else. It just was wrong.

But in terms of marketable securities, I cannot recall a case where we've lost that kind of — I mean, we've done a lot of things in things — in securities — that had a very high beta. We've dealt with a lot of things in securities that had a low beta.

It's just the whole development of volatility as a measure of risk, it has really occurred in my lifetime. And it's been very useful for people who wanted a career in teaching, but it is not — we've never found a way for it to be useful to us.

Charlie?

CHARLIE MUNGER: Well, it's been amazing that both corporate finance and investment management courses, as taught in the major universities — we would argue it's at least 50 percent twaddle, and yet these people have very high IQs.

One of the reasons we've been able to do pretty well is that we early recognized that very smart people do very dumb things, and we tried to figure out why, and also wanted to know, who so we could avoid them. And — (Laughter)

WARREN BUFFETT: We will not run big risks at Berkshire. Now, we will be willing to lose, as I put in the annual report, $6 billion in a given catastrophe, but our catastrophe business, run over many years, is not risky.

You know, a roulette wheel will occasionally pay off at 35-to-1, and that sounds like you're paying out an awful lot of money compared to the amount bet on one number, but I would love to own a lot of roulette wheels.

7. What an annual report tells you about the CEO

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Hi. My name is Stuart Kaye, and I'm from New York City.

Warren and Charlie, you spend a lot of time evaluating the management quality and integrity of the companies that you may invest in.

In my current job, I do not have the opportunity to do that. As I read through annual reports and financial statements, what do you suggest I focus on to help me to determine the quality and integrity of management?

WARREN BUFFETT: Well, you can — we've spent many, many years — and we've bought many things. I mean, I — without meeting managements at all, having any entree to them.

The stocks — the 5 billion of stocks — that we may have bought in the first quarter, most of those were companies I never met the management, never talked to them.

We read a lot. We read annual reports. We read about competitors. We read about the industries they're in.

In terms of sizing up managements — obviously if we're going to buy the whole business, that's a different question. Then you — because you — we're going to buy it, be in bed with them, they're going to run them, and we care very much about whether they're going to behave in the future as they have in the past once we own the business. And we've had very good luck on that.

But in terms of marketable securities, we read the reports. Now, Charlie and I were just talking about one the other day where we read an annual report of a large oil company.

And the company — you know, hundred pages, public relations people, lots of pictures — spent a fortune on it. And you can't find in that report what their finding cost per McF or per barrel of oil was last year. That's the most important figure in an oil and gas company over a period of years, but every year counts.

The fact it wouldn't even be discussed — the reason it wasn't discussed, it was absolutely terrible — but the fact it wouldn't even be discussed — and to the extent it was touched on, it was done in a dishonest manner.

When we read things where we basically are getting dishonest messages from the management, it makes a difference to us.

You know, like I say, in marketable securities we can solve that by selling the stock, and it's not the same thing as buying the entire business.

But I think you can learn a lot by reading the annual letters. I mean, for one thing, if it's clearly the product of some investor relations department or outside consultant or something of the sort, you know, that tells you something about the individual.

If he's not willing to talk once a year through a few pages to the people that gave him their money to invest, I mean, that — I've really got — I've got some questions about people like that.

So I like that feeling that I'm hearing directly from somebody who regards me as a partner.

And you may not get it all the way, but when I get it 0 percent of the way, I don't like it.

I've still bought — we've still bought into some — in marketable securities — we've bought into some extremely good businesses where we thought they were run by people we didn't really like very well, because we didn't feel they could screw them up.

Charlie?

CHARLIE MUNGER: Yeah. I think that's exactly right. There are two things: the quality of the business and the quality of the management.

And if the business is good enough, it will carry a lousy manager. And the converse case, where a really good manager gets in a really lousy business, he'll ordinarily have a very imperfect record.

In other words, it's a rare person that can take over a textile business, totally doomed, which is what Warren did in his youthful folly —

WARREN BUFFETT: Right.

CHARLIE MUNGER: — and turn it into what's happened here. You should not be looking for other Warrens on the theory they're under every bush.

WARREN BUFFETT: I figured it out in 20 years, though. I'll have to say that for myself. (Laughs)

Twenty years, and I finally figured out I was in the wrong business.

But there are businesses — if you gave me first draft pick of all the CEOs in America and said it's your job to run Ford Motor now or, you know, pick a company that's in a terribly tough business, you know, I wouldn't do it.

I mean, that it's just too tough. They may get it solved, you know, if they get cooperation from unions and a whole bunch of things, but it will not be solely in the control of the CEO who has that job.

He is dependent on too many good things happening outside to say that he alone can get the job, even if he's the best in the world.

8. Stocks over bonds, but with modest expectations

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hi, Warren. Hi, Charlie. I'm Walter Chang (PH) from San Jose, California. My wife and I are expecting our first baby boy in July, and we're going to name him Warren after you. (Laughter)

WARREN BUFFETT: You're trying to get into my will again.

AUDIENCE MEMBER: Charlie, I'm rooting for you, for the next one.

WARREN BUFFETT: I'd move him further down the line, maybe to number five. (Laughter)

AUDIENCE MEMBER: Warren and Charlie — Warren, if you were writing a follow-up to the very prescient Fortune magazine article from November 1999 in which you were talking about the lean and fat 17-year periods, what would you be writing?

And since we're halfway through the third 17-year period, how is it turning out, based on your expectations from back in 1999?

WARREN BUFFETT: Yeah. The 17 years, of course, I had a little fun with because of the fact there were two 17-year periods and there are also 17-year locusts. So I stretched it a little from a literary standpoint.

But there's nothing magic about given spans of time. There was something very different between the first 17 years of that 34-year period and the second 17, and I used that for kind of a dramatic contrast.

If I were writing something now, I would say what I said just a little earlier in response to Frank Martin's question, that it is — if I had to own long bonds or long-term position equities, I'd rather have equities. But I would not have high expectations for them, but I would have expectations beyond 4 3/4 percent.

How much beyond, I'm not sure, but something enough beyond four 3/4 percent that I would rather own equities than bonds.

I did not feel — I felt, in 1999, that people were extrapolating the experience of the previous 17 years and assuming there was something magic about owning equities.

And expectations of the people were bound to be — that they were — people were bound to be disappointed. They simply had an unrealistic view by extrapolation, and that was the main purpose of that article.

But if I were writing something now, I would not have high expectations for equities, but I would have better expectations for equities than for bonds.

Charlie?

CHARLIE MUNGER: Yeah. And I would say that since that article was written, the results from owning equities have been pretty lean, at least compared to what happened in the glorious 17 years that preceded.

So Warren has been right so far, and he's probably right now when he says modest expectations.

WARREN BUFFETT: Yeah. You really don't have — in markets you can't say something terribly important or intelligent every day or every week or every month.

That's one of the problems of — if you went on television too often or had to write weekly letters or something of the sort.

Every now and then you get something extreme. I mean, I did close down the partnership in 1969, and an article appeared. I did give an interview in ’74. I gave another interview in ‘81 or ’2.

I mean, every now and then, things really get out of whack. But the gradations in between, they’re too tough.

But the nice thing about it is you don’t have to have an opinion every day or every week or every month. If you own some good businesses and you bought them at the right price, if they get to a silly price, you probably should sell them.

And if you find that everything is extremely cheap, like in ’74, you should put every available dime into equities. And that’s what we’ve tried to do.

9. PacifiCorp and the Klamath Dams controversy

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Yes. Thank you, gentlemen, for this opportunity to ask you a question. My name is Ronnie Pellagreen (PH), and this is my 14-year-old daughter, Mikayla (PH).

We are here representing hundreds of ocean, commercial, hook-and-line salmon fishermen, and their families from the West Coast. They are barely hanging on to their livelihoods because of the Klamath River crisis.

My husband is a fourth-generation hook-and-line commercial fisherman from Eureka, California. His family has fished for the last 100 years.

Last year, our commercial salmon season was completely shut down because of the crisis in the Klamath River. It is caused by the four lower hydroelectric dams owned by your subsidiary PacifiCorp.

We personally took a 95 percent hit in our income — excuse me — and we had no way to make up that loss. We have used our savings and were forced to take out a Small Business Administration disaster loan to meet our financial needs.

Our daughters were so upset after overhearing my husband and I last Christmas, they came to us wanting to give us all the money in their bank accounts.

I am telling you this, gentlemen and shareholders, because you and the shareholders can help.

Under Klamath Dam relicensing, it is shown that this dam removal makes economic sense for PacifiCorp and MidAmerican.

You are a great businessman who has built an incredible empire. We sure could use your creativity and expertise in solving this crisis situation so the Indian people along the river, and we, in the coastal communities, can continue our long and proud heritage.

People back home are eagerly waiting for me to bring a response back from you.

My question is, what can I tell them is your position on removing the outdated Klamath dams?

WARREN BUFFETT: Yes. Our position on it is quite simple.

The FERC and several of the regulatory commissions have before them 27 different proposals or positions by various interest groups.

Some want — some like hydropower, which is what comes from the dams, because it does not generate the emissions that come from coal or gas-fired generation.

Some like the fact that hydropower is cheaper, several hundred thousand consumers. Some people have been hurt by what you describe in terms of the fish.

And you have a public policy question which will not be determined by PacifiCorp. It will be determined by FERC because they are — they represent the public. In fact, the secretary of Interior has advised FERC that it's a very tough question.

FERC will be having hearings. They will listen to the positions. The Oregon and Utah, California, perhaps, public utility commissions will be listening to the arguments.

And, in the end, we are a public utility responding to public policy. Public policy, weighing both your interests and the interests of others in the matter, will come to a determination, and PacifiCorp will do exactly what they say.

We are responsive to the people that regulate us, just as people have been in that position since the first dam was put in in 1906. So that is entirely a question for FERC and the state commissions.

10. No opinion on NYSE and Euronext merger

WARREN BUFETT: Number 6.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. Thank you for taking my question.

This is my second time at the Berkshire Hathaway meeting that I have attended. My name is Cameron Sparrow (PH). I am 13-years-old and from Boulder, Colorado.

My question is for Mr. Buffett. Mr. Buffett, what is your opinion about the merger of the New York Stock Exchange with the Euronext?

Do you think that the merger will have a positive or negative effect on the market?

WARREN BUFFETT: Well, I really don't know the answer to that. My guess is that — I mean, both of those institutions were very large institutions beforehand, and we would judge a positive effect in terms of narrowness of spreads, as an investor, in terms of costs of execution and that sort of thing.

Both places have been very efficient in the past. I mean, we pay quite low payments. Although my broker is here. We probably should be paying even less.

But the New York Stock Exchange has gotten far more efficient in terms of costs from 30 or — from the days of fixed commissions back in the early '70s and before that. I mean, it's a fraction of the cost.

And the real test from our standpoint is, you know, do we get better executions and less costly executions. And, like I say, both institutions were big, effective institutions before.

And if they get a little more efficient, I hope it gets passed on to the customers, but it may just result in larger profit.

But we're pretty satisfied with — quite satisfied, actually — with the functioning of the New York Stock Exchange where we do most of our business.

But we've done business — we've been buying international stocks, and we've had generally good executions throughout the world. So it's not a source of either concern or enthusiasm to me.

Charlie?

CHARLIE MUNGER: I don't know anything about it. (Laughter)

WARREN BUFFETT: I don't either, but I took longer to say so. (Laughter)

11. Beware when someone says "it's so easy"

WARREN BUFFETT: Number 7, please.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, thanks for hosting this wonderful meeting. My name is Chander Chavla (PH), and I'm visiting from Seattle, Washington.

And I think Berkshire Hathaway can contribute to the reduction of global warming if, for next year shareholder's meeting, Mr. Gates and I fly on the same plane. (Laughter)

My question is, I have made a few mistakes in business by trusting the wrong people. So in — and I don't know where to learn how to trust the right people.

They don't teach you that in business school, and the people who are supposed to teach you in the corporate world sometimes betray you.

So how can I learn who to trust and who not to trust?

WARREN BUFFETT: Boy, that's a great question. But you probably have about as good a chance of getting a good answer from me on that as you have on getting on Bill Gates' plane next year. (Laughter)

I get letters all the time, and I hear from people who have been taken advantage of in financial transactions. And, you know, it really is — it's sad. And a lot of it isn't even — it's not fraud or anything.

For one thing, I mean, just the charges involved, the frictional costs and the baloney that is presented is tough.

Charlie and I have had very good luck in terms of buying businesses and putting our trust in people. It's been just overwhelmingly good.

But we filter out a lot of people. And then you say, "Well, how do you filter them out?"

I would say — I think Charlie will agree with this — people give themselves away fairly often. And maybe it does help to have been around as long as we have in seeing the various ways they give themselves away.

They — when somebody comes to me with a business — and I probably shouldn't tell this publicly because they'll probably tailor their approach subsequently — but when they come, just the very things they talk about, what they regard as important and not important, there are a lot of clues that come as to subsequent behavior.

And, like I say, we've really had a batting average I wouldn't have thought we would have had in the people that we've joined with.

But it hasn't been a hundred percent. It's been well above 90. And I get asked that, you know, I mean, "How do you make those judgments?" And I don't know.

Charlie, can you articulate the way we do it?

CHARLIE MUNGER: Well, partly we're deeply suspicious when the proposition is too good to be true.

Warren once introduced me to a gentleman promoter who wanted to inveigle us into an insurance program. And he said, "We only write fire insurance on concrete bridges that are covered by water." He says, "It's like taking candy from babies." We are able to filter out propositions like that.

WARREN BUFFETT: Yeah. Anybody that, implicit in their comments or what they kind of laugh about or — all kinds of things in terms of the fact — you know, it's so easy and — it ain't that easy, you know, and we get suspicious very quickly.

And the truth is, we rule out 90 percent of the times. And we may be wrong about a fair number that we're ruling out. The important thing is whether the ones we're ruling in we're right about.

And so we don't mind — we're looking for the obvious cases of people you can trust.

I mean, go back to 1969 again. When I was thinking about who to turn my partners over to, all kinds of people with great records. That was a hedge fund — that was the first hay-day of hedge funds. And there were books written about it, "New Breed on Wall Street" and some of those. You can look them up.

And dozens and dozens and dozens of people with good records. And when I sat down and thought about, I'm going to write my partners and tell them who to turn over all their money to — because most of them had a hundred percent or close to it with me — you know, Charlie, Sandy, Bill Ruane.

I couldn't have told you which of the three was going to do the best. And, you know, I couldn't even tell you those three would done better than five others that somebody else might pick.

But the one thing I was sure of is that they were going to be sensational stewards of money.

They were going to care more about those people — the people that were turned over to them — in getting the best result possible than they were going to care about, you know, whether they made X or 2X this year in terms of commissions or fees or any of that sort of thing.

Anytime I find somebody with a — what I regard as an unfair fee structure, and saying, "Well, I can get it," well, you know, I rule them out.

And I may rule out some of the wrong people. But the ones that are left in, I feel very good about. And I wish I could give you better advice than that, but that's all I can do.

12. Pay attention to opportunity costs

WARREN BUFFETT: Eight.

AUDIENCE MEMBER: Yes. Mr. Buffett, Mr. Munger, thank you again for being so generous with your time with us every year.

I'd like to follow up on the question from the gentleman from Australia and from Munich on valuation.

The gentleman from Australia asked about margin of safety, and you replied that a superior business may not require that much of a margin of safety.

And my follow-up would be, does that suggest market rate of returns going forward for superior businesses?

And then on the Munich valuation, in which you cited a farm example on discounted cash flows, I'm very curious how you come up with your discount rate and how you might adjust that discount rate based upon various businesses.

You might want to discuss your discount rates used for Coca-Cola, J&J, or some of your past investments. Thank you.

WARREN BUFFETT: Yeah. We don't formally have discount rates. I mean, every time I start talking about all this stuff, Charlie reminds me that I've never prepared a spreadsheet. But, in effect, in my mind I do.

But we are going to want to get a significantly higher return, obviously — in terms of cash produced relative to the amount we're outlaying now for a business — than we are from a government bond.

I mean, we — you know, we are going to — that has to be the yardstick at a base. And how much more do we want?

Well, if government bond rates were 2 percent, we're not going to buy a business to earn 3 or 3 1/2 percent expectancy over the years. We just don't want to commit our money that way. We'd rather sit around and wait a little while.

If they're 4 3/4 percent, you know, what do we hope to get over time? Well, we want to get a fair amount more than that.

But I can't tell you that we sit down every morning and I call Charlie in Los Angeles and say, "What's our hurdle rate today?" I mean, we've never used the term.

You know, it's a little bit of the — we want enough so that we feel very comfortable if they closed down on the stock market for a couple of years, if interest rates go up another hundred basis points or 200 basis points, we're still happy with what we've bought.

And above that, I really — I know it sounds kind of fuzzy, but it is fuzzy.

Charlie?

CHARLIE MUNGER: Yeah. The concept of a hurdle rate makes nothing but sense, and yet a lot of terrible errors are made by people who are talking about hurdle rates.

Just because you can measure something and guess it, doesn't mean that it's the controlling variable in what you're dealing with in a messy world.

And I don't think there's any substitute for thinking about a whole lot of investment options and thinking about why one is better than another and what the likely returns are from each, et cetera, et cetera.

And the trouble with the hurdle rate concept — not that we don't have one, in a sense — is it doesn't work as well as a system of comparing things.

In other words, if I have something available that I think will give me 8 percent for sure and I can buy all I want of it, and you've got a perfectly good investment that I think will earn 7, I don't have to waste 5 minutes with you.

You're like the mail order service offering the bride through the mail and she's got AIDS. You know, I can go on to some different subject.

And so this — the concept of opportunity cost is — it's so little taught in investment. They teach it in the freshman course in economics in all the major universities, but when you get to the corporate finance departments and so forth, it doesn't lend itself with the kind of mathematics they want to use, so they ignore it.

But in the real world, your opportunity costs are what you want to make your decisions based on.

WARREN BUFFETT: Yeah. And even if you had something you were really familiar with and were very sure on the 8 percent, 8 1/2 wouldn't tempt you if somebody came along, as a practical matter.

CHARLIE MUNGER: Sure.

WARREN BUFFETT: As I mentioned, I've been on 19 corporate boards. I would say that of the presentations I've seen — and I've seen a lot of them — and every one of them had a calculation of internal rate of return, if they'd burned them all, the boards would have been better off.

I mean, there's so much nonsense presented, because the presenters, essentially, know what the listeners are desirous of hearing, and what is needed in order to get through something the CEO wants to do anyway — you just get nonsense figures.

And, you know, we may get nonsense figures, too, but they're ours, and we — (Laughs)

CHARLIE MUNGER: Let me give you an example of that. I have a young friend who sells private partnership interests to investors. And he's in a really tough field where it's hard to get decent returns.

And I said, "What return do you tell them you're aiming for?" And he said, "20 percent." And I said, "How did you pick that number?" And he said, "If I chose any lower number, they wouldn't give me the money." (Laughter)

WARREN BUFFETT: And there's no one in the world we think can earn 20 percent with big money. I mean, it just — so anybody making a promise like that, basically, we're going to write off immediately.

It's amazing to me what — you know, in a sense, how gullible big investors are, pension funds and so on, in that they have people come around and promise them the Holy Grail.

And they want it so badly, you know, that they're willing to believe things that just have to be nonsense.

13. Some problems are too important to be "too difficult"

WARREN BUFFETT: Let's go to number 9.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett, Mr. Munger. My name is Robert Piton (PH), and I'm from Chicago, Illinois.

Over your careers, has there been any question, either personally or professionally, that you haven't been able to get a comfortable answer to that you cannot simply put in your "too difficult" pile? Thank you.

WARREN BUFFETT: Charlie?

CHARLIE MUNGER: Well, sure. You get —

WARREN BUFFETT: You may have just asked one. (Laughter)

CHARLIE MUNGER: Sure. If you've got a child dying of some horrible disease, you have a problem you can't just put in a "too difficult" pile.

So there are lots of things in life that come to you that you — where you have no option to not consider the issue.

But where it's voluntary, like choosing one investment from many, then the "too difficult" pile is a marvelous way of sifting your daily grist.

WARREN BUFFETT: Yeah. I have a file on my desk — Laura Graham gave it to me — that's entitled "too hard." And, as Charlie said, if something is optional and it's too hard, you just throw it in there.

If you've got the problems of weapons of mass destruction, it is too hard, but you have to keep wrestling with it. Because if you even reduce the probabilities a tiny bit, you know, you're doing something. But you're never going to solve it.

You just have to keep working at certain types of problems, and you hope you don't have too many like that.

14. We're thinking all the time

WARREN BUFFETT: Ten.

AUDIENCE MEMBER: Many greetings from Germany. I am Bernard Yaadan (PH) from (inaudible), a little town close to the Black Forest, and I'm the mayor of it.

My question to Mr. Buffett and Mr. Munger is, how often do you review each single position in your portfolio?

Some look at their stocks every day, sometimes more, some only once a year. What is your frequency? Thank you.

WARREN BUFFETT: Well, that sort of breaks down into two periods in my life. When I had more ideas than money, I was thinking about everyone all the time because I was thinking about buying the next one and which one I would have to sell in order to buy something even more attractive.

So my opportunity cost, as Charlie would put it, then, was the least attractive stock which I would give up to buy something more attractive.

So I — literally, if I had $100,000 and it was all invested and I wanted to put $10,000 or 20,000 into something I felt was more attractive, I would be thinking all the time of which one of these do I unload.

Now our situation is such that we have more money than ideas, and that means that we really aren't re-examining something every minute, because the option is cash and not doing something that we really are excited about.

We still think about the businesses we're in — whether they're wholly owned or whether they're partially owned through stocks — we think about them all the time.

I mean, we've got a lot of information filed away in our minds. And you keep getting little incremental bits about that company or the competition or other things going on.

So it's — you know, it is a continuous process, but it's not a continuous process with the idea that daily activity, or weekly activity, or monthly activity, is going to result.

It's just we want to just keep adding to our thinking and knowledge, refining it further about every business that we're in.

If we needed some money for a very big deal, for example — let's say we needed 20 or 30 or $40 billion and we had to decide to sell 10 billion of equities, just to pick a figure, you know, we would use the information we've been collecting daily, which hasn't really meant much as we've gone along, and we would come to a decision about where we raise that $10 billion.

Charlie?

CHARLIE MUNGER: Yeah. But even in Warren's salad days when he had way more ideas than he had money, he did not spend a lot of time thinking about his number one choice. You know, he could put that aside and devote his efforts to other subjects.

15. It's hard to buy billions of dollars of stock

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: Good afternoon. Charles Fisher (PH) from New York.

In the last 18 months, the company has allocated at least $1 billion to four or five publicly traded companies.

Berkshire has an abundance of capital and a scarcity of ideas. Since these stocks investments were made in large cap companies in which we could have probably made $5 billion investments, have you thought about allocating more capital to each stock investment?

WARREN BUFFETT: Yeah, we do think about that, obviously. And there's certain ones that we have added billions of dollars to that we already had substantial positions in a couple years ago.

Obviously, when we add to the present list, we think we're adding to the ones either that look the most attractive to us, or to the ones that we can just buy. I mean, there's some things where we can't put that much money in, or where we will have reporting thresholds that will cause a problem.

If we own over 10 percent of a company, you know, we can't sell a share of it, then, for six months without it being — if there's a profit — it being recaptured pursuant to a short-swing rule.

So there's some technical things that enter into whether we cross certain thresholds of ownership size.

But if you look at — you know, if you look at the portfolio at the end of 2007, you're going to see that certain positions in there from 2006, there will probably be an increase by billions of dollars.

And that's always something that I'm considering and Charlie is considering.

We like to add to present positions. I mean, those are companies we know, understand, obviously like to some degree.

And if the price gets reasonably attractive and we've got money around, we will add. If we can find a good business to buy, you know, we will sell the least attractive.

Charlie?

CHARLIE MUNGER: Yeah. It isn't as easy as it looks to buy these big positions. When we were buying Coca-Cola, we were buying every share we could. We bought, what, 30 or 40 percent of the daily trading?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: And it took us a long, long time to get our position. And so there are huge difficulties to managing great, big, common stock portfolios.

We like it way better when we have those problems now than we liked it when we didn't have them early, but it does make it much harder. We have no easy way of moving these elephants around.

WARREN BUFFETT: In general, we think we usually can buy something like 20 percent of the daily trading volume and feel that we're not causing the price to be violently different than it would have been if we hadn't been participating in the market.

So that means if we're going to buy $5 billion worth of something, $25 billion worth of it is going to have to trade, and that's a lot for many stocks.

So we are a big ocean liner, and that has its disadvantages compared to being a smaller boat.

16. Buffett responds to concerns about Klamath Dams

WARREN BUFFETT: Number 12?

AUDIENCE MEMBER: Heya hamalio (PH). My name is Wendy George, and I am from the Hoopa Indian Reservation in northern California. I'm here with the Yurok and Karuk indigenous people who live along —

WARREN BUFFETT: I don't know if the microphone isn't working or not, but we want to make sure it is working.

AUDIENCE MEMBER: — who live along the Klamath River. My people are river people. Our entire culture, religion, and subsistence is centered around the river.

Your subsidiary company PacifiCorp owns dams on our river. Mr. Buffett, I know you care very much about humanity and ethical business. We also understand that you cannot exercise direct control over PacifiCorp's operations.

However, there are things you can do to help us. So we are here to ask you if you would be willing to meet with the tribal representatives, learn more about our issues, and explore ways to help save our salmon?

WARREN BUFFETT: Are you complete? Just take your time here.

AUDIENCE MEMBER: Complete.

WARREN BUFFETT: OK. As I said earlier, we will not make the determination in the end. It will be made by FERC.

It's the same way as if we're going to put in a coal generation plant or a gas generation plant or more wind-powered.

For example, we put in a lot of wind power in Iowa, but that was decided, essentially, by the utility commission in Iowa, that they wished to make that decision.

And, incidentally, sometimes people are unhappy when we put in wind because they don't want the transmission lines that are going to be involved.

They're usually happy to give us the plots on which to put the wind turbines because they get paid very well for it, but they're not happy to have the transmission lines.

Anytime you get into the public utility field, there are people happy and unhappy with decisions. Nobody wants a generating plant built near them, and that's the nature of it.

The world does want electricity. And because it wants electricity, and it wants more electricity, it essentially has to decide the public policy issues through regulatory authorities.

And we will do exactly what FERC, finally — and with the consent of the state commissions — what they finally decide on it.

And all of the arguments will be presented to them. As I say, there are 27 groups, I believe. And then they go and then they get the opinion of the secretary of the interior and so on and a lot of other groups.

And somehow they come out with a decision on public policy, and we will follow it.

It takes a lot of time, too, I must say. Anytime you've got an issue that's got 27 different views and more than one authority, it's going to take significant time.

I'm in a peculiar position on this. Because when we bought PacifiCorp, we had to — Walter Scott and I both signed affidavits. As part of the acquisition of PacifiCorp, the Oregon Public Utility Commission required that we submit these affidavits.

And I'll read to you from this. I don't want you to think I'm ducking behind this, but this was executed several years ago.

And it says, "I agree I will not exercise any control, directly or indirectly, on matters that pertain to PacifiCorp, except for relating to PacifiCorp that are ministerial in nature."

And then, "I agree, as a MidAmerican Holding Company and Berkshire Hathaway director, I will recuse myself from voting on MidAmerican Holding Corp. or Berkshire Hathaway board of director matters concerning PacifiCorp activities or operations."

This is part of the order that came down that allowed MidAmerican to buy PacifiCorp.

I must say, too, that in terms of the Oregon Commission and the five other states, that our application went through in almost record time because MidAmerican does have such a good record in terms of being responsive to the public utility commissions under which it's operated, and we will continue to be responsive.

WARREN BUFFETT: But I appreciate your point. Thank you.

17. Florida's public-sector hurricane insurance

WARREN BUFFETT: Number 13, please.

AUDIENCE MEMBER: Peter Vanden Broeck (PH), Cleveland, Ohio. Mr. Buffett and Mr. Munger, thank you for so eloquently answering some of these tough questions. I know of no other public company that would allow a forum such as this. You're doing a great job. (Applause)

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: My question is a follow-up question to the Katrina aftermath situation regarding policyholders with insurance companies and the tussle between coverage and what's the proper remedy for those that suffered after such a storm.

Part of that tussle, or one of the results of that tussle, was some legislation that was passed in the state of Florida.

Could you please explain that legislation, as you understand it, to shareholders? And what effect, if any, does that have on Berkshire's insurance subsidiaries? Thank you.

WARREN BUFFETT: Yeah. I can't tell you with precision what the Florida — I don't know whether Joe Brandon, or Ajit [Jain], or Tad Montross — if they're in the managers' group, if somebody could pass the microphone over to them.

Essentially — I should let them explain it — but the state of Florida has gotten more into the business of insuring the citizens by a considerable margin than it did before, but there are some significant limitations on that.

And I think, if we've got a microphone with one of the three of them, they could answer that question better than I.

Do we have somebody over there? Are they all out writing insurance, or — (Laughter)

CHARLIE MUNGER: More likely buying jewelry. (Laughter)

VOICE: Check, one, two.

WARREN BUFFETT: Who do we have?

It's impossible for me to see over there with the lights.

VOICE: I'm getting a mic.

WARREN BUFFETT: What are they yelling?

CHARLIE MUNGER: Seven.

JOE BRANDON: Hello.

WARREN BUFFETT: Ah.

JOE BRANDON: Warren, it's Joe.

WARREN BUFFETT: OK.

JOE BRANDON: Took me a little time to get here.

WARREN BUFFETT: OK. Fine.

JOE BRANDON: I was looking for Ajit. What was the specific question?

WARREN BUFFETT: I think the questioner wanted to know what has really happened in Florida in the last three or four months, in terms of the state getting involved in the homeowner's insurance business.

JOE BRANDON: Well, back in mid-January, the Florida legislature met in a special session and passed legislation, at the urging of the governor, that expanded the reinsurance fund and ultimately is moving a lot of risk, both personal lines and commercial lines, from the private market to the public market.

You know, this is going to, and has manifested itself, in lower prices for wind risks in Florida and has freed up capacity that was dedicated to Florida for other markets.

So ultimately it's going to have a depressing effect on the insurance industry.

Longer term, you know, there is no free lunch, and the state and the citizens of Florida are taking a tremendous amount of risk.

And it will all work out if the wind doesn't blow, but the odds are eventually it will, and Florida is going to have a large public policy issue to deal with.

WARREN BUFFETT: Are they — Joe, are they explicitly taking on about 30 billion and then sort of leaving it in the laps of the gods above that? I'm not sure myself, but —

JOE BRANDON: Yeah. I believe they take out about 30 billion. It's about — the increase was 12 to 16 billion. So they previously had taken about 18 billion out, and they took an additional 12 to 16.

WARREN BUFFETT: Yeah. The real problem will be if there turns out to be a $100 billion insured loss.

And then the — you know, the state may decide to issue 60 or 70 billion of bonds. They may decide to go to the federal government and say, “This really isn’t our fault, and therefore the entire country should pay, in some form.”

Who knows what will happen? And the truth is, you know, it’s very unlikely that a $100 billion storm occurs. The biggest one was Hurricane Andrew, which trended, through inflation to present day, probably wouldn’t quite hit 30 billion.

But if that same storm come through as a Category 5 about 20 miles north of where it came — where it hit — you would have — or you could easily have something like $100 billion storm.

So, you know, you’re going to have to stay tuned on that. And if they don’t have any hurricanes in the next couple of years, the whole matter will die down — big hurricanes.

And if they have a $100 billion storm, they will probably go to Washington, and we will find out whether the whole country has been insuring hurricanes in Florida or whether the federal government will throw it back to the State of Florida, and the State of Florida will, presumably, issue a lot of bonds, and taxes would go up.

And, in effect, you would distribute insurance — insured losses — in relation to the proportion people pay of the general tax revenues of a state like Florida.

It’s tough to be where the wind blows a lot, but it’s also a very nice place to live, apparently. So we will find out how it plays out.

18. “Associate with people who are better than you are”

WARREN BUFFETT: Number 14, please.

AUDIENCE MEMBER: Steve Rosenberg (PH), originally from Michigan. Thank you very much for continuing to serve as excellent role models and for the values that you continue to teach by example.

I’m curious to know who are your present-day role models. And I know that your prior heroes included your father, Ben Graham, and Davy [former GEICO CEO Lorimer Davidson], but would be curious to know who in addition to those three. Thank you.

WARREN BUFFETT: Well, I’ve had a number of them. And I’m not sure I want to name them because the ones you don’t name might feel a little left out.

But the one thing I've been very lucky on is that the ones I've had have never let me down. So I've never had that experience where you've looked up enormously to somebody and then had that person let you down in some way, which would be a terrible experience and very hard to get over it.

And, you know, I'm sure some people have had that in marriage, and they've had it in business.

And the worse situation, of course, is if you have it with your parents, but that did not happen.

In fact, the reverse happened with me. So I can just tell you that choosing your heroes is very important. I tell that to the students when they come. Because you are going to gravitate toward the behavior of those around you.

I tell people to be sure and associate with people who are better than you are. Marry up and hope you find somebody that doesn't mind marrying down. (Laughter)

And it will do wonders for you. It was a huge help to me. I can tell you that.

Charlie?

CHARLIE MUNGER: Yeah. I would say that you're not restricted to living people when picking your mentors. Some of the very best people are dead. (Laughter and applause)

19. "I have my resume screen-printed on my shirt"

WARREN BUFFETT: Well, with that, we better go to number 1. (Laughter)

AUDIENCE MEMBER: Hello, everyone. My name is Kendall Brubaker (PH). I'm a senior from Purdue University in West Lafayette, Indiana.

I have my resume screen-printed on my shirt. Charlie and Warren, I brought a shirt for each of you, as well as one for (inaudible), who is responsible for my presence today.

Additionally, I have a strong interest in social entrepreneurship and the Gates Foundation and would love to offer a shirt to Bill, if he is willing to accept.

Now, I had an overly technical question about the historic rate of economic growth and why it's 3 percent as opposed to 2 or 5.

However, given my circumstances, I feel it is more appropriate to ask if I made a sound economic decision to make this trip to Omaha to display my own intrinsic value, and to turn down the $500 that the man just offered me for my spot in line to 27,000 people and to learn from you, or if I would have been better off charging the equivalent amount to my American Express card on See's Candy and Coca-Cola?

Thank you. And, again, my name is Kendall Brubaker. (Applause)

WARREN BUFFETT: Thank you. I thought your question was going to be what shirt size we wore, but — (Laughter)

CHARLIE MUNGER: Mine is small. (Laughter)

20. Munger: Running cars on corn is "dumb"

WARREN BUFFETT: I think we'll move on to number 2. (Laughter)

AUDIENCE MEMBER: Tom Nelson (PH), North Oaks, Minnesota.

This one is for Charlie. What are your current views on the costs and benefits of ethanol production in this country?

CHARLIE MUNGER: Well, you know, even [Sen. John] McCain has had a counter revelation lately. He's decided that ethanol is wonderful now that he realizes that's the way they think in Iowa.

I'm somewhat in his position here, but I won't allow that to stop me. (Laughter)

I think the idea of running automobiles on corn is one of the dumbest ideas — (applause) — that has gotten widespread acceptance that I have ever seen.

But in a government with a lot of political pressures, weird decisions get made. But that has to be about as crazy a decision as was ever made.

You want a social safety net under people, and the most basic safety net of all is food. And you're going to raise the cost of food so you can run these automobiles around? And you use up just about as much hydrocarbons making the corn as you get out of the ethanol.

I would say that — and you don't count in the cost of the ethanol, the cost of the topsoil that goes away forever when you — it's a — I love Nebraska. I'm a Nebraskan to my core. But this was not my home state's finest moment.

WARREN BUFFETT: We're going to try to smuggle him out of town tonight. (Laughter)

21. "Supermoney" book available for purchase

WARREN BUFFETT: I should make one announcement.

In terms of the books at the Bookworm outside, Jerry Goodman, a friend of mine from way back, wrote a book many years ago called "Supermoney," which he just brought out a new addition.

They actually flew those in. They arrived here at the auditorium about 9 or 10 — 10 or 11 o'clock — I guess, this morning. And the new revised issue of "Supermoney" is now out there, in addition to all the other titles.

And I would feel remiss, after all the trouble they went to, if I didn't mention that to this group.

It's a very good book. Jerry was a great writer. He wrote "The Money Game," which was a classic. And "Supermoney" is a good book, too.

22. Best hedge against inflation

WARREN BUFFETT: Let's go to number three.

AUDIENCE MEMBER: Good afternoon, gentlemen. Paul Wigdor (PH) from Montclair, New Jersey.

What are you doing to protect our company's portfolio against the perils of inflation? Specifically, are you looking at further currency investing and metals investing?

WARREN BUFFETT: Well, we would not necessarily look at metals investing as being any protection against inflation at all.

But we are — the best protection for inflation is your own earning power. I mean, somebody that is a first-class surgeon, or lawyer, or teacher, or salesperson, or anything else, whether the currency is seashells, or paper money, or whatever, will do all right in terms of commanding the resources of other people.

So your own earning power is your best — is the best hedge against inflation.

The second best hedge is to own a wonderful business, not a metals business, necessarily, not a raw material business, not a minerals business, but a wonderful business.

And the truth is, if you own Coca-Cola, if you own Snickers bars, if you own Hershey bars, if you own anything that people are going to want to give a portion of their current income to keep getting, and it has relatively low capital investment attached to it so that you don't have to keep plowing tremendous amounts of money in just to meet inflationary demands, that's the best investment you can probably have in an inflationary world.

But inflation is bad news for investors under almost any circumstances.

You can argue that if you own some business that required very little capital investment and had real flexibility of price during an inflationary period so that people would continue to give up a half an hour of work — of their own work — every month to buy your product, and you leveraged it, then you might even beat inflation to some extent.

But leverage is not our game, but we try to own good businesses.

I think that the Berkshire would not do as well during high rates of inflation at all as it does — in real terms — as it does in periods of low inflation, but I think we would do better than a good many companies.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

23. Railroad business is better but won't be "sensational"

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hello, Warren and Charlie. My name is Felton Jenkins. I'm from Savannah, Georgia.

I've been a shareholder for a number of years. This is my third annual meeting. Thanks to you guys, and thanks to your managers and all your employees for the great job.

Just briefly follow up on one thing. It's been published in the Washington Post, LA Times, a number of media outlets, that the FERC, the California Regulatory Commission, the Department of Interior, have determined that it would save between 100 to $200 million to decommission the dams and find alternative power versus doing the capital retrofit.

But, anyway, my question is, what can you tell us about your views on the future profitability of the railroad industry? And what might make that more exciting going forward versus what it's done historically? Thank you.

WARREN BUFFETT: Yeah. Thank you.

I don't think it will be a lot more exciting. But the relative — the competitive position of the rails has improved somewhat from, really, not a very good competitive position 20 or 25 years ago.

There's been a lot of progress made on the labor front. They benefit in their competitive position vis-a-vis trucking as oil prices go up.

Higher diesel fuel, obviously, raises costs for rails, but it raises costs for their competitors, the truckers, by probably a factor of close to four compared to how it hurts them. And there isn't a whole lot of new capacity being created in the rail industry.

So what was a terrible business 30 years ago, and it was operating under regulation — it's still under — operates under the threat of reregulation, which has a tempering effect on their pricing power — but it's a better business now.

It will never be a sensational business. It's a very capital-intensive business. And when you put tons of capital out every year, it's very hard to earn really extraordinary returns on capital.

But if they earn a decent return on capital, it can be a good business over time, and it can be a lot better business than it was in the past.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that one, either.

24. Best ways a 10-year-old can earn money

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. My name is Marie Blevins, and I am from Bardstown, Kentucky. This is my first shareholder meeting.

My question is, what do you think are the best ways a 10-year-old can earn money? (Laughter and applause)

WARREN BUFFETT: Well, I must say that was a subject I gave a lot of thought to when I was 10 — (laughs) — more than I gave to school and some other things.

You know, you have to — you're probably a little young to deliver papers. That was always my favorite. And I got about half the capital I started with by delivering papers, and I always liked it because I could sort of do it by myself.

I don't know the situation and the town in which you live, but, like I say, 10 is probably a little young, but 12 or 13 would not be.

And almost any — there can be a lot of — I tried to — I must have tried 20 different businesses by the time I got out of high school.

The best one was a pinball machine business, but I'm not sure I want to recommend that you get into that.

When I did it, it was a much purer business where you put a nickel in, and that was about it.

But it is interesting — I read a study a long time ago — I wish I could get my hands on it because I've quoted it a lot but I never quoted it as authoritatively as I would be able to if I could actually find the damn thing that I read 30 years ago.

But it correlated business success with certain variables.

And, you know, they tried grades in school, and they tried what your parents did, and they tried whether you went to business school, all those kind of things.

And they found it correlated best with the age at which you started your first business, got into business, that the younger you were when you did your first piece of business seemed to correlate best with later business success.

And to some extent, that's sort of natural. It's probably true that — that when you see it in athletics, you see it in music and that sort of thing.

So whatever you can figure out that other people will pay you to do that they don't want to do themselves or that they'd like done for them — I advise you to look around the neighborhood and talk to your parents, talk to your friends, see what other people have done that have been 10 or 11 or 12 years old that's worked for them and copy it.

But if you can get a good paper route when you're 12 or 13, that's a sure way to save some money.

I've often wondered about people that are having trouble being in debt, you know, that have a normal eight-hour job.

If they added a route in the morning and just put that aside, you know, it could be the way out of being behind the game instead of being — and getting ahead of the game — and take another hour and a half out of their day, but not too many people seem to do it.

Charlie used to sell — didn't you used to sell yourself the best hour of the day or something, Charlie?

CHARLIE MUNGER: You bet.

WARREN BUFFETT: Yeah. Tell them what you did.

CHARLIE MUNGER: Well, when I was young, I read that savings bank thing, "The Richest Man in Babylon," which taught the joys of underspending your income and investing the difference and how wonderfully it would work over time.

And, lo and behold, I did exactly what this little pamphlet suggested, and it worked. And the other idea — and then so I got the idea that — I had a mental compound interest thing, too.

And so I finally decided I was going to give the best hour of the day to improving my own mind, and then the world could buy the rest of the time. And that may have been a very selfish thing to do, but it worked.

WARREN BUFFETT: Yeah. Charlie was selling his time — I don't know. What you were getting per hour as a lawyer?

CHARLIE MUNGER: Not much.

WARREN BUFFETT: Yeah. He just decided to sell himself the best hour, and not a crazy thing to do.

CHARLIE MUNGER: But I would tell that little girl if you make yourself a very reliable person and stay reliable all your life, faithfully doing whatever you engage to do, it will be very hard for you to fail at anything you want. (Applause)

25. Global competitors matter, not global trends

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: Good afternoon, everyone. My name is Dennis Batrowski (PH). My hometown is West Point, Nebraska, and I now live in Omaha with my family.

WARREN BUFFETT: As you may know, my mother came from West Point.

AUDIENCE MEMBER: Yes. Thank you, Warren and Charlie, for your incredible education, generosity in this great meeting. I've attended every meeting since 1994.

Warren and Charlie, assuming a necessary margin of safety in the future cash flow estimates and proper adjustments in discount rates, would you discuss which trends of global economic growth that you think will be sustainable, given our holdings in railroads, steel, materials, and energy, with our modest expectations, enormous trade deficit, tight credit spreads, low risk premiums, and explosive growth in emerging economies? Thank you.

WARREN BUFFETT: Yeah. We think we're — we think we're in a pretty good group of businesses for the world we face. You know, we don't know which ones will turn out to be the best. There's a few that we think are real superwinners, and we think a significant number of them will do OK.

And we don't try to buy our businesses with thoughts much of world trends. We certainly think in terms of international — foreign competition.

I mean, we do not want to buy into a business that has a very high labor content and that has a product that can be shipped in from abroad very easily.

Because, sooner or later, that will probably be trouble, just like Charlie and I — really, I bought into an airline — he came along and tried to rescue me — some years ago that had very high seat mile costs and it had protected routes — US Airways — so it was able to operate with 12 cents a seat mile of cost because Southwest hadn't gotten there yet with their 8 cent costs.

But they get there. And you do not want to have something whose competitive position is going to erode over time. But I think most of our businesses have got pretty strong competitive positions.

And, really, the variables you name don't bother us. You know, we will play the hand as well as we can, and we're playing it with terrific people in very good businesses, and we're dealing from strength all the time. You know, we've always got a loaded gun.

And we think we've got the right values with our managers, the people. Think we've got a culture that's owner-oriented.

We've got a lot of things going for us, and they won't produce huge returns, but they're likely to work OK.

Charlie?

CHARLIE MUNGER: Well, we learned about foreign labor competition in our shoe business. And in that, it reminds me of Will Rogers, who didn't think man should have to learn these easy lessons in such a hard fashion.

Will Rogers believed that you should learn not to pee on an electrified fence without actually trying it. (Laughter)

WARREN BUFFETT: Will told Charlie a lot of things he didn't tell me. (Laughter)

26. It's all relative with currencies

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. I'm Shinydaz Guynadewa (PH) from Fort Lauderdale, Florida.

First of all, I want to thank you for your efforts in making investors aware of the high transaction cost involved with several investments, and I got lot of personal benefit by reading your articles.

My question today is in reference to the declining value of dollars compared to all other major currencies. In last three years, dollar declined as high as 25 to 30 percent.

So I want to understand how it is going to impact individual investors and the how big is the threat? Thank you?

WARREN BUFFETT: The question is about the declining dollar but I didn’t get all the —

CHARLIE MUNGER: He asked you for — what do we think about it, what are we going to do about it.

WARREN BUFFETT: We think it — we think the dollar over time is — unless policies are changed in a major way — is likely to decline somewhat more against most major currencies.

And we originally backed that opinion up with transactions that got as high as 21 or -2 billion in the ownership of foreign currencies.

And then the carry on that, the difference between interest rates in the various countries, made that quite an expensive way to express that belief.

So we have focused much more on buying into companies that earn lots of money in other currencies, on the thought that they will be somewhat favored over companies earning just U.S.

But that’s not — as I mention in the report — that is not a huge determination of what we buy. It’s a factor, but it’s not — it’s not 50 percent of the decision or anything like that.

We are following policies in this country that are likely to cause the dollar to decline in value against many major currencies. And who knows what speed, whether it happens this year or next year. We don’t have any idea on that sort of thing.

But the fundamental forces are fairly strong.

We actually only own one currency now — trade — which would surprise you, actually. We’ll tell you about it next year.

Charlie?

CHARLIE MUNGER: Yeah. So far, something peculiar has happened. During this exact period of maximum dollar decline in value versus other currencies, the dollar prices at Costco have showed an inflation factor of approximately zero.

So what really matters, of course, is how things are working in your own country, and it’s been perfectly amazing how well we’ve gotten by so far with the decline of the dollar.

WARREN BUFFETT: Yeah. As Charlie says, you know, we reference everything in terms of our own country.

If you look at oil, for example, which we'll say has gone from roughly $30 a barrel to $60 a barrel over the last few years, you know, during that same time the euro has gone from, like, 83 cents to a $1.35.

So the price of oil, if you're a European, has gone up very little. I mean, we think oil has run wild. But in terms of anybody that's using the euro, the price of oil has gone up about 25 percent, and we feel the price has gone up a hundred percent.

So you do have this anchoring of thought to your own currency, which is understandable.

I do think you'll need to think about currency matters more than Americans traditionally have. I was struck 20, 30, 40 years ago, when I would travel elsewhere, how much more sophisticated most people in Europe and the UK, wherever, were about currency than the United States.

We never really had to think about it. Everything was dollar-based, and an American didn't have to be smart about currency or even think too much about it in terms of their business. But that world has changed.

27. Corporate directors aren't doing their job

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: John Norwood from Des Moines, Iowa. A quick question — a quick comment and then a question.

The comment, following on Charlie's comments on ethanol, I would ask him at least to look at the environmental benefits of ethanol as a fuel blend — octane boosters superior to other types of chemical additives, such as MTBE, which has been so damaging to groundwater.

My question is for Mr. Buffett. And I'm hoping you might be able to tell us a little bit more about your interactions with the board of directors and the types of ideas and idea exchange and, perhaps, a model for how you believe a board of directors is supposed to function with management. Thank you.

WARREN BUFFETT: Yeah. I would say that most writers and most shareholders probably have a little bit of a distorted version, at least, how most corporations — large corporations — have operated over the years.

Usually — for a long time I would say that directors, generally, were sort of potted plants. I mean, you sat there and the management had its agenda and didn't really want input on major matters.

And Charlie and I can certainly testify to the fact that we have had great lack of success, even when we were the largest shareholder of a company, in terms of talking about things that really count.

I mean, if somebody spends their whole lifetime— 25, 30 years — rising to the position of CEO, you know, they want to be boss, and you can't blame them, and the only thing in their way is the board of directors.

So they look for people who are big names and they look for ways to keep them happy, but they don't really want them getting into the business very much.

There's a lot more process now that's been imposed by the recent rules. But I would say still, in terms of the reality of the guts of business and the discussions that take place and all that, I think you might be surprised at the level overall of that throughout corporate America.

As I've written in the report, overwhelmingly, the job of the board of directors is to have the right CEO. I mean, if you've got the right CEO, 90 percent of it takes care of itself. If you were the director of Cap Cities and you had Tom Murphy as the CEO, you know, case closed. It was all you needed.

And if you have that CEO, I think you have an obligation on the board to make sure that there's not overreaching by the CEO, because the CEO can have different interests.

And I think the third thing that the board does — should do — is they really should bring some independent judgment in on major acquisitions. Because there is a natural tendency for people with, usually, big egos, big motors, who get to be CEOs that like to do big things and to become bigger spending other people's money.

And normally, when big deals come along, you know, the management — by the time it gets there, they've made the deal anyway. They have investment bankers there who go through a little ritual. I've never seen one come in and make a presentation that says it's a dumb idea. I mean, they know what the answer is supposed to be, and it just becomes kind of a little game.

So I think in those three respects, a good director will first make an affirmative decision. You've got a very good CEO — not the best in the whole world, not everybody can do that — but a very good CEO.

That that CEO is not overreaching.

And when significant deals come along, that they get a chance to weigh in, and that you really get a balanced discussion about the real economics of what you're doing.

And I would say in that latter point, what I've seen over the years has really been pretty bad. But I can understand it because the CEO wouldn't bring in the deal unless he wants it done.

And once he brings it in, he’s going to stack the deck and make the presentation in such a way that it’s almost impossible to exercise independent judgment.

Charlie, do you have any thoughts on —

CHARLIE MUNGER: I think big, big deals, on average, in America, are contrary to the shareholders’ interest. That’s the way to bet. On the acquirer’s side, usually the shareholders are worse off.

WARREN BUFFETT: Most stock deals, they think about what they’re getting and they don’t think about what they’re giving.

I mean, I have been involved time after time where people are giving a significant percentage of the business, which they wouldn’t sell at the current market price. If somebody came along with a tender offer 20 percent higher, they would say that’s inadequate.

But they hand away a piece of the business because they want to own something else. And there’s nothing wrong with that, but you just have to be sure that you’re getting as much as you’re giving.

I have very seldom heard a discussion — in fact, I don’t think I’ve virtually ever heard of a discussion — of weighing what you were actually giving away on a stock deal versus what you’re getting.

I’ve heard a lot of discussion about dilution and when dilution will be overcome and all that sort of thing, but that is not the question.

The real question is are you — if more value is being created, how is it being whacked up between the two companies?

And if not extra value is being created, are you getting more than you’re giving?

When I gave away 2 percent of Berkshire Hathaway to acquire Dexter Shoe, that was one of the dumbest deals in the history of the world.

And I did it all by myself. Charlie didn’t participate in that one. I wish he had.

But, you know, it was dumb. I mean, here’s — it wasn’t 2 percent of what I had then at Berkshire, it’s 2 percent of the present Berkshire Hathaway company.

You’d all be 2 percent richer — a little more than 2 percent richer — but you’d be a full 2 percent richer if I hadn’t done that.

CHARLIE MUNGER: Fortunately, you’ve made some better decisions.

WARREN BUFFETT: Yeah. Well, I have to, or we wouldn't be here. (Laughs)

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: But, you know, the point is that doesn't show up under conventional accounting at all. You know, it gets brushed under the rug.

At Gillette, literally, we had ten deals in a row that never met — came close to meeting — the case that was presented at the time they were presented to the board. Was that ever mentioned to shareholders? Did it show up in our financial report?

Never. It never will. And that goes on all the time in corporate America.

And, unfortunately, shareholders, to the extent they get unhappy with managements, are complaining about whether they've got diversity on the board or something like that.

But when you're blowing away the company, I mean, that, to me, is a whole lot more important.

Charlie, you want to —

CHARLIE MUNGER: Yeah. The self-serving delusional nature of even some very good minds, in terms of IQ points, is amazing.

I had a friend who sold a business to a government-controlled business in a socialized Scandinavian country.

And my friend had a very nice business, and the people on the other side, after they had bought it for stock in their government corporations, said, "This was such a marvelous deal. We got your whole business, and we didn't have to give anything."

WARREN BUFFETT: Well, we owned stock in the Third National Bank one time down in Nashville. And they got the ability — and they're wonderful people — really wonderful people — but they got the ability to acquire other banks where they formerly had been limited in that ability.

And they went out to some very small bank, and the guy at the very small bank said, "I want stock." And he says, "My stock is worth private market value, and your stock is worth market price."

Well, market price happened to be half of — but he says, "All I'm getting is whatever the market is, so I want you to value your stock at market and value mine at this huge premium."

And he said, “And there’s one other condition.” He said, “Since I’m going to be putting my whole net worth in your stock,” he says, “I want you to promise you’ll never do a deal this dumb in the future.” (Laughter)

Do you remember that one, Charlie?

CHARLIE MUNGER: Yeah, I remember.

WARREN BUFFETT: Yeah. And that fellow was just being a little — was just getting a little more out in the open than is typically the case.

I’ve been on some terrific boards. There was a local one here called Data Documents that really functioned with everybody on the board thinking about the business, understanding the business, making decisions as owners.

Every one of them had a significant percentage of their net worth in the business, and probably the best board I’ve ever been on. I mean, every decision there was made for business reasons.

The worst decisions — at least they have the potential for being the worst — but it’s standard procedure now when an acquisition comes up to trot in the, you know, investment bankers and the lawyers, and the momentum is just totally to get the deal done. And, like I say, there will be a lot of slides presented.

And I can — I don’t need to look at the slides. I know what the answer is going to be. At the end they’re going to say it’s a great deal, you know, and there will be nobody arguing the other side.

They’re just — you know, it is not like something where you would make a decision and you’d have somebody give pro and con. It just doesn’t work that way. I don’t know how to improve that a lot.

I think we’ve got a sensational group at Berkshire. You have a group with almost everybody on the board having a significant percentage of their net worth — Bill’s is so big we can’t get him to a significant percentage, but that’s — he’s got hundreds of millions of dollars in it.

We’ve got a board that is in exactly the same position as the shareholders. They don’t have directors’ and officers’ insurance. They’ve got the downside as well as the upside. They bought their stock in the open market, so it hasn’t been given to them. It is a real owners’ board, and I like it that way.

I think it’s a terrific group, and I’m glad I can get them to work cheap. (Applause)

28. Why Berkshire avoids deals with partners

WARREN BUFFETT: Number 9, please.

AUDIENCE MEMBER: My name is Eid (PH) and I'm from Kuwait. In response to earlier comment about borrowing from Kuwait, I can tell you that after 40 years we now lend in dollars, and you are always welcome in Kuwait. (Laughter)

My question is, if you would pick your partners to invest with you in big deals, what would be your criteria for choosing partners?

WARREN BUFFETT: Yeah. We — is that — are you complete on that?

AUDIENCE MEMBER: I'm complete.

WARREN BUFFETT: Yeah. We normally don't want to do deals with partners. If we like a deal, we want to own it all.

And we usually have the money to do it all, so almost — in very few cases would there be a need for a money partner.

And then there's a question for a knowledge partner. And we really wouldn't want to be going into something, in most cases, where we were relying on somebody else to be the brains of the deal. We've made exceptions on that, but very seldom.

So we — by our nature, we would like to have a hundred percent of any deal for the benefit of our shareholders. If we're going to spend our time on it, we just as soon get a hundred percent of the rewards. We don't mind taking a hundred percent of the downside.

And we ought to understand it well enough so we don't need a partner.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that one, either.

WARREN BUFFETT: Number 10. Wait, I'm just trying to think. Have we done any big partnership deals?

CHARLIE MUNGER: Well, you made that partnership deal with Leucadia, but they brought you the deal.

WARREN BUFFETT: That is true. We made a very good partnership deal with Leucadia. They did way more than their share, but they brought us the deal. And so they asked us to participate in their deal.

Now, in effect, we own less than a hundred percent of some of our businesses, and we're in partnership with the management. But that's perfect. I mean, we've had some great experiences with that, and we'll continue to have great experiences.

But, you know, they came — they're in on the same terms we are, and they're owners.

All of our managers think like owners. But in certain cases, they are real owners directly in those businesses as well.

But just some outside party as a partner, we really haven't done, although I would do another deal with Leucadia if they came to me and I liked the deal. I mean, that was a very good experience.

29. No opinion on commodity prices

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Good afternoon, ladies and gentlemen. My name is Ari Jahja. I'm a junior from Baruch College, New York City.

And on behalf of the Portfolio Management Club, I would like to thank you, Mr. Buffett, for inviting us to this wonderful event.

And my question is that, first of all, speaking about Berkshire's portfolio, there's an increasing exposure of your investments toward commodities, such as to oil through PetroChina, to steel through POSCO, and to coal and agriculture through the rail stocks that you recently purchased.

So my question is that what is your long-term view on commodities, and how does it impact your view on the geopolitical state of the world in the future? Thank you.

WARREN BUFFETT: Yeah. I — and, to my knowledge, Charlie — we'll hear from him — but we have no opinion on commodities.

We — if we were in an oil stock, it's because we think it offers a lot of value at this price, but it does not mean that we think the price of oil is going up. If we thought oil was going up, we could buy oil futures, which we actually did once.

But very seldom — very, very seldom would we have any opinion on what any given commodity would do.

Owning POSCO, we just think it's one of the — well, it is probably the best steel company in the world and — remarkable record.

When we bought that stock, we were buying it at four or five times earnings, with a debt-free balance sheet, one of the lowest-cost producers around. I mean, it's a fabulous company.

And in addition, it was a play on the Korean won, and we made 20 percent on the won by being invested through a won-denominated security.

So we may occasionally be in those kind of businesses.

We, basically, like best the businesses that require very little capital, because they're the only ones that have a chance of earning really high returns on capital.

You can't have a business that has huge capital expenditures year after year, and end up with a high- return business. It just doesn't work in this world.

But you can find some businesses that really require relatively minimal capital investment.

Here's the case. This is a small one. But See's Candy is not going to require a huge capital investment.

It requires some capital investment, but it's a wonderful business. It's a small business, but it's a wonderful business. And it's far better business, relative to size — adjusted for size — it's a far better business than any steel business is going to be or any oil business is going to be.

It's just that it's not very big. We'd love to have it bigger. And we'll do our share in every way we can, as you may have noticed up here.

But we do not have any — we do not have a bias toward — at all — toward businesses involved in commodities. And if we had any bias, it would be against.

Charlie?

CHARLIE MUNGER: Yeah. We're going to be investors in businesses, not commodities, by and large. And that has to work better over time.

30. Dual class shares at the New York Times

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: Good afternoon. My name is Andy Peake from Weston, Connecticut.

Recently the newspapers have been in the news: the [Rupert] Murdoch bid for Dow Jones, Morgan Stanley's Hassan Elmasry's push to eliminate the New York Times dual-class share.

Given you are both experts in the dual-class share and newspapers, what advice would you give to the long-suffering New York Times shareholders, and what advice do you have for Arthur Sulzberger, the besieged CEO of the New York Times and head of the family that owns the newspaper?

WARREN BUFFETT: Well, I think the "long suffering," as you put it, shareholder of the New York Times has probably made a mistake — I don't think I'd necessarily blame the Sulzbergers for the woes of the newspaper business.

I mean, we have said for a good many years that we thought — in effect, we thought newspapers were overpriced because they reflected a valuation based on looking in the rearview mirror rather than through the window.

And we — it's interesting. We have this dual-class structure at Berkshire. But because I converted a whole bunch of shares to B, I own about the same percentage of the B as the A, because I converted about six or seven times as much as I needed for present gifts.

I only go down to my safe deposit box when I have to, and I didn't want to go down every year to convert stocks, so I just converted a bunch of stock early on.

And now I own about 30 percent of each. So it has no effect, in terms of voting power at Berkshire.

But the woes of the newspaper business are not connected with the difference in voting structure at the Times or other places. The newspaper business has just gotten a lot tougher.

And if you think about it — I mean, let's assume that Mr. [Johannes] Gutenberg, back there in the 15th century, instead of wasting his time developing movable type and all of those kinds of things, decided to become a day trader or hedge fund operator and really made something of himself, so that we never had print.

But along came the internet, along came cable TV, all kinds of other things. And then now this year, you know, Johannes Gutenberg the 28th or something, came along and said, "I've got this wonderful idea. We're going to chop trees down. We're going to haul them great distances.

"And then we're going to put them through expensive newsprint machines. And then we're going to send them down to someplace where they've got expensive presses.

"And we'll run these things all night. And then we'll send delivery trucks out through the snow to get these little pieces of paper out to people where they can read about what happened yesterday."

Well, I don't think we would be backing him, you know.

Now, it happened, you know. The other one came along first, and people's habits don't change immediately, and, you know, the world doesn't turn over.

But, in effect, you know, the position of newspapers today still reflects the fact that they have inertia and momentum on their side from the past.

And I don't care how smart you are. You know, there was a fellow that came into the LA Times a few years back. He was going to take the circulation up to a million- five, as I remember, Charlie. And the circulation is now 800-and-some thousand of the LA Times, and it's gone down every week.

And I don't know that — you know, I don't know that Joseph Pulitzer or William Randolph Hearst or E.W. Scripps or anybody who were geniuses in their day, maybe, at building circulation, could do much about that.

The truth is that the world has changed in a significant way. We used to sell 300,000 World Books a year. It was a good value. You know, and we sell 22,000 sets or something like that now.

And it isn't because the World Book isn't worth what it sells for. It's just not worth what it sells to for most people who can go on the internet and get an awful lot of that information free.

So I don't think I would blame the dual-class structure on anybody's investment losses in the New York Times.

The companies that have not had dual-class structures — I mean, we own the Buffalo News. And the Buffalo News earnings have been — they're certainly down over 40 percent from the peak.

We have terrific management. We've got a paper that has among the highest penetration in circulation of any large metropolitan paper in the country. But we are — our earnings are going down, and it's a fact of life.

Charlie?

CHARLIE MUNGER: Yeah. He was talking about that dual-class structure as being intrinsically wrong, but I would argue that the Sulzbergers set it up that way when they went public, and so that was in the basic contract.

And once a contract has been made, the idea that you can just stamp your foot and take away the contract strikes me as a — kind of an immature idea.

WARREN BUFFETT: I would add, too, that the Sulzbergers from the start — anybody that bought the New York Times knew that they would not try to maximize earnings in a given quarter or try to minimize the downturn by slashing costs or something of the sort.

They didn't build the New York Times by doing that. It did not have a reputation which allows it, perhaps, to have a decent future on the internet. It did not get to where it is by a policy of, you know, Management 101 as taught as some business school.

And, yet, following that differing course, you know, I don't know how many papers in New York disappeared. But whether it's The Herald Tribune or The Sun or The World-Telegram or you name it, the world — they had a different management approach, and they all fell by the wayside, and the Times is still around.

So I — I'm not sure 10 years from now or 15 years from now that people will regard the Times' playing of their hand as being, necessarily, an inferior one.

They may have a better position going into the internet than almost any newspaper around. Certainly a lot better than, you know, the Philadelphia Inquirer or the LA Times has.

You know, the LA Times will have more trouble monetizing their reputation on the internet than the New York Times will, if there's a national game to be played in that. So we'll see how it plays out.

31. Annual meeting is running out of space

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: My name is Betty Stuart Rodgers Jeffreys, and I live in Barrington Hills, Illinois, 35 miles northwest of Chicago.

This is the first time I've ever been to your annual meeting, and I want to thank you both for giving us so much time to answer our questions and give us such words of wisdom.

I would also like to thank you for giving us a wonderful weekend of lunches, brunches, cocktail parties, time at Gorat's and Borsheims.

The problem is that when I told my two adult daughters that I was going to have such a wonderful weekend, they both made me promise to bring them next year.

And if 25,000 people bring two people next year, where are we going to meet?

WARREN BUFFETT: Well, I would — if you get the answer to that, I'm really waiting to hear it. Because we — it's about 27,000, and we are just about maxed out here. We're just about maxed out in terms of hotel rooms. I think we're going to have four new hotels in Omaha —

AUDIENCE MEMBER: Oh, good.

WARREN BUFFETT: — before next year. But, you know, that's a couple thousand people. And, you know, based on the growth, at some point we sort of hit the wall, and I haven't figured out how to handle that.

If anybody has any suggestions, I'll appreciate hearing about them.

But I'm delighted you're having a good time here. I hope you've all had a good time here.

AUDIENCE MEMBER: Thank you.

WARREN BUFFETT: We're now going to take a ten-minute recess, and then we'll reconvene. Thank you.

32. Formal business meeting begins

WARREN BUFFETT: OK.

If you'll please take your seats? We want to finish by 4, so we'd like to move quickly through the rest of the business, and we'll get on to the PetroChina question.

And let's see. Here we are. The meeting will now come to order. I'm Warren Buffett, chairman of the board of directors of the company. I welcome you to this 2007 annual meeting of shareholders.

I will first introduce the Berkshire directors — I've already done that.

So, also today with us are partners in the firm of Deloitte & Touche, our auditors. They are available to respond to appropriate questions you might have concerning the firm's audit of the accounts of Berkshire.

Mr. Forrest Krutter is secretary of Berkshire. He will make a written record of the proceedings.

Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott and Marc Hamburg.

Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and represented at this meeting? Forrest?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 6, 2007, being the record date of this meeting, there were 1,113,240 shares of Class A Berkshire stock outstanding, with each share entitled to one vote on motions considered at the meeting, and 12,888,424 shares of Class B Berkshire Hathaway common stock outstanding, with each share entitled to one two-hundredth of one vote on motions considered at the meeting.

Of that number, 955,276 Class A shares, and enough — 11,301,274 Class B shares are represented at this meeting by proxies returned through Thursday, May 3rd.

WARREN BUFFETT: Thank you. That number represents a quorum, and we will therefore directly proceed with the meeting.

The first order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott, who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

I guess I heard a second.

The motion has been moved and seconded. Are there any comments or questions? We will vote on this question by voice vote. All those in favor say "aye."

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion is carried.

33. Berkshire directors elected

WARREN BUFFETT: The first item of business is to elect directors.

If a shareholder is present who wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholder that is present has not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles, and we'll furnish a ballot to you.

Would those persons desiring ballots please identify themselves so that we may distribute them.

I now recognize Mr. Walter Scott to place a motion before the meeting with respect to election of directors.

WARREN BUFFETT: I move that Warren Buffett, Charles Munger, Howard Buffett, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Don Keough, Tom Murphy, Ron Olson, and Walter Scott be elected as directors.

WARREN BUFFETT: Is there a second?

VOICE: Second.

WARREN BUFFETT: It's been moved and seconded that Warren Buffett, Charles Munger, Howard Buffett, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Donald Keough, Thomas Murphy, Ronald Olson, and Walter Scott be elected as directors.

Are there any other nominations? Is there any discussion?

The nominations are ready to be acted upon. If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections a ballot on the election of directors voting the proxies in accordance with the instructions they have received.

Miss Amick, when you are ready, you may give your report.

REBECCA AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast not less than 1,008,564 votes for each nominee.

That number far exceeds a majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as any cast in person at is this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. Warren Buffett, Charles Munger, Howard Buffett, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Donald Keough, Thomas Murphy, Ronald Olson, and Walter Scott have been elected as directors.

34. Shareholder proposal to divest PetroChina shares

WARREN BUFFETT: Now, the next item of business we'll spend more time on, and that is a proposal put by — forth by Berkshire shareholder Judith Porter, the owner of ten Class B shares.

Miss Porter's motion, as set forth in the proxy statement, provides that Berkshire Hathaway not invest in the securities of any foreign corporation, or subsidiary thereof, that engages in activities that would be prohibited for U.S. corporations by executive order of the President of the United States.

The directors have recommended that the shareholders vote against the proposal.

The microphones at zone 1 and 7 are available for those wishing to speak for or against Miss Porter's motion.

These are the only microphone zones in operation; so I ask that you go to either 1 or 7 if you'd like to talk on this.

I ask that you confine your remarks solely to Miss Porter's motion.

Now, we have a number of shareholders who want to the talk about this, and we will let shareholders speak.

If there's sufficient time at the end of that — and we're willing to — certainly willing to — have them speak for half an hour, and Charlie and I will give them, maybe, a couple minutes' response after that.

But you've got a half an hour. Different shareholders can speak. I hope you tailor the length of your remarks, the early ones, so that it gives other people a chance.

And if we have time after the shareholders have spoken and there are other people that are in attendance as visitors that wish to speak, we'll have them also.

But if the shareholders use up the full time until almost 4 o'clock, then we'll have to finish at that time.

So, Miss Porter, if you're available — if we can turn the light on there at station 1 — to speak, you have the floor.

JUDITH PORTER: Thank you. Mr. Buffett, my name is Judith Porter, and I'm the shareholder who introduced the proxy resolution involving Berkshire Hathaway's divestment of PetroChina.

PetroChina is implicated in the genocide in Darfur, Sudan.

I want to thank you for allowing us to speak to this resolution. In many countries it would be impossible for us to do so, but we are indeed fortunate to live in a country where we can express our opinion without fear or without recrimination.

Before my husband formally presents the resolution, I want to explain to you why I have introduced it.

My family is no stranger to genocide. My grandparents were murdered in 1941 in the Nazi genocide, as were other members of my family.

I will never forget the despair my father expressed when my aunt, who was released from Bergen-Belsen concentration camp, sent him a letter telling him what happened to his family.

It deeply affected him for the rest of his life. And I was raised to believe that genocide should never, ever again happen, never again.

The world was silent when my grandparents were murdered. But genocide has continued.

In the genocide in Cambodia, the world was silent. In the genocide in Bosnia, the world was silent until late in the slaughter. The world was again silent in the horrible genocide in Rwanda.

How many times must we say, “Never again?”

Now, there’s the first genocide of the 21st century in Darfur. Two and a half million civilians have been driven from their homes. More than 400,000 have been killed, and 1,600 villages have been destroyed.

Berkshire Hathaway can play a role in ending this slaughter by divesting in PetroChina, as we’ll shortly describe. As an exemplar of both business ethics and personal integrity, your support of divestment will send a signal to China and to the Sudan that there are costs to continuing this destruction, and it will lead other corporations to follow your ethical actions.

Genocide is never a good investment. I can think of no greater tribute to my grandparents than introducing this resolution. As Elie Wiesel said in his Nobel Peace Prize speech, “We must take sides. Neutrality helps the oppressor, never the victim. Silence encourages the tormenter, never the tormented. Sometimes, sometimes we must interfere.”

My husband will now present the proxy resolution. He will be followed by Jason Miller, who will speak about the relationship between CNPC and PetroChina. Abdul Makjid (PH), who is from Sudan, will speak about the genocide taking place. And Bob Edgar, Secretary General of the National Council of Churches, will conclude our discussion of this resolution. Thank you.

GERALD PORTER: Thank you. Mr. Buffett. Since you’ve read the resolution, I will not repeat the resolution. I will speak about the resolution, though.

On November 3rd, 1997, President Bill Clinton issued Executive Order 13067, which imposed a trade embargo prohibiting most American businesses from operating in the Sudan.

This executive order was expanded on April 27th, 2006, by President George W. Bush. While it is true that American companies cannot do business in the Sudan, Americans can invest in Asian and European companies that do business in the Sudan.

Such investments do not violate the letter of this law, but they certainly do violate the spirit of the law and are counter to the stated policy of the United States.

We believe there is general agreement that the Chinese National Petroleum Company, CNPC, plays a major role in funding the genocide, in providing weapons to the Sudanese, in cooperating with the Sudanese military, in forcibly displacing local populations, and in myriad other ways, facilitating the killing of hundreds of thousands of Darfuris.

CNPC is the largest foreign investor in Sudan's oil industry, and fully 70 percent of the revenues Khartoum generates from CNPC's operations go to its military, which, in turn, conducts the genocide in Darfur.

We are here today because Berkshire Hathaway is the major non-Chinese investor in CNPC's subsidiary, PetroChina.

You, Mr. Buffett, have stated that you believe that we are wrong, both in our analysis of PetroChina's connection to the genocide and the belief that divesting the company's PetroChina holdings would in any way have a beneficial effect on Sudanese behavior.

We disagree. You are correct in stating that PetroChina does not do business in the Sudan. However, as you agree, its parent company, CNPC, is a major investor in the Sudan, and funds from that relationship help provide the instrumentalities of genocide.

Managements claim that the relationship between PetroChina and CNPC is similar to that between Fannie Mae and the U.S. government. That argument is fallacious.

The Harvard University Advisory Committee on Social Responsibility examined the management of the two companies. The results of that review were striking.

There was almost total management overlap between the two companies. Andrew Leonard, writing for Salon.com commented, "To declare that a subsidiary has no ability to control the policies of the parent when the two entities are run by exactly the same people is an exercise in specious obfuscation."

In short, PetroChina is an artifact created for the sole purpose of allowing some shareholders to distance themselves from the action of its parents, CNPC.

In China, the companies share the same brand name and the same logo. If you look at a coin, the images on the two sides are different, but the coin is a unity. You cannot spend one side of a dime or own one side of a quarter.

It's the same with PetroChina and with CNPC. They look different, but they are simply two faces of the same corporation.

Two U.S. presidents have stated clearly that it's against the national interests of the United States for U.S. companies to do business in Sudan.

It is the position of the U.S. government that a targeted economic boycott of the Sudan will help end the genocide in Darfur.

For a U.S. company to invest in a subsidiary of a foreign company, such as PetroChina, that engages in business in the Sudan is a circumvention of Executive Order 13067 and weakens the U.S. sanctions.

Economic sanctions against the Sudan have worked in the past. For example, Talisman Oil's sale of its assets in the Sudan helped bring about the end of the civil war in the Sudan.

Sudan's main protector in the United Nations is the government of China. China will be hosting the 2008 Olympics and is very sensitive about negative publicity that could be aimed at that event.

In response to the recent criticism of the Chinese support of Sudan by Mia Farrow and Steven Spielberg, a senior Chinese official traveled to Sudan to push the Sudanese government to accept a United Nations peacekeeping force.

You and the company are viewed as exemplars of ethical behavior. If Berkshire were to take the lead and divest, others would follow. If Mia Farrow can cause change to occur, then so, too, can Warren Buffett.

No one divestment in South Africa brought about the end of apartheid. But if we all act together, we have tremendous power to bring pressure on the Sudanese government to stop the killing of innocent people.

During the last two decades, beginning with the tearing down of the Berlin Wall in October 1989, we have seen events that no person could ever have anticipated: The breakup of the Soviet Union, the democratization of Eastern Europe, and an unbelievable transition in South Africa.

What we have learned is that all things are possible. There are important issues in our society that desperately need our attention. Remember the words of Hillel: "If I am not for myself, who will be for me? If I am for myself alone, what am I? If not now, when?"

Thank you. And I'm pleased to introduce Jason Miller. (Applause.)

JASON MILLER: I'm Jason Miller, the National Policy Director for the Sudan Divestment Task Force and also an owner of three shares of Berkshire Class B stock.

I'd like to echo the Porters' comments that CNPC is by far and away the most irresponsible and abusive oil operator in Sudan.

They've participated with the government in forced displacements and other human rights violations, and 70 percent of the revenue that they provide to Sudan gets funneled into the military that prosecutes the genocide at Darfur. But what does that have to do with PetroChina?

Currently, the chairman of PetroChina's board is the immediate past president of CNPC. The president of CNPC is the president of PetroChina and vice chair of the PetroChina board. The CFO of CNPC is the CFO of PetroChina. The chairman of the PetroChina supervisory board is the chief of discipline and inspection at CNPC.

Eight of the nine PetroChina directors have a current or immediate past connection to CNPC. Four of the five PetroChina supervisors have a current or immediate past connection to CNPC. All PetroChina senior executives are currently or formerly connected to CNPC.

We've also documented a slew of other management irregularities. Furthermore, asset transfers between the two are fluid and often cross-subsidized. After PetroChina's IPO, it took on $15 billion in debt from CNPC, which freed up cash flows for CNPC to spend on Sudan.

Ten percent of IPO revenue from PetroChina went to CNPC's operations in Sudan. Fifty percent of CNPC's profits come from PetroChina dividends.

PetroChina, in 2005, provided $3.15 billion in cash for CNPC's finance arm to provide to other CNPC subsidiaries like those in Sudan. And 64 percent of CNPC's assets are represented by PetroChina stock.

If this isn't management overlap and two manifestations of the same entity, I would challenge people to find one that is more overlapping.

As a result, and because of the huge magnitude of the atrocities in Darfur, even a whiff of this type of overlap between PetroChina and CNPC, and the lack of strong corporate governing structures there, would suggest that engagement with PetroChina by Berkshire Hathaway is a minimum requirement in order to investigate these connections and their potential contributions to the Darfur genocide.

I'd very quickly also like to mention the important question that Berkshire Hathaway was asked, which is what's next? If we engage PetroChina, ask them about these questions, what happens?

The answer by unanimous consent with all foreign policy experts we interact with and those international organizations working in Sudan is that China would change its behavior in Sudan.

Sudan is too important to China as an energy policy for China for it to abdicate those assets. And, as a result, we've already seen changes in China's behavior.

And taking leadership from the queues of Berkshire Hathaway would be one more in the line of Mia Farrows and Steven Spielbergs that could help catalyze the important sea change that's necessary to bring an end to the genocide. (Applause)

JASON MILLER: I'd now like to introduce a Darfurian who's from Des Moines and would like to speak —

WARREN BUFFETT: I would — I would —

Is he a shareholder or not? I want to be sure all the shareholders have a —

GERALD PORTER: He has the proxy of Etta and James Friend, who are the shareholders of three shares —

WARREN BUFFETT: I just want to make sure. Are there other shareholders at 7 that want to talk too or not? I want to make sure that all the time isn't taken.

AUDIENCE MEMBER: We will not take all the time.

WARREN BUFFETT: OK. That's fine. I just want to make sure that the shareholders aren't shut up.

AUDIENCE MEMBER: Good afternoon, and thank you for inviting me to speak about Darfur. My name is Abdamide Jusef (PH), and I am speaking today as a proxy of Etta, Freta, and James Friend, who are the holder of four shares of Class B stocks.

I am from western Darfur, and my parents still live in Darfur. I fled from Sudan to Egypt in September 2002 after being expelled from Sudan University in Khartoum for speaking out in (inaudible) of Darfur.

We are detained for a few week and we suffered from abuse physically and psychologically every day until they released and told us we are not allowed to go to any university and we had to stay away from any activity for that student association. I get refugee status in the United States, and I move to Des Moines, Iowa, on March 2005.

The Janjaweed attack my family — my family's home — in Darfur in January 8, 2007. Four Arab men from the Janjaweed attack our home in the early morning.

At that time, there was a guest in my family home. The Janjaweed left him without attention; so he run away to get help from our neighbors. The Janjaweed started by taking all the money and jewelry from my family.

When the Janjaweed found out that someone had run to get help, they left my family, but they promised them they were going to come back.

Even that my family escaped injury, my neighbor (inaudible) and his entire family of five were murdered by the Janjaweed. The Janjaweed also took their horses, and these activities were ongoing in my town for a while.

And everybody in my community or someone was murdered, have someone was murdered and raided by the Janjaweed. My mom told me everybody wake up every day, and the first thing they do is check their neighbor and their relative to see if they are alive or not, and so do I.

The Janjaweed are stealing my town. Now they work as gangs who kill and rape. Every family is affected, and nobody can stop them.

Even though I live in safety and peace there — here in United States, I still worry about my family back home in Darfur.

Please try to do anything to help my family and all people in Darfur. I need your help. If you do the simple thing like tell your friend about the genocide in Darfur or join an organization, or talk or send letters to your member of Congress, or don't invest in any companies that's helped genocide in Darfur.

Please, Mr. Buffett and Berkshire Hathaway shareholders, get involved to bring the hope and peace to the children and women and all of us in Darfur. Whatever you do to stop the genocide in Darfur is saving life of human being.

Thank you for listening, and now I would like to introduce Bob Edgar, the General Secretary of the National Council of the Church. Thank you.

BOB EDGAR: As we close, I'm Bob Edgar, General Secretary of the National Council of Churches and a former member of the United States Congress. I'm here in support of the resolution and a proxy for Doris Gluck, who holds ten shares in the company Class B stock.

In February of 1968, I had the privilege of meeting Dr. Martin Luther King five weeks before he was assassinated. Later, as a member of Congress, I served on the Select Committee on Assassinations, looking into both the death of Dr. King and John F. Kennedy. I come here today in honor of the kind of dream that Dr. King had.

He said this: "Our lives begin and end the day we have become silent about the things that matter. We will not be silent."

I am here today representing millions of faithful Americans — Christians, Jews, Muslims, and others — who have stood up and said no to this genocide. Just 11 or 12 or 13 years ago, 800,000 people were killed in Rwanda in 90 days, and we were silent. We will be silent no more.

Mr. Buffett, this morning you said a great thing, and I quote, “I find it reprehensible when a government preys on the weaknesses of its citizens rather than protecting them.” I wholeheartedly agree. You were talking about gambling. We urge you to think the same way about genocide.

On the document in opposition to this resolution, you said this: “Proponents of the Chinese government’s divesting should ask the most important question in economics, ‘And then what?’”

We are prepared to answer that question, “And then what? And then what?” Then the world will finally focus on the issue of genocide in Darfur.

Then the international investors all over the world in many companies would follow the ethical actions of Berkshire Hathaway’s moral leadership, moral leadership, and call for all governments of the world to stop the genocide.

“And then what?” Children would be saved, women would not be raped, fathers would not be killed, and we would find our way in this human family to care for one another.

Jesus said, “We should love our neighbors as ourselves.” I think he meant, “We should probably try every means available to stop those neighbors from being killed.” This is just one way we can follow those words of Jesus.

And, finally, the former pope, John Paul, said, “I dream of a world where none will be so poor they have nothing to give and none will be so rich they have nothing to receive.” I urge support of this resolution. (Applause.)

WARREN BUFFETT: Are there other shareholders that would like to talk before we respond?

AUDIENCE MEMBER: Mr. Buffett, my name is Aaron Frank. Thank you for hearing us on this matter. I’m from Atlanta, Georgia. And along with being a — along with being a Berkshire shareholder, I also independently own shares of PetroChina.

And this issue is something I’ve struggled with for years, in terms of whether to divest or not. What I’ve done personally is given the dividends that I receive from PetroChina to organizations that help in Darfur, but this is mostly symbolic.

What is clear to me is if I had the opportunity to engage the management of PetroChina in a meaningful way as I do with you here today, that I would be compelled to do so ethically.

As owners of Berkshire Hathaway, we have a unique opportunity to engage the management of PetroChina in a way that will be heard not only by the management of PetroChina but by CNPC, China, and the international community due to your standing.

That’s a unique opportunity, and this is an incredibly — this is an incredibly important matter. I think we have an ethical obligation to do so. Thank you for listening.

WARREN BUFFETT: OK. Thank you. (Applause.)

WARREN BUFFETT: Is there anyone —

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: Yeah.

AUDIENCE MEMBER: My name is Bill Rosenfeld from Lexington, Massachusetts. In your web posting you claim that a subsidiary can’t control the actions of its parent, so actions against PetroChina will have no impact on CNPC.

Suppose that millions of Americans boycotted GEICO Insurance or other Berkshire companies because of a policy at Berkshire Hathaway. Wouldn’t that make you reconsider that policy even though your subsidiaries are voiceless in Berkshire Hathaway management?

How does targeting PetroChina to influence CNPC differ from this situation? (Applause.)

WARREN BUFFETT: Well, I actually would say it’s quite different. If a shareholder of Wesco — you might — Marc, you might put up the chart that shows the flow of ownership both with China and with —

MARK HAMBURG: It’s up.

WARREN BUFFETT: OK. Wesco does not control Berkshire Hathaway. We can have all the — we can have lots of overlap in management and everything.

Berkshire Hathaway controls Wesco. If a shareholder of Wesco were to complain to the management of Wesco, which is analogous to PetroChina, about the fact that, let’s say, that Berkshire bought ISCAR or any other activity or anything I was doing personally, they would have no ability to control me.

If somebody controlled — complained to Berkshire about something that was going on at Wesco, we could certainly introduce action. So the — it flows downward.

The overlap means nothing. I mean, obviously the Chinese government controls PetroChina. They own 88 percent of the stock. We control MiTek. We own 90 percent of the stock. We control Wesco. We own 80 percent of the stock. We can tell MiTek what to do. We can tell Wesco what to do. But MiTek and Wesco cannot tell Berkshire what to do.

I think there's a fundamental misunderstanding on that. The Chinese government controls 20 — 32 of the largest 33 publicly-owned companies in China. And the Chinese government, in effect, is in charge of all of those companies.

The Chinese government does business with the Sudan. PetroChina does not. PetroChina in no way tells the Chinese government what to do. And we've seen evidence of that in a lot of ways.

So it seems to me it's backwards. If it was PetroChina following a policy that the Chinese government disagreed with, believe me, there would be a change in a hurry.

We have no disagreement at all about what's going on in Darfur. There's two questions.

One is PetroChina influence the Chinese government. And, secondly, if we don't agree with what the Chinese government is doing, should we sell our stock in PetroChina?

The people here who are come, who own stock in Berkshire Hathaway, have obviously made the choice, even though they disagree with what our policy is, to continue as shareholders.

And I agree with them — with that — a hundred percent. And we, in turn, elect to continue to hold our shares in PetroChina because we have no disagreement with what PetroChina is doing.

If there's a disagreement, it may be with what the Chinese government is doing. Now, in terms of what the Chinese government is doing, you know, we've heard talk about divesture by China.

If the Chinese left the Sudan tomorrow, 400,000 barrels of oil would be being produced, a good bit with the money that China has invested in the Sudan.

You can't take the assets. You can't the refinery. You can't take pipelines. You can't take the oil out of it.

They can sell their interest. They can sell it to other people who are doing business in the Sudan. They can sell it to the Sudanese government.

But, believe me, they would probably sell it very cheap. The Sudanese government would get a bargain, or the Sudanese government might very well renegotiate terms in their favor, if they allowed a third party to buy.

Believe me, you know, they would be in a position if they — assuming they could affect the transfer — and I think there's a lack of understanding of what really would happen if China said tomorrow, "We're going to get — we're going to take our interest away from our activities in Sudan."

They would have to sell them or they'd have to give them up one way or the other. And, like I say, I think the Sudanese government would probably end up better off financially if they had a half-decent adviser in the question than they are presently.

I might mention one other thing which is kind of interesting in this. We buy about — currently about $250 billion worth more of goods from China than we sell to them, and we give them little pieces of paper in exchange.

And we say to them, "We want your goods, and you should work hard and send us your goods, and we'll send you these little piece of paper called American dollars."

Two years ago, China wanted to use some of those American dollar — we'd use their goods — to want to buy a company called Unocal. Unocal was a (inaudible) U.S. company.

The majority of their production of oil and gas came from outside the United States — a substantial majority — came from places like Thailand, Indonesia.

And the Chinese wanted to buy that company, and by a vote of 395 to 18, the U.S. House of Representatives sent their message to President Bush that it would be against the national interest to let this company be sold, which, as I say, produced very little oil and gas in the United States. Got most of it from the rest of the world.

So, in effect, we snubbed the Chinese in a big way on something important to them: energy.

And I might mention that we import perhaps four times as much energy from all the countries around the world as the Chinese do, even though they have four times the population.

So we have, in a sense, told the Chinese a couple of years ago "Don't even think about buying the small U.S. company with a lot of production — fair amount of production — abroad to satisfy your energy needs."

And I think it's understandable to some extent that the Chinese are looking for energy around the world just as we have for the last century. They are buying significant amounts of oil from Sudan. They put money in there, and the — they are going to buy four or — they are going to buy that 400,000 — they're not taking the whole 400,000 barrels a day from the Sudan, but they're taking significant amounts.

They're going to buy that oil in the world market. That oil is going to get produced. Revenue is going to flow to the Sudan. The question is how much the Sudanese keep themselves and how much gets disbursed to the Chinese because of the investment they've made.

So I see no effect whatsoever in Berkshire Hathaway trying to tell the Chinese government how to conduct their business.

I agree a hundred percent with the fact that what is happening in the Sudan should not be happening, and I — there are other parts of the world where say some — that same situation may exist, although not to the same degree.

But I don't think you can — I don't think it's proper for us to divest our shares in PetroChina. They would be sold to somebody else. I think the proponents of the motion probably would like the idea that the price of the stock would go down.

But we don't sell stocks, you know, basically to try and drive them down in price. We might sell PetroChina if it went up enough, but we would not be selling it to try and drive down the price, because all that would be doing is giving a bargain to somebody else who is buying the stock of PetroChina.

It doesn't change the funds available to them at all.

One of the speakers mentioned the amount of money that goes from PetroChina up to its parent. Well, money from Wesco comes up to Berkshire from our subsidiaries. You know, that's the nature of having a major ownership in a subsidiary is that you get money from MiTek, you get money from Nebraska Furniture Mart, which we own 80 percent of.

But that really has nothing to do — in my view, at least — it has nothing to do with the fact that it is China that has a policy in respect to being partners in Sudan, and it is not PetroChina at all. Selling our stock would not change one thing.

If we would have any communications, as a practical matter, the communications should be with Chinese government — and actually people here have had a chance because we have a lot of media here — they've had a chance to express their views to the Chinese government.

Believe me, unless the opinions get expressed to the Chinese government, expressing them to PetroChina means nothing.

I mean, PetroChina is controlled by the Chinese government, and they are not — if you were an official of PetroChina, you are not going to tell the Chinese government what to do. They are going to tell you what to do.

Charlie?

CHARLIE MUNGER: Well, the issue also is China is a rapidly rising nuclear power, and who should decide how the federal government — or how the Americans — should react to China?

There's a lot to be said for letting the policy flow through the U.S. government instead of sort of a vigilante effort of various citizens.

Now, I would also point out that there's a lot wrong all over the Earth, and there's a lot of cruelty and there always has been, and there will always be a lot of oil produced in a lot of lands with a lot of cruelty.

And nobody is in favor of cruelty, but there's a limit to how much you can fix. And so I'm very skeptical of the idea that Berkshire should become an instrument of telling — of setting United States policies vis-a-vis China. (Applause)

WARREN BUFFETT: Yeah. Charlie and I have our own views, for example, on reproductive freedom, but we don't have a Berkshire Hathaway policy on reproductive freedom nor do we finance from Berkshire Hathaway funds — the funds of our shareholders — we do not finance any activities that relate to our personal beliefs, although we may, obviously, fund them by ourselves or speak out on them by themselves, but we do not have a Berkshire Hathaway funding just because we believe that women should have the right to choose or questions of that sort.

CHARLIE MUNGER: I think reasonable minds can disagree on these subjects.

At Berkshire, there's all kinds of businesses we won't buy and control individually, but we're willing to own stock in the same businesses.

Is that the correct moral line to draw? I don't know. We do our best, and we make the decisions, and we make the calls.

WARREN BUFFETT: I would say — I wonder really whether when the Unocal question was being determined here, were the Chinese to whom we'd given lots of little tickets in exchange for taking their goods, and they came along with a perfectly decent offer to the shareholders of Unocal, 18 1/2 billion dollars.

They wanted to buy a little more oil and gas production around the world. And the U.S. Congress overwhelmingly said this is a terrible thing and we want the United States to oppose it and we want it sold to Chevron for less money.

And I really don't recall a lot of people speaking up on behalf of the Chinese right to buy oil companies over here, just like we've bought oil companies around the world for many decades.

So to the extent that they may feel themselves somewhat alienated from the rest of the world in this respect, I think we've actually contributed our share.

Charlie?

CHARLIE MUNGER: Another thing in the complexity of life, the woman who lost her family to the Holocaust, we clobbered the people that committed that genocide by joining genocidal Joe Stalin. These issues are complicated.

WARREN BUFFETT: OK. If there are any shareholders that want to vote in person in this — on this — matter or to change their proxies, we have monitors. If you just raise your hand.

And if there are none of those, Miss Amick, are you ready to give your report?

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast 15,740 votes for the motion and 830,598 votes against the motion.

As the number of votes against the motion exceeds a majority of the number of votes related to all Class A and Class B shares outstanding, the motion has failed.

Certification required by Delaware law of the precise count of the votes will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Ms. Amick. The proposal fails.

35. Formal meeting adjourns

WARREN BUFFETT: Does anyone have any further business to come before this meeting before we adjourn?

If not, I recognize Mr. Scott to place a motion before the meeting.

WALTER SCOTT: I move this meeting be adjourned.

WARREN BUFFETT: Is there a second?

VOICE: Second.

WARREN BUFFETT: All those in favor say “aye.”

VOICES: Aye.

Morning Session - 2008 Meeting

1. TV soap star Susan Lucci trades jobs with Buffett

NEWS ANCHOR (CNBC's Becky Quick, on tape): Folks, this just in. It appears that Warren Buffett has struck a deal to trade jobs with daytime soap opera diva Susan Lucci.

Buffett has reportedly negotiated a permanent spot on the cast of All My Children. Apparently, Ms. Lucci is en route to Omaha as the new CEO of Berkshire. (Applause.)

CHARLIE MUNGER: Where could he be? (Laughter and applause as actress Susan Lucci comes on stage)

SUSAN LUCCI: Do you mean Warren, Charlie? He's been detained at the TV studio. (Laughter)

CHARLIE MUNGER: Really?

SUSAN LUCCI: Hi, Charlie. I'm Susan Lucci. Oh, haven't you heard about the deal between Warren and me? He's going to be a big star in All My Children, and I'm going to be taking over Berkshire Hathaway.

CHARLIE MUNGER: Well, you've certainly got some important qualities that Warren lacks. (Laughter)

SUSAN LUCCI: Well, thank you, Charlie. And you can relax now, you dear man. You just make yourself at home because I'll take it from here, thank you.

I've been wanting to talk to our shareholders for quite some time now. There's some changes I really think we need to make around here.

The first thing we need to look at is our dividend policy. (Laughter)

I have never heard of anything so cheap and so unfair to our wonderful shareholders. We need to change it. (Applause)

CHARLIE MUNGER: Sounds good to me. (Laughter)

SUSAN LUCCI: And, second, we need to look at giving guidance on earnings. And we need to do that every single week. (Laughter)

CHARLIE MUNGER: Sounds good to me. (Laughter)

SUSAN LUCCI: And, third, we need to pay our directors more than $900 a year. (Cheers and applause)

WARREN BUFFETT: Just one minute. (Applause.)

SUSAN LUCCI: Hi, Warren. Warren, I thought you were at the All My Children studio.

WARREN BUFFETT: What's that talk about dividends that I hear?

SUSAN LUCCI: Oh, nothing important, Warren. You just concentrate on your role on the show.

WARREN BUFFETT: Susan, my show is Berkshire Hathaway. And my role is to run it. (Takes paper out of jacket pocket and rips it up)

SUSAN LUCCI: Warren, you can't do that.

WARREN BUFFETT: I just did it. All My Children can't do without you, and I can't do without Berkshire. (Applause.)

SUSAN LUCCI: Oh, Warren. So you mean the deal is off?

WARREN BUFFETT: The deal is off. I really want to thank you. You've brought me to my senses. You can go back to All My Children. I'll stay here at Berkshire.

But I am so grateful to you Susan, that I want you to go out to Berkshire — not to Berkshire — to Borsheims and I want you to pick out anything you would like, and charge it to Charlie. (Laughter)

SUSAN LUCCI: Oh, Warren, you are darling. Thank you. (Applause.)

SUSAN LUCCI (to MUNGER): And you're a darling, too.

WARREN BUFFETT: Now, wait a second.

SUSAN LUCCI: Thank you. (Applause)

2. Welcome

WARREN BUFFETT: OK. Charlie, let's get this show on the road. (Laughter)

The — she spent more time with him than she did with me, but — (Laughter)

The — we're going to follow the usual procedure.

The business meeting will start at 3:15. But between now and then, with a break for lunch, we're going to answer your questions. We don't screen them ahead of time, as you know — based on who gets lined up at the microphone first.

And we'll go around from sections to sections and then go to the overflow rooms. My understanding is that our best estimate is that we have about 31,000 people here today. (Applause.)

WARREN BUFFETT: Somewhere I have a map here. Marc, do we have that?

Pardon me? Can't hear a thing up here. But in any event — on the yellow pad. OK. We'll just mark them off as we go along.

The — I would like, before we start — I heard Ron Olson laughing there. I think he made it. I'm glad to hear it.

Let me introduce our directors. I really wasn't sure whether to go through with this part of the show after they showed that rousing applause for things like dividends and raising their — but we have up here — we have Charlie Munger on my left. He's the one that can hear; I can see. We work together for that reason. (Applause.)

WARREN BUFFETT: And if the rest of you will just stand as I give your name. And if you'll hold your applause to the end — or even longer if you would like — (laughter) — I will introduce them.

It's Howard Buffett, Susan Decker, Bill Gates, David Gottesman, Charlotte Guyman, Don Keough, Tom Murphy, Ron Olson, and Walter Scott. The best directors in America. (Applause.)

WARREN BUFFETT: Charlie and I will take a break at noon because we will probably, by that time, have finished all of the things we have up here to eat, and we'll need to have lunch.

I'd appreciate it if you would limit your questions to one question, and that means not embodying a three-parter or a four-parter or something like that.

And there's no need to make a long introductory statement because we'll get more questions answered that way, and we want to cover as many people as we can.

3. How NOT to be a lemming

WARREN BUFFETT: So with that, we'll go right over to post number 1 and start in with the first question.

AUDIENCE MEMBER: Very good morning to Mr. Buffett and Mr. Munger. My name is Rajesh Furor (PH) from Bombay, India.

I have been learning a lot from letters of yours. It's been a great insight into investment philosophy that I haven't learned from anywhere else. Great job.

That’s on the mind side. But on the heart side, what touches me the most is what you have achieved all these years is through a hundred percent honesty, and I salute to that. Thanks.

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: Now, my question is on what key steps would you recommend to correct the mind set of typical investor like me, which is what you noted as lemmings-like, the crowd mindset?

WARREN BUFFETT: What would we recommend — we got the question being repeated here — about the mindset of an investor? Is that —?

CHARLIE MUNGER: He wants you to advise him as to how he can become less like a lemming. (Laughter)

WARREN BUFFETT: Well, since you repeated the question, I’m going to let you give the first answer to that, Charlie. (Laughter)

Until he eats about a thousand calories, it — (Laughter)

CHARLIE MUNGER: He wants to invest less like a lemming.

WARREN BUFFETT: Oh, I understand that. I was giving you the first shot at it. Well, I will tell you what changed my own life on investing.

I started investing when I was 11. I first started reading about it — I believe in reading everything in sight. And I first started reading about it when I was probably six or seven years old.

But for about eight years I wandered around with technical analysis and doing all kinds of things, and then I read a book called “The Intelligent Investor.” And I did that when I was 19 down at the University of Nebraska.

And I would say that if you absorb the lessons of “The Intelligent Investor”, mainly in — I wrote a forward and I recommended particularly Chapters 8 and 20 — that you will not behave like a lemming and you may do very well compared to the lemmings.

We have here in the Bookworm, copies of “The Intelligent Investor”, and I think it’s as great a book now as I did when I read it early, I guess, in 1950.

You will never — you can’t get a bad result if you follow the lessons of — Ben Graham taught in that book.

I should mention that there's a book out there also that I did not know it would be completed by this time.

My cousin, Bill Buffett, has written a book about our grandfather's grocery store called "Foods You Will Enjoy." And Bill will be out there. He's signing books.

I just got my first copy a couple days ago. Read it, and I enjoyed it a lot.

Charlie worked at the same grocery store — how many years ago? Probably a good 70 years ago in Charlie's case. Neither one of us was very good. (Laughter)

But my grandfather — you don't want to pay much attention to his advice on stocks. He wrote a lot of letters, and he was very negative on the stock market and big on hard work at the grocery store.

So we quit listening to him. (Laughter)

Instead, read The Intelligent Investor. That's the book that gave me the philosophy that has taken me now for a lot of years.

And there's three big lessons in there which relate to your attitude towards stocks generally, which is that you think of them as parts of a business; and your attitude toward the market, which is that you use it to serve you and not to instruct you; and then the idea of a margin of safety, of always leaving some extra room and things.

But the people in this room, I think, have learned that important first lesson. I mean, I think most people that own Berkshire do not see themselves as owning something with a little ticker symbol or something that may have a favorable or unfavorable earnings surprise or something of the sort, but they'd rather think of themselves as owning a group of those businesses that are out there in the other room.

And that's the way to look at stocks. You'll never be a lemming if you do that.

4. Buffett will handle Cologne Re's investment portfolio

WARREN BUFFETT: Let's go to Number two.

AUDIENCE MEMBER: Good morning, Warren. Good morning, Charlie. My name is George Iscis (PH) from Cologne, Germany.

My question: how is the operational integration of the Cologne Re progressing? Thank you very much.

WARREN BUFFETT: Cologne Re, for those of you who are not familiar with it, is a 95 percent-owned subsidiary of General Re, of which Berkshire Hathaway owns 100 percent.

And Cologne Re, I believe, is the oldest reinsurance company in the world. It's done a magnificent job for us as part of, first Gen Re, and then Berkshire Hathaway.

And we have a process in place that will, before too long, result in us owning a hundred percent of Cologne.

One difference, then — there won't be any difference in operation. It runs magnificently the way it's being run. But at that point — up until this point, they have run their own investment portfolio. That portfolio and the equity portfolio of GEICO are the only two that I don't run.

But when we own a hundred percent of Cologne, then I will take the responsibility for Cologne's investment portfolio. Otherwise it would be hard to improve on the operation of the management of Cologne.

So there will be — you will not see any other changes except we will consolidate in 100 percent of the earnings of Cologne rather than 95 percent.

5. "Forget about the word 'stock'"

WARREN BUFFETT: Area 3.

AUDIENCE MEMBER: Good morning, Mr. Buffett, Mr. Munger. My name is Sam Reiner (PH) from Fort Lee, New Jersey, and my question concerns your comment this week about the recession, and the stock market going up so significantly in April.

Can you expand on where the market is going from here? (Laughter)

WARREN BUFFETT: Hah. Well, I can expand, but I couldn't answer. (Laughter)

Charlie and I haven't the faintest idea where the stock market is going to go next week, next month, or next year. We never talk about it. You know, it never comes up.

Our directors will tell you that they've never been to a directors meeting where the subject of the direction of the stock market is — we are not in that business. We don't know how to be in that business.

Obviously, if we could guess successfully a high percentage of the time where the stock market was going to go, we would do nothing but play the S&P futures market. There wouldn't be any reason to look at businesses and stocks. So it's just not our game.

We don't think — what we see when we look at the stock market is we see thousands and thousands and thousands of companies priced every day, and we ignore 99.9 percent of what we see, although we run our eyes over them.

And then every now and then we see something that looks like it's attractively priced to us, as a business. Forget about the word "stock."

So when we buy a stock, we would be happy with that stock if they told us the market was going to close for a couple years. We look to the business.

It's exactly the same way as if you were going to buy a farm a few miles here outside of Omaha. You would not get a price on it every day, and you wouldn't ask, you know, whether the yield was a little above expectation this year or down a little bit.

You'd look at what the farm was going to produce over time. You'd look at expected yields. You'd look at expected prices, the taxes, the cost of fertilizer, and you would evaluate the intelligence of your purchase based on what the farm produced relative to your purchase price.

Quotes would have nothing to do with it. That's exactly the way we look at stocks. We look at them as businesses. We make judgments about what the future of those businesses will be. And if we're right about — in those judgments, the stocks will take care of themselves.

Charlie?

CHARLIE MUNGER: Nothing to add. (Laughter)

WARREN BUFFETT: He's been practicing for weeks. (Laughter)

6. We don't cultivate great managers, we keep them

WARREN BUFFETT: Let's go to area 4.

AUDIENCE MEMBER: Good morning, Mr. Buffett and Mr. Munger. My name is Chander Chavla (PH), and I am from Seattle, Washington.

Berkshire Hathaway has some of the best managers in the world, and I am very bad at hiring good managers. The — some of the decisions that I've made, which were without any phone calls from Jamie Lee Curtis, I look back and I see — you know, what was I thinking.

What can you advise on, how in one hour you can assess the capability of a person to be a good manager?

WARREN BUFFETT: Well, you have to understand that we cheat. (Laughs)

We buy businesses with good managers. So if you give me a hundred MBAs — and I have these classes come out all the time to Omaha. I've had about 30 schools this year, and usually there's 75 or a hundred men and women in the classes.

I no more could take those hundred and spend a few hours and rank them from number one to a hundred in terms of their future achievements as managers, you know, than I could pick them — you know, it would be impossible for me.

But what we do is we buy businesses with great managers in place. We've seen those people perform for, in many cases, decades. We've seen their record, and they come with the business.

Now, our job is not so much to select great managers, because we do have this proven record that they come with. Our job is to retain them.

And many of the managers — a majority of the managers that work at Berkshire — are independently wealthy. We hand them checks, sometimes, in the billions, often in the hundreds of millions. So they do not have a monetary reason to work, in many cases.

So our job — we are dependent on them, incidentally. I mean, we have 19 or so people at headquarters, and we have 250,000 working for Berkshire around the world, and we can't run their businesses.

And our job is to make sure that they have the same enthusiasm, excitement, passion, for their job after the stock certificate changes hands, than they had before.

Now, that requires some judgment on our part as to whether these people love the business or love the money. They all like money, but many of them — well, our managers in particular — they love their businesses. I mean, they've worked at them — they're a work of art to them, and they've been in the family sometimes as many as four generations.

So we have to see the passion in their eyes, and if we see that, then we have to behave in a way that that passion remains.

Can't be done by contract. We don't have contracts. It won't — that doesn't work.

But we can try to create an environment — and Berkshire, frankly, is the ideal environment — it's even an ideal environment because of events like this.

Our managers feel appreciated. And they are appreciated. They're not just appreciated by me and Charlie; they're appreciated by you. And we want to give you a chance to applaud them. (Applause.)

WARREN BUFFETT: So I can't be of enormous help. And if you're looking at a group of MBAs, you know, it's not easy. I mean, they know — they sort of learn by that point in life how to fool you, in terms of what answers you want to hear and all of that sort of thing.

I would look for the person with passion for the job. I mean, the person that is always doing more than their share. You look for people that are goods communicators and all of that sort of thing.

But I like my way better. It's a lot easier just to take somebody that's been batting .400 in baseball and say, "I think I'll stick them in the lineup."

And the nice thing about our game is that, you know, in baseball, unless you're Nolan Ryan or somebody, you have to hang up things at 40 or thereabouts, but in our game, they go on and on and on.

I mean, I use as an example — we had a famous Mrs. B from the Furniture Mart, and she worked for us until she was 103, and then she left and she died the next year. And that is a lesson to our managers that — (Laughter)

Charlie?

CHARLIE MUNGER: Well, that was very useful advice. It reminds me very much of the late Howard Ahmanson.

And a young and starving business student once asked him for advice as to how to get ahead, and Howard said, "Well, I always keep a few million dollars laying around in case a good opportunity suddenly turns up." (Laughter)

7. Teaching option pricing is "totally nonsense"

WARREN BUFFETT: Well, let's go to number 5. (Laughter)

AUDIENCE MEMBER: Good morning. I'm Joe Hutchin (PH), a shareholder from Culver, Indiana.

Could you please comment on how you use stock options when trying to enter or exit a position in a public company?

WARREN BUFFETT: Yeah. We've — I think there's one time we sold a put on Coca-Cola with the idea that, if it got exercised, we were very happy to own more Coca-Cola. It didn't get exercised. We would have been better off if we had just bought the stock.

Usually, if you want to buy or sell a stock, you should buy or sell the stock.

And using an option technique to buy a call on a stock instead of buying the stock outright with the idea that you get it a little cheaper that way means that about four times out of five you'll be right and the fifth time the stock will have moved earlier and you'll have missed, you know, the transaction you wanted to have.

And so we virtually have never used options as a way to enter a position or exit a position, and I would doubt very much if we do.

We've used — we've sold these equity — long-term equity put options that were described in the press release yesterday and were described in the annual report, but that's a different sort of thing.

If we want to buy something, we'll just start buying it. And if we want to get out of it, we'll start selling it. And we won't get involved in any fancy techniques.

Charlie?

CHARLIE MUNGER: Well, if I remember right, you wrote a letter when the public authorities were deciding whether we should have option exchanges for stocks. And Warren was all alone at that time, and he wrote a letter saying that he didn't think it would do any good at all for the country to throw out the margin rules in this fashion.

I've always thought that Warren was totally right. We — it's — the idea of turning financial markets into gambling parlors so the croupiers can make more money has never been very attractive to us.

WARREN BUFFETT: Yeah. (Applause.)

WARREN BUFFETT: Yeah. It's very interesting to me when I talk to these MBA students. One of them from the University of Chicago, the very first question I got a few years ago, he says, "What are we being taught that's wrong?"

I love questions like that. I have to plant them in the future.

The amount of time spent at business schools — maybe it's a little less now — but teaching things like option pricing and that sort of thing, it's totally nonsense.

I mean, you need two courses in a business school: one is how to value a business, and — from the standpoint of investments — how to value a business and how to think about stock market fluctuations.

But the idea that you would spend all of this time with formulas — but the problem, of course, is that the instructors know the formulas, and you don't when they come, and so they've got something to fill the time explaining to you.

And, you know, it is no fun if you — I mean, if you were teaching Biblical studies, you know, and you could read three or four of the most important religious tomes forward and backward in five different languages, you would hate to tell somebody that it comes down to the Ten Commandments. I mean, any damn fool can do that.

So there's a great desire of the priesthood in finance to want to teach the things that they know and you don't know and that they spent a long time learning and that maybe requires a fair amount of mathematics.

And it really has nothing to do with investment success. Investment success depends on buying into the right businesses at the right price. And you have to know how to value businesses, and you have to have an attitude that divorces you from being influenced by the market.

You want the market there, not to influence you, you want it there to serve you. And that requires a mindset, which goes back to an earlier question, and it's a mindset that's described quite well in Chapter 8 of "The Intelligent Investor."

8. Buffett praises sister Doris for her "retail" charity

WARREN BUFFETT: Let's go to number 6.

AUDIENCE MEMBER: Hi. I'm Irene from Bonn, Germany. Both of you are very generous person. What is your joy of giving, and what are the potential pits when donating money — pitfalls when donating money? I'm sorry.

WARREN BUFFETT: The joys and giving and the pitfalls of donating money, huh. The — I know personally I've never given up anything in my life that made a difference in my life.

I mean, there are people that will go to church this Sunday and they will drop money in a collection plate, and it will make the difference about where they take their family, or whether they take their family, in terms of where they eat, whether they go to a movie, whether they get an extra present at Christmas, whatever it may be.

I mean, they are giving some money that makes a difference in their lives. I've never given a penny that way, and I never will.

I mean, I get to do everything I want to do in life. But because I've lived a long time — which gives you an enormous advantage in terms of accumulating money — and most of the things I want in life don't come from the expenditure of money.

So it accumulates, and basically I'm giving away excess. I'm not giving away anything from necessity.

So I really — you know, I think what I'm doing is useful with the money, but I don't think it's on a par at all with the actions of somebody that's giving money that really makes a difference in how they or their children live.

Those are really charitable people. I think my sister Doris is here. She has given away money that made a difference in her life. She gives away time, too. She gives away eight or ten hours a day, in terms of actually looking into the real needs of people, and giving them things beyond the money — giving them help and advice and somebody to talk to.

And, you know, that's real giving. And I admire her for it. I'm not emulating her. I mean, she is in the retail business of giving; I like wholesale much better.

In terms of the pitfalls, you know, you can make mistakes in any area. But if you — you should give to things that you personally have an interest in and believe in, and that can be anything. I don't — I'm not going to prioritize what should be done with gifts.

Something you're involved in. Something you want to give your time to as well as money. But beyond that, I'll let Charlie carry on.

CHARLIE MUNGER: Yeah. Regarding pitfalls, I would predict that, if you have an extreme political ideology, whether of the left or the right, you're very likely to make a lot of dumb charitable gifts. (Laughter and applause)

WARREN BUFFETT: If you hang around Charlie like I do, you get the sunny side of life. I mean — (laughter)

We ought to have that playing, "The Sunny Side of the Street."

9. We don't "tell the world how to run their business"

WARREN BUFFETT: Let's go to number 7.

AUDIENCE MEMBER: Good morning. My name is Okosh Vajay (PH), and I'm from India. I worship Mr. Buffett for his philanthropy, and I do hope to serve the Gates Foundation someday.

My question to Mr. Buffett is, what's your level of involvement when one of your companies is faced with an ethical dilemma? For example, Fruit of the Loom's competitors have sweatshops in Central America. So what do you do to ensure that you don't fall into the same trap?

WARREN BUFFETT: Yeah. Well, we let our managers run their businesses. And we've got some terrific managers, not only in terms of ability, but I would say that what we have seen of the ethical standards of our managers has been extraordinary over the years.

That doesn't mean there isn't — there aren't slip ups here or there. But taken as a group, over decades, I think that I'm very happy, in effect, turning over the keys, not only to the financial performance of the business, but in terms of how they behave.

And I would say that I think you're quite wrong in terms of — Fruit of the Loom's operations are conducted in absolutely terrific standards. John Holland is here. I'd be glad to have you meet with him later.

But we — we're proud of our businesses and how they operate.

We do not give them elaborate guidelines. I write them a letter every two years, roughly, and I ask them to send me a letter telling who they think should be the successor if anything happened to them that night. I keep those letters around. Fortunately, they don't come into play very often.

But I also tell them we've got all the money we need. It's nice to have more money, but we're not going to lack for money at Berkshire Hathaway.

We don't have a shred of reputation more than we need, and we never want to trade away reputation for money.

So we give them that same message that was given in the movie, in terms of the Salomon situation, which is that not only do they behave in a way that conforms with the laws, but that they behave in a way where, if a story were written by an unfriendly but intelligent reporter, the next morning, in their local paper, they would have no problem with their neighbors, their family reading it.

And we run that in the movie every year, just because we like the managers to keep getting that message all of the time. There is no pressure from Berkshire's corporate office to report X dollars per — of earnings in any quarter. They don't give me budgets, so they don't — there's no feeling that they have to come through with given numbers or I'll be embarrassed in public in terms of publishing earnings or anything of the sort.

We have no incentives to cause people to do anything that would go against their conscience or play games or cut corners or anything of the sort.

And, overall, I think it's worked pretty well. It isn't perfect. You can't have 250,000 people in the city without having something going on at some point. And we do have 250,000 people working. But I'm not unhappy with our batting average.

Charlie?

CHARLIE MUNGER: Yeah. And, of course, Fruit of the Loom does have foreign plants, and we have no rule against that at all. We've got quite a few foreign plants now.

We don't favor foreign plants. We just do whatever makes sense under the circumstances.

WARREN BUFFETT: Yeah, we had a shoe business I've written about in Maine, and we had wonderful, wonderful workers there. They were more productive than workers around the world.

But the United States was producing, 20 years ago, roughly a billion pairs of shoes a year, and we were a nation of Imelda Marcoses. I mean, it was wild.

And Brockton, Massachusetts, and you name the towns, revolved around the shoe business, as did a town called Dexter, Maine.

And we bought that business. And we tried to compete. We had a good brand name. We had great workmanship. And we found out that it just plain wouldn't work against — competing against — shoes produced in China.

So now of the — it's over a billion pairs of shoes a year used in this country. Basically they all come from outside the borders. And you're going to see that.

And factories in China, factories in Central America — they do not have exactly the norms that we have in this country. And, you know, that's going to be the situation.

We are — we will not — we are not going to tell the world how to run their business in any great way.

We — obviously we have some standards that have to be met, but we are not — they are not exactly the situation you are going to find in the United States.

10. Buffett dismisses higher raw material costs

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Good morning. My name is Mike McGowan (PH). I'm from Pasadena, California. I'm a shareholder in both Berkshire and Wesco. I run a website called FinancialFoghorn.com, and I write about precious metals and things.

And I've asked you questions in the past about silver, and I didn't really get them answered. So I thought I'd ask about a different commodity this time.

I read about the Chinese raising the price of tungsten, and I think about your comment last year in buying ISCAR.

Will commodity price increases in things like tungsten affect the profitability of ISCAR? And would that be the reason you're locating a plant in China to build machine tools? Thanks.

WARREN BUFFETT: Yeah. The reason the plant was built in China was to serve the Chinese market, which is large and growing. And we opened in Dalian late last fall.

It's nicer to be closer to the raw material, but it really had nothing to do with changes in the price of tungsten.

Generally speaking, if you're creating a higher value-added product, as ISCAR is doing, from a raw material, there may be three months, six months, of adjustment to changes in raw material prices. And obviously, with some commodities, if it gets high enough you get into substitutes.

But there isn't going to be any substitute for tungsten in the cutting tools, and there won't be — you know, we tried some substitutes for crude oil in terms of gasoline or — not so — heating oil but then the substitutes like natural gas go up in price, too.

So I think largely, in our businesses, raw materials get passed through.

Now, we're having a tough time, for example, in the carpet business in passing through the cost increases that we experience in oil-based raw materials. But we would be having trouble — we probably would be having trouble in the carpet business regardless now because of the slowdown in residential housing. It does make it tougher.

But over a period of time, our businesses are going to reflect raw material costs. You know, the candy here I have, this fudge, which I can hardly wait to get into, you know, it's going to reflect sugar and cocoa and things like that over time.

And if you're running an airline, it's going to reflect the cost of fuel. So you can have little squeezes here and there, but it's not a big deal, and it certainly isn't the reason that we went to China to locate the ISCAR facility.

That facility — incidentally ISCAR — we have a number of people here from ISCAR, and families in some cases.

That is — I had very high expectations for that when we bought it. It's exceeded it in every way. It's exceeded in terms of financial performance. It's exceeded in terms of the human relations we've developed with the people.

I mean, it was — I told you it was a terrific acquisition a few years ago. It's been a dream acquisition, and I know Charlie wants to add to that. (Applause)

CHARLIE MUNGER: Yeah. I would say that the short answer is that, while we don't like inflation because it's bad for our country and our civilization, that we will probably make more money over time because there is inflation.

11. Lots of work to find a better buy than Berkshire

WARREN BUFFETT: Go to number 9.

AUDIENCE MEMBER: Good morning. My name is Marc Rabinov from Melbourne, Australia.

My question is, Berkshire has bought a lot of shares over the last 12 months in listed companies. Do you expect the return on these investments to be between 7 and 10 percent per annum over many years, which is, I would say, well below what Berkshire has achieved in the past?

WARREN BUFFETT: The answer to that is yes. (Laughs)

The — we would be very happy if we could buy common stocks where our expectation over a long period, pretax, from a combination of dividends and capital gains — we'd be very happy if we thought it was going to be 10 percent, and we would probably settle for a little less than that.

And there's no question — absolutely no question — that returns from owning Berkshire will be less in the future than they have been in the past.

There's no question that we will not do as well with the common stocks at Berkshire that we own in the future as we have over the last, really, 40 years or thereabouts.

We operate now in a universe of marketable stocks that — where we're talking about companies with market caps of at least 10 billion but really, in most cases, to have a meaningful impact on Berkshire, we're talking much bigger than that, maybe 50 billion and up.

Well, that universe is not as profitable a universe to operate in as if you have the entire universe of thousands and thousands of companies.

So we — if we — just take an example. If we find a company with a market cap of 10 billion and we can buy 5 percent of it — and usually that's what we can buy without disturbing things — we can have a $500 million investment.

Let's say it doubles over a period of time. That's 500 million. You pay a 35 percent tax. You have 325 million. That's less than two-tenths of 1 percent in terms of Berkshire performance.

So our universe has shrunk enormously, and we will not do as well in that universe — remotely as well — as we would if we were the operating in a much wider universe and could do all kinds of things.

We've found little things to do from time to time where we've made some money. I may refer to them a little later, a couple things. And they're nice, but they don't move the needle very much at Berkshire.

So anyone that expects us to come close to replicating the past should sell their stock. I mean, because it isn't — it isn't going to happen.

And, you know, I think we're going to get decent results over time, but we're not going to get indecent results. And in this field we prefer indecent, but we're not going to get them.

Charlie?

CHARLIE MUNGER: I think you can take Warren's promises to the bank.

We are very happy making money at a rate in the future that is way less than the rate at which we made money in the past. And I suggest that you adopt the same attitude. (Laughter)

WARREN BUFFETT: Well, I wouldn't condemn them to that. I think if you're working with small amounts of money — I've talked —

CHARLIE MUNGER: Oh, yeah.

WARREN BUFFETT: Yeah. Then you may have something very much better to do with your money than to buy Berkshire.

I mean, if you're working with small amounts of money, and you want to put in significant amounts of time, and examine thousands of securities, you will find things that are more intelligent to buy than Berkshire.

You know, we still think Berkshire is an attractive investment over a long period of time. We think that it stacks up reasonably well with other very large companies.

We don't think it's the most attractive investment in the world, in terms of what you can find if you're willing to go through those thousands of possibilities, which is what Charlie and I used to do many years ago. It's not feasible for us to do it now and wouldn't have any impact on Berkshire.

What we really like at Berkshire is buying good-sized to very large first-class businesses with first-class management and just sitting there. Because the nice thing about that is you don't have go from flower to flower. You can just sit there and watch them produce more and more every year and give you capital and you can buy more businesses.

That's a nice formula. It's a formula that will work, I think, for us. It won't produce returns like the past.

12. PacifiCorp will follow regulators on Klamath River dam

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: (Inaudible). My name is Chu Chu (Inaudible), and I come here from the Klamath River, and I come here with a heavy heart.

And I know this is a pretty light-hearted event, but I came here last year with a heavy heart, too. And I fasted for ten days driving over here to speak with you.

And, you know, we really were disrespected last year, because one of your subsidiaries, PacifiCorp, has dams on the Klamath River that are creating toxic algae blooms, along with multiple other things. I won't go into it too far.

But I just come here today with a principle agreement between you and I, that you will sit down at the table and help us figure this out, help us make PacifiCorp accountable.

And being that I'm an indigenous American, and you're a guest in my home as a European American, that you would do that in front of all your shareholders today in good faith, that you care, you know, as a philanthropist and you care about, you know, helping, you know, third-world countries, you know, fight poverty, disease, when you're helping create it right here in the United States.

WARREN BUFFETT: You may not — you may not — last year we read the order under which we acquired PacifiCorp.

And, actually, as you may know, I'm prohibited from actually making decisions in that — in the area of PacifiCorp. That was part of the public utility commission ruling when we bought it.

But we have Dave Sokol here who can speak to that. I think the first dam was built in 1907, and we bought PacifiCorp a couple of years ago.

But David — if Dave could go to a microphone, I think that — I think he could address the issues that you brought up. I don't think we meant in any way to be disrespectful last year.

Those of you who were here last year, we may have a difference of opinion on this, and incidentally there are strong differences of opinion, as I understand it, in your area about what should be done.

And — well, I think I should have Dave make the explanation on it. Dave? Somebody want to put a spotlight on the —

DAVE SOKOL: Thanks, Warren. As you stated first, it would be inappropriate for Mr. Buffett to respond in any detail on this issue, because it's part of the acquisition in 2006 of PacifiCorp.

He specifically agreed in writing not to interfere with any decisions of our regulated assets within PacifiCorp. So having said that, these four dams that we operate on the Klamath River were built over the last 100 years.

There are a whole series of issues in the Federal Energy Regulatory Commission relicensing process as to what should occur.

These decisions, through that regulatory process, have been ongoing for eight years, and they won't culminate for probably another six.

Having said that, there are 28 various parties from federal, state, and local agencies, Native Americans, fishery folks, local landowners, that are party to a discussion as to what should or should not happen with these assets — and I left out the irrigators.

Of those 28 parties, other than PacifiCorp, there are at least four different directions in which people think this process should go.

From our perspective, we will be pleased to find a resolution when the 28 parties agree as to how that resolution should go forward, how it would be funded, et cetera.

Fundamentally, it's up to the Federal Energy Regulatory Commission, state and federal regulators, in addition to them, and then our specific regulators in each of the six states that PacifiCorp operates in.

So if public policy moves in a direction of dam removal, fish ladders, or maintaining the existing status quo, that would be the process in which we would go forward.

We are working constructively with each of the various parties. We've met numerous times with each of the four tribes. And it's a complicated situation and one that hopefully, over time, a cooperative resolution can be met. (Applause.)

13. Eat what you want and love what you're doing

WARREN BUFFETT: Area 11, please.

AUDIENCE MEMBER: Good morning. I'm (inaudible) from Walnut Creek, California. Well, we learned something from the comic movie, but could you please expand on how do you maintain your good mental and physical health? (Laughter)

WARREN BUFFETT: Well, you start with a balanced diet. (Laughter)

Some Wrigley's, some Mars, some See's, some Coke.

Basically it — if Charlie and I can't have a decent mental attitude, who can? I mean, we get to do what we love doing every day. We do it with people that are not only cheerful about it and like us, but they do their jobs extraordinarily — they like their jobs too.

We're forced to do virtually nothing we don't want to. I have a trainer that comes three times a week. She — I think she's probably here. And she may think I'm a little begrudging in that particular activity, but that's only 45 minutes, three times a week.

The rest of the time I am doing almost — well, I'm doing whatever I love, you know, day by day by day by day. And I do it, you know, in air-conditioned offices and, you know, with all kinds of help and it — I mean, how could you be sour about life, you know, being blessed in so many ways?

And then the amazing thing is that Charlie is 84; I'm 77. And we've slowed down, I'm sure, in a lot of ways, but we pretend we haven't, and it doesn't seem to bother us. (Laughs) We get along fine.

Great partners, great managers, you know, great families. I — there's just no reason to look at any minuses in life and to focus on that. It would be crazy.

So we really do count our blessings because they've been many and they continue to come forth, and we'll enjoy it as long as we can. There's not much more to it than that.

Charlie?

CHARLIE MUNGER: Well, I wish we were poster boys for the benefits of running marathons and maintaining a very slim bodily state and so forth.

But as nearly as I can tell, neither of us pays much attention to any health habits or dietary rules — (laughter) — and it seems to have worked pretty well so far. I don't think we can recommend it to everybody, but I, for one, don't plan to change. (Laughter and applause)

WARREN BUFFETT: Really, from the moment we get up to when we go to bed at night, we get to do all kinds of things.

We get to — associating with wonderful people is about as good as it gets. And, you know, we live — we're biased, obviously — but we think we live in the best country in the world and have all kinds of good things. I mean, just imagine — (Applause.)

WARREN BUFFETT: We could have stayed in my grandfather's grocery store, and it would have been hell. (Laughter)

CHARLIE MUNGER: By the way, this relates to the subject of corporate compensation.

You're in a job which you would pay to have, if that were the only way to get it, and you're supposed to be an exemplar from other people — for other people. There's a lot to be said for not paying yourself very well. (Applause.)

WARREN BUFFETT: He points that out to me regularly. (Laughs)

Well, if you think about it, you know, the idea that CEO compensation represents a market system and that you have to pay some guy a $10 million retention bonus or something to stay around in the job that, you know, he's been fighting to keep and stacking the board and everything so they keep him around.

I mean, it's — I don't know of a CEO in America — I'm sure there are a few — but I don't know of any that wouldn't gladly do the job at half the price or a quarter of the price.

And I've seen some that have left jobs paying them eight figures and nobody's offered them anything, you know, a year later or two years later. I wonder where that wonderful market system is that is supposed to have all these bidders for their services. It's really sort of ridiculous, I think. (Applause.)

14. Follow your passion and marry the right spouse

WARREN BUFFETT: Let's go onto 12.

AUDIENCE MEMBER: Hi. I'm Richard Rentrop from Bonn, Germany.

At the moment I attend high school and would like your wisdom on how to approach the question of what to do with the rest of my life. So — (Laughter)

WARREN BUFFETT: We prefer things a little more difficult than that if you're got a — (Laughter)

AUDIENCE MEMBER: So, Mr. Buffett and Mr. Munger, if you were about to start all over again, what profession would you choose and why?

WARREN BUFFETT: Well, I would choose what I do because, A, I have fun at it. I'm reasonably good at it. You know, I meet a lot of interesting people through it. No heavy lifting. You know, it — it's — it fits me.

It doesn't — but that — that's not advice for you. I mean, you have to find out what really — what's your passion in life?

You know, it's a terrible mistake to kind of sleepwalk through your life, because unless Shirley MacLaine is right, you know, it's the only one you're going to have.

And the — so I've — I was very lucky in that I found my passion early. I mean, I — that's not easy. You know, that takes some luck.

It just so happened my dad was in a business at a very small office and he had a bunch of books down there. And when I would go down there on Saturday or after school, I would start reading those books, and it turned me on.

And this was before Playboy actually existed. (Laughter)

And so, you know, that was just plain lucky, you know. If he'd been a minister, I'm not so sure I would have been quite so enthused about visiting the office. (Laughter)

But that's the way to go. And I can't prescribe that for you. But I can tell you that if you're going through the motions in life, you're doing something — now, obviously, if you need the job you have and you can't make a change and your kids have to eat and all of that, you deal with realities like that.

But when you're in a position to make choices, you know, I always tell the kids that come visit me, I tell them, "Go to work for an organization you admire or an individual you admire."

That means many of them become self-employed, but they — (Laughter)

The idea — you know, you can't get a bad result. I went to work for Ben Graham when I was 24. I only worked for him for less than two years, but I jumped out of bed every day in the morning.

I was excited about what I was going to do. I was learning things. I was with a man I admired. I never asked my salary when I took that job. I moved to New York City and found out what my salary was when I got the check.

So just be sure you — and be sure and get the right spouse. That's enormously important.

You know, as Charlie says, the problem, you know, is that we talk about that fellow that spent 20 years looking for the perfect woman, and then he found her, and unfortunately she was looking for the perfect man. So you may have a problem in that respect. (Laughter)

But it's enormously important who you marry. I mean, it's a huge, huge, huge decision.

And, you know, if you're lucky in a couple things like that, you're going to have a happy life.

And you're going to behave better as you go along. I mean, it's a lot easier to behave well when things are going your way and you are enjoying your work and you like the — you're thinking about things every day that are the kind of things that you like to think about.

And Charlie has a lot better advice than I have about it. Go to it.

CHARLIE MUNGER: Well, of course, you'll do better if you develop a passion for something in which you have a considerable aptitude. I think if Warren had gone into the ballet — (laughter) - nobody would have ever heard of him.

WARREN BUFFETT: Oh, I think they'd have heard of me, just in a different way, Charlie. (Laughter)

Well, the chances are, if you find something that turns you on, you probably do have some talent for it. I mean, it — I never — I don't think I could have gotten turned on by ballet. (Laughs)

15. How Buffett overcame his fear of public speaking

WARREN BUFFETT: Let's go — we're going to go now to 13, which is in an adjacent ballroom.

We have multiple overflow rooms, which is how we're handling the 31,000. The grand ballroom is the only one we've got a microphone in. So let's go to number 13. Somebody there?

AUDIENCE MEMBER: I'm Nancy Ancowitz. I'm from New York City, and I teach at New York University.

Mr. Buffett, I'd love to get your advice on something that's a little off the investing path but that taps into your business experience and wisdom.

I'm writing a book to help people of a more introverted nature get the recognition they deserve.

What advice would you give to the quieter half of the population to help them raise their visibility in their careers?

WARREN BUFFETT: Well, that's a very good question. And I sort of faced that at one time.

I was absolutely, throughout high school and college, terrified of public speaking.

And I would have — I avoided any classes, signing up for them, that would require it. I would get physically ill if I even thought about having to do it, let alone doing it.

And I took a Dale — well, I've — first of all, I signed up — I went down to a Dale Carnegie course when I was at Columbia, and signed up for it, gave him a check for a hundred dollars, went back to my room and stopped payment on the check. (Laughter)

This is a real man of courage you're looking at up here. (Laughter)

And then I came out to Omaha, and I saw a similar ad. It was at the Rome Hotel, for you old-timers in Omaha, on 16th Street.

And I went down there, and this time I took a hundred dollars in cash and gave it to Wally Keenan, who some of you may know. He died some years ago. First time I'd met him.

And I took that course, and when I finished that course, I went right out to the University of Omaha and volunteered to start teaching, knowing that I had to get up in front of people.

I think the ability to communicate, both in writing and orally, is of enormous importance, under taught.

Most graduate business schools, they wouldn't find an instructor to do it because it would sort of be beneath them to do something so supposedly simple.

But if you can communicate well, you have an enormous advantage. And to you, who are talking to the group of introverted people — and, believe me, I was in certain ways quite introverted — it — you know, it's important to get out there and do it while you're young.

If you wait until you're 50 it's probably too late. But if you do it while you're young, just force yourself into situations where you have to develop those abilities.

And I think the best way to do that is to get in with a whole bunch of other people who are having equal problems, because then you find you're not alone, and you don't feel quite as silly.

And, of course, that's what they did at the Dale Carnegie course. I mean, we would get up in front of 30 other people who could hardly give their own name, and after a while we'd find that we could actually pronounce our own name in front of a group.

But we would stand on tables and do all kinds of silly things, just to get outside of ourselves.

You may have thought — by this point you may think it went too far in my particular case, but that's another problem. (Laughs)

But you're doing something very worthwhile if you're helping introverted people get outside of themselves. And working with them in groups, where they see other people have the same problem and they don't feel quite as silly themselves, I think is — I think you're doing a lot for some human beings when you help them do that.

Charlie?

CHARLIE MUNGER: Yeah. It's a real pleasure to have an educator come who is working to do something simple and important instead of something foolish and unimportant. (Applause)

WARREN BUFFETT: I hope he's not going to name names. (Laughter)

16. Klamath River dam economics

WARREN BUFFETT: OK. Let's go back to number 1.

AUDIENCE MEMBER: Hi, Mr. Buffett. My name is Regina Chichizola, and I'm the Klamath Riverkeeper.

I came here today with many of the other people from the Klamath that came here, and I thank you for having us, and I thank the shareholders for being a lot nicer to us this year than they were last year.

So my question is, I'm sure you're familiar with the severe pollution issues in the Klamath River, such as the toxic algae problem that is 4,000 times allowable recreation levels, and that the fish are also now toxic due to the Klamath dams.

I was wondering if you were familiar with the finances behind the Klamath dams? Many economic studies have shown that removing the Klamath dams would be up to hundreds of millions of dollars cheaper than relicensing them.

So my question is, what would you do if PacifiCorp decided to keep these dams, even though it would mean that your shareholders would lose money in the long run and that PacifiCorp's ratepayers would also be losing money?

WARREN BUFFETT: Well, I think the question about the ratepayers will be addressed by the public utility commissions.

I mean, it is their job to represent the citizens of Oregon, and weigh a number of different considerations — for example, clean energy. Do you want to replace hydro energy with a — what you're talking about — with coal, which emits carbons into the atmosphere? There are enormous tradeoffs.

Anytime the government gets involved in eminent domain — we have that with wind farms, for example, in Iowa — there's some people that are unhappy with us using the land for wind farms. But, on the other hand, you get clean energy that way.

There are tradeoffs involved in government policy. You get into that with the question of eminent domain, all of that sort of thing.

But I think I'm going to let Dave talk to the more technical questions you get into.

But I would say, overall, you have people with widely different interests. Obviously, a big interest is the cost of electricity.

And to some extent, every public utility commission that makes a decision on gas versus coal versus wind versus solar is making a decision based partly on the economics to their ratepayers, partly on their feelings about what is the best for society, and those commissions are appointed state by state to make those decisions.

Now, in addition, in this case we have the FERC as it's called, the Federal Energy Regulation Commission, that will also have to rule on it.

They will listen to everybody. They'll listen to you. They'll listen to the 28 others that Dave mentioned. In the end we will do exactly what they say.

I mean, as a public utility, if they tell us to put up — not put up coal, we will not put up coal. If they tell us to put up wind, assuming that there is a place where there is wind, we will put up wind. We follow the dictates of the regulatory bodies that tell us what to do.

And in the end they give us a fair return on the assets employed, and we will get that return whatever the assets may be. If they tell us to put in coal assets, we'll get a return out of that.

So from our standpoint, from the standpoint of profitability, it's neutral.

From the standpoint of society, weighing all these different things, that's a decision society will make.

But, Dave, let's — do you want to talk to the algae question?

DAVE SOKOL: Sure. First, it's important, the Karuk tribe did do a study and found bioaccumulation of microcystins, or blue-green algae, in the perch and the fresh water mussels in the Klamath River.

What's important to understand about that — and by the way, we disseminated that report immediately to state and federal health agencies because they should know about it.

Microcystin is not unique to the Klamath River. There are 27 other lakes in the state of Oregon that have blue-green algae, 70 different countries, every province in Canada, and 27 of the U.S. states have lakes that have blue-green algae.

It is created from lakes that have a high abundance of nutrients and naturally-forming algae. And at the head of the Klamath River is a lake known as Upper Klamath Lake, which is actually a Bureau of Reclamation reservoir — it's a shallow, large reservoir, that is known as being hypereutrophic, which means a great abundance of algaes and various nutrients.

Those nutrients then flow down the river and do pass through or, in cases, get backed up by the four reservoirs down below the Bureau of Reclamation-linked dam.

The important issue is those things are, in fact, taken into account by the Federal Energy Regulatory Commission. They issued their environmental impact statement last November, which endorsed various fish passage methods on the dams but do not call for removal of the dams.

But, again, those are decisions that all the state, federal, agencies, and the various involved parties will either have to come to agreement with or let them run their course through the FERC process.

17. Long-short strategy wasn't a big money maker

WARREN BUFFETT: Thank you. Number 2.

AUDIENCE MEMBER: Hi. My name is Henry Pattener (PH). I'm hailing from Singapore, most recently.

In one of your older letters, you — your older partnership letters in 1964 — you introduced a fourth investment method called "Generals — Relatively Undervalued."

In your description you say, "We have recently begun to implement a technique which gives promise of very substantially reducing the risk from an overall change in valuation standards.

"We buy something at 12 times earnings when comparables or poor-quality companies sell at 20 times earnings, but then a major revaluation takes place so that the latter only sell at ten times."

Is this technique pair trading and, if so, how did you think about and calculate the ratio of longs to shorts?

WARREN BUFFETT: Yeah. I didn't remember we started as early as '64, but certainly in the '60s we did some of what, in a very general way, would be called pair trading now, which is a technique that's used by a number of hedge funds, and perhaps others, that go long one security and short another, and often they try to keep them in the same industry or something.

They say that British Petroleum is relatively attractive compared to Chevron or vice versa, so they long one and short the other.

And actually that technique was employed first by Ben Graham in the mid-1920s when he had a hedge fund, oftentimes — I read articles all the time that credit A.W. Jones with originating the hedge fund concept in the late '40s, but Ben Graham had one in the mid-1920s — and he actually engaged in pairs trading.

And he found out it worked modestly — very modestly — well because he was right about four times out of five but the time he was wrong tended to kill him on the other four.

We did — we shorted out the general market for about five years in the partnership, to a degree. We borrowed stocks directly from some major universities. I think we were probably quite early in that.

We went to Columbia and Harvard and Chicago and different places and actually arranged for direct borrowing. They weren't — it wasn't as easy to facilitate in those days as it is now.

And so we would take their portfolios and we would just say, "Give us any of the stocks you want, and then we'll return them to you after a while and we'll pay you a little fee."

And then we went long things that we thought were attractive. We did not go short things that we thought were unattractive; we just shorted out the market generally.

It was always kind of interesting to me, when I would visit the treasurer of Columbia or something like and I'd say, "We'd like to borrow your stocks to short," and, you know, he thought his stocks were pretty good at that point.

And he'd say, "Which ones do you want?" And I said, "Just give me any of them — (laughs) — I'm happy to short your whole damn portfolio." (Laughter)

I needed the Dale Carnegie course to get me through that kind of thing, you know.

We didn't have any specific ratios in mind. We were always limited by the number of institutions that would give us the stocks to short.

So it was not a big deal, but we probably made some extra money on it in the '60s. It's not something that would fit our — what we do these days at all.

And, generally speaking, I think if you've got some very good ideas on businesses that are undervalued, it's really unnecessary to do any shorting out of the market.

There's a — for those of you who are in the field — I mean, there's a — kind of a popular proposal — money managers always have some popular proposal that's being sold to the potential investors — and now there's something called 130-30, where you're long 130 percent long, short 30 percent.

That stuff is all basically a bunch of stuff just to try and sell you the idea of the day. It doesn't really have any great statistical merit.

But the fish bite, as Charlie says. Charlie can elaborate on that.

CHARLIE MUNGER: Yeah. We made our money by being long some wonderful businesses. We didn't make it by a long-short strategy.

18. Big opportunities often don't last long

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Dear Mr. Buffett, dear Mr. Munger. My name is Oliver Krautscheid from Frankfurt in Germany.

The subprime crisis has led to inconsistent pricing in capital markets. Credits are trading at large discounts, and at the same time, the equities do not reflect this.

My question is, when will this be over, and how do you take advantage of market dislocations?

WARREN BUFFETT: Well, when there are market dislocations, there are always ways to take advantage of it, but we'll leave for you the joy of searching for those.

But there have been some really important dislocations. And I brought along, just for your amusement, a few figures on something that we've done recently. But it doesn't have any big significance for Berkshire. I mean, Berkshire will make some extra money out of this.

It doesn't take any time to think about. But it does illustrate just how dramatic the changes were. And the ones I brought along relate to the tax-exempt money market funds.

There were 330 billion of these. That's a lot of money — 330 billion. And they relied on repricing of — really, in almost all cases — first-grade municipal bonds.

Every seven days they have these auctions, and it was all set up very elaborately so that people could have their money, more or less, in their minds, instantly available and something that was tax exempt, and they were marketed extensively.

And I brought along — for example, here's one that related to the — they were backed by various municipal issues. This one happens to be one by the LA County Museum of Art. Just pulled that out.

And on January 24, it was marketed at 3.15 percent; January 31, 4.0; February 7, 3.5; February 14, 8 percent.

Now, how can a tax-exempt bond of short-term nature be selling at a 3 1/2 percent rate one week, and one week later on Valentine's Day be at 8 percent, and one week after that be at 10 percent?

It's now back to 4.2 percent. Now, those are huge dislocations in markets. That's crazy.

It would be one thing to be some little obscure item, but this happened with billions and billions and billions of dollars of securities.

It even happened — we get these bid sheets every day, and this happens to be a bid sheet, I think, from Citigroup. And they were repricing these every seven days.

And what you would find on these — you'll see there's lots of issues involved — the same issue would appear on several different pages, because it would represent some different auction, although handled by the same broker at the same time.

On one page you would find an issue — we would bid all these — we happened to bid these at 11.3 percent.

On one page, we bought them at 11.3 percent. On another page, the same issue, we bid the 11.3 percent and somebody else bid 6 percent.

So you have the same issue with the same broker at the same time being sold at 11.3 percent and 6 percent. Those are marks of extreme dislocation, and you find those occasionally.

You found that after the Long-Term Capital Management crisis is 1998. You found the equivalent of it in the stock market in 1974, and so on.

And those are great times to make unusual amounts of money. And if you — there's certain things we can't figure out.

I see — in the Wall Street Journal — I see advertisements these days of auctions taking place in some esoteric mortgage securities. If you had enough time, you could probably figure out some of those that were very mispriced. We don't fool around with that. We just don't have the time.

We were able to do four — we have about 4 billion in this right now. When we get all through, we'll have made some extra money for a couple of months.

It won't be significant, in relation to Berkshire's size, but it's something that's very easy to do.

You may be able to find — by working very, very hard on some smaller issues — you might be able to find in this mess in mortgages — and it's gone beyond subprime. It's gone into Alt-As and it's gone into Option ARMs and that sort of thing.

There very well could be some great opportunities out there that Charlie and I will no longer spot because we just can't be looking at that many things.

Charlie?

CHARLIE MUNGER: Yeah. What is interesting is that — how brief these opportunities to take advantage of dislocations frequently are.

Some idiot hedge fund bought unlimited municipal bonds at, you know, incredible margins. I think they bought 20 times more municipal bonds than they could afford with their own money, borrowing all the rest.

And when those things were dumped on margin calls, municipal bonds suddenly got mispriced in America. But the dislocation was very brief. So you —

WARREN BUFFETT: But very extreme.

CHARLIE MUNGER: But very extreme.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: So if you can't think fast and act resolutely, it does you no good.

So you're like a man standing by a stream trying to spear a fish and the fish just comes by once a week or once a month or once every ten years. And you've got to be there to throw that spear fast before the fish swims on. It's a pretty demanding business if you do it right.

WARREN BUFFETT: But there have been times. I mean, in the junk bond market, there was a three- or four-month period in 2002 where some really incredible things happened and they happened on a large scale. So —

CHARLIE MUNGER: Yeah. It happens about twice a century.

WARREN BUFFETT: Yeah. (Laughter)

Which means he and I have only had four or five times when we could do it. (Laughter)

19. "Automatic formula for getting ahead"

WARREN BUFFETT: Let's go to number 4.

AUDIENCE MEMBER: Hello, Mr. Buffett and Mr. Munger. My name is Svinneyvaz Canadival (PH). I'm from Fort Lauderdale, Florida.

I read all your letters and annual reports multiple times, and every time I get a different insight. So thanks for doing it.

My question is about converting the successful small businesses into large enterprise. I have a good and successful small business from the last few years, and I'm unable to grow it to the next level. It seems like there are some components are missing, so I wanted to take your advice on it.

WARREN BUFFETT: Well, Berkshire was a small business at one time. I mean, it just takes time. I mean, it's the nature of compound interest. You know, you can't build it in one day or one week.

So Charlie and I — you know, we've never tried to do in some master stroke — convert Berkshire into something four times as large. People have done that sometimes in business.

But we've sort of felt that if we kept doing what we understood, and did it consistently, and had fun while we were doing it, that it would be something quite large at some point.

But there's nothing magic — it would be nice to attract a whole bunch of money into some great idea and have it — you know, multiply it manyfold in a few weeks or something of the sort. But that has really not been our approach.

We have just — we have done — in a general way, we've done the same thing. Now, we do little variations of it, but we kept doing the same thing for years and we'll keep doing it.

You know, we will have more businesses a few years from now than we have now. And we'll have all the ones we have presently. Most of them will do better. Some won't. And we will have added something.

And that's an automatic formula for getting ahead, but it's not an automatic formula for galloping ahead.

But we don't really feel — we're not unhappy because we're not galloping. We're not happy if we're not moving at all.

But, you know, we've got 76 or so, in most cases, pretty darn wonderful businesses. And, like I say, we'll have more as we go along. So it's a very simple formula.

Gypsy Rose Lee said once — she said, "I have everything I had five years ago. It's all that it's 2-inches lower," you know.

Well, what we want to have five years from now is a whole bunch of businesses we had before that are 2-inches higher, plus some more businesses. And that's the formula.

Charlie?

CHARLIE MUNGER: Yeah. You've got to remember that it's the nature of things that most small businesses will never be big businesses.

It's also in the nature of things that most small — most big businesses — eventually fall into mediocrity or worse. So it's a tough game out there.

In addition, the players of the game all have to die, and that is — those are just the rule of the game, and you have to get used to it.

We've only created from scratch one small business that became a huge business that I can think of, and that's the reinsurance department.

And there, Warren and Ajit and others have created a great and valuable business out of air. But can you think of anything other that's large that we've done in all these decades?

WARREN BUFFETT: No. No.

CHARLIE MUNGER: We've only done it once, so we're a one-trick pony.

WARREN BUFFETT: Yeah. We were lucky on that one, too. (Laughter)

Yeah, and incidentally, without Ajit we wouldn't have done it at all.

CHARLIE MUNGER: Right, right.

WARREN BUFFETT: It isn't that we did it. Ajit did it. We just sat there cheering.

CHARLIE MUNGER: Somebody asked us once what was the best investment we ever made, and I answered the fee we paid to the executive recruiter to find Ajit Jain. (Applause.)

20. Bond insurance business off to strong start

WARREN BUFFETT: In that connection, I'd like to give you a little report.

We went into the municipal bond insurance business a few months ago, and naturally, we did it through Ajit. And he got our companies up, licensed, and running.

And in the first quarter of 2008 — I don't have the figures for all the other people — but our premium volume came to over $400 million.

And I think — now, that was overwhelmingly written in the secondary market, but I think our premium volume was not only larger than any other municipal bond insurer in the United States, I wouldn't be surprised if it's as large as all of the rest of them combined.

And this was from a standing start that Ajit accomplished this. And I have here a list of, what, 300 and — this is the end of the quarter — 278, I believe it is, transactions.

Now, that's all done out of an office with 29 or 30 people who are doing a lot of other things, too. I mean, it's a remarkable, remarkable place.

One of the interesting things about this is that almost all of this business — although not all the premium volume — all of — almost all of this business was — came from people who came to us with municipal bonds asking us to insure them, and in every case, except two or three, they already had insurance from the other bond insurance, most of whom are rated triple-A.

So they were paying us a fee which was higher to write insurance which would only be paid, not only if the municipality didn't pay, but the original bond insurer didn't pay.

So we were writing business at an average rate of two and a fraction percent for the quarter, and the original insurer had charged, perhaps, an average of 1 percent. And they had to pay and they — in fact, the only way we're going to pay is if they went broke.

So it tells you something about the meaning of triple-A in the reinsurance — in the bond insurance — field in the first quarter of 2008.

Ajit has done a remarkable job in this arena. And Berkshire wrote a couple of primary policies for the Detroit Sewer District and the Detroit Water District that — each about 370 or 380 million — and people have found our insured bonds trading in the secondary market at a more attractive yield to the issuer. In other words, at lower yields than from any other bond insurer.

So this whole company has been built, just in a matter of a couple of months, by Ajit in his small office in Connecticut. It's pretty remarkable, and I congratulate him for it. (Applause.)

21. We prefer "the business which drowns in cash"

WARREN BUFFETT: Let's go to area 5, please.

AUDIENCE MEMBER: Hello. My name is Stuart Kaye, and I'm from New York City.

I wanted to know, if you could not talk with management, could not read an annual report, and did not know the stock price of a company, but were only allowed to look at the financial statements of a company, what metric would you look at to help you determine whether you should buy the company?

WARREN BUFFETT: Well, what we're doing in investment, and what everybody is doing in investment, is they're laying out money now to get more money back later on.

Now, let's leave the market aspect of the asset out. I mean, when you buy a farm, you really aren't thinking about what the market on it's going to be tomorrow or next week or next month.

You're thinking about how many — what the — how many bushels of beans per acre can you get or corn per acre and what the price is likely to be. You're looking to the asset itself.

In the case you lay out, the first question you'd have to make is do I understand enough about this business so that the financial statements will tell me the information that's useful to me in making a judgment about what the future financial statements are going to look like.

And in many cases, the answer would be no. Probably in a great majority of the cases it would be no.

But I've actually bought stocks the way you're describing many times, and they were in businesses that I thought I understood where, if I knew enough about the financial past, it would tell me enough about the financial future that I could buy.

Now, I couldn't say the stock was worth X or 105 percent of X or 95 percent of X, but if I could buy it at 40 percent of X, I would feel that I had this margin of safety that Graham would talk about, and I could make a decision.

Most times I wouldn't be able to make it. I wouldn't know — if you hand me a bunch of financial statements and you don't tell me what the business is, there's no way I could make a judgment as to what's going to happen. It could have been a hula hoop business; it could have been a pet rock business. You know, on the other hand it could have been Microsoft early on.

So unless I know the nature of the business, the financial statements aren't going to tell me much, you know. If I know the nature of the business and I see the financial statements, you know, if I see the financial statements on Wrigley, I know something about the business. Now I have to know something about the product before I can make that judgment.

But we've bought lots and lots of securities. The majority of the securities Charlie and I bought, we've never met the management and never talked to them, but we have primarily worked off financial statements, our general understanding of business, and some specific understanding of the industry in the business we're buying.

Charlie?

CHARLIE MUNGER: Yeah. I think there's one metric that catches a lot of people. We tend to prefer the business which drowns in cash. It just makes so much money that the main — one of the main — principles of owning it is you have all this cash coming in.

There are other businesses, like the construction equipment business of my old friend John Anderson. And he used to say about his business "You work hard all year, and at the end of the year there's your profit sitting in the yard."

There was never any cash. Just more used construction equipment.

We tend to hate businesses like that.

WARREN BUFFETT: Yeah. It's a lot easier to understand a business that's mailing you a check every month. But that's what an apartment house — you know, if you own — you can probably value an apartment property pretty well if you know anything about, you know, the city in which it's in.

And if you have the financial statements, you could make a reasonable guess as to what the future earnings are likely to be. But that's because it is a business that gives you cash. Now, you can — there can be surprises in that arena as well.

But I've bought a lot of things off financial statements. There are a lot of things that I wouldn't buy, you know, if I knew the — actually, there are a lot of businesses I wouldn't buy if I thought the management was the most wonderful in the world because, if they were in the wrong business, it really doesn't make much difference.

22. Pollution in Klamath River

WARREN BUFFETT: Number six?

AUDIENCE MEMBER: Good morning. My name is Mike Palmateer (PH), fisheries supervisor for Karuk Fisheries.

Mr. Buffett, you grew up and still live in the banks of the Missouri River. I, too, live on a river called the Klamath. My family has lived there since time immemorial.

In 2002, 68,000 fish died at the mouth of the Klamath River due to disease and bad water quality. These fish are also my relations.

If another company polluted your river and killed all the fish and made the river unswimable and unfishable, how would you approach this problem? Thank you.

WARREN BUFFETT: Well, I think society would — as a whole — should approach that problem by looking at the net benefits from whatever is taking place in that situation and what the costs of electricity would be and what the farmer's situation would be if he went to a different form of water distribution.

I mean, there are a lot of competing ideas and desires in a large society, and it's up to government, basically, to sort out those.

We're sorting it out — right now, we're building coal plants in the country. We're building gas plants. We're doing various things.

People are coming to different conclusions about what kind of tradeoffs they want to make, and generally these are being made at the state level, although you could have a national energy policy that would override individual states' decisions.

We're responsive to national policy on that. We're responsive to local policy. The Oregon Public Utility Commission, I'm sure, is aware of exactly what you've discussed and they have to consider that, but they have to consider a lot of other things in determining what is the best way to generate the electricity required for the citizens of Oregon.

And, Dave, would you want to add anything to that?

DAVE SOKOL: Warren, just one comment. And not in any way to be disrespectful of the fishermen, but it — we are not polluting the river.

We're not doing — adding — anything to the water that isn't coming out of Upper Klamath River, and we do recognize the different views as to whether the irrigation is a good thing or a bad thing, whether renewable power such as hydro is better than returning the river to its prior 1907 date.

But the one thing that — just to be clear — is that PacifiCorp is not adding anything. The water is flowing through penstocks, creating electricity, and coming out the rear end, and it did so under a 50-year FERC license.

Again, we understand the varying concerns, and hopefully, over the next six years a societal answer that balances all those concerns will be reached.

WARREN BUFFETT: Thank you. (Applause.)

CHARLIE MUNGER: I'd like to — I'd like to point out how refreshing it is to have people addressing a pollution problem which has nothing to do with burning carbon. (Applause.)

23. Buffett's advice to a 12-year-old

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Hey. I'm Jack Range (PH). I'm from Philadelphia. I'm in seventh grade, and I'm 12-years-old.

I just wanted to ask, what kind of things should I be reading, like, in my grade? 'Cause I know there are a lot of things that they don't teach you in school that you should know, but what things should I be looking into? (Applause.)

WARREN BUFFETT: Well, I would get in the habit, if you don't have it already — but you sound like you very well may — of reading a daily newspaper, which is not the most popular thing in the world among younger people these days.

But you want to learn as much as you can about the world around you. And Bill Gates, I think, quit at the letter P in the World Book. Doesn't seem to have hurt him too much to quit there.

But you can have a set of World Books. You can read the newspapers. You should just sop it up. And you'll find out what's the most interesting to you.

I mean, you know, there's a certain point where the sports pages were most interesting to me, then the finance pages. I happen to be a political junkie. But you just can't learn enough in life.

And I think the fact — what you'll find is the more you learn, the more you want to learn. I mean, it is fun, and — but you sound to me like a young person that's going to do a lot of that on their own.

Do you have any suggestions, Charlie? You'd probably suggest reading Ben Franklin.

CHARLIE MUNGER: My suggestion would be that the young person that just spoke has already figured out how to succeed in life. You've got it made. (Applause)

24. "We never urge people to sell good businesses"

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Greetings to all of you from the Midwest of Europe, from Bonn, Germany, on the Rhine River. I'm Norman Rentrop. I'm a shareholder in Berkshire, Wesco, and Cologne Re.

I want to thank you and Eitan Wertheimer to take the initiative and the time to come to four cities in Europe, and potentially throughout the world, to tell owners of family businesses what great alternative Berkshire Hathaway is to selling their businesses to buyout funds.

Now, my question regarding the chocolate industry. I'm challenged since I cannot buy See's Candy in my hometown, Bonn, Germany. You gave that great example of the great business, the good business, and the gruesome business.

See's Candy, you cited, having sent, like, $1.3 billion in cash profits to Omaha. There's another company called Lindt and Sprungli.

Now, while See's Candy achieves more than 20 percent profit on sales, you describe that their growth has been "OK." Lindt and Sprungli does only 14 percent on sales, but they did go almost global.

WARREN BUFFETT: Yeah. Could you get to the question, please, on this? (Laughs)

AUDIENCE MEMBER: Yeah. The question is in — whether you want to have a company with high profitability but OK growth versus a company going global but lower profits? What are your considerations?

WARREN BUFFETT: It really makes no difference to us. We evaluate all kinds of businesses.

And what we do want is we want a business with a durable competitive advantage, which both of the companies you named do.

And we want something we understand. And we want a management that we like and trust. And then we want a price that makes sense.

And we try to look at — we probably looked at every confectionary business, you know, for 20 years that was publicly owned where we got the figures. And sometimes we find something where we can take action, and most of the time we don't.

When they're private businesses, we don't determine — a really good private business — I always tell the manager, the best thing to do if you've got a wonderful private business is just keep it. It's going to be worth more next year and the year after.

So there's no reason to sell a wonderful business except for kind of extraneous factors. It may be family situations. It may be taxes. It may be that there isn't another potential heir or whatever it may be.

But there's no need — if you've got a business worth a billion dollars, you don't need the billion dollars — you've got a business that's worth a billion dollars — any more than if you've got a farm that's worth a million dollars. You've already got the million dollars. You just happen to have it in the farm. And if you like farming, you keep it.

So we never urge people to sell good businesses. We urge them to keep them.

But there comes times when they do want to sell for one reason or another — maybe once every 20 or 50 years — and we do think if they have a business that they're enormously proud of — it's a really fine business — that they can keep more of the attributes that they love in that business by selling it to Berkshire than they can, by far, selling it to anyone else.

So we are the logical buyer. As you mention, I'm going to Europe — Eitan, who's been wonderful about setting this up — and we're going to make presentations, not to try to get anybody to sell us their business now, because most people shouldn't sell us their business now.

But we do want them to think of us when the time comes when an event occurs that does cause them to think about selling. And we want to be on their radar screen.

And we're more on the radar screen in the United States than we are in Europe, and we're going to try to correct that.

But if you take a firm like you name, a Lindt, you know, there's a price at which we would buy stock in Lindt. There's a price at which we'd buy the whole business. But it's unlikely to be selling there.

You know, the — if you think about hundreds and hundreds of wonderful companies — I get all these managers that — just got a CEO yesterday who called me — and they want to tell me about their business, and they imply their businesses — or they think — their business is the most attractive investment in the world.

It isn't the most attractive investment in the world. There are thousands of possible investments. And, you know, the idea that all these managers are saying "Our stock is the most wonderful in the world" is crazy.

But it's our job to look at hundreds of things and, in terms of marketable securities, buy what we think are the most attractive ones, among the ones we understand and like as a businesses.

And then occasionally we get the chance to buy an entire business. We never do that at a bargain price. It just doesn't happen. People don't do that. The stock market gives you bargain prices; individual owners won't. But when we get a chance to do that at a fair price, we like doing it.

We love building Berkshire with a bunch of businesses with favorable long-term economic characteristics.

But the chance that any one of them — you know, we aren't going to look for a given confectionary company and say, "Regardless of price, we're going to do this," because we don't do anything when the phrase "regardless of price" enters into the sentence.

Charlie?

CHARLIE MUNGER: Yeah. I watched a man build up a business in southern California, which was a wonderful business. And the time came to sell it — and he devoted his whole life to creating it — he sold it to a known crook who was obviously going to ruin the business just because he could get a slightly higher price.

I think that's an insane way to live a life if you own a prosperous business. I think the better course is to sell to somebody you know is going to be a good steward of what you've created. (Applause.)

25. Dollar will probably weaken over time

WARREN BUFFETT: Let's go to number 9, please.

AUDIENCE MEMBER: Hi. My name is Johann Freudenberg (Ph) from Germany.

How would you, as a European investor that invests in U.S. equities, hedge the U.S. dollar risk? Thank you.

WARREN BUFFETT: How would I what?

CHARLIE MUNGER: How do you hedge the U.S. dollar?

WARREN BUFFETT: Oh. Well, whether you're thinking about starting in Germany and hedging the dollar risk of investing here or vice versa, we are happy to invest in businesses that earn their money in euros in Germany, or whether it's there, or France, or Italy, or earn their money in sterling in the UK, because we do not have a feeling — at least I don't have a feeling — that those currencies are likely to depreciate in a big way against the U.S. dollar.

That would be how we would get hurt. We could offset that by borrowing the money in those countries and borrowing in their currency to make the purchases.

But, overall, I think that the U.S. is going to continue to follow some policies that have made the dollar weaker in recent years.

So if I had to bet my life one way or another over 10 years, I would probably bet that the dollar would weaken against other major currencies, and, therefore, I feel no need — if we buy companies whose earnings primarily arise elsewhere in major countries — I feel no need to try and hedge those purchases.

I mean, if I landed from Mars today with a billion of Mars dollars or whatever they call them on Mars, and I was thinking about where to put my money, you know, I went to the local — wherever my UFO landed — and went to the bank and said, "I've got this billion of Mars currency," and they said, "Well, what would you like to exchange here?" I don't think I'd put all the billion in U.S. dollars.

So it doesn't bother me to buy businesses around the world, unhedged in terms of their currency, and have a fair amount of our earnings coming from earnings that originate in other currencies and which I will convert at current rates to dollars at some time in the future.

If you take Coca-Cola — we own 200 million shares of Coca-Cola. And if their earnings are roughly $3 a share, that means our share of the earnings of Coca-Cola are $600 million a year.

And of those earnings of 600 million, you know, maybe close to 500 million will be from around the world — all different kinds of currencies.

Basically I like that. I think that that will be a net plus to us over time, and it certainly has been a net plus to us in recent years.

So we are not in the business of hedging currencies, basically. We do not have a lot of hedges set up.

Charlie?

CHARLIE MUNGER: Nothing to add.

26. Small stocks and mispriced bonds offer opportunities

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Hey. How you doing? I'm Eric Schline (PH) from Larchmont, New York.

This is actually a follow-up question from a question that I asked last year at the meeting. I'd asked you guys, you know, what you would do with small sums of money since — you know, I run a small portfolio, under a million dollars.

And I asked you if you'd be doing things, you know, like the net-nets that Benjamin Graham used to talk about and, you know, liquidation arbitrage. You know, a lot of things you used to do at the Buffett Partnership.

And you acknowledged that you wouldn't be just a buy-and-hold investor, that you — as you are today — but we would be doing a lot of those transactions.

And, Mr. Buffett, you also talked about how a lot of the investments you would do with under a million dollars would have nothing to do with stocks and would be with other types of securities, and you really don't elaborate — neither of you really elaborated any more than that.

So I guess I was wondering if you could elaborate a little bit more on how your investment strategy, you know, back then, you know, in reference to non-stock investments, would be different than your buy- and-hold strategy today?

So what kind of stuff would you be doing? Maybe you could give me a past example that you did in the '50s and the '60s. That would be great. Thank you. Appreciate it.

WARREN BUFFETT: Well, if I work with small sums of money — and I'd be happy doing that — it would just open up thousands of possibilities to me.

And you might very well — certainly we found very mispriced bonds, where we could come nowhere near buying a position of enough size in Berkshire to make a difference, but where it would have made a difference if you were working with a million dollars.

But it would be bonds. It would be stocks of both in the United States and elsewhere. We found them in Korea a few years ago that were ridiculously cheap.

You know, you basically had to make very significant returns, but you couldn't put big money on it.

So it could be in stocks. It could be in bonds. It wouldn't be in currencies with small amounts.

But, you know, I had a friend who used to buy tax liens — you know, Tom Knapp, he's got some relatives here. An enterprising person can find a lot of different ways to make money.

You'll find most of them will be in small stocks. If you're working with small money, they'll be in small stocks or in some specialized bond situations. Wouldn't you say that, Charlie?

CHARLIE MUNGER: Sure. (Laughter)

27. Pandering politicians behave better in office

WARREN BUFFETT: Number 11, please.

AUDIENCE MEMBER: Hi. I'm Dr. Silber from the Infertility Center of St. Louis. And we feel that by making many, many babies, we're doing the best we can to help salvage the solvency of Social Security. (Laughs)

WARREN BUFFETT: We won't pursue the logic of that too far. (Laughter)

AUDIENCE MEMBER: We need someone to pay into the system, and with the demographic implosion that we're facing and the current anti-immigration feeling, that this is the real cause of the Social Security dilemma that we're facing. And it's true in most of the developed world.

But my question is, everybody is looking very closely at what you and Charlie are going to say at this meeting because there's just a huge amount of confusion since the credit crisis, and I guess you've been through many, many years and decades of confusion.

But everybody really wants to know what you think, because we have three candidates, one of whom I like, which I won't mention, but all three of whom seem to be pandering to voters and not really demonstrating a profound understanding of economics.

And we're going to decrease interest rates to help the credit crisis, and we're going to inject $180 billion as free gifts into the economy, and yet our dollar is down 50 percent, and we certainly don't want a recession and all the misery that would bring.

But aren't we going to eventually have a gigantic inflation here in the U.S.?

And so — in China, which is our major partner in this, the stock market has gone down and people are losing money because they're worried about the U.S.

So I'm wondering if you could just shed some words of wisdom on, if you were the presidential candidate — which I would like to see happen — what would be your position or your policy?

WARREN BUFFETT: Well, I think it was Bill Buckley that ran for mayor of New York, you know, 40 years ago or something like that, and they asked him what the first thing he would do if he were elected. He said, "I'd ask for a recount." (Laughter)

It's not an easy game. I think we have — just personally— I think we have three pretty good candidates this time — quite good candidates.

But I think that your comments about the pandering and all that, I'm afraid that's just part of — if you have a very long political process, and you have people only generally willing to listen to ideas in fairly short form, and you're trying to make the other candidates look bad one way or another — I think that the truth is you do get a lot of pandering in the policies that are proposed.

I think you have candidates that are pretty smart about economics. I happen to think two of the three are maybe a little smarter about economics than the third, but the third may be just as smart, too. They may just be forced into a different position.

You know, a political process is something that doesn't lend itself to Douglas-Lincoln debates on the fine points of policy, and it's a tough game.

And I don't — the one thing I think is I think they will behave better in office than on the stump. I think that's true of all three of them, and I think — but I think that's just built into the system.

We — you know, we have a country that works awfully well. You know, whether Warren Harding is in office or Franklin Pierce, or whatever it may be over the years.

And it gets back to that saying I've said many times that you want to buy stock in a business that's so good that an idiot can run it because sooner or later one will. (Laughter)

And we live in a country, frankly, that is so good that your children and grandchildren will live a lot better than you live, even though an idiot or two runs it from time to time in between.

But we've got a lot better than idiots running. Believe me. I think we've got three very good candidates, and I wish — whichever one of them wins, I wish them well.

You know, it's the toughest job in the world, the most important job in the world, and I think the motivations of the people running it are a lot better sometimes than their proclamations as they go along in the political process.

I think it's very hard to run in Iowa without being for ethanol. You know, it may be — you may win some badge for courage or something in the end, but you won't win the presidency.

Charlie?

CHARLIE MUNGER: Well, I'd like to address the recent turmoil and its relation to politics.

After Enron totally shocked the nation with the gross amount of folly and misbehavior, our politicians passed Sarbanes-Oxley, and it has now turned out that they were shooting at an elephant with a pea shooter.

And low and behold, we have a convulsion that makes Enron look like a tea party.

And I confidently predict that we will have changes in regulation and that they won't work perfectly. (Laughter)

Human nature always has these incentives to rationalize and misbehave, and the learned professions very often fail in their basic responsibility to be learned. And we're going to have this turmoil as far ahead as you can see.

WARREN BUFFETT: But look at it this way: I have a job here I love. You know, I'd gladly pay to have this job.

Now, I have enough stock so that I'm reasonably assured of keeping the job, but let's just assume for the moment that there are three other candidates out there, and none of us had any stock, and we were all up here making a pitch to you.

My answers might have been a little different today, you know, in terms of what Berkshire's prospects would be under me and all that sort of thing going forward. It's a corrupting process.

Now, you know, it works pretty well, but the process itself has to be corrupting.

Just take the boom in commodity prices we've had. We've had a boom in the price of oil, but we've had a boom in the price of corn and soybeans.

Now, I've heard no political candidate say you've had this huge increase in the price of corn and soybeans. That means all these poor people throughout the country, they'll be paying more for food, so we ought to put an excess profits tax on farmers. That is not something you're going to hear.

On the other hand, when it happens in oil and it happens to be Exxon, you know, people will propose occasionally we ought to put a terrible tax on Exxon because the price of oil has gone up.

There's a lot of situational ethics, or situational policymaking, that depends on how many voters there are in any given category and what state you happen to be in and all that. But I don't think I'd behave any better.

If my ambition were to be President of the United States, you know, I would — I'm sure it would affect my — what I talked about and my behavior. You know, we're all human beings.

So I don't condemn the people for the fact that when they, you know, are working 18 hours a day and the other guy is shooting at them and they start exaggerating things a little, I just don't think you should expect more of human beings than — and I think that they will tend — I think any one of the three candidates — will tend to behave quite well in the White House.

They'll succumb to all the things that presidents do in terms of having to — certain groups that helped them get there and all that sort of thing. But I think, on balance, they will end up doing what they think is best for the country, and I think they're all smart people.

28. "There will be no gap after my death"

WARREN BUFFETT: Number 12?

AUDIENCE MEMBER: My name is John Ebert (PH). I'm from Bremerton, Washington. I'm very pleased to see that both you and Charlie look so healthy, and I'm also glad to know that your goal is to work to at least 102 before you retire.

I think your secret must be the Cherry Coke and the See's Candy by evidence of what you're doing on the screen there.

My question, obviously, deals with succession. At last year's meeting, you spoke about your plan for your chief financial officer. Could you please update us on where you stand on succession?

WARREN BUFFETT: Yeah. And we've said, on the CEO front, we have three that any one of which could step in and do a better job than I do in many respects.

And the board is unanimous, I believe, in terms of knowing which one it would be if it were tomorrow morning, but that might be different two or three years from now.

I think in any event, when the time comes, they'll want to pick somebody reasonably young, because I think, on balance, it's good idea to have a long run at this job, and I think it aids in acquisition and being able to make promises to people about how their businesses will be treated and so on.

In terms of the investment officer, the board has four names. We've discussed the four. Any one or all of the four would be good at doing my job, probably better in some ways, and — but they all have good jobs now. They're happy where they are now.

They would — I think any one of the four would be here tomorrow if I died tonight and they were offered the job by the board. They're all reasonably young. They're all very well to do or rich, and compensation would not be a major factor with them.

I think any of the four would take the job at less money than they're making now, but there's no reason for them to come now.

I would still end up making the decisions, and they would probably chafe at the idea of not being able to make the decisions.

I actually worked for Ben Graham for a few years. And I loved the man enormously. I learned an amount from him. I named my older son, middle name, is after him.

But in the end, I wanted to make decisions, and I — if Ben Graham made them differently — you know, I actually prefer to make my own decisions. And anybody that manages money well is going to feel that way.

So it's just better in this case. It can happen tomorrow. It could happen five years from now. But whenever I'm not around to make the decisions, the board will decide whether to have one, two, three, or four of these people.

They'll decide — you know, they may decide to have four and divide it up four ways. They may decide to have only one. They will probably be heavily influenced by how the incoming CEO feels about exactly how he wants to work with a group or with one.

And they'll come. So there will not — there will be no — there will be no gap after my death in terms of having somebody managing the money, and they'll probably be a lot more energetic than I am now.

And they'll — they could very easily have a much better record. Some of them have a much better recent record than I do.

Charlie?

CHARLIE MUNGER: Well, you know, we still have a rising young man here named Warren Buffett. And having — (Applause)

WARREN BUFFETT: That's the advantage of working with a guy 84. You always look young. (Laughter)

CHARLIE MUNGER: And I think we want to encourage this rising young man to reach his full potential. (Laughter and applause)

WARREN BUFFETT: One thing I should point out, with our average age being 80, people talk about aging managements. We haven't found a management that isn't aging. If we ever find them, we want to start eating what they eat.

And what I can point out about your management, since our average age is 80, we're only aging at the age of 1 1/4 percent a year, and that is the lowest rate of aging that I know of in corporate America.

I mean, some of these companies have 50-year-olds, and they're aging at 2 percent a year, and just think how much riskier that is. (Laughter)

29. "Diversification is for the know-nothing investor"

WARREN BUFFETT: Let's go to 13.

AUDIENCE MEMBER: I'm Isaac Dimitrovski (PH) from New York City. Mr. Buffett, it's great to be here.

I've read that there were several times in your investing career when you were confident enough in one idea to put a lot of your money into it — say, 25 percent or more.

I believe a couple of those cases were American Express and the Washington Post in the '70s. And I've heard you discuss your thinking on those.

But could you talk about any of the other times you've been confident enough to make such a big investment and what your thinking was in those cases?

WARREN BUFFETT: Charlie and I have been confident enough — if we were only running our own net worth — I'm certain a very significant number of times, if you go over 50 years, there have been a lot of times when you would have put at least 75 percent of your net worth into an idea. Wouldn't there, Charlie?

CHARLIE MUNGER: Well, but 75 percent of your worth outside Berkshire has never been a very significant amount.

WARREN BUFFETT: No. Well, I'm going back — let's just assume it was. (Laughter)

Let's just assume you didn't have Berkshire in the picture. There have been times — I mean, we've seen all kinds of ideas we would have put 75 percent of our net worth in.

CHARLIE MUNGER: Warren, there have been times in my life when I've had more than a hundred percent of my net worth invested in things.

WARREN BUFFETT: That's because you had a friendly banker; I didn't. (Laughter)

That — there have been times — well, initially, I had 70 — several times I had 75 percent of my net worth in one situation.

There are situations you will see over a long period of time. I mean, you will see things that it would be a mistake — if you're working with smaller sums — it would be a mistake not to have half your net worth in.

I mean, there — you really do, sometimes in securities, see things that are lead-pipe cinches. And you're not going to see them often and they're not going to be talking about them on television or anything of the sort, but there will be some extraordinary things happen in a lifetime where you can put 75 percent of your net worth or something like that in a given situation.

The problem has been the guys that have put 500 percent of their net worth in. You know, I mean, if you look at — just take LTCM. Very smart guys. Very decent guys. Some friends of mine. High grade. Knew their business.

But they put, you know, maybe 25 times their net worth into things that were a cinch, if they hadn't have gone in that heavily. I mean, they were in things that had to converge, but they didn't get to play out the hand.

But if they'd have had a hundred percent of their net worth in them, it would have worked out fine. If they would have had 200 percent of their net worth in it, it would have worked out fine. But they instead went to, you know, maybe 2500 percent or something like that.

So there are stocks — I mean, actually, there's quite a few people in this room that have close to a hundred percent of their net worth in Berkshire, and some of them have had it for 40 or more years.

Berkshire was not in a cinch category. It was in the strong probability category, I think.

But I saw things in 2002 in the junk bond field. I saw things in the equity markets.

If you could have bought Cap Cities with Tom Murphy running it in the early — in 1974, it was selling at a third or a fourth what the properties were worth and you had the best manager in the world running the place and you had a business that was pretty damn good even if the manager wasn't.

You could have put a hundred percent of your net worth in there and not worry. You could put a hundred percent of your net worth in Coca-Cola, earlier than when we bought it, but certainly around the time we bought it, and that would not have been a dangerous position.

It would be far more dangerous to do a whole bunch of other things that brokers were recommending to people.

Charlie, do you want to —?

CHARLIE MUNGER: Yeah. If you — students of America go to these elite business schools and law schools and they learn corporate finance the way it's now taught and investment management the way it's now taught.

And some of these people write articles in the newspaper and other places and they say, "Well, the whole secret of investment is diversification." That's the mantra.

They've got it exactly back-ass-ward. The whole secret of investment is to find places where it's safe and wise to non-diversify. It's just that simple.

Diversification is for the know-nothing investor; it's not for the professional.

WARREN BUFFETT: And there's nothing wrong with the know-nothing investor practicing it. It's exactly what they should practice. It's exactly what a good professional investor should not practice. But that's — you know, there's no contradiction in that.

It — a know-nothing investor will get decent results as long as they know they're a know-nothing investor, diversify as to time they purchase their equities, and as to the equities they purchase. That's crazy for somebody that really knows what they're doing.

And you will find opportunities that, if you put 20 percent of your net worth in it, you'll have wasted the opportunity of a lifetime, you know, in terms of not really loading up.

And we've had the chance to do that, way, way in our past, when we were working with small sums of money. We'll never get a chance to do that working with the kinds of money that Berkshire does.

We try to load up on things. And there will be markets when we get a chance to from time to time, but very seldom do we get to buy as much of any good idea as we would like to.

30. Parents Television Council and appropriate ads

WARREN BUFFETT: Go to number 1.

AUDIENCE MEMBER: Good morning, Mr. Chairman and Charlie. I'm Father Val Peter.

For 25 years I was lucky to be head of Boys Town. Expanded across the whole country. Warren was very kind to me, very helpful, over long periods of time.

What I represent today is Parents Television Council, where 1.2 million folks across the country, and our concern is to help keep toxicity off television programs — excessive violence, et cetera.

And I was very surprised, being on a parents television council board, when I read a report — I hope it's not true, but it might be — that says that of the best and most troublesome advertisers, Berkshire Hathaway, is near the bottom at 444 out of 452. I hope that's not true.

But my point is this: when I was head of Boys Town and somebody said something like that, I'd say, "Go find out. Correct it." My question is would you be kind enough to say, "Go find out," if it's necessary, "Correct it." Thank you.

WARREN BUFFETT: Yeah. I would say this: I don't know where the rankings come from. I mean, I see the — certainly by far our biggest advertiser would be GEICO.

We spend over $700 million a year on advertising. I see their ads all over the place, and, you know, I don't regard them as offensive or inducing antisocial behavior or anything like that.

But I would be glad for you to contact Tony Nicely because I can't think of any other company at Berkshire that does, remotely, the amount of advertising. And Tony is an easy fellow — he's here now, actually, but you could write him at GEICO or you could find him at the GEICO booth, probably, later in the day and just talk to him about that. I'd be glad to have you do that, Father Peter.

31. Diversification, IRAs, and brokerage accounts

WARREN BUFFETT: Number 2.

AUDIENCE MEMBER: Good morning Mr. Buffett, Mr. Munger. My name is Deb Caviello, (PH) and I'm from Windsor, New Jersey.

I'm 45-years-old and have achieved financial independence in that I'm able to manage the money of my spouse and myself full time. And that goes to marrying well, part of that. I was —

WARREN BUFFETT: That can be a big part of it. (Laughter)

AUDIENCE MEMBER: Marrying well in the sense that I received the encouragement and the confidence to pursue that.

WARREN BUFFETT: That's terrific.

AUDIENCE MEMBER: I was going to ask you a question more along the lines of diversification, but I think I will put it this way. I'll skew it a little differently.

Each of us has a traditional IRA, a Roth IRA, and together we have a brokerage account. Should the assets in those accounts be separated or better managed as a whole pile?

In other words, have overlapping securities in each account or different types of securities relegated to a specific account?

WARREN BUFFETT: Yeah. Well, I would say your marriage sounds like it's going to last, so I think you should think of yourself and your husband as a unit.

And I would — you should — in my view, you should look at your overall financial condition and not worry about where the location of the assets will be.

So if you have a net worth of X and you have 20 percent of it in a 401(k) and 30 percent outright and so on like that, just look at the whole picture and decide what mix of assets, what type of assets you want, and don't treat them as being in separate pots.

I mean, at Berkshire, you know, we own stocks in a whole bunch of different — our insurance companies own stocks in separate portfolios and we even have a portfolio in Cologne as mentioned earlier.

I don't even think about what entity anything is in. You know, it's all working for Berkshire, and I think you should — the way to think about your situation is to think about it all working for your family.

Now, if you're — you strike me as having a very solid marriage, and I think your husband would be crazy if he split with you. But the — if you're just starting out, you may want to keep your money separate for a while until you see how it plays out, because a significant percentage do end up in divorce.

Listen, I don't get into marriage counseling very often. (Laughter)

But I can feel the ground sort of disappearing between my feet here. But I will turn it over, therefore, to our marital expert, Charlie Munger. (Laughter)

CHARLIE MUNGER: Yeah. Occasionally, you'll find an investment that is going to produce a huge amount of taxable income. It's a junk bond paying a high yield that's taxable or something.

So some items are more suitable for those retirement accounts that get tax-deferral benefits. But apart from that, it's all one pot. Sure.

32. Eventually power will have to come from the sun

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Hi, Warren. I'm Doug Hicks (PH) from Akron, Ohio. And you hear on the news lately a lot of people say that oil will run out during this century.

Considering the U.S. policy is to do nothing until the very last second, how do you think the end of oil will play out?

For example, do you think that this would, unfortunately, result in World War III? Or do you think alternative energy will be available, the day that oil runs out, to take its place?

And maybe, do you think these oil companies' value will go to zero when oil runs out?

WARREN BUFFETT: Yeah. Oil won't run out. It doesn't work that way.

What oil will do at some point — who knows when — people predict a lot of different things — oil at some point, daily productive capacity throughout the world will first level off and then start declining very gradually.

The nature of oil extraction is such that wells don't — with rare exceptions — they don't go to a given point producing a hundred barrels a day and then all of a sudden quit or anything like that. So you run into this depletion aspect and get into decline curves and that sort of thing.

So we won't — we're producing in the world, 86 or 87 million barrels a day of oil, which is more than we've ever produced before.

We are closer — by at least my calculations — we are very much closer to producing almost as much as our productive ability is in the world, with fields in their current stage of development, than we've ever been.

I mean, our surplus capacity, I think, is less than, well, any time I can remember. And it's quite a bit less than most periods.

So we don't have the ability to crank up, in any short period of time, the 86 or 7 to a hundred million barrels a day.

But whatever that peak will be, and whether we hit it five years from now or 50 years from now, and then it will just gradually taper down, and the world will adjust to it, and hopefully we'll be thinking about it, you know, well before it happens, and various adjustments will be made in the world that will cause the demand to somewhat taper down as the available supply.

But we will be producing oil far beyond this century. It's just — the question is whether we're producing 50 million barrels a day, or 75 million, or 25 million barrels a day. I don't know the answer to that.

There's a lot of oil in place in the world. We've messed up the recovery of a lot of the oil. I mean, we never recovered the, you know, the total potential of fields. And some fields we've mis-engineered in ways so that we will recover a very small percentage. Now, maybe there will be better engineering, tertiary recovery, and that sort of thing in the future.

It's nothing like an on and off switch, though, in terms of the world producing oil or adjusting to reduced capacity or anything like that.

You may still have enormous political considerations to — access to the available oil — because it's going to be so darn important to our society for so long.

There's nothing we can do, in any short period of time, that will wean the world off of oil. You know, that is a fact of life.

Charlie?

CHARLIE MUNGER: Well, if we get another 200 years of economic growth pretty well disbursed over the world, while the population of the world also goes up, all of the oil, coal, natural gas, and uranium reserves of the world are like nothing.

So eventually, of course, you have to use the sun. There is no other alternative. And I think we can confidently predict that there will be some pain in this process of adjusting to a different world.

Personally, I think it's extremely stupid to use up the hydrocarbon reserves of the world as fast as we are.

I don't think we've got any good substitutes for those things as chemical feed stocks, and I think it's perfectly crazy to use up something so precious for which you have no alternative that's sure to be available.

And if you look at it backwards, what should we have done? Hell, we should have bought all the oil in the '30s in the Middle East and take it over here by tankers and put it in our own ground.

I mean, it's obvious to see what should have been done in the past.

Even though that's obvious, are we doing the equivalent of that now? And the answer is, basically, no.

So I think the governmental policy tends to be way behind in terms of rationality. And I think we'll just have to soldier through. But eventually the — if we're going to have a prosperous civilization — we have no other alternative than the sun.

WARREN BUFFETT: What's your over-under figure for 25 years from now, world production oil per day?

CHARLIE MUNGER: Down.

WARREN BUFFETT: Yeah. (Laughter)

That's not an insignificant prediction. I mean, it — believe me. If oil production is down 25 years from now, it will be a different world.

I mean, you — China's going to sell over 10 million cars this year. I mean, the demand is going to keep — even at these prices — it's hard for me to imagine demand falling off a lot. So if production falls off, you'll have some interesting consequences.

33. Higher taxes for the superrich under Pres. Buffett

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, my name is Guy Pope, and I'm from Portland, Oregon.

I enjoyed the cartoon this morning, and I'd like to expand on that.

I, too, like the idea of both of you serving as a single term as the President of the United States. During — hypothetically, let's say, Mr. Buffett, you served the first term; Mr. Munger, you served a second term.

WARREN BUFFETT: I think the other way around is better, but go ahead. (Laughter)

AUDIENCE MEMBER: Each of you please name three difficult policy decisions you would implement during your term to better the country.

WARREN BUFFETT: Well, Charlie is going to serve the first term, so I'm going to let him name his three.

CHARLIE MUNGER: I think that one takes us so far afield that I think it's asking too much. Three perfect solutions to the major problem of mankind from each of us in a few minutes?

We've just barely managed to stagger through life as well as we have, and I don't think we're quite up to it. (Laughter)

WARREN BUFFETT: We'd probably have a massive federal program for retirement homes, actually. (Laughter)

I would probably do something about the tax system that would change things so that the superrich paid a little more and the middle class paid a little less, but — (Applause.)

WARREN BUFFETT: That might be why you'd prefer to have Charlie serve first.

34. Munger: Ethanol is "monstrously dumb"

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Hi. I'm Ryan Johnson (PH) from Arizona, and I wanted to ask what you think about the food shortages in the world and what trends you see in the next decade or two?

WARREN BUFFETT: Well, again, I'm no expert on that. Charlie?

CHARLIE MUNGER: Well, I said last year that I thought that the policy of turning American corn into motor fuel was one of the dumbest ideas, in terms of the future of the world — (applause) — that I'd ever seen.

I came out here with the head of an academic institution, and he called the idea stunningly stupid.

Now, I'm here in Nebraska where I like Nebraskans to prosper. But this idea was so monstrously dumb that I think it's probably on its way out.

35. Amateurs should stick with low-cost index funds

WARREN BUFFETT: We've now — oh, no. We've got time for a couple more. Let's go to number 6.

AUDIENCE MEMBER: Hi. My name is Timothy Ferriss. I am a guest lecturer at Princeton University twice a year. And I'd like to touch on an earlier question about investing with small sums of money.

I'd like to ask both of you, if you were 30-years-old again and had your first million in the bank, how would you invest it, assuming you're not a full-time investor, you have another full-time job, you can cover your expenses with other savings for about 18 months, no dependents, and it would be really helpful for my students, for myself and others here, if you could be as specific as possible about asset classes, percentages, whatever you're willing to offer. (Crowd noises)

WARREN BUFFETT: Well, I'll be very simple: I — under the conditions you name, I'd probably have it all in a very low-cost index fund, and it would probably be — you know might be Vanguard — somebody I knew was reliable, somebody where the cost was low.

And because you postulated that you're not going to become a professional investor, I would recognize the fact that I'm an amateur investor, and I would feel that a — unless bought during a strong bull market, which this hasn't been — I would feel that that was going to outperform, to a degree, bonds, under current conditions over a long period of time, and then I'd forget it and go back to work.

Charlie?

CHARLIE MUNGER: Yeah. It's in the nature of things that you aren't going to have a whole lot of screamingly successful professional investors.

You've got a great horde of professionals taking croupiers profits out of the system, most of them by pretending to be professional investors, and that is in the nature of things, too.

But if you don't have any rational prospects of being a very skilled professional investor, of course you should compromise on some simple thing like an index fund.

WARREN BUFFETT: Yeah. And that — you will not get that advice from anybody because nobody gets paid to give you that advice.

So you will have all kinds of people telling you how much better they can do for you than that, and how if you just give them a wrap fee, or give them commissions, or whatever it may be, that they will do better, but they won't do better.

On average, you know, if a thousand other people like you do the same thing, that group of a thousand will do worse if they listen to the people that make pitches at them.

And in the end, why should you expect — I mean, you've got a very perfectly decent return over a 30- or 40-year period by doing what I suggest.

And why should you expect more than that when you don't bring anything to the party? The salesman will tell you that you'll get it, but you won't.

CHARLIE MUNGER: I would give you another word of warning: do not judge stockbrokers generally by the ones you meet at this meeting. We attract some of the most honorable, intelligent stockbrokers in the world. They are not representative of the class.

WARREN BUFFETT: (Laughs) The politician in him just came out

36. No "extreme frugality" but don't spend more than you make

WARREN BUFFETT: OK. We'll do one more, and then we'll break for lunch. Number 7.

AUDIENCE MEMBER: Good morning. My name is Tim Fam (PH). I'm from Austin, Texas.

For my children, I would like to hear from both of you as far as the temptation to keeping up with the Joneses.

And can you give them advice that they can live by with respect to frugality, debt, and work ethic?

WARREN BUFFETT: Yeah. Just tell them to keep up with the Buffetts. (Laughter)

Well, Charlie and I have always been big fans of living within your income, and if you do that, you'll have a whole lot more income later on.

And, you know, it — I think they will, to a considerable extent, not a perfect extent, they will follow the example of their parents.

I mean, if their parents are coveting, you know, every possession of their neighbor, you know, or trying to figure out ways to increase their cost of living without necessarily their standard of living, the kids are likely to pick up on it.

But now you can get the reverse effect. If you get too tough with them, they go crazy later on. (Laughs)

But the — it's — people make that election.

Incidentally, there are people — there are plenty of people that I don't advise to save.

I mean, the real — if you're struggling along and making a reasonable income and you have a job with a 401(k) being put aside for you, and you have Social Security, who's to say whether it's better to defer a dollar of expenditure on your family on a trip to Disneyland or something that they'll get enormous enjoyment out of so that when you're 75 you can have a, you know, 30-foot boat instead of a 20-foot boat?

I mean, there are choices and there are advantages to spending money in various forms for your family when it's young, and giving them various forms of enjoyment or education or whatever it may be.

So I don't — I don't advocate — I may practice — but I don't advocate extreme frugality.

The — and I don't say that it's always better to be saving 10 percent of your income instead of 5 percent of your income.

I think it's crazy to be spending 105 percent of your income, and I think that leads to all kinds of problems, and I get letters from people every day that have experienced those problems.

But, you know, in the end you want to have an internal score card. I mean, you are not a better person or a worse person because you live a different kind of life than your neighbor. Live a life that, you know, is true to yourself.

Charlie?

CHARLIE MUNGER: Yeah. It’s obviously the best method to train your children to provide the proper example.

(A person in the audience is shouting)

WARREN BUFFETT: I think we’re hearing a child that didn’t get that advice. (Laughter)

CHARLIE MUNGER: But of course, even if you do provide the proper example, it’s likely not to work —

WARREN BUFFETT: It’s noon.

CHARLIE MUNGER: — some of the time anyway.

WARREN BUFFETT: It’s noon now. We’ll take about a 30 to 40-minute break. We’ll come back. Some of those who are in the other room — we always have some openings here after lunch so you might be able to move into the main room.

We’ll reconvene, we’ll say, at 12:45. We’ll go to 3 o’clock.

Afternoon Session - 2008 Meeting

1. No more Klamath Dam questions

WARREN BUFFETT: OK. We're going to go back to work here. We broke off at area seven last time.

I have asked — just so everybody's aware of it — we've had three questions relating to the Klamath situation, and I think that's more than proportional to the interest of the crowd. (Applause)

So we'll skip any more like that. I think the position is known.

2. "Too big to fail" banks can't have "too much risk to manage"

WARREN BUFFETT: And we'll go onto number 8.

AUDIENCE MEMBER: My name is Ola Larson (PH). I live in Salt Lake City. And I think — on Lou Rukeyser, Wall Street Week, 1981 or something. So you must really have impressed me, Warren.

What I'd like to ask you is that looking at the future, have the business practices of the investment banks become so complex that it is not possible for the head of the investment bank to be aware of the exposures to financial risks day-to-day or week-to-week?

WARREN BUFFETT: Yeah. That's an exceptionally good question, and I think the answer, probably, is yes, at least in some places, although there's a few investment bank heads I've got enormous respect for their ability to sort of get their minds around risk.

But I decided, for example, when we bought Gen Re, it had about 23,000 derivative contracts, and I think I could have spent full time on that and not really been able to get my mind around how much risk we could — we were running — under some fairly extreme conditions that I did not think were impossible, but that the people who were running the operation might have thought were impossible, or that might not have cared about it that much because their own incentive compensation was such that if they made a lot of money one year on something, it would work 99 years out of a hundred, they would feel the chances of something going wrong big were very slim.

But I don't want to have it slim. I want to have it none. So I regard myself as the Chief Risk Officer at Berkshire.

If something goes wrong at Berkshire because of — in terms of risk — of the way we run the place, there's no way I can assign that to a risk committee or have some mathematicians come in and make a bunch of calculations and tell me I'm only running a risk that will happen once in the history of the universe or something of the sort.

I think the big investment banks, a number of them — and big commercial banks — I think they're almost too big to manage effectively from a risk standpoint in the way they've elected to conduct their business.

And it's going to work most of the time. So you don't see the risk in a way that — I mean, you don't — if you have a 1 in 50-year risk that a place will go broke, it may not be in the interest of a 62-year-old executive that's going to retire at 65 to worry too much about that.

I worry about everything at Berkshire. So I would say they're too — they're very hard to manage, very hard to have your mind around. I mean, clearly, you've seen cases in the last year where very big institutions, if the CEO knew what was going on, he certainly hasn't admitted it subsequent to what's happened.

It's embarrassing either way, but it's less embarrassing to say I didn't know what was going on than to acknowledge that you knew these kind of activities were going on and you let them go on.

It's — I've been asked for advice on regulation sometimes, and we've seen an extraordinary example, which somehow the press really hasn't picked up on much.

But you had an organization called OFHEO whose sole job was to supervise two big companies, and these big companies were Fannie Mae and Freddie Mac.

And they had a large element of public purpose in them, and they were chartered by the federal government, and they had — their activities had overtones for the whole mortgage and securities markets.

So Congress said, "If we're going to give you all this 'too big to fail'-type protection, in terms of the federal government stepping in and giving you special privileges, we want to keep an eye on you."

So they formed OFHEO and they had 200 people going to work, I presume at 9 o'clock every morning, and going home at 5, and their sole job was to see what these two places were doing. And they turned out to be two of the biggest accounting misrepresentations in the history of the world.

So they were two for two with the only things they had to examine. And I fear that if you tried to do the same thing with the biggest commercial banks or the biggest investment banks, I'm not sure you can keep track of it.

What you need is somebody at the top whose DNA is very, very much programmed against risk. And he is going to have to resist the entreaties of those who work beneath him who say everybody else is doing it, and if they can do it over there and make all this money doing it, why can't we be doing it here?

And that’s not easy to do. When you’ve got a bunch of high-powered people who are used to making in seven figures every year, and they want to do things and they say, “If you don’t do them here, we’re going to go elsewhere,” it’s a very tough system to be.

So I would say that, in many ways, there are firms that, in terms of risk, are simply — they are conducting themselves in a way that they’re too big to manage.

And if at the same time the government says they’re too big to fail, that has some very interesting policy implications.

Charlie?

CHARLIE MUNGER: Well, I would argue that you say that very well. It does have interesting policy implications.

It’s crazy to have people get so big and so important that you can’t allow them to fail, and allow them to be run with as much knavery and stupidity as permeated the major investment banks.

It’s not that Berkshire hasn’t had wonderful service from investment banking all these years, because we have. It’s just that, as an industry, this crazy culture of greed and overreaching and overconfidence in trading algorithms and so on creeps in.

I would argue it’s quite counterproductive for the country, and it ought to be reigned way back.

These institutions are too big to fail, and it was demented to allow derivative trading to end up the way it’s ended up and with the current risks that are embedded in the present system.

And it’s amazing how few people spoke against it as it was happening. There was just so much easy money to be reported.

A lot of the money that was reported as being earned wasn’t really being earned. It was in that wonderful category of assets that I call “good until reached for.”

They sit there on the balance sheet, and when you reach for it, it just fades away like — (laughter)

WARREN BUFFETT: He’s not kidding.

CHARLIE MUNGER: — mist.

WARREN BUFFETT: He’s not kidding.

CHARLIE MUNGER: We had 400 million of that “good until reached for” assets we got with General Re.

WARREN BUFFETT: And they were behaving honorably.

CHARLIE MUNGER: Yes. But at any rate, people pushed it way too far.

In the drug business, they say, "Prove that this works" before they certify the drug.

On Wall Street, they start believing in the tooth fairy, and if one guy is reporting a lot of money, why, everybody else is asking, "Why aren't we betting on the tooth fairy?"

It's a crazy culture, and to some extent it's an evil culture, and it needs a huge reigning in.

And the accounting profession utterly failed us. The worst behaving were the people who set the accounting practice standards. And they're very bureaucratic and take forever, and they don't want to do anything real difficult that displeases people.

This is not a combination of wonderful qualities when your job is to set accounting standards, which ought to be dealt with sort of like engineering standards. And they don't even have the right approach. So there's a lot wrong.

WARREN BUFFETT: When Charlie and I first got to Salomon, we noticed that they were trading with Marc Rich, who had fled the country. And we suggest — well, we told them — we wanted to quit trading with Marc.

And they said, well, they were making money doing it one way or another, and they said, what the hell did we know about crude oil trading, and they wanted to keep trading with him.

And only by just total directive could we stop our own employees from trading with Marc Rich.

Now, if you can't stop your people trading with Marc Rich, you know, when you're focusing on it, just imagine what goes on, you know, in those trading rooms elsewhere.

It's — if Bear Stearns — I think the Fed did the right thing by stepping in on Bear Stearns.

If Bear Stearns had failed on Sunday night — and it would have — they would have walked over to a federal judge and handed him a bankruptcy petition, I guess, a little after 6 o'clock Midwest time, because that's when Tokyo opened.

If they had failed, the next day, as I understand it, they had about 14 1/2 trillion — which isn't as bad as it sounds — but 14 1/2 trillion of derivative contracts.

Now, the parties that had those contracts that had a claim against Bear Stearns would have been required, I think, almost by the contracts they signed, but they would have been required to undo those contracts very promptly to establish the damages they would have against the bankrupt estate.

Just imagine thousands of counterparties around the world, you know, trying to undo contracts, everybody knowing they had to undo contracts in a very, very short period of time.

The 400 million we tried to reach for and didn't find — we had the luxury of spending about four or five years unwinding those contracts. These people would have had four or five hours to do the same thing with everybody else doing it simultaneously.

It would have been a spectacle that would have been of, I think, of unprecedented proportions, and, of course, it would have resulted, in my view, of another investment bank or two going down, you know, within a matter of days.

Because nobody has to lend you money. In fact, that was one of the interesting things that was said at the testimony when they called them down to the Senate Finance Committee.

They — I think two of the witnesses said, we didn't understand — we understood we couldn't borrow money unsecured, if people started looking at us with askance, but they said, we didn't dream we couldn't borrow money secured.

Well, we'd found that out at Salomon that we were having money borrowing money secured 17 years earlier.

When the world doesn't want to lend you money, ten basis points doesn't do much, you know, or 20 basis points, or 50 basis points much, or a bigger haircut on collateral.

If they (don't) want to lend you money, they don't want to lend you money. And if your dependent on borrowed money every day, you have to wake up in the morning hoping the world thinks well of you.

And there was a period there a few months ago when I think every investment bank in the United States was plenty worried about whether people were going to think well of them the next morning.

3. Why we don't do 'due diligence' for even the biggest deals

WARREN BUFFETT: Well, let's go on to number 9.

AUDIENCE MEMBER: Harry Beguy (PH), San Francisco.

Mr. Buffett, I was reading recently in Fortune magazine that when you invested $500 million in PetroChina back in 2001 or 2002, all you did was read the annual report.

Now, I was thinking that most professional investors with the kind of resources that you have would have liked to have done a lot more research and talked to management, maybe regulators, et cetera, et cetera.

The question I have is, how — what is it that you look for when you're reading an annual report like that? How is it that you were able to, and did, make an investment purely on the back of reading that report?

WARREN BUFFETT: Yeah. Well, it was in 2002 and 2003, and the report came out in the spring, and I read it. And that's the only thing I ever did. I never contacted any management. I never got a brokerage report. I never asked for anybody's opinion.

But what I did do is I came to the conclusion that the company — and it's not hard to understand crude oil production and refining and marketing and the chemical operation they have. I mean, you can do the same thing with Exxon or BP or any of them, and I do that with all — I look at them.

And I came to the conclusion it was worth a hundred billion, and then I checked the price and it was selling for 35 billion, roughly.

What's the sense of talking to management? I mean, basically, if you talk to management of almost every company, they'll say they think their stock is a wonderful buy, and they'll give you all the good stuff and skip over things that — it just doesn't make any difference.

Now, if I thought the company was worth 40 billion and had been selling for 35 billion, then at that point you have to start trying to refine your analysis more. But there's no reason to refine your analysis.

I mean, I didn't need to know whether it was worth 97 billion or 103 billion if I was buying it at 35 billion.

So any further refining of analysis would be a waste of time when what I should be doing is buying the stock.

So we really like things that you don't have to carry out to three decimal places, you know.

If you have to carry it out to three decimal places, it's not a good idea. And, you know, it — with something like PetroChina — it's like if somebody walked in the door here and they weighed somewhere between 300 and 350 pounds. I might not know how much they weigh, but I would know they were fat. (Laughter)

That's all I'm looking for, is something that's financially fat. And whether PetroChina weighed 95 billion dollars or 105 billion didn't make much difference. It was selling for 35 billion. If it had been selling for 90, it would have made a difference.

So if you can't make a decision on something like PetroChina off the figures, forget about going further, and that's basically what we did. It's a straightforward report, just like reading another — just like reading Chevron's or ConocoPhillips or something like that. Just as informative.

And you weren't going to learn more, you know, by going out and deciding whether you thought — they've got one huge field in China where the life of it was 13 years or 14 years or something of the sort. They should hit you between the eyes.

Charlie?

CHARLIE MUNGER: Yeah. I would argue that we have lower due diligence expenses than anybody else in America — (laughter) — and that we have had less trouble because we had less expense.

I know of an investment operation in America that pays over $200 billion a year that —

WARREN BUFFETT: Two-hundred million.

CHARLIE MUNGER: 200.

WARREN BUFFETT: Million.

CHARLIE MUNGER: Yes. 200 million. Pardon me.

WARREN BUFFETT: Uh-huh.

CHARLIE MUNGER: — every year to its accountants, a lot to help them with due diligence.

And I think our operation is safer because we think like engineers. We want these margins of reliability. And they're trying to do something really difficult, which is to have fine-grain judgments in very complex areas, and rely on other people to do it who are getting paid fees.

It's a very dicey process to do that. I think it's much safer to do our way.

WARREN BUFFETT: If you think the auditors know more about making an acquisition than you do, you ought to take up auditing and let them run the business, as far as we are concerned.

We are not — I mean, when we get a call on something like the Mars-Wrigley situation, if we don't know enough about Mars and Wrigley by this point so that we have to go out — I still like to go out, of course, and sample all the bars.

So we have a 15 — I mean, I feel I owe that to the Berkshire shareholders (Laughter)

But I'm not going to look at their labor contracts or their leases or anything like that.

If the value of Wrigley depends on a specific lease someplace or a specific commitment to this or that, you know, or a given environmental problem, forget it, you know.

The — there are these overriding considerations that are enormously important, and then there's a whole lot of trivia that doesn't mean anything.

We have never made a — we've made plenty of big investment — I've made plenty of big investment mistakes. I've never made one, in my view, that would have been avoided by conventional due diligence.

And we would have spent a lot of money, and we would have wasted a lot of time and, in some cases, we would have missed deals, simply because we wouldn't have committed fast enough.

We have a significant advantage, and it gets bigger as we get bigger, because, in terms of big deals, people rely more and more often on process, in that when people want to get a deal done, they want to know it's going to be done, they will come to us.

I mean, the Mars people wanted to deal — in terms of this financing aspect of the Wrigley situation — they only wanted to deal with Berkshire because they knew we didn't have any lawyers involved. I'll admit to this group we didn't even have any directors involved.

We just — you know, we got a call, it made sense, and we said yes. And when we say yes, we don't say yes with a material adverse change clause. We don't say yes, if financing is available. We just say yes.

So I can tell people when we make a deal that, if we're going to have 6 1/2 billion available, it's going to be available, you know, whether there's a nuclear bomb goes off in New York City, or whether there's a flu epidemic, or whether Ben Bernanke runs off to South America with Paris Hilton. (Laughter)

The check is going to clear.

And if you're making a deal, you know, the guy that wants the 6 1/2 billion, that assurance is worth something. And you really can't get anyplace — they say, "Well, I'll do it, but I've got to have a due diligence team check this out and do all of that." So it's a real advantage to us, and I don't think there's any disadvantage to us.

4. Buffett on religion: "I'm a true agnostic"

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Hi, Mr. Buffett. My name is Matthew Millard (PH). I'm from Norman, Oklahoma, and —

WARREN BUFFETT: We'll forgive that as Nebraskans. (Laughter)

AUDIENCE MEMBER: That's OK. Thank you.

I've been a long-time Berkshire shareholder since I was 16. Really like the company. Really like your investment style, buy and hold forever, kind of beyond the grave.

But my question actually had to do with, do you know and believe in Jesus Christ and have a personal relationship with him.

WARREN BUFFETT: No. I'm an agnostic. And I grew up in a religious household. And if you'd have asked that question of my mother and father, you'd have gotten a different answer.

And I'm a true agnostic. I'm not closer to either a theist or an atheist. I simply don't know, and maybe someday I'll know and maybe someday I won't, but that's the nature of being an agnostic.

Charlie?

CHARLIE MUNGER: I don't want to talk about my religion.

WARREN BUFFETT: OK. Well — (Applause.)

WARREN BUFFETT: Being an agnostic, I don't have to talk about religion. It's very simple. (Laughter)

I don't — obviously I have no opinion on anybody else's religion because that's the nature of being an agnostic.

I wish everybody well on their own.

5. Berkshire takeover after Buffett dies is "very unlikely"

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: Hello. Good afternoon, Warren and Charlie. I want to thank you for hosting this annual meeting.

My name is James (inaudible) from East Brunswick, New Jersey.

I don't want to sound morbid, but my question is, once you two are gone and Warren's stock is placed in trust and slowly forced to be sold over the years, what safeguards are in place to prevent a hedge fund or LBO shops from joining together and acquiring Berkshire Hathaway, and putting in play and breaking up this wonderful company and endangering the culture of this company?

WARREN BUFFETT: Well, my stock would be sold over about a 12-year period after my death.

During the time of settling the estate, it gets disposed of in the same manner as presently, and then it gets on a time clock.

So that takes a lot of time. I may live a little longer, even, than now, but even if that started now, you would be dealing, I hope, with a company that had a market value much larger than even we presently have, and you'd still have large blocks of stocks held by institutions or people that certainly had a similar philosophy.

There's no guarantee that if somebody wanted to try a 6- or $700 billion takeover — and it might be, you know, a lot larger than that if you go out a ways — that it can't be done.

But I think it would be about as unlikely to happen in the case of Berkshire as any company I can think of in the world.

It can't happen at all, in effect, until sometime after I die. There will be a lot of votes concentrated until that period.

And like Charlie says, I've told — there's this period after I die before this 10-year distribution period kicks in — so I've told my lawyer to make sure that my estate lasts for quite a while. And he says that's like telling your teenage son to have a normal sex life, when you tell a lawyer that.

But it will be a long time. And like I say, if we do anything in the way of decent rates of compounding, you really are talking, you know, one of the very largest companies in the United States.

And I don't think anybody's going — I don't think there's going to be an LBO of General Electric or Exxon, and I think it would be equally difficult with Berkshire. There's no 100 percent guarantee, however.

Charlie?

CHARLIE MUNGER: Yeah. And, besides, Warren doesn't plan to leave very early.

I've heard him say several times when people ask him what he wants said at his funeral. And he always gives the same answer. He says he wants people to say, "That's the oldest-looking corpse I ever saw." (Laughter)

WARREN BUFFETT: And I'm unlikely to change my views on that subject. (Laughs)

But thanks for asking. (Laughs)

6. It's hard to challenge a well-established, popular brand

WARREN BUFFETT: Number 12?

AUDIENCE MEMBER: Hello. My name is Harold Yulean (PH). I'm from Chicago, Illinois.

I'd like you to describe the economic characteristics of the Kraft Corporation, why you feel this is a good business.

WARREN BUFFETT: Well, I would say most of the big food companies are good businesses in that they earn good returns on tangible assets.

And I don't want to get into — particularly into specifics on Kraft — but if you own important, branded products in this country, whether it's Wrigley's or Mars or Coca-Cola, or a number of the Kraft brands, or See's Candy, you have good assets.

It's not easy to take on those products. Just imagine, you know, taking on — Coca-Cola will sell a billion and a half eight-ounce servings of its product around the world today.

There's something in everybody person's mind virtually in the globe about Coca-Cola. It's a product of — since 1886 has been associated with happiness and good value in terms of refreshment and all that.

It's just about impossible, you know, to, in my mind, anyway, to take on a product like that. It's clearly satisfies people in a huge way, you know, everywhere on the globe.

And, you know, it may not be the same — Kraft, for example, has Kool-Aid in the powdered soft drink business. You know, I don't think I'd want to take on Kool-Aid. I'd rather have Coca-Cola. But it's a tough product.

And to get implanted — just think of — to get implanted in people's mind RC Cola around the world. And RC Cola has been around a long, long time. You know, it isn't going to go anyplace. I mean, that is very, very difficult.

And actually, Richard Branson came over to this country — you know, they say that a brand is a promise. I mean, there's a promise involved in picking up a Milky Way, or picking up a Coca-Cola, as to what it's going to deliver to you.

Richard Branson came over seven or eight years ago, 10 years ago, you know, a fellow with a famous airline and all of that, and he came out with something called Virgin Cola. And I thought that was kind of an unusual promise to have in a product. (Laughter)

Never could quite figure that one out, what the promise was. But whatever it was, it didn't work.

And there have been — I don't know how many — Don Keough would know — but there have been hundreds of colas over the years. But in the end, who is going to, you know, buy some substitute cola for a penny a can less, or two cents a can less, than Coca-Cola, or the same thing with See's Candy, or the same thing with Kool-Aid, or whatever it may be.

So we feel pretty good about branded products when they're runaway leaders in their field. And there's nothing unusual about Kraft in their position versus Kellogg or some other people like that.

So there's — the specifics of which one we buy may depend a little bit how we feel about the price. It certainly will make a difference how we feel about the price, the management, and some other factors.

But if you buy in with good branded products and you don't pay too much, you're probably going to do OK.

On the other hand, you're not going to get super rich because the attributes that I've just laid out are pretty well recognized.

Charlie?

CHARLIE MUNGER: I've got nothing to add.

WARREN BUFFETT: OK.

7. Avoid low-probability problems that could destroy the company

WARREN BUFFETT: I don't — do we need to go to the other room or not? Well, let's just go to number 1. If I'm skipping the other room and there are still people in there, somebody can let me know, and we'll go back for them. Number 1.

AUDIENCE MEMBER: Hello, Mr. Buffett, Mr. Munger. My name is Kevin Truitt (PH) from Chicago, Illinois.

My question is this: you have identified four investment professionals who will at some point in time be running the portfolio for Berkshire Hathaway.

What was the criteria that you used to select the four people and what will be the criteria for evaluating them going forward?

WARREN BUFFETT: Yeah. The criteria for selecting, I think, we laid out pretty well in the 2006 annual report.

We obviously look for people that have had pretty good records, but that criteria alone is nowhere near sufficient to come up with the candidates we want.

I mean, we care enormously about human qualities, and we think we can make that judgment in some cases, and in some cases we can't.

I mean — and it's no negative vote on people we skipped over. We just decided we didn't know whether they would be the right kind of person.

We made an affirmative judgment on four, as to both their ability and their integrity.

And I would like to — there was one other item in here, I believe, which I think achieved a little added relevance in the last year. I said, "We therefore need someone genetically programmed to recognize and avoid serious risks," and then I put in italics, "including those never before experienced."

And then I said, "Certain perils that lurk in investment strategies cannot be spotted by one of the models — by use of the models — commonly employed today by financial institutions."

Well, I think that proved to be somewhat prophetic of what happened last year. All of these places had models. I mean, the major banks, the major investment banks.

They would meet weekly at a risk committee, probably, and go over their models, and all of the statistics would be printed in nice columns and everything. And they didn't have the faintest idea what risk they were involved.

You really need, in the investment world, someone very solid, someone you trust, reasonable analytical skills.

But you also need someone that actually can contemplate problems that haven't popped up yet but which are starting to become possibilities, in terms of new financial instruments or new behaviors in markets and that sort of thing.

And that's a rare quality. I mean, that inability to envision something that doesn't show up in your past model, you know, can be fatal.

And Charlie and I spend a lot of time thinking about things that could hit us out of the blue that other people don't include in their thinking.

And we may miss some opportunities because of that, but we feel it's essential when managing other people's money or, for that matter, managing our own money.

So I would say that you might go back and read the 2006 annual report again, but those are the criteria we're looking for and we have identified as being met by the four people we're thinking about.

Charlie?

CHARLIE MUNGER: Yeah. You can see how risk averse Berkshire is. In the first place, we try and behave in a way so that no rational person is going to worry about our credit.

And after we've done that, and done it for many years, we also behave in a way that, if the world suddenly didn't like our credit, we wouldn't even notice it for months, because we have such liquidity and are so unlikely to be — unable to be — pressured by anybody.

That double layering of protection against risk is like breathing around Berkshire. It's just part of the culture.

And the alternative culture is just the opposite. You call a man the Chief Risk Officer, but often he is functioning as a guy that makes you feel good while you do dumb things. (Laughter)

So he's like the Delphic oracle that convinced the Persian king to attack somebody or other. I mean, it's — he's just a dumb soothsayer.

And how can a guy be dumb when he's got a Ph.D. and he can do all this advanced math?

WARREN BUFFETT: Easy.

CHARLIE MUNGER: You can — (laughter) — but you can. It's very — all you've got to do is crave system and computation so much that you torture reality into fitting some model — mathematical model — which really doesn't match, particularly, under extreme conditions.

And then, because of this work that you're putting into everything and these computations about daily trading, risk, and so forth, you feel confident that you've clobbered the risk, but you haven't. You're just clobbered up your own head. (Laughter)

WARREN BUFFETT: Yeah. We really want to run Berkshire, you know — (Applause.)

WARREN BUFFETT: I'll even applaud that one. (Laughs)

We really want to run Berkshire so that if the world isn't working tomorrow the way it's working today and it's working in a way nobody expected, that we don't have a problem.

We do not want to be dependent on anybody or anything else. And yet we want to keep doing things.

So, we've found a way to do it — we think we found a way — to do that. It may give up some of the — well, obviously gives up earning higher returns 99 percent of the time, and maybe 99.9 percent of the time.

Obviously, we could have run Berkshire with more leverage over the years than we have. But we wouldn't have slept as well, and we wouldn't feel comfortable — we'd have a lot of people in this room that have almost all their net worth in Berkshire, including me — and we wouldn't feel comfortable running a business that way.

Why do it? I mean, it doesn't — it just doesn't make any sense to us to be exposed to ruin and disgrace and embarrassment and — for something that's not that meaningful.

If we can earn a decent return on capital, you know, what's an extra percentage point? It just isn't that important.

So we will always try to behave in a way that, A, is not dependent on anybody else evaluating the risk except for us. It cannot be farmed out.

And you've seen what happened to some institutions where the management thought they were farming it out. And, you know, if that means a reasonable return instead of a slightly unreasonable return, we just accept it.

8. "If we can't make a decision in five minutes, we can't make it in five months"

WARREN BUFFETT: Number 2. (Applause)

AUDIENCE MEMBER: Hello, Mr. Buffett. Hello, Mr. Munger. My name is (inaudible) (PH), and I'm from Munich, Germany.

I would like to get back to your point that, as a professional investor, one should be able to act quickly and decisively. That means being able to know what the intrinsic value is and to act within a day or within an hour if the market offers an opportunity.

My question is, how large is the universe of companies which you have in your head whose intrinsic value you know, where you would be able to act within a day or two if the market offered an attractive price to you?

And, secondly, how come you suddenly invest in southern Korea or China?

WARREN BUFFETT: Yeah. We can act — our immediate decision is whether we can figure the — what's being offered out to us or not. I mean, there's a go/no-go signal.

And Charlie and I are often thought to be rude when we think we're just being polite and not wasting the other person's time. So as they start mid-sentence in their first conversation with us, we just say, "Forget it." And Charlie is pretty good at that, and I'm picking it up. (Laughter)

It's — we know very, very, very early in a conversation whether somebody's talking about something that there's any chance is actionable by us.

And we don't worry about the ones we miss. We want to make sure that we don't waste any time thinking about things that, when we get all through thinking about them, we're not going to know enough to make the decision on. So we just rule those out. And that rules a lot of things out.

But then, if it gets through a couple of these filters and makes it into an area where it says this is something that we know enough about to make a decision on, we're ready to move right then.

So we make decisions — we can make a decision in five minutes very easily. I mean, it just is not that complicated.

Now, we know about a number of businesses and industries, and there's a lot of businesses and industries we don't know anything about.

We know a lot of things about certain kinds of bonds, and we know — there's a variety of things we know about, and it's nice if we can expand that universe of knowledge. But the most important thing is that anything that gets through is in an area of knowledge.

And the truth is, if we can't make a decision in five minutes, we can't make it in five months. You know, we're not going to learn enough in the followings five months to make up for the fact that we went in deficient in the first place.

So it's just not a problem around Berkshire. If we get a call and somebody says either they've got a business for sale or — that's what we're going to get on the calls — or if I'm reading a paper, or a magazine, or an annual report, or a 10-K, and I look at a price and there's a significant differential between price and value, we move right then.

And Charlie and I don't need to talk to each other about it. I mean, we both think the same way, and we have generally similar spheres of knowledge.

Charlie?

CHARLIE MUNGER: It's — the answer to your question is, we could make a lot of decisions about a lot of things very fast and very easily.

And the — and we're unusual in that respect. And the reason we're able to do that is there's such an enormous other lot of things that we won't allow ourselves to think about at all.

It's just that simple. I mean, I have a little phrase when people make pitches to me, and about halfway through the first sentence, I say, "We don't do startups." They don't exist.

Well, if you blot out startups, there's a whole layer of complexity that goes out of your life. And we've got other little blotter-out systems. And using those, we finally find out that what remains is still a pretty large territory that we can handle. You think that's fair, Warren?

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: Yeah.

WARREN BUFFETT: And an awful lot of giveaways that people, in the first sentence or two, throw out that, you know, we just know we aren't — you know, it isn't going to work. (Laughs)

And we waste very — I would say — we waste a lot of time, but we waste it on things we want to waste our time on. (Laughs)

We're very selective about that, and then we're good at it. We waste a lot of time. But we're not going to waste it on things we don't want to waste it on.

9. No thoughts on Mexican billionaire Carlos Slim

WARREN BUFFETT: Number 3.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger, thank you very much for this wonderful rite. Coming — my name is Jorge Garza (PH), and I'm coming from Mexico City.

Coming from there, you have been occasionally compared to — or rather Carlos Slim has been occasionally compared to you, for other reasons than your love of the game of baseball. Can you please share your thoughts on him?

WARREN BUFFETT: Well, I — he came up once with two of his boys, and we had lunch. But that was probably 15 years ago. So I really have no special — I mean, you probably know a lot more about Carlos Slim than what I do.

I read the news stories and all of that. And we had a perfectly pleasant lunch. But that was a long time ago.

And, Charlie, do you have anything?

CHARLIE MUNGER: No. I think you speak for the total knowledge of both of us about Carlos Slim. (Laughter)

WARREN BUFFETT: We'll go down the rest of the Forbes 400 for you, too, if you would like. (Laughter)

10. Human rights issues shouldn't keep a country out of the Olympics

WARREN BUFFETT: OK. Number 4.

AUDIENCE MEMBER: Hello. My name is Andre Stalty (PH). I come from New York City, and I'm thrilled to be here. I'm greatly inspired by you. We follow you in our analyze business class in New York City, a small group of small investors. And my —

VOICE SHOTING: There are human rights violations in the Klamath.

AUDIENCE MEMBER: My question is, would you, or have you, considered asking Coca-Cola to withdraw sponsorship from the Beijing Olympics in light of the immense human rights violations in Tibet, possibly inspiring a new business model that would value humanitarian interest as well as monetary interest?

WARREN BUFFETT: Yeah. I personally — you know, I personally think that the Olympics — and I hope they are — you know, conducted forever with everybody participating.

I think that, personally, it's a mistake to start deciding whether this country should be allowed and this country shouldn't be allowed. (Applause.)

WARREN BUFFETT: I think it's very hard to grade a couple hundred countries that might be participating, according to how their behavior was.

I mean, we didn't let women vote in the United States, you know, until 1920. So we went 140 or so, 130 years, and I would say that was a great human rights violation, but I would have hated to see the United States banned from the Olympics, you know, in the years prior to that because of that.

So I just think it's a terrible mistake to try to get into — the Olympics have a wonderful event. I think the more people participate in them, the better. And I think that, on balance, they contribute to a better world over time.

So I would not start getting punitive about it. But I understand your motives on it. Thank you.

Charlie?

CHARLIE MUNGER: Well, Warren understates my position. (Laughter)

WARREN BUFFETT: I usually understate his position. This is a man of strong opinion.

CHARLIE MUNGER: And I would say to you people who are distressed by imperfections in China, ask yourself your question — the question — is China more, or less, imperfect as the decades have gone by?

And the answer is China is moving in the right direction. And as long as that's happening, I think it's a grave mistake to just pick the worst thing about somebody you don't like and obsess about it.

WARREN BUFFETT: Yeah. The U.S. has moved in the right direction over years. (Applause.)

WARREN BUFFETT: Our Constitution said blacks were three-fifths of a person, you know. We've moved a long way, and we're far from perfection.

But I think you do better with people that you're working with to — if they're going in the right direction, largely, to encourage them.

You may want to nudge them a bit, but I don't think the Olympics is the right way to do it.

11. We'll reduce our reliance on coal, but not soon

WARREN BUFFETT: Let's go to number 5.

AUDIENCE MEMBER: Hi. My name is Jessica Helmers (PH), and I'm from Scottsdale, Arizona.

My question is, what future trends do you see in the coal industry? Do you think its cost advantage will outweigh its environmental impact?

WARREN BUFFETT: Well, I think in the short-term the world is going to use more coal, you know, and I think that there's no question that there's an environmental disadvantage to it.

And as the — I think the world will slowly — maybe more rapidly than that — but we will figure out better ways to do the things that coal does, that will be more environmentally friendly over time, but it isn't going to happen fast.

I mean, if you shut down the coal-generated utilities in the United States, you know, this — we would not be able to hold this meeting in a room with the lights on.

So it's a very tough problem to solve, or to even make big inroads on in a short period of time.

Now, we — at MidAmerican — we've put in a lot of wind capacity in the last five years or so — probably about as much as anybody has.

But we are dependent a lot on coal. It's cleaner coal than it was 20 years ago, but — and we will be dependent on it for a long time.

And, you know, it's a worldwide problem, obviously. The Chinese are building coal plants at a very rapid rate.

It's going to require cooperation and leadership on a worldwide scale. And, frankly, the United States is not in a great position in terms of leadership because, you know, per capita, we've done as much to this planet of a negative nature as any country in the world.

So we — it's a little tough for us to go around preaching to people, but we will need a leader, in my view, that can sort of transcend our record of the past and get cooperation from major countries around the world.

I don't think it's going to be — but I don't think it's going to be fast. Charlie is less pessimistic on this than I am.

Charlie?

CHARLIE MUNGER: Well, I think the people who are very against the use of coal should reflect: which one they'd rather use up fast — the hydrocarbons, the oil and natural gas, or the coal?

I would rather use up the coal because it's less desirable as a chemical feed stock for what we need to feed the world.

And so I would argue that there's an environmental reason, in terms of human kind, for being very pro-coal use.

Most people don't think that way, but I do. (Laughter)

WARREN BUFFETT: Charlie does not find comfort in numbers.

CHARLIE MUNGER: No.

12. Don't lump regional banks together

WARREN BUFFETT: Number 6.

AUDIENCE MEMBER: My name is Rosat Bastar (PH). I live in Sacramento, California.

The stock prices of most small, regional banks have become more attractive in the past one year. Do you have any opinions about regional banks as investments? And if you were going to purchase shares, what are the areas that you would carefully examine?

WARREN BUFFETT: Yeah. I don't think you should make a categorical decision about something like — however you define them — small, mid cap, whatever, regional, or national banks for that matter.

So much depends on the character of the institution, which will probably be a reflection, to a great degree, of the type of CEO you have.

And I — a bank can mean anything. It can — you know, it can mean an institution that's doing all kinds of crazy things.

It can — there was one called the Bank of the Commonwealth up in Detroit many years ago that went to extremes, and it was very popular on Wall Street for a while.

It could mean the soundest of institutions. We had one — we owned a bank — the only bank Berkshire's ever owned in its entirety — in Rockford, Illinois, run by a fellow named Gene Abegg.

And, you know, it wouldn't make any difference whether it was a super-regional or a regional or a small or a mid-cap bank, there's no way Gene Abegg could run anything other than a super-sound bank.

So I don't think you should — I think you should know something about the culture of the management and the institution to make a firm buy decision on a bank, and that's hard to do for 99 percent of the banks.

We own stock, as you know — it's in our report — Wells Fargo and U.S. Bank and M&T up in Buffalo. And in all three cases, I think I understand quite well the DNA of the institution, in terms of how it behaves.

That doesn't mean those places are immune from problems, because they'll have problems. But it means — but it does mean — they're immune, in my view, from what I would call institutional stupidity. And I would not say that all banks are immune from that.

As a matter of fact, there was a very wise man named — I think it was Morris Cohen (Morris Schapiro) — that said, "There are more banks than bankers," and if you think about that awhile, you'll get my point. (Laughs)

Charlie?

CHARLIE MUNGER: Well, I think the questioner is onto something.

So many of our very large banks, both here and in Europe, have sort of cast a pall of disgrace over the whole industry, and that is undoubtedly pounded down the stocks of some small banks that there's nothing at all wrong with.

So I think you're prospecting in a likely territory.

WARREN BUFFETT: Yeah, but you can find a few big banks —

CHARLIE MUNGER: Yes. (Crosstalk)

WARREN BUFFETT: And it — I don't know if you took the 20 smallest banks in Florida and the 20 largest banks in Florida which group would be in better shape, in terms of the Florida real estate situation.

CHARLIE MUNGER: It's a territory that has some promise. (Laughter)

WARREN BUFFETT: That is a wildly bullish statement from Charlie. (Laughter)

13. Nuclear proliferation is the "primary problem of mankind"

WARREN BUFFETT: Number 7. I'm going to go out and buy that stuff as soon as we get out of here. (Laughter)

AUDIENCE MEMBER: Good afternoon. My name is Matt Thurman (PH), Chicago, Illinois.

Mr. Buffett, Mr. Munger, what are your thoughts on preventing further nuclear proliferation, given recent events in Syria, Iran, North Korea, and other countries? Thank you.

WARREN BUFFETT: Yeah. Well, it's the great problem of mankind, along with proliferation or the spread of other weapons of mass destruction in the chemical and biological field.

The genie is out of the bottle on nuclear knowledge, and more and more people are going to know how to do enormous damage to the rest of the human race as the years go by.

You'll have a given percentage of the population that are psychotics or megalomaniacs or religious fanatics or whatever, and will wish ill on their neighbors.

And the choke point will be — presumably — will be materials, and to a degree, deliverability.

I think there — people generally associate weapons of mass destruction threats these days with terrorists and rogue organizations of some sort and not so much with nations.

But I regard both as being enormous threats to the future of mankind, and we have not made much progress in that respect to — we should be doing everything possible to reduce access to materials — and I've even had a few thoughts on that which you can look up on the Nuclear Threat Initiative, probably on the website.

And we've got a proposal, actually, that might reduce by a tiny bit the rationale, at least, for all kinds of nations having highly-enriched uranium and that sort of thing.

But it's the — it is the primary problem of mankind. If you've got 6 1/2 billion people, you're probably going to have — in the world — you're probably going to have close to twice the number of people who wish ill on their neighbor than you had when you had 3 billion people.

And for a long time, if you were a psychotic or something, you could pick up a stone and throw it at the guy in the next cave, and you moved onto bows and arrows and rifles and cannon. But for millennia, the ability to inflict massive damage was quite limited, no matter how crazy you were.

And since 1945, when Einstein said that the atomic bomb, as they called it then, "has changed everything in the world except how men think." That was a comment made shortly after Hiroshima.

We live in a world where exponentially — has experienced exponential growth — in the ability to inflict harm on somebody else, and we haven't gotten rid of the nuts or the people who want to do it.

And it is — whether it's, you know, Iran or you name it, or whether it's terrorist organizations or whatever, you know, we live in a very, very, very dangerous world on that that is getting more dangerous as we go along.

And we've been very lucky since 1945, you know, when the Cuban missile crisis came along in the '60s, you know, it might have been 50-50, and I think we were lucky we were dealing with Khrushchev and we were lucky that Kennedy behaved the way he did. But we were lucky, and Charlie and I talked a lot about it in the '60s at the time.

But it won't go away. And you would hope, at least in the United States, that we have an administration, whether it's Republican or Democrat, where that's at the top of the agenda, trying to figure out a way to minimize that risk.

You can't eliminate it. It is out of the bottle. But we've got to — it should be paramount to minimize the risk that we really get into something that involves, you know, deaths on a scale that nobody's ever contemplated before.

Charlie?

CHARLIE MUNGER: Yeah. Well, you talk about deaths on a scale that people have never contemplated before.

People have recently figured out that the population of Mexico probably had a population decline of 95 percent caused by European man bringing in his pathogens. And it was a pretty big civilization that went through that little knothole.

These things can happen and have happened. And look at Mexico today. I don't think it's going to wipe out the species.

WARREN BUFFETT: Well, that's —

CHARLIE MUNGER: I hope that cheers you up. (Laughter)

WARREN BUFFETT: The cockroaches will survive.

It's a very good question. I wish I knew a better answer.

14. Buffett's advice for young people

WARREN BUFFETT: Number 8.

AUDIENCE MEMBER: Good afternoon. I'm (inaudible) from Apopka, Florida. I would like to thank you for this wonderful opportunity to learn so much more about finances and, at the same time, have a wonderful time. It's been fun.

WARREN BUFFETT: That's great.

AUDIENCE MEMBER: I teach at Valencia Community College in Orlando, Florida. I teach office administration and business.

I applaud my students for investing in themselves by enrolling in college. I also want to stress financial independence and financial freedom. I do this by telling them that slow and steady wins the race; also, good, sound financial management; and then the law of reciprocity.

I have them track every expense over a period of time. Also they buy, theoretically, one stock and track that, too, over a period of time. We keep track of the current financial news, current news, and also they have research papers. (Applause.)

AUDIENCE MEMBER: Thank you. (Laughter)

They research FICO scores, the credit reports, Clark Howard, Suze Orman, the top ten billionaires, not because — (Applause)

WARREN BUFFETT: I think —

Could you move onto your question, then, please? (Laughter)

AUDIENCE MEMBER: Yes.

WARREN BUFFETT: But thank you.

AUDIENCE MEMBER: OK. What else should I be doing to lead them — (laughter) — to make sound financial decisions and to have happy, sound financial life?

WARREN BUFFETT: I'm ready to hire your entire class right now. (Laughter)

Well, I think you're telling — you're giving them some very good advice. I think that the most important investment you can make is in yourself.

I mean, very, very, very few people get anything like their potential horsepower translated into the actual horsepower of their output in life.

And potential exceeds realization to just an enormous factor with so many people.

And I — one illustration you might try with your class — I tell them this when I talk to high school groups — just imagine that you're 16 and I was going to give you a car of your choice today, any car you wanted to pick, and — but there was one catch attached to it — it was the only car you were going to get in the rest of your life, so you had to make it last there. You can pick out the fanciest you want, a Maserati, whatever it might be.

How would you treat it? Well, of course you would read the owner's manual about five times before you turn the key in the ignition. You'd keep it garaged. Any little rust, you would get taken care of immediately. You'd change the oil twice as often as you were supposed to, because you know it has to last a lifetime.

And then I tell the students, you get one body and one mind, and it's going to have to last you a lifetime, and you better treat it the same way, and you better start treating it right now, because it doesn't do you any good to start worrying about that when you're 50 or 60 and the rust — that little speck of rust — has turned into something big.

So anything your students do to invest in their mind and body — particularly your mind — we didn't work too hard on the bodies around here, but — (laughter) — you know, it pays off. It pays off in an extraordinary way.

Your best asset is your own self. And you can become, to an enormous degree, the person you want to be.

When I get classes in universities, I just ask them to imagine they were going to buy one of their classmates to own 10 percent of for the rest of their life. Which one would they pick?

They wouldn't pick the one with the highest IQ, or necessarily the one with the highest grades. They'd pick the person that's going to be effective.

And the reason people are effective is because other people want to work with them. They want to be around them. And other people they don't want to be around.

And those are qualities than an individual picks up — being generous, being humorous, being on time, not claiming credit for more than you do but rather less than you do, helping out other people — all kinds of human qualities that turn other people on, and then there's things that turn other people off.

And those are habits, and they're the habits that you pick up when they're the age of your students. The habits they have today will follow them throughout life, so why not have good ones? So that's the only message I would give your students. (Applause)

CHARLIE MUNGER: Well, I've got a specific suggestion that answers your specific question. I would add to that extensive repertoire of yours by teaching them to avoid being manipulated to their disadvantage by vendors and by lenders using the standard tricks of the vendor and lender trade.

And you couldn't start with a better book than Cialdini's "Influence," and I think Bob Cialdini, who is a shareholder, is here somewhere in this audience.

And so I have a new textbook to — I suggest you add to your class — which is Cialdini's "Influence." And he's just got a new book that's coming out and for sale in Omaha today, I think, for the first time, and that's called "Yes."

So here's two books that I suggest you add to your class.

WARREN BUFFETT: OK. (Applause.)

15. Buffett on owning sports teams

WARREN BUFFETT: Let's go to number 9.

AUDIENCE MEMBER: I'm Andrew (inaudible) from Chicago, Illinois, and I'm nine years old, and I'm a big baseball fan. I know you like baseball, and my favorite team is the Chicago Cubs.

Would you like to buy the Chicago Cubs from Sam Zell? (Laughter)

And my question is, do you think buying baseball teams is a good investment? (Applause)

WARREN BUFFETT: Well, it's been a good investment. It's been a good investment. It's not been a good investment necessarily because the earnings have gone up so much, although cable television multiplied the value in a big way.

In effect, television expanded the stadium. Wrigley Field, I think, probably seats less than 40,000, maybe.

So you had 40,000 seats available when I went there for my first major league baseball game in 1939. But then along came television, and then cable television, and pay — in effect, pay-cable television for baseball or sports networks, and that multiplied the seats in a huge way.

Now, a lot of that went to the players, but some of it stuck to the owners.

I am not a — when I was your age, I would have thought if I made a lot of money, I would have bought a team.

But there were a lot of things I thought I would do then — (laughter) — I haven't done subsequently.

So, I don't think — if the Cubs sell for 700 million, and you've got a percentage of that in your bank account — now, I don't think I would buy in at that price.

There's a psychic income to many people in owning sports teams. I mean, it makes them famous. Maybe not in the way they anticipated when they bought the team, but the — you know, it is a way to instant celebrity and recognition and all that.

And as long as we live in a society where people have loads and loads of money, a certain percentage of people are going to want to become known for the fact that they have done very well in life, and a sports team is certainly one way of doing it. That isn't the only reason people buy them, obviously.

But I will say this, you are not the first one that's asked me about buying the Cubs. (Laughs)

I've had calls — not from Sam — but from other people, and it's — I think I'll leave that to you.

Charlie? You know anything about buying a sports team? He would be a tougher sell than I would. I might do something kind of stupid like that, but —

CHARLIE MUNGER: Well, you've already done it once.

WARREN BUFFETT: Yeah. (Laughter) Touche.

16. U.S. may be so rich it doesn't need to save

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Mr. Chairman, Mr. Vice Chairman, my name is Andy Peake (PH), and I'm from Weston, Connecticut.

Americans at the individual, municipal, state, and federal levels, historically, do not save.

On the other hand, Asians save approximately 40 percent of their income. Living beyond one's means is an American way that obviously cannot continue.

First, why is it that Americans do not save, and, secondly, what can we do to correct this long-term problem? Thank you.

WARREN BUFFETT: Yeah, well certainly the savings rate in this country is — has fallen significantly and may even be negative, although it does seem to me that the value of the country, in real terms, I think, does increase quite significantly decade to decade.

So I'm not sure exactly how it happens without savings, but it does seem to me that this country, as a whole, is worth considerably more than it was 10 or 20 or 30 or 40 years ago, in real terms. So something good has happened.

But the propensity to save, that almost seems innate, in at least the great majority of cases. I mean, we've got our friend from Florida teaching children to save, and I think that has some impact.

And I should have thanked Andy Heyward for that terrific cartoon this morning, and he's got a program that I'm participating in that we think — in cartoon form — might influence a few younger people towards saving.

If you own Berkshire stock, you're automatically saving, because we retain earnings, and you're indirect interest in those retained earnings is a form of saving.

So you can spend every dollar of your income that comes in the other way, and if you own Berkshire, you are, net, saving, which is a practice I have now been following for 40 years. Sometimes to my family's consternation.

I don't know that the — you know, the savings rate is based on calculations made on consumption and imports and so on. We are importing $700 billion more of goods and services than we're exporting. And that means that somebody else is doing our savings for us, basically, as we export ownership and claims against America.

I think that's going to have consequences over time, but we are so rich that it may not be really apparent.

I think the average American's standard of living is going to improve, in real terms, although I think it may be very, very, very disproportionate, the extent to which the — particularly the super-rich — benefit compared to those in the middle class.

But, net, I think the country will be — even with our present policies, the net — in net real terms, the value on a per capita basis of the country will increase from decade to decade.

But nothing like it will, in places like a China or Korea percentage-wise, where the savings rate is very high.

This country may not save very much because it may not need to save very much. We have $47,000 of GDP per capita. It may not be distributed very well, but we are one very, very, very rich country.

And a very rich country may not need to save as much as a country that's trying to reach its potential.

Charlie?

CHARLIE MUNGER: I've got nothing to add to that.

17. Why Buffett is going to Germany

WARREN BUFFETT: OK. Number 11.

AUDIENCE MEMBER: Mr. Buffett, Mr. Munger —

WARREN BUFFETT: This sounds serious.

AUDIENCE MEMBER: My name is — (Laughter)

I'm used to that. My name is Uta Bauda (PH) from Munich. Again, a guy from Germany.

We're going to meet in around about 14 days' time again in Germany, in Frankfurt at the Union Club. May I ask you a little bit ahead of the others, what your reasons for coming to Germany? Thank you.

WARREN BUFFETT: Yeah. It's very simple. We want more — not that there have been hardly any so far — but we would like more family owners of German businesses — in some cases in the family, maybe a hundred years, maybe 20 years, whatever it might be — we want more owners who, when they feel some need to monetize their business, think of Berkshire Hathaway.

We want to be on their radar screen. We want to be in the same position — we want them to be in the same position that the Wertheimer family was or Paul Andrews' family was here not so long ago, or the Pritzker family was.

When they have some reason — could be a variety of them — that they wanted to convert a — the ownership of a good — very good — company about which they care a great deal — translated into money, to think about calling us. And if they care about their business, we are their best call.

And I don't think we're anywhere near as prominent on the radar screen in Germany as we are in the United States, and it's something I probably should have done more about earlier, but now I'm going to hit four countries in Europe in a few weeks.

And when we leave, I think we'll be somewhat better known — what we're looking for, what we can do for those companies, why they should give us a call — I think we'll be better known a month from now than we are now.

Charlie?

CHARLIE MUNGER: Yeah. And Germany is a particularly advanced civilization, in terms of inventiveness and engineering.

You go into an American printing plant now, and the names on the machines are all German — not all, but mostly.

Now, some of the German names are Germans that came over here to America and formed printing equipment businesses. But it's just amazing the influence that the Germans have had on field after field in America. It's a very logical place for us to be looking.

WARREN BUFFETT: Sounds like maybe Charlie should go. (Laughter)

18. Munger on housing: A "particularly foolish mess"

WARREN BUFFETT: Number 12.

AUDIENCE MEMBER: My name is Len Yaffe. My wife, Ruth, and I live in Tiburon, California.

I was wondering if the current economic stresses remind you of any prior period in U.S., or any other nation's, history, and, if so, is there anything we can learn from the prior period that might help us manage the current period better?

WARREN BUFFETT: Well, they're all a little different and they all have similarities. But this one, obviously, had more of its origins in the mortgage field and in terms of the residential real estate bubble.

But the troubles that begin in one area have a way of spreading to other areas.

But I would say that, in my lifetime, it's been — I can't remember one where this particular residential real estate bubble has sent out the shock waves and the exposure of other practices elsewhere to — as to their weaknesses — like this one.

But I don't think there's any magic to the analysis or anything like that. I think that some stupid things were done that won't be done soon again, and they won't be done exactly the same again, but variations of them will pop up at some point.

Because humans are what lead to stupidity in behavior, and there are these sort of primal urges that — in terms of getting rich and using leverage and all of that sort of thing, and wanting to believe in the tooth fairy — that pop up from time to time in human behavior, and sometimes they pop up on a very big scale.

The — in terms of having any great insights on solutions or anything of the sort, I don't have them.

Charlie?

CHARLIE MUNGER: No. It was a particularly foolish mess. Now, at earlier meetings we talked about some idiot that decided that a credit delivery grocery business, like the old Buffett store —

WARREN BUFFETT: Webvan.

CHARLIE MUNGER: Yeah, Webvan. You know, internet-based delivery service for groceries. A really asinine idea. (Laughter)

And, of course, it met an ignominious failure.

That was smarter than what the people did in this mortgage field. (Laughter)

It was a lot smarter. I just wish we had those brilliant people back that gave us Webvan. (Laughter)

Which, by the way, reminds me of my general attitude toward political developments.

I have a rule and it's as follows: the politicians are never so bad you don't live to want them back. (Laughter)

WARREN BUFFETT: Pollyanna. (Laughs)

19. Financial crisis-era assets should be valued at market

WARREN BUFFETT: Number 1.

AUDIENCE MEMBER: I'm Bob Kline (PH) from Los Angeles.

Following up on the last question, can you speak to the accuracy of the financial statements of the world's major financial institutions?

What should be done to properly value their assets, like mortgages, leverage loans, CDOs, and other assets that are, as Charlie says, as good until reached for?

Since the leverage at these banks and brokerage firms is generally 15 to 20 times their tangible net worth, there isn't much margin for error. So what can be done to improve the integrity of financial statements?

WARREN BUFFETT: Well, it's a very tough thing.

I still lean strongly — there's a lot of controversy now about whether you should use fair value, however that may be determined. In many cases, it's very hard to determine.

But whether you should use that or some other figure like cost because people say that the present values are unrepresentative and so on.

I think that you get into more troubles as a society when you start openly valuing things at prices that make no sense in terms of what's going on, than whether you do your best to estimate them, even though those estimates may prove, many cases, optimistic later on, and certainly inaccurate in some respects.

So I would stick with financial institutions at least having to attempt to report their assets on a fair value basis.

But when you get into instruments — I've used this illustration before — but when you get into a CDO-Squared, if you read a standard mortgage — residential mortgage-backed certificate — security — it may consist of thousands of mortgages backing up this instrument.

And then that instrument may be traunched into 30 or so different traunches where each party has a different claim on the waterfall of funds received.

Now, that instrument itself can be kind of difficult to understand. But then you take that and you create a CDO by taking some of the lower junior tranches of a bunch of these RMBSs, maybe 50 of them, and then you create a CDO out of this.

So now you create, out of a whole bunch of junior — and perhaps — and very correlated — and perhaps kind of lousy instruments — and then you put them in a CDO and say that because you put them all together and diversified, in theory, you've got a lot of triple-A traunches of that — was a big error to start with.

And then when you took the lower tranches of a bunch of CDOs and stuck them into a CDO-Squared, that was nuttiness squared.

And if a residential mortgage-backed security had a 300 page prospectus and you had to read 50 of those to understand a CDO, you're up to 15,000 pages.

And if you had to read 50 more CDO prospectuses, and the material behind that, to evaluate a CDO-Squared, you had to read 750,000 pages, presumably, to evaluate one security, and that was madness.

To let people value that sort of thing, because they say the market at ten cents on the dollar is unrepresentative, so instead of using that, I'll use the hundred cents I paid, I think would be an abomination.

And I think that the discipline, mild as it may be, of telling managements that you're going to have to value this stuff at market may keep them from doing things that they would otherwise do that would be very stupid if they think they can get away with valuing them at some fictitious — or at cost — which would be fictitious, in terms of markets.

I lean toward the market value approach. I don't know — when you get into really complex instruments — I just don't know how you value them.

Charlie was on the audit committee at Salomon, and they would spend hours and hours and hours — and I think you found one that was mismarked by 20 million or something like that, back when 20 million was real money.

CHARLIE MUNGER: It was a floating plug.

WARREN BUFFETT: Well, we had the floating plug, too, yeah.

CHARLIE MUNGER: No. I — there's a lot that goes on in the bowels of American industry that is not pretty. (Laughter)

WARREN BUFFETT: So you can add sausage and laws — maybe you should add accounting practices to the things that people shouldn't have to witness the making of. (Laughs)

CHARLIE MUNGER: I think that part of the trouble comes from some prominent members of my own Republican Party.

Some of these people overdosed on Ayn Rand and what they learned in Economics 101, and they sort of got to thinking that if anything happened as a natural response of human nature in a free market system, even if it was an ax murder, it was a desirable development and part of a wise distribution of risk.

I don't know why grown-ups get these silly ideas, but they do. And one of them headed the Federal Reserve. I think Alan Greenspan did a very good job, averaged out, but he did overdose a little on Ayn Rand, and he had this tendency to believe that, if it happened in a free market, it had to be all right.

I think there's some things that should be forbidden. And I think that the world would have worked better if a lot of things that were described as follows: this is a financial innovation which will diversify risk — if that phrase had been banned from all discourse, the country would have worked better. (Applause.)

20. Plea from audience to read the U.S. Constitution

WARREN BUFFETT: Area 2.

AUDIENCE MEMBER: I'm Larry Tidrick (PH) from Elk Grove Village, Illinois.

My question is really more a plea. Get out your copies of the U.S. Constitution, read over Article 1, Section 8, the enumerated powers; the Ninth Amendment; the Tenth Amendment; and give Roger Pilon a call at the Cato Institute.

I think everything that's gone on today, regarding finance and economics, has to do with our Constitution, which was really based upon property rights and contract rights.

WARREN BUFFETT: Do you have a question, though, or not?

AUDIENCE MEMBER: Yes, sir.

WARREN BUFFETT: OK.

AUDIENCE MEMBER: Well, no, I don't. (Laughter)

WARREN BUFFETT: I sort of suspected that.

AUDIENCE MEMBER: I made — yeah. I made the plea and —

WARREN BUFFETT: OK.

AUDIENCE MEMBER: — that's really it.

WARREN BUFFETT: OK. Well, thank you.

21. American's distaste for mass transit won't change soon

WARREN BUFFETT: We'll go on to number 3.

AUDIENCE MEMBER: Yes. My name is Dan Schmidt (PH) from Burnsville, Minnesota.

And I'd like your opinion on the future of mass transit and how it relates to railroads, and will these transit systems and railroads be expanding in the future?

WARREN BUFFETT: In terms of passenger traffic?

AUDIENCE MEMBER: Correct.

WARREN BUFFETT: Yeah. The American public, basically, doesn't like mass transit. I mean, it endures it when it needs to, but there — the American love affair with the car, which translates to aversion to mass transit, is sort of overwhelming.

I used to be involved in bus companies. And, you know, you can make all kinds of rational arguments to people about the use of mass transit, but one person to a car seems to be an enormously popular method of moving around.

And I think it's unlikely that we see a large expansion in mass transit in this country. I think the American public is, for one reason or another, whether they're trained to it or whether it's just something in their genetic makeup, they do not like going out and waiting for buses or whatever it may be or trams.

And they want to get in their car. And even with gas at close to $4 a gallon, they want to go someplace and pay a lot of money to park, and they don't want to double up in the cars very much.

And that just seems to be human nature. Maybe it will change, but I never like to bet on something that has gone in one direction for a long time reversing unless the evidence is pretty strong.

Charlie?

CHARLIE MUNGER: You have a more optimistic view of it than I have. (Laughter)

22. Munger's in "awkward position of agreeing with Al Gore"

WARREN BUFFETT: Number 4.

AUDIENCE MEMBER: Hi. I'm Tom Nelson (PH) from North Oaks, Minnesota.

My question is for Charlie. If you were in charge of this country, how would you handle Al Gore's alleged climate crisis?

CHARLIE MUNGER: Well, of course, I'm in the awkward position of agreeing with Al Gore that we shouldn't be burning up so many hydrocarbons. (Applause)

I've just got a different reason. His brain doesn't work the way mine does, and you'll have to judge for yourself which you prefer. (Laughter)

WARREN BUFFETT: We'll have a vote a little later. (Laughter)

23. Disagreement on danger of CDOs

WARREN BUFFETT: Number 5.

AUDIENCE MEMBER: Good afternoon, Warren and Charlie. This is Frank Martin from Elkhart, Indiana.

WARREN BUFFETT: Nice to have you here, Frank.

AUDIENCE MEMBER: Thanks, Warren. One of my favorite aphorisms from you is, "To win, first you must not lose." The excerpt that you read a few moments ago from the 2006 annual report contemporized that aphorism, and I think was both prescient and prophetic. Notice I said "prophetic" and not "pathetic."

WARREN BUFFETT: I noticed.

AUDIENCE MEMBER: Yeah, thank you. (Laughter)

On several of occasions disagreeing with Alan Greenspan, you have called derivatives "weapons of financial mass destruction." We both have our own record as believing the country is currently in recession.

If corporate default rates, which are currently benign, escalate — should the recession deepen and we get back to default rates common in 2002 or back in the early 1990s — will the credit default swap problem materialize as a serious threat to financial stability?

I respect you as one of the all-time great pricers of risk. You and Charlie must consider selling insurance without reserves, without really understanding pricing risk, to be an abomination.

Is there a chance, in your judgment, that the CDS market may eclipse the subprime mortgage market as the next element of the financial meltdown?

WARREN BUFFETT: The credit default swap market — you can see these figures — and I'm repeating them, but I'm not validating them — but the last number that came out was over 60 trillion.

Now, there's lots of double counting in these things and all that sort of thing. But there's no question there's a lot of money on both sides of the credit default market. They call them credit default swaps.

You can think of it as insurance against a company going bankrupt. And actually, we have written two types of derivatives on a big scale. We explained them in the annual report. We explained them again in the press release that was issued yesterday.

And we have insured in the — we've written insurance that pays off to somebody else in the event of default by companies listed on given indices.

There's a high-yield two, a high-yield three, and so on, through high-yield nine. And we've written various traunches of risk on those things, and I think we're going to make significant money, although we could lose money, too. It will depend on credit experience in the next few years.

I think there's no question that the corporate default rate will rise. That's been cranked into the calculations I make in writing this insurance.

The question of whether the credit default swap — the size of that market — will lead to any kind of chaos in the financial markets, I think probably not.

Although if a Bear Stearns had failed, for example, you would have had a huge unwinding of contracts by counterparties who had to establish their claims and all that.

So you would have had rather chaotic conditions. Any time — a credit default swap is merely a payment by one party to another. So it's a negative-sum item. When somebody loses money on a subprime loan, on a mortgage loan, they've lost real money.

Now, somebody may be buying the house later on cheaper than they would have bought it earlier on, but there is not an equivalent swap of dollars at the time that a subprime loan goes bad.

With the credit default swaps, there is a swap of dollars. So as long as the counterparties pay, if A is up a million dollars, B is down a million dollars.

And the question is, is if you get a Bear Stearns-type situation that didn't get interrupted by the Fed, whether counterparties would fail and you get a lot of trip hammer effects, I don't think that's going to happen, and I think the chances of it happening were reduced significantly by what happened — by the fact that the Fed stepped in at Bear Stearns.

We’ve had enormous payments from one party to another, in terms of credit default swaps. Just — there’s a firm called Fairfax Financial that made — a relatively small firm — that made, as I remember, well over a billion dollars in credit default swaps.

Well, somebody else lost the billion, but it didn’t pose a threat to the system. It posed a threat to the guy that lost the billion, but he had to keep up putting up collateral, presumably, as he went along. So it wasn’t like he was called overnight for the billion.

So even though credit defaults — they’ve been the most volatile of instruments in the last 18 months. There’s been nothing that’s swung as much — maybe there’s some subprime index that has — but virtually it’s credit default swaps.

And that really hasn’t created a problem in the system. So I do not think — particularly if the Fed is going to step in when they see investment banks that they regard as too big to fail, or banks too big to fail — I don’t think that that will probably be the cause of the problem.

It may be a cause of enormous losses to some institutions, but those will be matched by enormous gains by other institutions.

I do think there’s that — the problem of the overnight disruption in the system, which Bear Stearns, I think, would have produced.

But maybe something else could produce it — a nuclear bomb going off in Manhattan, you know, or something of the sort. That kind of thing — where there’s a discontinuity, where the collateral posted the previous day was totally inadequate in terms of the kind of movement that occurred — certainly at that time something like having a large amount of CDSs out there, it could cause a — it could exacerbate — the chaos to a considerable degree.

Charlie?

CHARLIE MUNGER: Well, I think the answer to your question is — could we have a big-time mess out of credit default swaps — is yes, we certainly could.

I think the stupidity, while it’s extreme, is not as bad as sweeping bums off skid row to give them mortgages to buy houses, but it’s pretty bad.

One of the things that’s interesting about credit default swaps, which isn’t much commented on, is, let’s say you’re insuring against the outcome that people will lose money on a hundred million dollar bond issue.

And the credit default swaps, instead of amounting to a hundred million, amount to 3 billion. Now you’ve got people with $3 billion worth of contracts that really have a big incentive in having somebody fail.

And, of course, they may manipulate, in some fraudulent or extreme way, with the little loss in order to make the big collection.

It was insane for the regulators to allow this outcome to occur in America. It used to be illegal for people who had no insurable interest just to buy life insurance on people they didn't know, because society was afraid that people would do that and then kill the person.

And that happened in Los Angeles. We had sweet, little, old ladies that got bums off skid row. They'd take out life insurance on them. And when two years went past, they murdered them with fake hit-run accidents.

So human nature is up to this kind of venality where you have big payoffs. And why we wanted these enormous bets to be made, in relatively unregulated markets, where the bets are 10, 20 times the size of the original bond issue, it's crazy.

If I did this as a satire, you'd say I was overstating. I'm understating. We have a major nut case bunch of regulators and proprietors in this field. (Applause.)

WARREN BUFFETT: Charlie, one; invisible hand, zero.

24. Buffett's test on when to pay a dividend

WARREN BUFFETT: Let's go to number 6.

AUDIENCE MEMBER: Hi, Mr. Buffett and Mr. Munger. My name is Neharick Aneela (PH), and I'm from Houston, Texas. I'm a seventh grader, and I'm 12 years old.

I was wondering why you do not believe in dividends, Mr. Buffett, when your mentor, Ben Graham, believed in dividends?

He influenced you in so many ways, but why weren't you influenced into believing in dividends? Thank you.

WARREN BUFFETT: Well, I had to show a little individuality in some respect. (Laughter)

Well, the answer is I do believe in dividends in a great many situations, including many of the ones at companies in which we own stock.

The test about whether to pay dividends is whether you can continue to create more than one dollar of value for every dollar you retain.

And there are many businesses — take See's Candy, which we own. See's Candy has paid everything, virtually, out to us that they earn because they do not have the ability within See's Candy to use large sums, which they earn, intelligently in their business.

So it would be an enormous mistake for See's Candy to retain money. So they distribute to Berkshire, and we hope that we move that around in some other area where that dollar becomes worth $1.10, or $2.10, in terms of present value terms.

If we do that, the shareholder — whether they're taxable or whether they're not taxable, whether they're a foundation or whether they're living on income, even — they are better off if we retain the money.

Because if they were going to get a dollar in dividends and it became worth $1.10 or $1.20 in market value immediately on a present value basis, they're better off selling a small percentage of their stock and realizing the required amount that way, and they will have more money when they get all through doing that than if we paid it in dividends.

But if the time comes — and it will come someday — when the — if the time comes when we don't think we can use the money effectively to create more than a dollar of market value per dollar retained, then it should be paid out.

And, like I say, we do that individually within Berkshire. But because we have this ability to redistribute money in a tax-efficient way within the company, we probably had more — we had more reason — to retain all of our earnings.

If See's Candy were a standalone company, we would simply pay out a lot of the earnings, practically all of the earnings, in dividends. Just like we do now, except it goes to Berkshire.

We like our — we like the companies in which we have investments to pay to us the money they can't use efficiently in their own business.

In some cases that's a hundred percent of what they earn; in some cases it's 0 percent of what they earn. We own some stocks that don't pay any dividends.

Costco paid a very small — did they pay any dividend for a while, Charlie, or —?

CHARLIE MUNGER: They — while they were growing very rapidly, they paid no dividend. And finally they are paying one.

Berkshire's policy is much the same. Warren has always planned on paying large dividends out of Berkshire, and he does it in the mode of Saint Augustine when he said, "God give me chastity, but not yet."

WARREN BUFFETT: Right. I've always admired that.

25. Electricity in the Southwest

WARREN BUFFETT: Number 7.

AUDIENCE MEMBER: Good afternoon, Mr. Warren Buffett, Charlie Munger, shareholders. My name is Richard Meyers (PH). I'm from (inaudible), California.

In respect to your opinion earlier, I will go down to southern California, Arizona, and ask a question: if you have knowledge or interest of the corridor for electricity coming in from Arizona into California, or is it going from California back into Arizona?

As California is known as a sunny state, we should be able to have our own solar systems.

I have one more. I have saved $20 by staying in line since 2:30 this morning, and I would like to know which one of these books that I could buy that would do me the most good and my tribe. Thank you.

WARREN BUFFETT: Well, tell us about the books. You mean the whole list?

AUDIENCE MEMBER: Which one I can buy for $20. (Laughter)

WARREN BUFFETT: Probably the ones that haven't sold very well today. (Laughter)

Yeah, I'm not that familiar with the prices of the books. We try to have a good selection in there.

I'm a little partial to Larry Cunningham's books because — Larry Cunningham's book — because it consists of a rewriting of all my own stuff. (Laughs)

But, no, we — I think the whole collection is fine. I wouldn't want to recommend one over the other.

And I know nothing about that first subject. Charlie, do you?

CHARLIE MUNGER: Well, I know a little. You know, California did cause coal plants to be built near the Grand Canyon because California didn't want the pollution and it needed the electricity and they were nearer the coal mines.

And eventually that caused huge uproar, a lot like we heard about the Klamath River. And the Grand Canyon, that started having some visibility problems.

And I think those things are, maybe, decommissioned, or about to be decommissioned, so it's a very complicated subject. And I'm glad to (inaudible) it back to you.

26. Berkshire's international ambitions

WARREN BUFFETT: OK. Number 8.

AUDIENCE MEMBER: Good afternoon, Mr. Buffett and Mr. Munger. My name is Argin Row (PH).

I am in the eighth grade and live in Pearland, Texas. I ask everybody to call me Tony after reading your 2006 annual report. (Buffett laughs)

My question is, do you foresee Berkshire buying any businesses in either India or China in the near future?

WARREN BUFFETT: Well, Tony, I — (laughter) — we would like to. The odds are somewhat against us buying in any major country except the United States, if you'd name any specific one.

I would hope in the next three years that we might get a chance to buy one or two companies of size. We're always buying little companies that fit in with our present operations.

Right now, MiTek has several possibilities outside the United States. But in terms of major businesses that Berkshire would buy, you know, if we get lucky, we'll buy one or two in the next three or four years that's based outside the United States. We're trying to increase our chances of doing that.

Whether it turns out to be China or India or Germany or the UK or Japan, who knows? There's a lot of luck in that, just in terms of specific families thinking of us specifically. But we certainly wouldn't rule it out.

We've looked into developing an insurance company in some countries. Both India and China restrict the percentage ownership that Berkshire could have in any domestic insurance company.

They both have laws that would keep us — I know it's 25 percent in China, and I think it's 25 percent, but it may have been changed in the last year or so, in India.

We do not probably want to go into a country to own 25 percent of a company like that. We would want the laws to allow us to do more than that to make it worth our while.

But I hope we own something. You know, certainly at your age, you will see the day that Berkshire owns businesses — in my view, you'll see the day — that they own — we own — businesses in both countries.

Charlie?

CHARLIE MUNGER: Nothing to add.

27. Parents, spouses, and books are the best teachers

WARREN BUFFETT: OK. Number 9.

AUDIENCE MEMBER: Gentlemen, my name is Jim James (PH) from Minnesota, actually Minneapolis.

And clearly you've inspired 38,000 people here today. Books have been written about you, not solely for your financial prowess, but because of the people you are.

Could you share two or three influences on you — those kinds of people, educators, who have shaped your thinking on life and on investing? Thank you.

WARREN BUFFETT: Well, I think the biggest educator — certainly in my case — initially was my father. I think probably Charlie would say the same thing.

And I think— it's very, very, very important who you marry, and I've been lucky there, and those are great teachers.

And, of course, I had Ben Graham. I had Dave Dodd. I've learned from all kinds of people who have written books over the years. I've just devoured those and picking up things here and there.

Charlie learned a lot from Ben Franklin, obviously. (Laughter)

Many people think Ben Franklin learned a lot from Charlie but — (laughter) — we both learned a few things from my grandfather at the grocery store.

But your parents — I tell the students, you know, the most important job you have, you know, is being the teacher to your children.

I mean, you're the ultimate teacher. You're this big — great big thing. You provide warmth and food and everything else, and they're learning about the world, and they're not going to change a lot of that when they get into graduate school or sometime.

So it's — and you don't get any rewind button. You don't get to do it twice. So you have to do your best as a teacher, and you teach by what you do, not by what you say, with these young things.

And by the time they've got to a place where they're entering a formal school, they probably learned more from you than they're ever going to learn from anybody else.

Charlie?

CHARLIE MUNGER: Well, I would argue that differing people learn in differing ways.

With me, I was put together by nature to learn from reading. If some guy's talking to me, he's telling me something I don't know, I don't want to know, I already know, or he's doing it too slow or too fast.

In reading, I can learn what I want at the speed that works. So, to me, reading is the — is what works for my nature. And to all of you who are at all like me, I say welcome. It's a nice fraternity.

WARREN BUFFETT: You probably learn more from your father than you learned from all the reading you did, don't you think? In terms of actually forming you?

CHARLIE MUNGER: Well, yes. And my father was the type that always did more than his share of the work and took more of his share of the risk.

All that kind of example was, of course, very helpful, and you learn it better from a person close to you.

But in terms of the conceptual stuff, I'd say I learned it from books.

Now, those are fathers in a difference sense.

WARREN BUFFETT: Yeah.

CHARLIE MUNGER: The people who wrote the books.

WARREN BUFFETT: Yeah, well, one book, obviously, changed my whole financial life when I — you know, by happenstance, probably, I picked it up. I can't even remember why I bought it back when I was in school.

But if you just keep picking up enough books, you'll find some — you'll learn a lot. And I used to go through the Omaha Public Library and just go down the shelves.

It's kind of an inefficient way, maybe, of doing it, but I — if you read 20 books on a subject you've got an interest in, you're going to learn one hell of a lot. You don't know which one you're going to learn it in, though.

So I would take having — if you get the right parents, you're very, very lucky, and it's better than going to the right school or anything of the sort. And to get the right spouse, you've just doubled down.

28. Big institutional shareholders should take stand on CEO pay

WARREN BUFFETT: Number 10.

AUDIENCE MEMBER: Gentlemen, my name is Mark Slaybe (PH). I'm from Chicago. I probably am going to be one of the last guys speaking today or asking a question, so on behalf of 31,000 people, I'm going to thank you —

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: — for the respect and the common courtesy that you've exhibited to the shareholders today.

WARREN BUFFETT: Thank you. (Applause.)

AUDIENCE MEMBER: My question is this: I work for a fairly large computer company that's a competitor of Mr. Gates up there.

And I'm curious. As a common, ordinary person and a common shareholder, what can we do, 31,000-some odd folks here do, about the outrageous salaries, bonuses, perks, of these enormous corporations that we will never have a chance at, a shot at, you know, working with them and that amount of wealth?

What would you advise us as common shareholders that we can do to get this country going the right way and get this issue going the right way? (Scattered applause)

WARREN BUFFETT: Well, I would say that, particularly on the compensation part, you can't do much. But there are a relatively few people that could do a lot.

If the half a dozen or so largest institutional owners took a position on extreme cases — I don't advise them trying to go after each one — but when they see something egregious, if they would simply withhold their votes and issue a short statement as to why they're doing it, that has an effect on — particularly on boards of directors.

Big shots don't like to be embarrassed. You know, they don't — that gets their attention.

The press is an enormous factor. Press is more of a factor in changing corporate behavior than regulations or Sarbanes-Oxley or that sort of thing.

You want a good press. But the press needs the material, and material — the raw material — for that could be — I won't name the organizations — but if you take the half a dozen largest investment organizations, I think it would have a lot of impact if they would — if they could get together on short statements when they felt pay was really egregious.

And I don't know what you individually can do about that, and I don't know how you create the incentives for the big institutions to do that. I mean, it doesn't really do that much for them personally.

I don't think — I think the — a lot of the checklists that institutions use as determining whether they approve of corporate practices are asinine. I mean, they — you know, they get sort of the "issue du jure" and they get — and they get people recommending how they vote their proxies, which is kind of silly. I don't know why they can't make up their minds themselves as to what they think is proper or not proper.

And Ben Graham, many years ago, bemoaned investors as a bunch of sheep. And with big institutions, I haven't seen much difference.

But it wouldn't take many of them. It would take — just take a few of the biggest ones and the willingness to speak out. And the press would do the rest and boards would respond to that. But they're not going to respond to you. I mean, I have to be, you know, totally candid about that.

A small shareholder can write the most persuasive arguments in the world, and I've been on the board where they've received those kind of letters. And basically they turn them over to the corporate secretary and say, "Take care of this," or something of the sort.

It takes real effective pressure to change behavior where the behavior is in the self-interest of that person. People do not give up self-interest easily.

Charlie?

CHARLIE MUNGER: It's an old question. In England, where they had a lot of class warfare, they at one time got the income taxes up to, like, 90 percent, so there just wasn't any possibility of having a large earned income except, you know, by not reporting it. The tax rate got that high.

That was quite counterproductive for England. And so you can get a politics of envy that sort of ruins the economic system because of the natural resentments and jealousies and so forth involved in excessive compensation.

I think the people taking the compensation have a moral duty not to take it. I would argue that, when you rise high enough in American business, you get a moral duty to be underpaid, not to get all you can, but to actually be underpaid.

If people are going to be generals and archbishops and everything else at low pay, I don't see why leaders of great big enterprise can't take less than the last dollar. (Applause.)

WARREN BUFFETT: Do you have any suggestions on how to implement those sentiments? (Laughs)

CHARLIE MUNGER: It's very difficult.

WARREN BUFFETT: Yeah. Charlie has always said that envy is — strikes him — as the silliest of the seven deadly sins, because when you're envious of somebody, you feel worse, and they don't feel any — they feel fine. In fact, maybe they even feel better because you're envious.

So it's such a counterproductive type of thing. So we — rule out as envy as part of your repertoire. And gluttony — (laughs) — I mean, that has some upside to it. (Laughter)

Maybe temporary, may have some side effects, but, you know, there's something to gluttony. And so lust, of course, I'll let Charlie speak to. (Laughter)

29. It's OK to buy pharmaceuticals as a group

WARREN BUFFETT: Number 11.

AUDIENCE MEMBER: Hello. I'm Clemmon Low (PH) from Toronto, Canada. I want to thank you for the wonderful meeting, and I think I've learned a lot more here in a few hours than many, many more hours during university days.

My question is, you have invested in drug companies such as Johnson & Johnson and Sanofi. How do you evaluate the pipeline of these companies and know if their competitive advantage is, indeed, enduring?

WARREN BUFFETT: Well, that's a good question. And unlike many businesses, when we invest in something like pharma, we don't know the answer on the pipeline. It will be a different pipeline anyway five years from now.

So we don't know whether Pfizer or Merck, you know, or you name it — Johnson & Johnson — we don't know which of those will come up with a blockbuster commercial drug three or four years from now, and we don't try to assess it.

What we do feel is, if we have a group of those companies bought at reasonable prices, that, overall, pharma will do well. Maybe not quite as well as they have in the past, but they're doing something enormously important. They're doing something that should offer chances for decent profits over time.

And we do not pick one by one. I could not tell you what's the number one potential in the pipeline of a J&J or Sanofi — whatever which one you want to name.

So I think in that area, actually, a group approach makes sense, which is not the way we would go at the banks or something of that sort.

I do think if you buy pharma stocks at a reasonable multiple, a group of them, you know, you'll probably do OK five or 10 years from now. I would not know how to pick the specific winner.

Charlie?

CHARLIE MUNGER: Well, you speak from a position where you have a monopoly of our joint knowledge about pharmacology. (Laughter)

30. Why Berkshire sold PetroChina

WARREN BUFFETT: We will move on to number 12. (Laughter)

He gets cranky later in the day. (Laughter)

And we're just about to the end, but we can take a couple more.

AUDIENCE MEMBER: Thank you. My name is Chow (PH). I'm coming from Woshi, China. Thank you, Mr. Buffett and Mr. Munger, for your unbiased opinion on China and Olympics.

To support your (inaudible), we have a group of chairmen and CEOs from Chinese public companies to come to Omaha and try to learn from the best of how public companies should be run. (Applause.)

WARREN BUFFETT: Thank you.

AUDIENCE MEMBER: Quick question. We observed that you made a quick trade on PetroChina, not a typical buy and hold approach you do on investment.

Our question is, when it's come to selling PetroChina, what comes to your mind, and what suggestions you may have to these group of executives?

There are positive forces in China, and we welcome everyone to our Olympics.

WARREN BUFFETT: Thank you. (Applause.)

And I met Dr. Guo from the China Investment Corp here a few months ago. Was very impressed by him, had lunch with him here in Omaha.

The PetroChina decision, just as we made it to buy it at a valuation overall of 35 to 40 billion when we thought it was worth a hundred billion, when oil was at $70 a barrel, roughly, 75, I figured the value was about 275 or 300 billion and we could sell it at that price.

And we no longer felt it was undervalued compared to other oil companies, so we sold our stock. Now, incidentally, right after we sold it, it went up dramatically because, as you know, they issued A shares in in China, and it became very popular.

And at one time, PetroChina became the most valuable company in the world, measured by market value, which would have come as enormous surprise to investors seven or eight years earlier. So they've done a terrific job.

And if it went down to a price that we thought was a discount — a significant discount — to its valuation, we would buy PetroChina again. The — in terms of — I'm not so sure we don't have a lot to learn from the Chinese in terms of business currently, more than they have to learn from us. I'm not sure we would want some of our practices to spread to China.

It's a remarkable society, what's going on there now. And I did go to Dalian not long ago, and I must have traveled for 45 minutes from the center of town out to our plant there. And I just saw, really, hundreds of plants that — factories that had developed in recent years.

The economy is — the Chinese people are starting to realize their potential. I mean, what it amounted to is you had — for centuries — you had people of lots of ability but a system that did not unleash their potential.

And now it's starting to be unleashed, and that's why you're getting very substantial GDP growth per capita, and I think it will continue.

I would just look for the best practices in American industry as you see them and copy them, and I would discard the rest. And I think it's — you know, it's how you learn about human behavior. You try to — if you look at an effective individual, you try to figure out why they're effective.

You know, why is Don Keough, why are Tom Murphy — why are they so effective? Why do people want to be around them? Why are they leaders? Why do people love them? And you see certain human qualities, and you should copy those qualities.

And when you see some guy that should have everything going for him and everybody in town hates him, you know, you want to make sure you don't have any of those qualities.

Well, I would do the same thing in terms of looking at businesses in this country, and try to look for what I admire and emulate it, and make sure that — try very hard — not to let the things that you find over here that are distasteful to you creep into your own system.

Charlie?

CHARLIE MUNGER: Well, I hope you'll go back to China and tell them that you met at least one fellow that really approves the Confucius emphasis on reverence for elderly males. (Laughter)

WARREN BUFFETT: I think you should dig yourself out of that by including females too, Charlie. (Laughs)

CHARLIE MUNGER: That wasn't Confucius's idea.

WARREN BUFFETT: Oh, OK. No reason why you can't modify it. (Laughs)

31. Future hopes for Berkshire

WARREN BUFFETT: OK. We'll have one more, and then we'll take a break and come back for the business meeting in a few minutes. Number 1.

AUDIENCE MEMBER: Mr. Buffett and Mr. Munger, my name is Cynthia Beeman (PH), and I'm from Atherton, California.

This is my question: what is your fondest hope for Berkshire Hathaway moving forward in time?

WARREN BUFFETT: Well, in a general way, I hope for two things — obviously, I hope for decent performance, and I hope that the culture we have is maintained, which is both shareholder-oriented and manager-oriented, and that we are regarding as the best home in the world for large, wonderful, family businesses.

And I think the performance and those two goals will be intertwined, in a way.

And I not only hope, but I fully expect, that what we've tried to build into Berkshire lives far beyond, you know, my tenure as CEO. And I think it will because, A, we've got the right candidates to succeed me.

And, beyond that, we have a board, we have a bunch of managers, that have all seen how well the system works. So I think that we have about as strong a culture as you could find in this country among American businesses.

And if that's continued, as I'm really sure it will be for a long, long, long time, I think we will get decent results. We won't get great results, because you can't get them from our size base.

But that's my hope — that people 20 years from now, if they have a fine business they've spent a couple of generations building, and they immediately think — if they have to sell it for some reason — they think Berkshire Hathaway is the place where we want the ownership of this business and we want — as managers, we want to continue working at that company for the rest of their lives.

And if we can achieve that, we'll have something fine for shareholders, and we'll have something fine for managers and owners of those businesses we buy.

Charlie?

CHARLIE MUNGER: Yeah. I would say that I would like to see Berkshire even more deserved to be an exemplar, and I would like to see it have more actual influence on changes in other corporations.

I think there are things that have happened here that will be useful to others.

WARREN BUFFETT: We'd also like it to have the oldest living managers, but that's a minor point. (Applause.)

WARREN BUFFETT: Thank you. Thank you. Thank you. Thanks.

32. Break before formal business meeting

WARREN BUFFETT: The — now what we'll do is we'll just break for five or so minutes, and then we'll reconvene and have the formal business meeting.

After that, at 4 o'clock, for the international visitors, those from outside of North America, we will — Charlie and I — will meet with them personally.

And I thank you all for coming. I hope you come back next year and bring your friends. Thank you. (Applause)

33. Formal business meeting

WARREN BUFFETT (in progress): — appropriate questions you may have concerning their firm's audit or the accounts at Berkshire.

Mr. Forrest Krutter, our secretary at Berkshire, he will make a written record of the proceedings.

Miss Becki Amick has been appointed inspector of elections at this meeting. She will certify to the count of votes cast in the election for directors.

The named proxy holders for this meeting are Walter Scott and Marc Hamburg.

Does the secretary have a report of the number of Berkshire shares outstanding, entitled to vote, and representative at the meeting?

FORREST KRUTTER: Yes, I do. As indicated in the proxy statement that accompanied the notice of this meeting that was sent to all shareholders of record on March 5, 2008, being the record date for this meeting, there 1,081,013 shares of Class A Berkshire Hathaway common stock outstanding with each share entitled to one vote on motions considered at the meeting, and 14,033,343 shares of Class B Berkshire Hathaway common stock outstanding with each share entitled to 1/200th of one vote on motions considered at the meeting.

Of that number, 883,428 Class A shares and 10,921,716 Class B shares are represented at this meeting by proxies returned through Thursday evening, May 1.

WARREN BUFFETT: Thank you. That number represents a quorum, and we'll therefore directly proceed with the meeting.

First order of business will be a reading of the minutes of the last meeting of shareholders. I recognize Mr. Walter Scott who will place a motion before the meeting.

WALTER SCOTT: I move that the reading of the minutes of the last meeting of the shareholders be dispensed with and the minutes be approved.

WARREN BUFFETT: Do I hear a second?

Barely, I hear a second. The motion has been moved and seconded. Are there any comments or questions? We will vote on this motion by voice vote. All those in favor say "aye."

VOICES: Aye.

WARREN BUFFETT: Opposed? The motion is carried.

34. Election of board of directors

WARREN BUFFETT: First item of business is to elect directors.

If a shareholder is present and wishes to withdraw a proxy previously sent in and vote in person on the election of directors, he or she may do so.

Also, if any shareholders are present who not turned in a proxy and desires a ballot in order to vote in person, you may do so.

If you wish to do this, please identify yourself to meeting officials in the aisles who will furnish a ballot to you. Would those persons desiring ballots please identify themselves so that we may distribute them.

I now recognize Mr. Walter Scott to place a motion before the meeting with respect to election of directors.

WALTER SCOTT: I move that Warren Buffett, Charles Munger, Howard Buffett, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Don Keough, Tom Murphy, Ron Olson, and Walter Scott be elected as directors.

WARREN BUFFETT: Is there a second to the motion? Somebody second the motion.

VOICE: Second.

WARREN BUFFETT: OK. It has been moved and seconded that Warren Buffett, Charles Munger, Howard Buffett, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Don Keough, Thomas Murphy, Ronald Olson, Walter Scott be elected as directors.

Are there any other nomination? Is there any discussion? The nominations are ready to be voted upon.

If there are any shareholders voting in person, they should now mark their ballots on the election of directors and allow the ballots to be delivered to the inspector of elections.

Would the proxy holders please also submit to the inspector of elections a ballot on the election of directors voting the proxies in accordance with the instructions they've received.

Miss Amick, when you're ready, you may give your report.

BECKI AMICK: My report is ready. The ballot of the proxy holders in response to proxies that were received through last Thursday evening cast not less than 935,155 votes for each nominee.

That number far exceeds a majority of the number of the total votes related to all Class A and Class B shares outstanding.

The certification required by Delaware law of the precise count of the votes, including the additional votes to be cast by the proxy holders in response to proxies delivered at this meeting, as well as any cast in person at this meeting, will be given to the secretary to be placed with the minutes of this meeting.

WARREN BUFFETT: Thank you, Miss Amick. Warren Buffett, Charles Munger, Howard Buffett, Susan Decker, William Gates, David Gottesman, Charlotte Guyman, Donald Keogh, Tom Murphy, Ronald Olson, Walter Scott have been elected as directors.

35. Formal business meeting adjourns

WARREN BUFFETT: Does anyone have any further business to come before this meeting before we adjourn?

If not, I recognize Mr. Scott to place a motion before the meeting.

WALTER SCOTT: I move this meeting be adjourned.

WARREN BUFFETT: Is there a second?

VOICES: Second.

WARREN BUFFETT: A motion to adjourn has been made and seconded. We will vote by voice. Is there any discussion? If not, all in favor, say “aye.”

VOICES: Aye.

Morning Session - 2009 Meeting

1. Q&A sessions starts

WARREN BUFFETT: Good morning. I'm Warren. The hyperkinetic fellow here is Charlie. (Laughter)

And we're going to go in just a minute to a question and answer section, at least a question section, that will be a little different than last year.

We have a panel — I can't see very well here — over to the right, of journalists who will ask questions and alternate with the people in the audience.

And we'll go back and forth. Got a little checklist here that we'll use as we go back and forth. Here we are. And we should have a pen here someplace to check things off.

2. Board of directors introduced

WARREN BUFFETT: But first, even though we'll have the formal meeting later on, I would like to introduce our directors. And if they would stand as I announce them and then remain standing until the end.

And if you'll just hold your applause until the end or even later if you wish — (laughter) — we'll recognize them. We'll have a meeting later on to elect them. But if you'll stand up. And like I say, you can't see very well here with the lights, but —

There's me and Charlie, we start off. And then Howard Buffett, Susan Decker, Bill Gates, Sandy Gottesman, Charlotte Guyman , Don Keough, Tom Murphy, Ron Olson, and Walter Scott. Those are the directors of Berkshire Hathaway. (Applause)

3. Money under your mattress beats Treasurys

WARREN BUFFETT: Now, we only have one slide, which actually is more than we would usually have. (Laughs)

And — but it does tell you something about what happened last year.

And it also acts as a commercial for our Nervous Nellie mattress with the famous night depository feature. (Laughter)

Last year — and have we got that up on the slide?

Last year, we wrote a ticket on December 19th. And we sold 5 million of Treasury bills. I hope you can see that. It's — we've got the December 19th circled up there.

And those Treasury bills came due, or were to come due, on April 29th of this year. So they were going to come due over four months later.

And the remarkable thing is, and this tells you about what an extraordinary year it was, is that we sold those $5 million of Treasury bills, which were going to pay off at $5 million on April 29th of 2009, in December of 2008 we sold them for five million and ninety dollars and seven cents.

In other words, if the person who bought those from us and paid us five million and ninety dollars, instead had bought the Nervous Nellie mattress and had put their money under the mattress, they would've been $90 better off at the end of four months, than by buying Treasury bills.

If the U.S. Treasury had just sold 5 trillion of these, they could've made an easy $90 million and Tim Geithner could've put the money under a Nervous Nellie mattress and we all would've been better off.

Negative yields on U.S. Treasury bills are really an extraordinary thing. You've got less on — less for your money from the U.S. Treasury than you got from sticking it under a mattress.

I'm not sure you'll see that again in your lifetime. But it's been a very extraordinary year.

4. Panel of journalists introduced

WARREN BUFFETT: We have with us, the journalists. We have Carol Loomis of Fortune. We have Becky Quick of CNBC. And we have Andrew Ross Sorkin of the New York Times.

They have received questions from shareholders all over the country. Andrew told me that he received a couple hundred just this morning.

And they have selected what they think are — they're all Berkshire Hathaway-related questions.

We were having a problem in recent annual meetings where we sort of drifted away from Berkshire, into the realm of what people's children had done in school recently and that sort of thing. (Laughter)

So we wanted to bring it back a little bit to Berkshire.

So they have selected among the best of the Berkshire-related questions that they've received. And we will go from — we will start with Carol Loomis. And we will go then to the audience.

We have 13 sections, 12 in this room, one in an overflow room. And we have selected the people in each of the audience sections by a raffle system, half an hour to an hour ago. And we'll go back and forth. And with that, we'll start it off with Carol.

5. Carol Loomis comments

CAROL LOOMIS: Good morning. I come first because Loomis outrakes — outranks — the others alphabetically. But this gives me a chance to just have a few sentences to tell you that — about the questions that we received.

We conferred this morning. Andrew definitely got more than any, either Becky or me. We got almost 5,000 questions, which I think even will surprise Warren. Because I don't think he knew that it'd run that high.

And the main thing I wanted to say is that an awfully lot of them were very good. And we had a real problem trying to get them down to the number that we're probably going to be able to ask. We don't even know what that is for sure.

But we want to apologize to anybody who sent us a Berkshire-related question, because we did have to cut out some because they weren't that, and whose question we didn't get asked. And maybe in another year, it will work.

6. Our stock index derivatives aren't dangerous

CAROL LOOMIS: So, my first question, "Warren and Charlie, Warren particularly.

"You have referred to derivatives, this is famous, as weapons — financial weapons — of mass destruction.

"In the 1964 movie, 'Dr. Strangelove,' Major T.J. Kong, nicknamed 'King' Kong and played by Slim Pickens, rides a weapon of mass destruction out of the bomb bay of his B-52.

"As a long-term Berkshire shareholder, I'm feeling a little like Slim today. I understand that despite the dramatic decline in the stock market, there is a good probability we could make money on our derivatives, taking into account the return on our premiums.

"But given the amount of accounting equity and statutory capital, and, I would argue, market value —" this is the questioner saying this — "that these derivatives have destroyed, at least temporarily, do you think these large derivative positions are appropriate for a highly-rated insurance company?

"And if so, you do you think you will be adding to these positions?"

WARREN BUFFETT: Yeah. I would say this. The questioner to some extent answers his own question.

I don't know whether he anticipates as strongly as I do that, net, these positions will make money.

But over — you know, our job is to make money over time at Berkshire Hathaway. It does not impinge on capital. We have arranged them so that the collateral posting requirements, which are one of the big dangers in the derivatives field, that we have very, very minimal exposure to that.

Even on March 31st, at a time when the market was down very substantially from when we entered into these transactions, we had posted collateral of a little less than 1 percent of our total marketable securities.

So they have no — they pose no — they pose problems to the world, generally. And that's why I referred to them on a macro basis, in the 2002 report, as being financial weapons of mass destruction.

But I also said in that report, that we use them in our own business regularly when we think they're mispriced.

And we think our shareholders are intelligent enough that if we explain the transactions, as we try to do in the annual report, and explain why we think we will make money — there's no guarantee we'll make money, but our expectancy is that we will make money — we think that as long as we explain them, that the financial consequences to our shareholders far outweigh any accounting consequences.

We explained in earlier reports that because of mark-to-market, that these things can swing billions of dollars as an accounting liability.

But the only cash that has taken place, for example, in our equity put options, we have received $4.9 billion roughly. And we hold that money. Originally, the terms of these were 15 to 20 years. So we have the use of $4.9 billion for 15 to 20 years.

And then markets have to be lower at that time than they were at the time of inception. So I personally think that the odds are extremely good that on the equity put options, we will make money.

I think on the high-yield index, credit default swaps we've written, I think that we will probably lose money before figuring the value of the money we've held.

Now, I told you a year ago, I thought we would make money on those. But we have run into far more bankruptcies in the last year than is normal.

We've, in effect, had a financial hurricane. We insure against natural hurricanes. And we insure against a financial hurricane. And we have been in a bit of a financial hurricane.

So I would expect those contracts, before investment income, would show a loss, and perhaps, after investment income. The bigger contracts are the equity put contracts. And I think the odds are very high that we make money on those.

Now, it would be nice if we were writing with current prices. But we probably couldn't write them without getting into collateral posting requirements now. So we have a very favorable position on those.

In fact, in the last week, we modified two equity put contracts, one that had a strike price of 1514. That has been reduced to 994 on the S&P 500. Now, we shortened it up eight years. But it still has about 10 years to run.

So merely for reducing the term from 18 years to about 10 years, we still have the use of the money for 10 years, we reduced the strike price from 1514 to 994.

So I think those are going to be very advantageous contracts. I think our shareholders are intelligent enough to, if they're explained properly, to realize how advantageous they are. And we'll continue to hold them. And we'll continue to explain them.

And they have no impact on our financial flexibility. And we are far more than an insurance company. I mean, we have earnings coming in from many areas. We have lots of cash sitting at the parent company. We have lots of cash in the subsidiaries. We have no significant debt maturities of any kind.

So we're ideally suited to hold this sort of instrument.

And Charlie, what would you say?

CHARLIE MUNGER: Well, I would agree with the questioner that there is some limit to the amount of those things we should do. But I think we stayed well short of the limit.

7. Financial literacy problem could help Berkshire

WARREN BUFFETT: OK, we'll go to zone 1.

AUDIENCE MEMBER: Hi. My name's Scott Slaybee (PH). I'm from Denver, Colorado.

First off, I'd like to thank Mr. Buffett and Mr. Munger for having us out here today. I appreciate you bringing us out here so thank you very much.

WARREN BUFFETT: And thank you.

AUDIENCE MEMBER: And it's great that you answer our questions.

I'm a former teacher. Or I'm a teacher. I shouldn't say former. Being a former teacher yourself, I see a problem with financial literacy with our future generations.

And I'm curious what you think future generations should know and if there's anything that needs to be in school curriculums to teach younger people financial literacy as we move forward?

WARREN BUFFETT: Yeah. I think there's a problem with financial literacy with our current generation. (Laughter)

There's a — Andy Heyward, who has helped us with the cartoon, has a — will have a — he sold his company last year, but he has a new company.

And he will have a program coming out that works on that question. And that I play a very small part in.

ABC has a program coming up with a number of well-known personalities in it that will deal with the question of financial literacy.

And it's, you know, it is a tough sell in a world of credit cards and, you know, a world that depends on calculators rather than people sitting down and doing actual arithmetic and all of that, to teach people. But in the end, I think we make progress over time. I mean, I hope our annual reports contribute to that sort of thing.

But you're going to have people doing very foolish things with money.

I remember on my honeymoon. I was 21 and my wife was 19. And we drove west. I'd never been west. And we went through Las Vegas. And it was 1952. And we stopped at the Flamingo. And people were better dressed in the casinos then.

And there were a bunch of Omaha fellows that actually owned part of the Flamingo at that time, terribly nice to us.

But I looked around at that casino and I saw all kinds of well-dressed people who had traveled thousands of miles to do something very dumb. And I thought this is a country where you're going to get very rich. (Laughter)

If people are going to get on a plane in New York and fly a couple thousand miles to stand there and do things with a mathematical expectation that's negative on every action they take, that is a world of opportunity. So — (Laughter)

I, you know, I recommend that you and — you work with your students. I started teaching at the University of Omaha, you know, when I was 21. And you work with your students to make them literate. And they will have a terrific advantage.

Charlie?

CHARLIE MUNGER: Well, a world where legalized gambling is now conducted by a great many states in the form of lotteries where people are encouraged to bet against the odds and a world where we have a vast overuse of high-cost credit card debt, it needs a lot more financial litery. I would argue — literacy.

I think we've been going in the wrong direction. So I don't think you can teach people high finance who can't use a credit card — (laughter) — intelligently.

WARREN BUFFETT: Yeah. If you're — I talk to students about that. If you're willing to pay 18 or 21 percent on a credit card —

And the credit cards companies need it, incidentally, currently, because you have losses running close to 10 percent. So with expenses, they may need that.

But there's no way that you're going to financially come out borrowing money at those kind of rates. And I wouldn't know how to do it. And it's too bad. On the other hand, it's probably good for our business.

I mean, one of — you know — we are looking for things that are mispriced. And the more people think that borrowing money on credit cards is intelligent, they probably will not think that doing long-term equity put contracts is intelligent. And we'll go our way and they'll go their way.

8. Buffett "commends" DC's response to credit crisis

WARREN BUFFETT: Becky?

BECKY QUICK: Warren, first of all, we've been asked to pass on a message that the attendance today is 35,000.

WARREN BUFFETT: Good. (Applause) Now —

BECKY QUICK: This —

WARREN BUFFETT: Now if they all just spend appropriately, it'll be a big day. (Laughter)

BECKY QUICK: This question comes from James Lewis (PH) from Logan, Ohio, who said it was OK to use his name and city.

He says, "One of the substantial investments of Berkshire is Wells Fargo. The chairman of Wells Fargo supposedly indicated that he did not want to take TARP funds from the federal government.

"He, furthermore, recently said that some of the programs of the federal government to reinvigorate the banks were asinine.

"Mr. Munger, do you agree with the chairman of Wells Fargo? And please explain why you do or do not agree. And Mr. Buffett, do you agree with Mr. Munger?" (Laughter)

WARREN BUFFETT: Yes. (Laughter)

CHARLIE MUNGER: When a government is reacting to the biggest financial crisis in 70 years, which threatens important values in the whole world, and the decisions are being made hurriedly and under pressure and with good faith, I think it's unreasonable to expect perfect agreement with all of one's own ideas.

I think the government is entitled to be judged more leniently when it's doing the best it can under trouble.

Of course, there's going to be some reactions that are foolish. And I happen to share one of the troubles of some of the Wells Fargo executives, in that I'm pretty blunt.

I happen to think that the accounting principle that says your earnings go up as your credit is destroyed — because if you had any money left, you could buy your own debt back at a discount — I happen to think that's insane accounting.

And I think the people who voted it into effect ought to be removed from the accounting board. So a man who talks like that has to have some sympathy with the people at Wells Fargo.

WARREN BUFFETT: He usually gets to hang them by their thumbs, but he held back this morning.

The government, in mid-September last year, really did — they were facing a situation that was as close to a total meltdown throughout the financial system as I think you can imagine.

You had a couple hundred billion dollars move out of money market funds in a couple of days. You had the commercial paper market freeze up, which meant that companies all over the country that had nothing to do with the financial world, basically, were going to have trouble meeting payrolls.

We were — we really were looking into the abyss at that time. And a lot of action was taken very promptly. And overall, I commend the actions that were taken.

So as Charlie says, to expect perfection out of people that are working 20-hour days and are getting hit from all sides by new information, bad information, that one weekend with Lehman going, AIG going, Merrill would've gone, in my view, unless the BofA had bought it.

I mean it was — when you're getting punched from all sides and you have to make policy and you have to think about congressional reaction and the American people's reaction, you know, you're not going to do everything perfectly.

But I think overall, they did a very, very good job.

I'm sympathetic — that remark was made by Dick Kovacevich, who came in second last year to Charlie in the plain speaking contest around the world. (Laughter)

And it's true that Dick Kovacevich was called on a Sunday at a little after noon, as I understand it, and told would be in Washington the next day at 1- or 2 o'clock, without being told what it was about.

And there were 11 bankers there and some officials. And they were told that they were going to take TARP money. And they were going to take loans from the government and preferred stock. And that they only had an hour or two to sign it and they didn't get to consult with boards.

But that's the nature of an emergency. You know, it — I think you — well, you're going to have some decisions that later can be looked back at and somebody will say, "I could've done it a little bit better." But, by and large, the authorities, in my view, did a very good job.

And all banks aren't alike by a long shot. And in our opinion, Wells Fargo is a — among the large banks particularly — it's a fabulous bank and has some advantages that the other banks don't have.

But in a time like that, you're not dealing in nuances.

Incidentally, I would recommend to all of you, that you go to the internet and read Jamie Dimon's letter to his shareholders. Jamie Dimon of JPMorgan Chase. It's a fabulous letter. It talks about a point that Charlie made there.

But it — Jamie did a great job of writing about what caused this and what might be done in the future. It's as good a shareholders letter that I've ever seen. So by all means, look it up. It's long, but it's worth reading.

9. Higher mathematics can be dangerous for investing

WARREN BUFFETT: OK, we'll go to area 2.

AUDIENCE MEMBER: Yeah, thank you, Mr. Buffett and Mr. Munger. My name's Rick Franklin (PH). I'm from St. Louis, Missouri. I'd like to follow up on the microphone 1's question on financial literacy. And my own question from two years ago on your discount rate.

But before I do that, I hope you'll indulge me. Torstol's (PH) wife, Rosemary Coons (PH), if you could come to section 222. I found your husband. (Laughter)

You can come to microphone 2, if that's easier.

WARREN BUFFETT: You get a little of everything here. (Laughter)

AUDIENCE MEMBER: So my question is, free cash flow: sell-side analysts like to do a 10-year discounted cash flow analysis with a terminal value.

Even some of the books written about your style — "The Warren Buffett Way", "Buffettology" — imply that you go through that exercise.

But I know you're famous for not using computers or calculators. I'm wondering if those type of exercises fall into the "too hard" file, and you just do a simple free cash flow — normalized free cash flow — over a discount rate?

And if you care to augment the answer with your numerical analysis of Coke, I'd appreciate that. (Laughter)

WARREN BUFFETT: Well, the answer is that investing — all investing is, is laying out cash now to get more cash back at a later date. Now, the question is how much do you get back, how sure are you of getting it, when do you get it? It goes back to Aesop's fables. You know, "A bird in the hand is worth two in the bush."

Now, that was said by Aesop in 600 B.C. He was a very smart man. He didn't know it was 600 B.C. But I mean, he couldn't know everything. (Laughter)

But the — but that's what's being taught in the finance — you got a Ph.D. now and you do it more complicated, and you don't say, "A bird in the hand is worth two in the bush," because you can't really impress the laity with that sort of thing.

But the real question is, how many birds are in the bush? You know you're laying out a bird today, the dollar. And then how many birds are in the bush? How sure are you they're in the bush? How many birds are in other bushes? What's the discount rate?

In other words, if interest rates are 20 percent, you got to get those two birds faster than if interest rates are 5 percent and so on.

That's what we do. I mean, we are looking at putting out cash now to get back more cash later on.

You mentioned that I don't use a computer or a calculator. If you need to use a computer or a calculator to make the calculation, you shouldn't buy it.

I mean, it should be so obvious that you don't have to carry it out to tenths of a percent or hundredths of the percent. It should scream at you.

So if you really need a calculator to figure out that it's — the discount rate is 9.6 percent instead of 9.8 percent — forget about the whole exercise. Just go onto something that shouts at you. And essentially, we look at every business that way.

But you're right, we do not make — we do not sit down with spreadsheets and do all that sort of thing. We just see something that obviously is better than anything else around, that we understand. And then we act.

And Charlie, do you want to add to that?

CHARLIE MUNGER: Well, I'd go further. I'd say some of the worst business decisions I've ever seen are those that are done with a lot of formal projections and discounts back.

Shell Oil Company did that when they bought the Belridge Oil Company. And they had all these engineers make all these elaborate figures.

And the trouble is you get to believe the figures. And it seems that the higher mathematics, with more false precision, should help you. But it doesn't.

The effects, averaged out, are negative when you try and formalize it to the degree you're talking about. They do that in business schools because, well, they got to do something. (Laughter and applause)

WARREN BUFFETT: There's a lot of truth to that. I mean, if you stand up in front of a class and you say, "A bird in the hand is worth two in the bush," you know, you're not going to get tenure. (Laughter)

It's very important if you're in the priesthood to look, at least, like you know a whole more lot more than the people you're preaching to.

And if you come down and just — if you're a priest, and you just hand down the 10 Commandments and you say, "This is it," and we'll all go home, you know, it just isn't the way to progress in the world.

So, the false precision that goes into saying that this is a two standard deviation event or this is a three standard deviation event, and therefore we can afford to take this much risk and all that, it's totally crazy.

I mean, you saw it with Long-Term Capital Management in 1998. You've seen it time and time and time again.

And it only happens to people with high IQs. You know, those of you who are — have 120 IQs are all safe. (Laughter)

But if you have a very high IQ, and you've learned all this stuff, you know, you feel you have to use it. And the markets are not that way.

The markets of mid-September last year, when people who ran huge institutions were wondering how they were going to get funding the next week, you know, that doesn't appear on a — you can't calculate the standard deviation with — that that arises at.

It's going to arise much more often than people think, in markets that are made by people that get scared and get greedy. And they don't observe the laws of flipping coins, it's — in terms of the distribution of results.

And it's a terrible mistake to think that mathematics will take you a long place in investing. You have to understand certain aspects of mathematics. But you don't have to understand higher mathematics.

And higher mathematics may actually be dangerous and it will lead you down pathways that are better left untrod.

10. Moody's wasn't alone in making mistakes

WARREN BUFFETT: OK. Andrew, one of those 200 questions from this morning? Or what are —

ANDREW ROSS SORKIN: This one's not from this morning, but it relates to Moody's. And we've probably received about 300 questions, at least, on this topic.

This question, which is representative of many, comes from Aaron Goldsmeizer (PH). And the question is the following:

"Given the role of rating agencies in the current economic crisis — their conflict of interest, their reliance on, quote, 'flawed history-based models,' as you described in this year's letter to shareholders, and the likelihood that a loss of credibility and/or regulatory reforms could force drastic changes in their business models or earning streams — why do you retain such a large holding in Moody's?

"And more important, why didn't you use your stake to try to do something to prevent conflicts of interest and reliance on these flawed history-based models?"

WARREN BUFFETT: Yeah, I don't think the conflict of interest question was the — was the biggest —by anywhere close to the major cause of the shortcomings of the rating agencies in foreseeing what would happen with CDOs and CNBSs and all sorts of instruments like that.

Basically, five years ago, virtually everybody in the country had this model in their mind, formal or otherwise, that house prices could not fall significantly.

They were wrong. Congress was wrong. Bankers were wrong. People that bought the instruments were wrong. Lenders — the borrowers were wrong.

But people thought that if they were going to buy a house next year, they better buy it this year because it was going to be selling for more money the following year.

And people who lent them money said it doesn't make any difference if they're lying on their application or they don't have the income because houses go up, and if we have to foreclose we won't lose that much money. And besides, they can probably refinance next year and pay.

So there was an almost total belief — and there was always a few people that disagreed — but there was almost a total belief throughout the country that house prices would certainly not fall significantly, and that they would probably keep rising.

And the people at the rating agencies, one way or another, built that into their system.

And I don't — I really don't I think it was primarily the payment system that created the problem. I think they just didn't understand the various possibilities of what could happen in a market— or in a bubble, really — where people leveraged up enormously on the biggest asset that most Americans possess, their house.

And so you had a $20 trillion asset class in a $50 trillion of total assets of American families that got leveraged up very high. And then once it started melting down, it had self-reinforcing aspects on the downside.

So I say that they made a major mistake in terms of analyzing the instruments. But they made a mistake that a great, great, great many people made.

And that probably if they had taken a different view of residential mortgages four or five years ago, they would've been answering to Congressional committees that would be saying, "How can you be so un-American as to deny all these people the right to buy houses simply because you won't rate these securities higher?"

So I — they made a huge mistake. But the American people made a huge mistake. Congress made a huge mistake.

Congress presided over the two largest mortgage companies. And they were their creatures. And they were supervised by them. And, you know, they're both in conservatorship now.

So I don't think they were unique in their inability to spot what was coming.

In terms of us influencing their behavior, I don't think I've ever made a call to Moody's.

But it's also true that I haven't made it to, or made — maybe made one or two — to other companies in which we're involved.

I mean, we don't tell, you know, the Burlington Northern what safety procedures to put in.

We don't tell American Express who to cut off on credit cards and, you know, what they're — who they should lend to and who they shouldn't.

We are — when we own stock, we are not there to try and change people.

Our luck in changing them is very low, anyway. In fact, Charlie and I have been on boards of directors where we're the largest shareholders. And we've had very little luck in changing behavior.

So, we think that if you buy stock in a company, you know, you better not count on the fact that you're going to change their course of action.

And in terms of selling the stock, the odds are that the rating agency business is probably still a good business. It is subject to attack. And who knows where that leads? And who knows what Congress does about it?

But it's a business with very few people in it. It's a business that affects a large segment of the economy. I mean, the capital markets are huge. I think there will probably be rating agencies in the future. And I think that it's a business that doesn't require capital. So it has the fundamentals of a pretty good business.

It won't be doing the volume in the next — probably for a long time in certain areas of the capital markets. But capital markets are going to grow over time.

We have said in this meeting in the past, many times, that Charlie and I don't pay any attention to ratings. I mean, we don't believe in outsourcing investment decisions.

So we — if we buy a bond, the rating is immaterial to us, except to the extent if we think it's rated more poorly than it should, it may help us buy it at an attractive price.

But we do not think that the people at Moody's, or Standard and Poor's, or Fitch, or anyplace else, should be telling us the credit rating of a company. We figure that out for ourselves. And sometimes we disagree with the market in a major way. And we've made some money that way.

Charlie?

CHARLIE MUNGER: Yeah, I think the rating agencies, being good at doing mathematical calculations, eagerly sought stupid assumptions that enabled them to do clever mathematics. It's an example of being too smart for your own good.

There's an old saying, "To a man with hammer, every problem looks pretty much like a nail." And that's — (laughter) — what happened in the rating agencies.

WARREN BUFFETT: Yeah, the interesting things about all those triple-As, is the people that created them ended up owning a lot of them. So they believed their own baloney, themselves. Every — the belief was enormous.

So you had these people stirring up the Kool-Aid and then they drank it themselves. And they — (laughter) — you know, they paid a big penalty for it. But I don't think it was — I think it was stupidity and the fact that everybody else was doing it.

I send out a letter to our managers, only every couple of years. But the one reason you can't give at Berkshire, as far as I'm concerned, for any action, is that everybody else is doing it.

You know, and just — if that's the best you can come with, you know, something's wrong. But that happens in security markets all the time.

And of course, it's — when Charlie and I were at Salomon or someplace like that, it's very difficult to tell a huge organization that you shouldn't be doing something that people, well-regarded competitors, are doing. And particularly when there's a lot of money in it.

And so it's very hard to stop these things once you get sort of a industry acceptance of behavior. And you know, we were very unsuccessful, Charlie and I, at Salomon at saying, "Well, we just don't want to do this sort of thing."

We couldn't even get them — initially, when we got in there at first, they were doing business with Marc Rich. And we said, "Let's stop doing business with Marc Rich."

You know, that's like saying in the '30s, "Let's stop doing business with Al Capone," or something. And they said, "But it's good business. If he doesn't do it with us, he'll do it with somebody else." And they felt that way. And I think we won that one. But it wasn't easy.

You remember that, Charlie?

CHARLIE MUNGER: I certainly do.

11. Housing markets are beginning to improve

WARREN BUFFETT: OK, we'll go to area 3. (Laughter)

OK, zone 3, are we on?

AUDIENCE MEMBER: I'm Laurie Gould (PH) from Berkeley, California.

Where do you see the residential real estate market headed nationally, particularly in California, over the next year or two?

WARREN BUFFETT: Well, we don't know what real estate is going to do. We didn't know what it was going to do a few years ago. We thought it was getting kind of dangerous in certain ways. But it's very hard to tell.

I would say this. From what we're — from what I'm seeing, and I do see a lot of data — there's — and California, incidentally, is a very big — I mean, there are many markets within California. Stockton is going to be different than San Francisco and so on.

But, in the last few months, you've seen a real pickup in activity, although at much lower prices. But you've seen — I think you've seen something in the medium- to lower-priced houses. And medium means a different thing in California than it does in Nebraska.

But you've seen, in maybe $750,000 and under houses, you've seen a real pickup in activity, many more bidders. You haven't seen it bounce back in price. Prices are down significantly and it varies by the area.

But it looks as if — you know, you had a foreclosure moratorium for a while. And so get into distortions because of that.

But what it looks like, looking at our real estate brokerage data — and we have the largest real estate brokerage firm in Southern California, in Orange County, Los Angeles County, and San Diego in Prudential of California that's owned by MidAmerican — we see something close, I would say, to stability at these much-reduced prices in the medium to lower group.

If you've got a $5 million or $3 million house, that still looks like a very — erratic — it's a market in which there still isn't a lot of activity.

But in the lower levels, there's plenty of activity now. Houses are moving. Interest rates, of course, are down so it's much easier to make the payments.

The mortgages being put on the books every day in California, are much better than, you know, the mix that you had a few years earlier.

So it's improving. And I don't know what it'll do next month or three months from now.

The housing situation is pretty much this way. You can look at it this way.

We create about 1,300,000 or so households a year. It bounces around some. But — and it tends to — in a recession, it tends to be fewer because people postpone matrimony and so on to some extent.

But if there's 1,300,000 households created in a year and you create two million housing starts annually, you are going to run into trouble. And that's what we did. We just created more houses than the demand was — the fundamental demand — was going to absorb.

So we created an excess of houses. How much excess is there now? Perhaps a million and a half units. We were building two million units a year. That's down to 500,000 units a year.

Now, if you create 500,000 units a year and you have a 1,300,000 households created, you are going to absorb the excess supply.

It will be very uneven around the country. South Florida's going to be tough for a long, long time. So it isn't like you can move a house from one place to another if there's demand in one place and not another.

But we are eating up an excess inventory now. And we're probably eating it up at the rate of 7- or 800,000 units a year. And if we have a million and a half excess, that takes a couple of years. There's no getting away from it.

You have three choices. You could blow up a million and a half houses, you know. And if they do that, I hope they blow up yours and not mine, but that's a — (Laughter)

We could get rid of it. We could try to create more households. We could have 14-year-olds start getting married and having kids, and — (Laughter)

Or we can produce less than the natural demand increase. And that's what we're doing now.

And we're going to eat up the inventory. And you can't do it in a day. And you can't do it in a week. But it will get done.

And when it gets done, then you'll have a stabilization in pricings. And then you will create the demand for more housing starts. And then you go back up to a million and a quarter, and then our insulation business and our carpet business and our brick business will all get better.

Exactly when that happens nobody knows. But it will happen.

Charlie?

CHARLIE MUNGER: Oh, I think in a place like Omaha, which never had a really crazy boom in terms of housing prices, with interest rates so low if you've got good credit, that if I were a young person wanting a house in Omaha, I would buy it tomorrow. (Applause)

WARREN BUFFETT: We own the largest real estate brokerage firm in Omaha. So — (laughter) — Charlie will be — if he qualifies, we will give him a mortgage application.

If is true that 4 1/2 million houses will change hands. There's about 80 million houses in the country. Twenty-five million of those do not have a mortgage. About a third of the houses in the country do not have a mortgage. You've got about 55 million, or a little less, that have a mortgage. And five or six million of those are in trouble one way or another.

But we're selling 4 1/2 million houses every day. And by and large, they're going into stronger hands. The mortgages are more affordable. The down payments are higher. We're — the situation is getting corrected.

But it wasn't created in a day or a week or a month. And it's not going to get solved in a day or a week or a month. We are on the road to solution.

12. 2008 wasn't great for investment manager candidates

WARREN BUFFETT: OK, Carol?

CAROL LOOMIS: Perhaps I should have said one other thing at the beginning. Those of you who read the annual report carefully know that Charlie and Warren were to be given no clue as to what any of the three of us were going to ask. So don't think that they have gotten a little list. They have seen nothing.

This question, I got many versions of this question. This one happened to come from Jonathan Grant of New York City. It concerns the four investment managers you have said are in the wings as possible successors to you.

"Can you please tell us, without naming names, but preferably in both quantitative and qualitative terms, how each of the four did in 2008 with the money they are managing — they were managing — for their clients.

"You said you hoped to pick people who would be able to anticipate things that had never occurred before. While the world has seen credit crises before, there were a lot of things that happened in 2008, especially in the last few months of the year, that few were predicting and that you, yourself, have described as almost unprecedented.

"How would you rate the way that these managers — these four managers — did in managing against these low-probability risks? Are all four still on the list?

WARREN BUFFETT: Well, the answer is all four are still on the list. Let me just make one point first, though, because it got misreported a little bit.

We have three candidates for the CEO position. And this is always a major subject of discussion at our director's meetings. All of them are internal candidates. You should know that.

That's been said before. But it got misreported here once or twice. And it got confused, I think, because of the four possibilities for the investment job. And you could have all four come to work for us in that case.

We won't have three CEOs or two CEOs. But we might have multiple investment managers after I'm not around. Or we might just have one. That would be up to the board at that time.

They are both inside and outside the organization. And we don't preclude anything in terms of where they come from. So we could have a whole big list from outside the organization.

That will not be true about the CEO position. The person that follows me will come from within Berkshire Hathaway.

The four, I don't have precise figures from them, although I've got a fair amount of information on some of them. I would say they did no better than match the S&P last year, which was minus 37 after adding back dividends.

So I would say that in terms of 2008, by itself, you would not say that they covered themselves with glory. But I didn't cover myself with glory, either. So I'm very tolerant of that in 2008. (Laughter) They —

Charlie, you know some of the records pretty well. Wouldn't you say that's true?

CHARLIE MUNGER: Yeah. What's interesting to me is that practically every investment manager that I know of in America, and regard as intelligent and disciplined and with a unusual record of past success, they all got creamed last year. (Scattered laughter)

WARREN BUFFETT: The group — I don't hear a lot of laughter about that. (Laughter)

I think you're hitting a nerve out there, Charlie.

The four have a better-than-average record over time. If you'd asked me at the start of the year, if you'd said, "There's going to be a minus 37 percent year, will this group do better than average?" I would've said yes.

But I think I would've been wrong. And like I said, I haven't got audit returns from every one of them. But I would say I would be wrong.

I would say that their record over 10 years has been, in each case, has been anywhere from modestly to significantly better than average. And I'd be willing to be that would be the case over the next 10 years.

But certainly, last year, you know, there were a lot of things that didn't work. And our group was not exempt from them.

I have not changed the list. That doesn't mean that we're always looking with the idea of finding more people to add to it.

And as opposed to the CEO job, you know, if I dropped dead tonight, the board needs to put somebody in as a CEO tomorrow morning. And they will do so. And they know who it is. And they feel very good about it.

Not too good, I hope, but — (Laughter)

But on the investment officers — one or more, and it could easily be more — they don't need to do something the next day or the next week.

I mean, the portfolio isn't — everything doesn't stop because of that. So that can be a somewhat more leisurely decision they'll have. And it will be made, in an important way, in consultation and agreement with the new CEO.

So that is something that you shouldn't expect the next day to hear an announcement on the investment managers. But you should expect to hear, you know, within a month or something like that.

CHARLIE MUNGER: I don't think we would want a manager who thought he could just go to cash based on macroeconomic notions and then hop back in when it was no longer advantageous to be in cash. Since we can't do that ourselves —

WARREN BUFFETT: Yeah, we think it's impossible if we can't do it ourselves.

CHARLIE MUNGER: Yeah, right. (Laughs)

So we're not looking for a type who went to cash totally.

WARREN BUFFETT: Yeah, that would — in fact, we would leave out anybody that did that.

CHARLIE MUNGER: Yeah, we would exclude them.

WARREN BUFFETT: Yeah. That —

CHARLIE MUNGER: They're not dumb enough for us. (Laughter)

13. Munger expects public/private hybrid health care system

WARREN BUFFETT: OK, let's go to zone 4.

AUDIENCE MEMBER: Hi, Mr. Buffett, Mr. Munger. My name is Vern Cushenbery. I'm from Overland Park, Kansas.

I wonder if you might share your thoughts on the likelihood of a nationalized health care system, what that might look like and the effects on your portfolio?

WARREN BUFFETT: Well, I'm going to let Charlie answer that one since I don't know how to. (Laughs)

CHARLIE MUNGER: Personally, I think something more like Europe will come to the United States in due course. And I think it'll be supplemented by a private system, which is the equivalent of private school competition for public education.

And, although I'm a Republican, I'm not horrified by that probable development. Personally, I wish they'd put it off for a year while we solve the economic problems. (Applause)

WARREN BUFFETT: And I would say that in terms of its impact on Berkshire, you know, we have a broad cross section of companies — we have 246,000 people working for us — that we will adjust, like American business generally will adjust, to any developments along that line.

It won't pose special problems for us. It won't offer us special opportunities. We'll see what the national sentiment is, as expressed through Congress. And we'll behave accordingly.

14. Why we're not training or naming our next CEO

WARREN BUFFETT: Becky?

BECKY QUICK: This is a question that follows up on the succession question. This one is a, in particularly, though, addressed to the three candidates for CEO. It comes from Irving Fenster who writes:

"Running Berkshire is very complex and complicated. Give us some insight for your reluctance to bring in your replacement to give him the benefit of your training, instead of his having to tackle the myriad of problems of the transition on his own.

“The benefits for Berkshire, your replacement, and you, are so compelling your reluctance is puzzling. Having him on board may relieve some of the stress on you and help add many, many more years of good health for you.”

WARREN BUFFETT: Irving is a friend of mine in Oklahoma. Went in in my partnership 40 years ago, Irving and Irene. And he’s been writing me on this for 30 or 40 years. And he’s had — (laughter) — he’s had no luck with me. So he decided to write Becky, apparently. (Laughter)

If we had a good way to inject somebody into some role that was — would make them a better CEO of Berkshire, we would try it.

But the truth is that the candidates we have are running businesses. They’re making capital allocation decisions. They’re doing things every day of an operating nature. And these are major businesses.

And to sit around headquarters while I’m sitting in there reading and on the phone and, you know, who knows what else, they — it — there just is — there wouldn’t be anything to do.

I mean, we could meet every hour. You know, I could say, “Here’s what I’m thinking about now. What do you think about this?” and — (Laughter)

It’d be a waste of talent. It’d be ridiculous.

And Irving has this notion that somehow, that they would be absorbing all these things that I’m doing. I just throw The Wall Street Journal to him after I’m done reading it, and I’d throw him The New York Times and I’d throw him the FT. (Laughs)

And these are people that know how to run big businesses. They run businesses that make many, many, many millions, or even billions, of dollars.

So, they are ready for the job right now. I wouldn’t be happy unless we have — they are 100 percent ready. They know how to allocate capital.

The biggest job they’ll have is the fact that they will have to develop relationships with potential sellers of businesses, with the world, generally, with you, the shareholders, with other managers. That takes some time, not an extraordinary time.

But that — you know, they will have to become acquainted with people. But — different constituencies. But that — there’s, you know, that is nothing that really needs to be hastened along. It’s nothing terribly important.

I mean, they know how to run businesses. And they would do many things much better than I would. The biggest — probably the biggest challenge, because we have all of those talented managers that you saw during the movie.

And those people have different styles. And they have different needs to some degree. They have different ways of operating. They're all successes.

But you know, some of them bat left-handed. Some of them bat right-handed. Some of them stand deep in the box. You know, some of them crowd the plate. I mean, they all have a little bit of variation. But they all hit terrifically.

And for the CEO of Berkshire, it does require some knowledge of the individual personalities. And which ones like to run by themselves totally and which ones like to check in occasionally and all that.

But that is no reason to take a talent that's now running a business very successfully and building value and to have them sit in an office next to me and have us chew over the day's events.

I mean, Charlie and I worked together now for decades. And I've learned a lot from Charlie. But I haven't done it by, you know, having him sit next door and have hourly meetings or anything of the sort.

What do you think, Charlie?

CHARLIE MUNGER: Well, I think, averaged out, you're more likely to be qualified to be a CEO by running a subsidiary with an enormous amount of discretion than you are to being around headquarters watching somebody else do it his way.

A lot of the models that have worked well in the world, like Johnson & Johnson, are quite Berkshire-like, in that they're decentralized and they let these people pop up from the subsidiaries. They don't try and just create CEOs in a hothouse in headquarters.

WARREN BUFFETT: We have an unusual situation at Berkshire that most of the people at the top, virtually all of them, are doing what they want to do. I mean, they like running their businesses.

That's what they came in expecting to do. And that's what they're doing, and we're letting them do it the way they like to do it.

And so we don't have 50 people that all think they're on some pyramid to get to the top. And Irving would like me to name — he's talked to me about it. He would like to me name who it would be. But that could change in the future. It could create some possible —

Well, we saw it at General Electric, I mean, when Jeff Immelt got appointed from among three, the other two left. And I don't really see any advantage in having some crowned prince around. But Irving will keep writing me, I can promise you that. (Laughter)

15. Buffett's business school: only two courses

WARREN BUFFETT: OK, zone 5.

AUDIENCE MEMBER: Hi, Warren. That's a little loud, sorry. Hi. My name's Sarah. And I'm from Omaha, Nebraska.

I'd like to know if you could explain your strategies, namely value investing, in regards to cultivating the next generation of investors. How will you teach this young group?

WARREN BUFFETT: Well, I had 49 — mostly universities, a few colleges — that came to Omaha this year. We do them in clumps of six. And then the last one, we had an added university. So we had eight sessions, full-day sessions.

And they asked me what — sometimes they asked me what I'd do if I was running a business school, teaching investments.

And I'd tell them I'd only have two courses. One would be how to value a business, and the second would be how to think about markets.

And there wouldn't be anything about modern portfolio theory or beta or efficient markets or anything like that. We'd get rid of that in the first 10 minutes. The —

But if you know how to value a business — and you don't have to know how to value all businesses. On the New York Stock Exchange, I don't know, there's 4- or 5,000, probably, businesses and a whole lot more on NASDAQ.

You don't have to be right on 4,000 or 5,000. You don't have to be right on 400. You don't have to be right on 40.

You just have to stay within the circle of competence, the things that you can understand. And look for things that are selling for less than they're worth, of the ones you can value.

And you can start out with a fairly small circle of competence and learn more about businesses as you go along.

But you'll learn that there are a whole bunch of them that simply don't lend themselves to valuations and you forget about those.

And I think if — accounting helps you in that, you need to understand accounting to know the language of business, but accounting also has enormous limitations. And you have to learn enough to know what accounting is meaningful and when you have to ignore certain aspects of accounting.

You have to understand when competitive advantages are durable and when they're fleeting.

I mean, you have to learn the difference between a hula hoop company, you know, and Coca-Cola. But that isn't too hard to do.

And then you have to know how to think about market fluctuations and really learn that the market is there to serve you rather than to instruct you.

And to a great extent, that is not a matter of IQ. If you have — if you're in the investment business and you have a IQ of 150, sell 30 points to somebody else, 'cause you don't need it.

I mean, it — (laughter) — you need to be reasonably intelligent. But you do not need to be a genius, you know. At all. In fact, it can hurt.

But you do have to have an emotional stability. You have to have sort of an inner peace about your decisions. Because it is a game where you get subjected to minute-by-minute stimuli, where people are offering opinions all the time.

You have to be able to think for yourself. And, I don't know whether — I don't know how much of that's innate and how much can be taught.

But if you have that quality, you'll do very well in investing if you spend some time at it. Learn something about valuing businesses.

It's not a complicated game. As I say — said many times — it's simple, but not easy.

It is not a complicated game. You don't have to understand higher math. You don't — you know, you don't have to understand law. There's all kinds of things that you don't have to be good at. There's all kinds of jobs in this world that are much tougher.

But you do have to have sort of an emotional stability that will take you through almost anything. And then you'll make good investment decisions over time.

Charlie?

CHARLIE MUNGER: Yeah, you do have the basic problem that exactly half of the future investors of the world are going to be in the bottom 50 percent.

In other words — (laughter) — you're always going to have more skill at the top than you have at the bottom. And you're never going to be able to homogenize the investment expertise of the world.

There is so much that's false and nutty in modern investment practice, and in modern investment banking, and in modern academia in the business schools, even in the Economics departments, that if you just reduce the nonsense, that's all I think you should reasonably hope for.

WARREN BUFFETT: Beyond a certain basic level, though, of skill, wouldn't you say your emotional make-up's more important than the — than some super high degree of skill?

CHARLIE MUNGER: Absolutely. And if you think your talent — if you think your IQ is 160 and it's 150, you're a disaster. (Laughter)

You know, much better a guy with a 130 that's operating well within himself.

WARREN BUFFETT: I get to see the students that come by. I loved a fellow from the University of Chicago, one of the students. And the first question that was asked of me was, "What are we learning that's most wrong?" That's the kind of — I mean, I wish they'd ask that sort of thing of the panel here.

CHARLIE MUNGER: How do you handle that in one session?

WARREN BUFFETT: Yeah. (Laughter)

But it was holy writ 25 years ago, efficient market theory. You know, I never understood how you could even teach it.

I mean, if you walked in in the first five minutes, you said to the students, "Everything is priced properly," I mean, how do you kill the rest of the hour?

But — (Laughter) — they did it. And they got Ph.D.s for doing it well. You know, and the more Greek symbols they could work into their, you know, their writings, you know, the more they were revered.

It's astounding to me and I — that may have even given me a jaundiced view of academia generally — is the degree to which ideas that are nutty take hold and get propagated.

And then I read a quote the other day that may have partially explained it. Max Planck was talking, the famous physicist.

Max Planck was talking about the resistance of the human mind, even the bright human mind, to new ideas. And particularly the ones that had been developed carefully over many years, and were blessed by others of stature, and so on.

And he said, "Science advances one funeral at a time." And I think there's a lot of truth to that. Certainly been true in the world of finance.

16. Ajit Jain's successor won't have the same broad authority

WARREN BUFFETT: OK, Andrew?

ANDREW ROSS SORKIN: OK. We have a succession question. However, this one has a twist, coming from Ben Knoll.

“You famously said, quote, ‘You should invest in businesses that a fool can run, because someday a fool will.’ (Laughter)

“Given your reinsurance company’s capacity and inclination for big financial bets, can you provide us more reassurance about the risk once Ajit is gone?

“Do you have a succession plan for him?”

Ben says, “The Titanic-like ending at AIG, once Greenberg was gone, has me spooked.”

WARREN BUFFETT: Yeah, I would say that it would be impossible to replace Ajit. And we wouldn’t try. And, therefore, we wouldn’t give the latitude, in terms of size of risk or that sort of thing, that we give to Ajit.

No, we’ve got a unique talent, in my view there, and I think in Charlie’s. And so, when you get somebody like that, you give enormous authority to them after you firmly establish in your mind that that’s who you’re dealing with.

But that doesn’t mean that the authority goes with the position. The authority goes with the individual. And we would not — giving your pen away in insurance, as they say, is extraordinary dangerous.

And we have in this town, we have Mutual of Omaha, which in the 1980s, had been built up carefully over, probably, 75 years by that time, and become the largest health and accident association in the world, I believe.

And they got the idea that they should be writing property-casualty reinsurance. So they gave a pen to somebody within the place. And probably nobody had even heard the guy’s name, you know.

And in just signing a few contracts, they lost half their net worth in a very short period of time. And they were worried that they might have lost more than that.

So you can do enormous damage in the insurance business with a pen. And you’d better — have to be very careful about who you give your pen to. And we’ve given our pen to Ajit in a way that we wouldn’t give it to anyone else.

Now, it just so happens that I enjoy hearing about the kind of things he does. So we talk daily. But we don't talk daily because he needs my approval on anything. We talk daily because I find it very interesting.

When he says, "How much should we charge to insure Mike Tyson's life for a couple of years?" I mean, that's the kind of thing I can get kind of interested in. I — (Laughter)

I asked him whether there was an exclusion in case he got shot by a woman that felt unhappy about her treatment or something, but —

And it makes a difference in the price, but —

I enjoy that sort of thing. But I'm not needed. And Ajit is needed. And we won't find a substitute for him. And you know, there's some things that have to be faced that way.

Charlie?

CHARLIE MUNGER: Yeah. What that quotation indicates is sometimes, stated differently, you say if it won't stand a little mismanagement it's not much of a business. Of course, you prefer a business that will prosper pretty well, even if it's not managed very well.

But that doesn't mean you don't like even better when you get such a business that's managed magnificently. And both factors are quite important.

We're not looking for mismanagement. We like the capacity to stand it, if we stumble into it. But we're not looking for it.

WARREN BUFFETT: Yeah, we will not do things that we think are — we will not assign tasks to people that we think are beyond their capabilities. And it just so happens that Ajit has enormous capabilities.

So he gets assigned some very unusual things. But you don't see that prevailing throughout our insurance operation. And our managers don't expect to operate that way.

That's a one-off situation with Ajit. And he's in good health. And, you know, we send him all the Cherry Coke or fudge that he wants. (Laughter)

17. Berkshire was "cheaper" at the end of 2008

WARREN BUFFETT: OK, area 6. I recommend this fudge, incidentally. It's terrific. I'm having a good time. (Laughter)

AUDIENCE MEMBER: Good morning. I'm Steve Fulton (PH) from Louisville, Kentucky. I gave up box tickets to the Kentucky Derby this afternoon to come out and ask you this question. Thank you for this opportunity.

My question relates to how you view, or what your view is of the market's valuation of Berkshire's shares.

You commonly comment that Berkshire has two primary components of value: the investments that they own — the stocks, the bonds, and similar — and the earnings from the non-insurance operating companies that you've got.

And when you compare 2007 to 2008, the investments were down about 13 percent. And the earnings were down about 4 percent. But the value that the market was placing on the shares was down about 31 percent. And I was curious as to your comments on that valuation.

WARREN BUFFETT: Yeah, well, I think you put your finger on something.

We do think that the — we think, obviously, the investments are worth what they're carried for, or we wouldn't own them.

In fact, we think they're worth more money than they're carried for at any given time because we think, on balance, they're underpriced. So we have no problem with that number.

We define our earning power — we leave out insurance underwriting profit or loss, on the theory that insurance is — if it breaks even — will give us float, which we will invest. And on balance, I actually think that insurance probably will produce some underwriting profit. So I think we even understate it a little bit in that respect.

But we think the earning power of those businesses was not as good last year as normal. It won't be as good this year as normal.

But we think those are pretty good businesses overall. A few of them have got problems. And — but most of them will do well. And I think a few of them will do sensationally.

So, I think it's perfectly reasonable to look at Berkshire as the sum of two parts. A lot of liquid marketable securities — or maybe not so liquid, but at least fairly priced, or maybe even undervalued, securities — and a lot of earning power, which we are going to try and increase over time.

And if you look at it that way, you would come to the conclusion that Berkshire was cheaper in relation to its intrinsic value at the end of 2008 than it was at the end of 2007. But you would also come to the conclusion that was true of most securities. In other words, the whole level of securities.

And every stock is affected by what every other stock sells for. I mean, if the value of ABC stock goes down, XYZ, absent any other variables, but XYZ is worth less.

If you can buy stocks at eight times earnings, good companies, you know, or nine times earnings, you know, they — it reduces the value of Berkshire, as opposed to when stocks were selling, well, at 18 or 20 times earnings. I'm pulling those numbers out of the air.

But everything is affected by everything else in the financial world.

When you say a bird in the hand is worth two in the bush, you're comparing it — you've got to compare that to every other bush that's available.

So, you're correct that Berkshire was cheaper in relation to intrinsic value at the end of 2008, than 2007, at least in my opinion.

And that that those two variables will count. We'll report them to you regularly. And over time, we would hope that both increase.

And we particularly hope the operating earnings aspect increases, because that's our major focus. We would like to move money into good operating businesses over time and build that number a lot.

Charlie?

CHARLIE MUNGER: Well, I would argue that last year was a bad year for a float business. It was naturally going to make the owner of the float appear, briefly, to be at a disadvantage.

But long-term, having a large float, which you're getting at a cost of less than zero, is going to be a big advantage. And I wouldn't get too excited about the fact that the stock goes down.

I happen to know that there was one buyer there who rather inartistically bought about 10,000 shares when Berkshire was driven to its absolute peak. And how much significance does that have in the big scheme of things over the long term?

What matters are things like this: our casualty insurance business is probably the best big casualty business in the world — our utility subsidiary, well, if there's a better one, I don't know it — and if I had to bet on one carbide cutting tool business in the world, I'd bet on ISCAR against any other comer.

And I could go down the list a long way. I think those things are going to matter greatly over the long term. And if you think that it's easy to get in that kind of a position, the kind of position that Berkshire occupies, you are living in a different world from the one I inhabit. (Applause)

WARREN BUFFETT: Yeah, our insurance business now, it is a remarkable business. And it's got some remarkable managers.

18. How GEICO benefited from the financial crisis

WARREN BUFFETT: There's one interesting thing that's happened. In September, when we had a financial meltdown and, really, almost the ultimate — it was almost the China Syndrome-type thing — Americans started behaving differently.

Probably people around the world, but I certainly know in terms of our businesses, it was like a bell had been rung. And one manifestation of it was kind of interesting.

Whereas it hurt very much our jewelry business, our carpet business, it hurt NetJets, it hurt all the businesses. Hurt American Express, for example. You know, the average ticket went down almost 10 percent.

I mean, it just was like that, that people's behavior changed. But one of the things it did, was it also caused the phones to start ringing even more at GEICO.

And we didn't change our advertising, particularly. Our price advantage, relative to other companies, didn't change that much. But all of a sudden, just — it was remarkable. Thousands and thousands and thousands of more people came to our website or phoned us every week.

So, it — all of a sudden, saving $100 or $150 or whatever it might be, became important. Not only the people who were watching our ads that day, but just with the people that it was lurking in the back of their minds. They went to geico.com.

So in the first four months of this year — last year, we added about 665,000 policy holders. That's a lot of people. It made us, by far, the fastest growing auto insurer among the big companies.

First four months of this year, we've added 505,000 in four months. It's the behavioral changes. And that franchise, that competitive advantage, has been built up over decades.

And Tony Nicely has nurtured it like nobody else could, just day after day, office after office, associate after associate. But then it just pays off huge when the time comes.

Because we can — we are the low-cost producer among big auto insurance companies. That means we can offer the best value. And now people are value conscious.

So these things are going on all the time with our subsidiaries, with those managers. And it's — it builds a lot of value over time.

I mean, every GEICO policy holder is a real asset to the company. I could give you an estimated value. But I don't think it'd necessarily be smart. But they're worth real money.

And, we are now the third largest auto insurer in the country. I think we'll end up the year maybe at 8 1/2 percent of the market.

And it was 2 and a small fraction percent back in 1993 when Tony took charge of the business. And the fundamentals are in place — (applause) — to take us much higher.

19. 2008 was tough, but still no plans for dividend

WARREN BUFFETT: Carol?

CHARLIE MUNGER: (Quietly) Can you reach that peanut brittle?

CAROL LOOMIS: I promise you, this question did not come from Susan Lucci. However, it does concern dividend policy. It came from Peter Sargent of Yardley, Pennsylvania.

And to ask that, he quotes from principle number 9 of the "Owner's Manual." And Warren wrote there, quote:

"We feel noble intentions should be checked periodically against results. We test the wisdom of retaining earnings by assessing whether retention over time delivers shareholders at least $1 of market value for each $1 retained. To date, this test has been met." Now, this was written some time ago.

"We will continue to apply it on a 5-year rolling basis. As our net worth grows, it more difficult to use retained earnings wisely."

So I'm now quoting the questioner here:

"The recent annual report made me think about the performance of both the company and the stock price. Berkshire seems to have done quite well in the past few years. But the stock price seems to have not quite kept pace.

"So I looked at the last five years of earnings per share. They're on page 26 of the annual report. And they add up, in total, to $29,207.

"As you probably know, the closing price of Berkshire on December 31st, 2008 was 84,250. If you add the 29,207 per share of retained earnings to this, you come up with a, quote, 'minimum market value of 113,457.'

"Since Berkshire closed on 12/31/2008 at 96,600" — oh, wait, I have read something wrong here.

“The closing price of Berkshire on 12/31/2003 was 84,250.

“And since Berkshire closed on 12/31/2008 at 96,600, and it’s been lower than that since, and is now around that now, it would seem that the market value has not increased for each $1 retained.

“Assuming my analysis is correct, it raises the question of whether or not Berkshire will pay a dividend in the coming year or not.”

WARREN BUFFETT: Well, we’ll now have a short quiz on that program — (laughter) — on the question.

The earnings, incidentally, of the 5-year period would include gains from things that were listed in unrealized appreciation at the end of the period.

In other words, some of those were actually built into the asset value at the time, but then become realized.

But the truth is if you take all of the money we earned in the five years, and the stocks, bonds, businesses purchased, and you sold them for cash on December 31st, 2008, we would not have — we would’ve had a loss on that, I mean, under the conditions that existed on December 31st, 2008.

I think that’s probably true of almost all capital programs that were (inaudible) — if you really measured it by what you could’ve sold, the businesses we bought — we love those businesses.

But there was no market to speak of for many businesses at that time. And security values were down significantly.

So I would say that he’s absolutely right, that measured on the value on December 31st, 2008, that the reinvested earnings had not produced a dollar market value at that particular market point.

Now, I would say this, that we also say we measure our business performance against the S&P. And we use book value as a conservative proxy for intrinsic business value.

We think intrinsic business value is higher, but we use that as a proxy. And we’ve done that consistently throughout the history of Berkshire.

And during that 5-year period — or during any — we’ve never had a 5-year period when we’ve under-performed the S&P, in terms of the — what I would call the intrinsic value measure of Berkshire.

And, as I said a few years ago, it's — as we get larger, it's much harder to do that, and we'll settle for a couple of points better.

But so far, that test has been made — been met. And it's been met while we reinvested all earnings.

So I think that we still have got the burden of — we still should have to prove by the fact that Berkshire will sell above the earnings we've retained. Berkshire sells above it — every dollar that's been retained at Berkshire translates even today into more than a dollar of market value.

But I would certainly say that if you took the five years and just sold all the things we bought during that period at that price, that there would be a loss.

Charlie?

CHARLIE MUNGER: Yeah, I don't get too excited about these oddball things that happen once every 50 years.

If you're reasonably prepared for them and you're dented a little on the bottom tick, and other people are suffering a lot more, and unusual opportunities are coming to you that you don't see under other conditions, I don't think we deserve any salt tears.

20. Wells Fargo's stock price plunge shouldn't spark selling

CHARLIE MUNGER: Take Wells Fargo. I think Wells Fargo's going to come out of this mess way stronger. The fact that the stock at the bottom tick scared a lot of people, I think will prove to be a very temporary phenomenon.

WARREN BUFFETT: Yeah. Wells Fargo got down below — actually, ticked below $9 a share at a time when spreads on business were never better, when depositing flows were never better, when their advantage in relation of costs of funds versus other large banks had never been better.

But you know, in a market that was terrified, it — literally, I had a class meeting that day, and it was the only time any of those classes have ever got me to name a stock. But they actually pushed me.

And somebody there with a BlackBerry, or whatever those instruments are that they carry around these days, checked the price and it was below $9. And I said, if I had to put all my net worth in one stock, that would've been the stock.

The — their business is — you know, the business model is fabulous.

And it, you know, when would you get a chance to buy something like Wachovia, which had the fourth largest deposit base in the United States, and bring that in? And then start getting the spread on assets versus liabilities that Wells gets and build the relationships they have. It's a great business opportunity.

Wells Fargo will be better off — unless they have to issue a lot of shares, which they shouldn't — Wells Fargo will be a lot better off a couple of years from now, than if none of this had happened.

And I think that's true of some of other businesses as well. But you — you know, you have to be prepared. You can't let somebody else get you in a position where you have to sell out your position.

Leverage is what causes people trouble in this world. So you don't — you never want to be in a position where somebody can pull the rug out from under you. And you also never want to be emotionally in a position where you pull the rug out from under yourself.

I mean, you don't want to have other people force you to sell and you don't want to let your own fears or emotions to cause you to sell at the wrong time.

I mean, why anybody sells Wells Fargo at $9 a share when they owned it at $25 and the business is better off, is one of the strange things about the way markets behave. But people do it. And they get very affected by looking at prices.

If they own a farm like I do, you know, 30 miles from here, they don't get a price on it every day. You know, they —

I bought that farm 25 years ago. And you look to the production of corn. You look to the production of soy beans and prices and cost of fertilizer and a few things. And you look to the asset itself to determine whether you made an intelligent investment. You have your expectations about what the asset will produce.

But people in stocks tend to look at the price. So they let the price tell them how they should feel or — that's kind of crazy in our view.

We think you should look at the business just like you'd look at the apartment house that you bought or the farm you want. They let the fact that a quote is available every day turn into a liability rather than an asset.

And all I would say there is you better go back and read chapter 8 of "The Intelligent Investor," where it tells you how to think about the market. And it will do you more good than learning what modern portfolio theory is all about.

21. Big stimulus spending bound to have some "slop"

WARREN BUFFETT: OK, number 7.

AUDIENCE MEMBER: My name is Jim Powers (PH). I'm from West Newton, Massachusetts. My question has to do with this stimulus bill by the federal government.

I've read that only 8 percent of the money is intended to go to infrastructure. When you invest money, you normally look at the asset you're getting for the money.

With the country going into so much debt, don't you think it would be better if a great percentage of the money invested by the federal government go to solid assets, as it did during the Great Depression with the Tennessee Valley Authority, Hoover Dam, other facilities, that are still making money today, and paying back the original investment by the government many times over, while putting numerous people to work?

CHARLIE MUNGER: Let me answer that one. Yes. (Laughter and applause)

WARREN BUFFETT: I would certainly agree. I mean the '30s — a lot of really wonderful things were done with the money that was used to then to stimulate the economy. And that should be the goal and a model.

I can't evaluate perfectly what the current stimulus bill will do. I know that I — I did get a notice the other day from the Social Security Administration telling me I'm getting $250 more. That ought to last me 6 or 7 months. (Laughter)

Charlie will make his last longer, I'm sure. (Laughter)

But you know, that's the stimulus that the Buffett household has received at the present time.

Obviously, you want to use the money as intelligently as possible.

Obviously, also, anytime the federal government does anything on a massive scale — any time any big organization, a church or a business or anything, you know, throws all kinds of resources at something, usually there's a fair amount of slop.

I think that the intent — but by the time it gets through Congress and everything, I can't guarantee how the result comes out — but I think the intent is to get the money into action quickly and to end up having it utilized in intelligent ways.

But if the day after Pearl Harbor happened, you know, if you'd attached 5 or 6 thousand earmarks to the declaration of war, you know, it would not have been a pretty sight.

I mean, it — we have a system now where — that doesn't seem to be perfectly effective, I would say, in detaching the interests of particular legislators away from the common goal.

I mean, I get distressed when I look at what gets attached to some of these bills. And that certainly was a case in point. So I'll go along with Charlie on the answer.

But I think the intent of the administration is the right thing. When the American public pulls back like they have, government does need to step in.

It will have consequences. We are doing things on a scale — we're doing the conventional things, but we're doing them in unconventional amounts.

And we will see consequences from what we are doing now. I think we should be doing it. But I don't think we should think it's a free ride.

CHARLIE MUNGER: Yeah, we have one big no-brainer on the list of infrastructure investments that can be made. And that is a hugely improved nationwide electricity grid. The chances that that won't help us are zero.

And that, when it happens, will enormously benefit Berkshire's utility subsidiary. But that isn't the reason I'm raising it. I would be making this argument if we didn't have a utilities subsidiary.

WARREN BUFFETT: We might make it a little more strongly if we had the utilities subsidiary, however. (Laughter)

22. Hard to compete with government-guaranteed debt

WARREN BUFFETT: Becky?

BECKY QUICK: This question comes from Rita Addison (PH), who says, "How does Berkshire's strong balance sheet and credit rating help take advantage of buying opportunities when even weak financial companies can now borrow more cheaply than Berkshire by using U.S. government guarantees of their debt?"

WARREN BUFFETT: Yeah, well, as I pointed out in the annual report, we are at a significant disadvantage in any financing-type business where we are competing against people who are getting their funding and their financing with a government guarantee.

Our raw material costs us a lot more money. And that's particularly applicable at Clayton where we have 10- or $11 billion of, really, mortgage paper on mostly manufactured homes.

And it's exceptionally good quality portfolio. Kevin Clayton and the people at Clayton Homes have done a great job in terms of lending responsibly. Our borrowers have behaved very well.

But the raw material to fund that portfolio — money — costs us a whole lot more than some bank that's in trouble.

And that's a real problem for us. And it's forcing us to try to come up with various other sources of funding that portfolio where, one way or another, we get people with government guarantees involved in the program.

That's just a fact of life with us now. There are the blessed who have government guarantees. And there're the ones that aren't.

And of course, you see that dramatically, in the case of some companies that have a government guarantee for part of their money and then sell other money — and then sell other bonds — that aren't guaranteed.

I mean, just the other day, as I remember, I may be wrong on this, but I think Goldman Sachs sold something with a 400 basis point spread that wasn't guaranteed. Whereas their guaranteed paper would be hundreds of basis points underneath that.

General Electric sold something earlier this year that wasn't guaranteed. And the spread between the guaranteed and the un-guaranteed was huge.

We don't have anything guaranteed to sell, so we are not in that favored class in any way. And we can't become a bank holding company. So as long as the situation goes on, we have to figure out ways that we adjust.

We only really use borrowed money — we use it in our utility business. But other utilities are not in this favored class. I mean, the utility industry generally.

So our utility borrows money quite well, compared to most utilities. MidAmerican's credit is regarded as very good.

And generally speaking, we've raised our money at a lower rate, which benefits our customers in the utility business.

We don't use much money in the rest of our businesses, except for the financing at Clayton. And we won't use much money.

So we get our money by float, basically. And our float is — it was $58 billion. I mentioned a little while ago, that Wells Fargo raises its money in the first quarter at, I think, 1.12 percent — 112 basis points — which is very cheap.

But our money's cheaper. We can't get as much of it as Wells does. But we do have 58 billion — in fact, we have more now — that you would think will cost us less than zero over time, although there will be given periods when we have a cost to it.

But we don't have an answer for going head-to-head against a government-sponsored business that gets — can raise money with a government guarantee. We do not have a way of going head-to-head with them at any business, no matter how prudently we conduct our operations.

Charlie?

CHARLIE MUNGER: Well, of course we're at a funding disadvantage. But on the other hand, we aren't regulated like a bank or a bank holding company.

I think we'd be pretty ungrateful if we took this one disadvantage that has come to us and obsessed on it.

WARREN BUFFETT: I get those kind of lectures all the time. (Laughter)

23. Graham would probably agree with us on derivatives

WARREN BUFFETT: OK, number 8.

AUDIENCE MEMBER: Hi, Mr. Buffett. Hi, Mr. Munger. My name is Mary Kimble (PH) from New York City.

In getting back to basics, what do you think Ben Graham would have said about derivatives?

WARREN BUFFETT: He would not have liked them. I think he probably would've said pretty much what I said back in 2002, that they pose a real risk to the system.

They cause leverage to run wild. They cause counterparties to sign up for things that may be difficult to achieve under certain circumstances. That they place an already fragile economic system — added strains on them — which can pop up in unpredictable ways.

But he would probably also say if he saw some that were mispriced, he would act accordingly. But he wouldn't get himself in a position where the problems of the people who didn't act prudently could cause him any problems. And I think that probably would be the answer.

The — one of the — one basic problem on derivatives — well, there are several problems.

I mean, back in — after 1929, Congress met — there was a Pecora committee and so on— and they decided that it was very dangerous to let people borrow a lot of money against securities and that it contributed to the Great Depression.

And therefore, they said the Federal Reserve should regulate how much people could borrow against securities. And it was important for society.

And the Federal Reserve started requiring margin — they had margin requirements. Those requirements still exist. You are not supposed to be able to borrow more than 50 percent against your securities.

Actually, during one period, they went to where they didn't — the Federal Reserve allowed no borrowing whatsoever. They went to a hundred percent margin.

But derivatives came along and just turned that into a — made those rules a laughingstock. You have what they call "total return swaps," which means you can borrow a hundred percent against what you own. That goes way beyond anything that existed in 1929.

So derivatives became a way around regulation of leverage in markets, which like I say, Congress felt was important and the Federal Reserve still has a responsibility for enforcing.

Derivatives also meant that settlement dates got pushed out. One of the problems in securities markets comes about when you have a trade today, if you had — didn't have to settle it for a year, you'd find it very hard sometimes to find the person on the other side.

And derivatives allow these very long settlement periods. Whereas security markets demand them in three days. There's a reason they demand them in three days.

As you extend out periods, you get more and more defaults. So they're a danger — they are a danger to the system. There's no question about that.

We have a book in The Bookworm called "The Great Crash" by Galbraith. It's one of the great books. You really ought to buy it. It tells the story of the '29 and it gets into margin requirements, so…

Ben Graham would not like a system that used derivatives heavily. But he would — I don't think he would have been above — if he saw something that looked way out of line and he knew he could handle it himself — I think he would have been quite willing to buy or sell one that was mispriced.

Charlie?

CHARLIE MUNGER: I think there's been a deeper problem in the derivative business. The derivative dealer takes two advantages of the customer.

One, there's croupier-style mathematical advantage equivalent to the house advantage in Las Vegas.

And two, the derivative dealer is playing in the same game with his own clients, with the advantage of being a better player. So —

WARREN BUFFETT: And having knowledge of what they're doing.

CHARLIE MUNGER: — and having knowledge of what the clients are doing.

This is basically a dirty business. And you're really selling things to your clients who trust you, that are bad for the clients.

We don't need more of this kind of thing in America. We need less. (Applause)

24. Bailouts shouldn't hurt senior debt holders

WARREN BUFFETT: Andrew?

ANDREW ROSS SORKIN: Well, this question came in this morning. And it's a timely, philosophical one, given the results of the stress test that will coming out next week. And it relates to your stakes in Wells, U.S. Bancorp and Goldman Sachs. And the question is the following:

"The government's proposed restructuring plans for Chrysler and GM require creditors, as well as common shareholders, to bear losses.

"Yet, with the banks, the government's actions, to date, have not required concessions from holders of preferred stock and debt. The government has merely required the dilution of common stock holders.

"To what extent should holders of preferred stock and debt share losses in the bank rescue plans or in the resolution of a major bank holding company? And do you expect to be diluted in any of your holdings?"

WARREN BUFFETT: Yeah, I would say this. That's very institution specific. With Freddy and Fannie, the preferred was gone. I mean, there was no equity. And the preferred got — in effect, it's gotten wiped out along with the common stock.

With U.S. Bancorp or Wells, those are companies making lots of money. There's lots of equity there. So there's no reason to go up to senior securities and say that they should give up anything when there's lots of common equity underneath.

It'd be like if I have a mortgage on my house and it's 70 percent against its current value, saying, just because other people are having trouble in the neighborhood paying their mortgages because they got much higher mortgage or something, your saying my mortgage holder with 70 percent mortgage, that he should give up something and increase my equity even further.

There's lots of equity there, which there is at Goldman, U.S. Bank, Wells Fargo. There's lots of equity, lots of earning power. There's really no reason for senior debt to give up anything.

You know, you could make an argument at Freddy and Fannie, about the subordinated debt, whether they should've suffered as well as the preferred stock and the common. But I don't see it as applying to earning institutions with lots of future earning power.

I would love to buy all of U.S. Bancorp. You know, or I'd love to buy all of Wells if we could do it. You know, we're not allowed to do it because it'd make us a bank holding company. But those businesses, there's no reason for the creditors to suffer.

Now, you get into Chrysler or something of that sort, you know, there is no — I mean, they're losing money all of time and they do not have a competitive advantage. You know, whether they've got a sustainable business model under any circumstances is open to question.

Whether there's any common equity there is not open to question. You know, there isn't any common equity. Nobody would pay a dollar, you know, if they had to take on Chrysler and all its debts.

Lots of people would pay billions of dollars to take on U.S. Bancorp or Goldman Sachs, you know, with all their debt. So those are different situations. I —

If you get into a situation where the common equity is wiped out, then you get into a question of — then you get into the proper allocation of things within the capital structure — who gives up so much, and the senior debt may give up something, and so on.

But I don't see it as applying at all to businesses that are worth a lot of money, where the equity's worth a lot money.

Charlie?

CHARLIE MUNGER: I have nothing to add. (Laughter)

25. Ignore original cost when reviewing your portfolio

WARREN BUFFETT: OK, number 9.

AUDIENCE MEMBER: Hello, Mr. Buffett. Sorry, about that. Mr. Buffett and Mr. Munger, my name's Kelly Cardwell from Warrenville, Illinois.

Guys, if either of you were starting a smaller investment fund today, let's say in Warrenville, Illinois, $26 million fund called Central Square Capital — hypothetically?

WARREN BUFFETT: What? You'll get billed for a commercial later on. (Laughter)

AUDIENCE MEMBER: With this smaller asset base, what would you do differently, both in terms of the number of positions and frequency of turnover?

For example, if you owned a portfolio of 10 stocks and five of them doubled in a short time period, would it make sense to actively manage the portfolio and take profits in the five that had doubled and redeploy the proceeds into your positions, into the ones that had not moved higher, where, presumably, more upside exists and the odds are more dramatically stacked in your favor? Or would you favor the strategy of sitting on your hands in the name of long-term investing?

WARREN BUFFETT: We would own the half of dozen or so stocks we like best. Their — and it wouldn't have anything to do with what our cost on them was.

It would only have to do with our evaluation of their price versus value. It doesn't make any difference what the cost is.

And incidentally, if they went down 50 percent, we would say the same thing. I — you know, and using your illustration, I don't know whether that fund has actually had something that went up or went down.

So, we would — our cost basis, except in rare cases — and we actually have a situation like this at Berkshire now, which I may explain a little later. But the cost basis doesn't have anything to do the fund.

When Charlie and I ran funds, we didn't worry about whether something was up or down. We worried about what it was worth compared to what it was selling for.
